Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste Code: D000
Waste Description: Not Defined

Waste Code: D001
Waste Description: IGNITABLE WASTE

Waste Code: D002
Waste Description: CORROSIVE WASTE

Waste Code: D004
Waste Description: ARSENIC

Waste Code: D005
Waste Description: BARIUM

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: D009
Waste Description: MERCURY

Waste Code: D010
Waste Description: SELENIUM

Waste Code: D011
Waste Description: SILVER

Waste Code: D013
Waste Description: LINDANE (1,2,3,4,5,6-HEXA-CHLOROCYCLOHEXANE, GAMMA ISOMER)

Waste Code: D022
Waste Description: CHLOROFORM

Waste Code: D024
Waste Description: M-CRESOL

KAPIOLANI MEDICAL CENTER FOR WOMEN AND CHILDREN (Continued) **1004688971**

Waste Code: F001
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: P001
Waste Description: 2H-1-BENZOPYRAN-2-ONE, 4-HYDROXY-3-(3-OXO-1-PHENYLBUTYL)-, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3% (OR) WARFARIN, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3%

Waste Code: P012
Waste Description: ARSENIC OXIDE AS2O3 (OR) ARSENIC TRIOXIDE

Waste Code: P042
Waste Description: 1,2-BENZENEDIOL, 4-[1-HYDROXY-2-(METHYLAMINO)ETHYL]-, (R)- (OR) EPINEPHRINE

Waste Code: P075
Waste Description: NICOTINE, & SALTS (OR) PYRIDINE, 3-(1-METHYL-2-PYRROLIDINYL)-,(S)-, & SALTS

Waste Code: P081
Waste Description: 1,2,3-PROPANETRIOL, TRINITRATE (R) (OR) NITROGLYCERINE (R)

Waste Code: P105
Waste Description: SODIUM AZIDE

Waste Code: P188
Waste Description: BENZOIC ACID, 2-HYDROXY-, COMPD. WITH (3AS-CIS)-1,2,3,3A,8,8A-HEXAHYDRO-1,3A,8-TRIMETHYLPYRROLO[2,3-B]INDOL-5-YL METHYLCARBAMATE ESTER (1:1) (OR) PHYSOSTIGMINE SALICYLATE

Waste Code: P204
Waste Description: PHYSOSTIGMINE (OR) PYRROLO[2,3-B]INDOL-5-OL, 1,2,3,3A,8,8A-HEXAHYDRO-1,3A,8-TRIMETHYL-METHYLCARBAMATE (ESTER), (3AS-CIS)-

Waste Code: U010
Waste Description: AZIRINO [2',3':3,4]PYRROLO[1,2-A]INDOLE-4,7-DIONE, 6-AMINO-8-[[(AMINOCARBONYL)OXY]METHYL]-1,1A,2,8,8A,8B-HEXAHYDRO-8A-MET

KAPIOLANI MEDICAL CENTER FOR WOMEN AND CHILDREN (Continued) **1004688971**

HOXY-5-METHYL-, [1AS-(1AALPHA, 8BETA, 8AALPHA, 8BALPHA)]- (OR) MITOMYCIN C

Waste Code: U034
Waste Description: ACETALDEHYDE, TRICHLORO- (OR) CHLORAL

Waste Code: U058
Waste Description: 2H-1,3,2-OXAZAPHOSPHORIN-2-AMINE, N,N-BIS(2-CHLOROETHYL)TETRAHYDRO-, 2-OXIDE (OR) CYCLOPHOSPHAMIDE

Waste Code: U059
Waste Description: 5,12-NAPHTHACENEDIONE, 8-ACETYL-10-[(3-AMINO-2,3,6-TRIDEOXY)-ALPHA-L-LYXO-HEXOPYRANOSYL)OXY]-7,8,9,10-TETRAHYDRO-6,8,11-TRIHYDROXY-1-METHOXY-, (8S-CIS)- (OR) DAUNOMYCIN

Waste Code: U129
Waste Description: CYCLOHEXANE, 1,2,3,4,5,6-HEXACHLORO-, (1ALPHA, 2ALPHA, 3BETA, 4ALPHA, 5ALPHA, 6BETA)- (OR) LINDANE

Waste Code: U150
Waste Description: L-PHENYLALANINE, 4-[BIS(2-CHLOROETHYL)AMINO]- (OR) MELPHALAN

Waste Code: U188
Waste Description: PHENOL

Waste Code: U205
Waste Description: SELENIUM SULFIDE (OR) SELENIUM SULFIDE SES2 (R,T)

Waste Code: U248
Waste Description: 2H-1-BENZOPYRAN-2-ONE, 4-HYDROXY-3-(3-OXO-1-PHENYL-BUTYL)-, & SALTS, WHEN PRESENT AT CONCENTRATIONS OF 0.3% OR LESS (OR) WARFARIN, & SALTS, WHEN PRESENT AT CONCENTRATIONS OF 0.3% OR LESS

Environmental Interest/Information System:
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting

KAPIOLANI MEDICAL CENTER FOR WOMEN AND CHILDREN (Continued) **1004688971**

requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Summary:	During a pipeline replacement project, Styrene contamination was discovered above DOH s action levels. In a multi-increment sample of the lines that run from the UST to the dispensers, Styrene concentration was 9.4 ppm. No stains. No odors. Field screening equipment found nothing. The source of the Styrene is unknown.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with

LA PIETRA HAWAII SCHOOL FOR GIRLS (Continued) **1006806682**

a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
STATE MASTER

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Property History:	THE SITE WAS COMMANDEERED BY THE MILITARY GOVERNOR IN DECEMBER 1941 TO BE CONVERTED INTO A HOSPITAL. IT WAS EXPANDED TO 2,500 BEDS WHICH SERVED ABOUT 33,000 PATIENTS. FOURTEEN BUILDING ERECTED BY TRHE ARMY WAS PURCHASED BY THE MARIANISTS FOR SCHOOL USE. THE SCHOOL WAS RETURNED TO THE MARIANISTS SHORTLY AFTER WORLD WAR II. FOUR USTS WERE FOUND AND REMOVED IN 1970 BY THE SCHOOL. THE SCHOO L USED THOSE TANKS TO FUEL THEIR VEHICLES UNTIL 1990.
Project Required:	No

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

PUNAHOU SCHOOL (Continued) **1007092151**

corrective action activities required under RCRA.
HAZARDOUS WASTE BIENNIAL REPORTER
STATE MASTER
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Island:	Oahu
SDAR Environmental Interest Name:	2700 South King Street
HID Number:	Not reported
Facility Registry Identifier:	Not reported
Lead Agency:	HEER Office
Potential Hazard And Controls:	Hazard Managed With Controls
Priority:	NFA
Assessment:	Response Not Necessary
Response:	Not reported
Nature of Contamination:	Not reported
Nature of Residual Contamination:	Lead above industrial EALs is present under an asphalt cap.
Use Restrictions:	Controls Required to Manage Contamination
Engineering Control:	Engineering Control Required
Description of Restrictions:	The Site is limited to commercial use. The parking lot cover (asphalt) must remain in place, otherwise the ash layer with lead contamination at 15 inches bgs must be removed.
Institutional Control:	Government - Hawaii Dept. of Health Letter Issued
Within Designated Areawide Contamination:	Not reported
Site Closure Type:	No Further Action Letter - Restricted Use
Document Date:	02/03/2004
Document Number:	2004-039-CAC
Document Subject:	No Further Characterization Required

HALE KOA HOTEL (Continued) **1007092121**

Waste Code: D035
Waste Description: METHYL ETHYL KETONE

Waste Code: F001
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLORETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F002
Waste Description: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F004
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: CRESOLS, CRESYLIC ACID, AND NITROBENZENE; AND THE STILL BOTTOMS FROM THE RECOVERY OF THESE SOLVENTS; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS ECHO FIRE TRAINING: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

1. Introduction

The purpose of this appendix is to document the environmental coordination that has been undertaken for the feasibility of providing flood risk management measures in the Ala Wai Canal Flood project, Honolulu, Hawaii. The Corps is obligated to address the following authorities, consultations, and permits:

- Section 7(a)(2) Consultation, Endangered Species Act with the U.S. Fish and Wildlife Service and National Marine Fisheries Service
- Essential Fish Habitat, Magnuson-Stevens Fishery Conservation and Management Act with the National Marine Fisheries Service
- Fish and Wildlife Coordination Act with the U.S. Fish and Wildlife Service and National Marine Fisheries Service
- Coastal Zone Management Consistency Determination, State of Hawaii
- Department of Health, Water Quality Certification, State of Hawaii

MEMORANDUM FOR RECORD

SUBJECT: Ala Wai Canal General Reevaluation Report, Initial Resource Agency Meeting

LOCATION: Virtual

DATE OF MEETING: October 5, 2021

ATTENDEES:

Steve Kolinski, NMFS PRD
Dan Polhemus, USFWS
Jiny Kim, USFWS
Nadiera McCarthy, USFWS
Anthony Montgomery, USFWS
Elliott Porter, USACE-LRP
Cindy Acpal, USACE-POH
Debby Scerno, USACE-HQ
Sue Davis, USACE-LRC
Alex Hoxsie, USACE-LRC
Shawna Herleth-King, USACE-LRC

REPORT: Attendees discussed the following items.

Elliott Porter presented a powerpoint presentation providing an initial overview of the General Reevaluation Report (GRR) being prepared for the Ala Wai Canal Flood Risk Management Project.

Management Measures – The U.S. Army Corps of Engineers (USACE) requested input on additional management measures that should be considered during the GRR effort (any additional ones beyond those presented in the powerpoint presentation). Recommendations included looking at underground retention in the upper reaches of the Ala Wai watershed due to limited real estate; looking at setbacks for the Woodlawn Bridge area; looking at available detention capacity under existing roadways or paved areas; looking at underground cisterns or other underground storage areas as offshoots to existing channels; and looking at artificial wetlands around the Ala Wai Golf Course.

Section 7(a) consultation (USFWS) – The U.S. Fish and Wildlife Service (USFWS) noted that there are multiple listed species in the upper valley of Manoa (i.e., damselfly) and would want the project to avoid impacts to these species. Elepaio and blackline damselfly are primarily in the upper Ala Wai watershed; Hawaiian hoary bats are located everywhere in the watershed; threatened and endangered birds in the action area can be attracted by nighttime lighting; stilts will use any standing water that might be created by the project; and gallinule are potentially not an issue. It was noted that for the past Ala Wai Canal FRM efforts a Section 7 concurrence letter had been provided to USACE.

Section 7(a) consultation (NMFS) – The National Marine Fisheries Service (NMFS) noted that previous coordination that occurred was on inland waters as the 2017 and 2020 proposed project features were all located upstream (there wasn't a big marine component in previous documents). Some subsequent features have been discussed downstream that could potentially be within marine areas. In general, sea turtles and monk seals would be a NMFS consideration, although there is not nesting in the project action area.

Fish and Wildlife Coordination Act – USFWS noted that an extensive Fish and Wildlife Coordination Act Report (FWCAR) on upstream detention basin structures was provided to

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

USACE for the 2017 effort. A supplemental FWCAR was in development for the 2020 effort which included downstream detention basin structures, etc. For the GRR, USACE would need to reinitiate FWCAR coordination for downstream measures not included in the 2017 FWCAR. In general, the habitat most likely to be impacted by the current effort is the Ala Wai Canal, but it is far from pristine. For the current effort, USACE needs to send letter to USFWS requesting a Scope of Work for the FWCAR.

Essential Fish Habitat Analysis – In general, NMFS noted that they prefer upper water retention so as not to increase flow through the Ala Wai Canal which could potentially increase the amount of sediment reaching the nearshore marine habitat. For the 2017 effort there was no EFH analysis as there were no marine considerations since all measures were in the upper watershed. NMFS would need a description of the alternatives being considered under the GRR to determine involvement for the current effort.

GENERAL DISCUSSION –

Climate Change Considerations: USACE designs projects with a 50-year project life and that is how they are assessed. USACE looks at 100-year period for sea-level rise. Anticipate Hawaii to be similar or drier, however, frequency of heavy rainfall events is expected to increase. At the time of the meeting, no documented 100-year event in the Ala Wai watershed.

Contaminated Sediment Considerations: If holding back water also going to be holding back sediment. There are a lot of legacy contaminated sediments in the Ala Wai watershed and proper disposal of these sediments is important. USACE will have to consider disposal of contaminated sediment as part of the total project cost.

Operations and Maintenance Considerations: The non-federal sponsor takes over operation and maintenance responsibilities once construction of the project is complete; however, the costs and activities are incorporated into the feasibility study. Therefore, as an example, the operation and maintenance of potential pump stations is factored into the decision when selecting an alternative to recommend. USACE doesn't want to push high maintenance and operation costs onto the NFS. Therefore, USACE is actively seeking opportunities with green infrastructure that may capture some sediments before they enter the stream or a detention basin.

Structural Modification Considerations: USACE not considering any type of structural modifications in the upper basin. There is limited ability to affect the surface water in the upper basin and there is a greater potential of environmental impacts.

CONCLUSION AND FOLLOW UP ITEMS:

Follow-up Items:
-Send cooperating agency request letters to USFWS and NMFS
-Begin Scope of Work for FWCAR in the February/March 2022 timeframe
-Section 2020 USFWS coordination information to NMFS
-Set up recurring resource agency meeting for every 2 months initially

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

3. Section 7(a)(2) Consultation with the U.S. Fish and Wildlife Service

Section 7(a)(2) Consultation with the U.S. Fish and Wildlife Service will be completed for Hawaiian Seabirds, Hawaiian waterbirds, and the Hawaiian hoary bat. The Corps has determined that the flood risk management project may affect, but is not likely to adversely affect the federally listed species. Consultation letters and communications with the Service are contained in this section (attached).

Herleth-King, Shawna S CIV USARMY CELRC (USA)

From: Herleth-King, Shawna S CIV USARMY CELRC (USA)
Sent: Thursday, November 10, 2022 10:48 AM
To: Kim, Jiny
Subject: Reinitiation of Section 7 Consultation for the Ala Wai Canal GRR
Attachments: Final Array Visuals.pptx

Importance: High

Hi Ms. Kim,

The Corps would like to reinitiate informal Section 7 consultation for the Ala Wai Canal GRR study. As discussed during our coordination calls on the subject project, the GRR that the Corps is preparing is a reevaluation of the previous 2017 study and will ultimately result in a recommendation from the Corps that will either update and confirm the 2017 authorized project or make a new recommendation. Currently the Corps is evaluating six alternatives that make up the final array (please see the attached powerpoint for the final array visuals). Further analysis of these alternatives/measures may still result in further screening. Please note that since our last discussion the Corps has screened the Kapiolani Park Detention Basin measure from Alternative 1 – Storage Cornerstone. The remaining measures/alternatives are still being further evaluated, and it is still likely that additional measures/alternatives could be screened out of the final array (including Alternative 2C – Conveyance Cornerstone). However, the only measure that has been for sure screened from the attached final array of alternatives is the Kapiolani Park Detention Basin.

This email is a request for an updated official species list for the study area. It appears from previous consultation on the subject project that the official list from USFWS included the following species as recent as 2020: Hawaiian blackline damselfly (*Megalagrion nigrohamatum nigrolineatum*), Hawaiian hoary bat (*Lasiurus cinereus semotus*), O'ahu 'elepaio (*Chasiempis ibidis*), Hawaiian stilt (*Himantopus mexicanus knudseni*), Hawaiian coot (*Fulica alai*), Hawaiian common gallinule (*Gallinula galeata sandvicensis*), Hawaiian duck (*Ana wyvilliana*), Hawaiian damselfly (*Megalagrion leptodemas*), oceanic Hawaiian damselfly (*Megalagrion oceanicum*), orangeblack Hawaiian damselfly (*Megalagrion xanthomelas*), O'ahu tree snails (*Achatinella sp.*), hāhā (*Cyanea acuminata*), hāhā (*Cyanea crispa*), hāhā (*Cyanea koolauensis*), *Diella erecta*, nānū (*Gardenia mannii*), *Gouania meyenii*, wāwai 'iole (*Huperzia nutans*), *Lobelia oahuensis*, 'ihi'ihi (*Marsilea villosa*), *Pteris lidgatei*, *Schieda nuttallii*, and *Spermolepis hawaiiensis*.

If you could please provide an updated species list or confirm the above species should still be considered in our analysis we would appreciate it.

Thank you,
Shawna

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1. Introduction

At the request of the City and County of Honolulu (CCH), the U.S. Army Corps of Engineers, Pittsburgh District (USACE) is conducting a feasibility study for the Ala Wai Canal Project (hereafter referred to as "the project"). The purpose of the project is to reduce flood hazards within the watershed, which is comprised of approximately 19 square miles (12,064 acres) on the southeastern side of the island of Oahu in the State of Hawaii (Figure 1).

In accordance with Section 7 of the Endangered Species Act (ESA) (Title 16, United States Code [USC], Section 1536[c]) and in consultation with the United States Fish and Wildlife (USFWS) and the National Marine Fisheries Service (NMFS), this Biological Assessment (BA) defines and evaluates the potential effects of the proposed project on ESA-listed species and their designated critical habitats.

1. 1 Project Authority

The project is authorized under Section 209 of the Flood Control Act of 1962. Section 209 is a general authority that authorizes surveys in harbors and rivers in Hawaii "with a view to determining the advisability of improvements in the interest of navigation, flood control, hydroelectric power development, water supply, and other beneficial water uses, and related land resources."

1.2 Project Purpose and Need

The purpose of the proposed action is to reduce the on-going flood risks throughout the Ala Wai watershed.

The need for the project is due to the high level of flood risk that exists within the Ala Wai Watershed. Extensive urban development throughout the watershed, coupled with the basin's unique topography and hydrology (i.e., steep mountainous terrain and propensity for intense rainfall events within the headwaters) and aging and undersized infrastructure result in elevated flood risk for a large proportion of the population both along the Ala Wai Canal and within the Makiki, Manoa, and Palolo valleys. The population density within the Ala Wai watershed is approximately 200,000 residents. The watershed also contains the University of Hawai'i and the Waikiki District – a prime tourist destination that attracts more than 79,000 visitors per day and accounts for approximately 8% of the gross state product and 11% of all civilian jobs in the state.

It is estimated that the Ala Wai Canal has the capacity to contain about a 20% annual exceedance probability (AEP) flood event. Overtopping of the Canal has previously flooded Waikiki multiple times, including November 1965 and December 1967 storms and during the passage of Hurricane Iniki in 1992. Upstream areas are also at risk of flooding, as demonstrated by several recent events, including the October 2004 storm that flooded the Manoa Valley and the March 2006 storm that flooded Makiki. The October 2004 event was estimated to have a 4% AEP that caused more than $85 million in damages.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Figure 1: Regional Location of the Action Area.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1.3 Project History

In response to a request from DLNR, the reconnaissance phase of the Ala Wai Canal Project was initiated in April 1999. At that time, Federal, State, and local agencies sought a comprehensive management and restoration plan to restore aquatic habitat and biological diversity in the Canal and upstream tributaries. The reconnaissance report was submitted in August 1999 and recommended that the USACE assist the State with restoration of the Canal. Approval by USACE for continuation into the feasibility phase was granted in September 1999.

Independently, the Ala Wai Flood Study was initiated in September 1998 under the Planning Assistance to States (PAS) Program (Section 22 of the Water Resources Development Act [WRDA] of 1974) to determine the potential flood risk to the Waikiki area, in response to a request by the DLNR Land Division. The study was completed in October 2001 and documented a high flood hazard associated with potential overtopping of the Ala Wai Canal. This study identified several mitigative measures and conceptual alternatives that could potentially minimize flood damages to Waikiki and surrounding areas. The results of this technical study were used to establish that the USACE could be involved in the investigation of flood risk management in the Canal. As a result, a flood risk management objective was added to the Ala Wai Canal Project, thus expanding the project focus to both ecosystem restoration and flood risk management in the Canal area.

The FCSA was executed between USACE and the non-Federal sponsor, DLNR Engineering Division, in 2001. The feasibility phase of the project was initiated in July 2002, and an EIS scoping meeting was held in June 2004. Subsequently, in October 2004, heavy rains caused Manoa Stream to overtop its banks, resulting in significant damages. In response, the USACE temporarily ceased work on the feasibility study, such that the project could be expanded to include the upstream portions of the Ala Wai Watershed. While the cost-share agreement was being amended to address a more comprehensive scope, the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) received Federal funds to identify specific actions to address flooding in Manoa Valley. The Manoa Watershed Project was initiated in 2006 and resulted in detailed topographic mapping, hydrologic and hydraulic modeling, and identification of potential measures to address specific flood problems. However, because of insufficient Federal funding to complete the project, the Manoa Watershed Project was terminated before implementation.

Information developed through the Manoa Watershed Project by NRCS was subsequently incorporated into the Ala Wai Canal Project, which was restarted in 2007. A second EIS scoping meeting was held in October 2008. Project-related efforts were primarily focused on bringing the technical information for the entire watershed up to the same level of detail as produced for Manoa under the Manoa Watershed Project.

In October 2012, a charette was held to re-scope the study as part of the USACE Civil Works Planning Modernization process. The purpose of the charette was to bring together the USACE project delivery team (PDT), Pacific Ocean Division, and Headquarters staff with the non-Federal sponsor and other cooperating agencies, in order to determine the path forward for completing the feasibility study in compliance with current USACE planning requirements. Key outcomes of the charette included consensus on the problems and opportunities, objectives and constraints, screening and decision criteria, the initial array of alternatives, and a framework for identification of the recommended plan. Based on the project review at the charette, ecosystem restoration was eliminated as a study objective, as it was determined that the biological

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

resources within the watershed did not have enough national significance to adequately justify ecosystem restoration as an objective.

The feasibility study was completed in 2017 and resulted in a recommendation that was subsequently authorized for construction under Section 1401 of the Water Resources Development Act of 2018. The 2017 recommended plan consisted of six in-stream debris and detention basins of varying height in the upper reaches of the watershed, one standalone debris catchment structure, three multi-purpose detention basins, floodwalls along the Ala Wai Canal averaging four feet in height and an earthen levee at the perimeter of an adjacent golf course averaging seven feet in height, two pump stations to reduce the threat of interior flooding, and a flood warning system. The record of decision (ROD) was signed on September 18, 2018, initiating the next phase of the study, Preconstruction Engineering and Design (PED). In 2020, an Engineering Documentation Report (EDR) provided the technical basis for modifications necessary to the Authorized Project. Subsequent analysis found that the modifications in the 2020 EDR were not cost effective and lacked the economic justification necessary for continued federal involvement.

In 2021, acknowledging the need to reduce the risk to life, safety, and economic damages from flooding throughout the Ala Wai Watershed in Oahu, Hawaii, the USACE began reevaluating the previously completed Ala Wai Canal Flood Risk Management Study in a General Reevaluation Report (GRR) using current planning criteria and policies. The GRR that is being developed will redefine the flood problems and risks in the Ala Wai Watershed by updating hydrology, physical, biological, and socioeconomic conditions; reevaluate alternatives for reducing flood damages in the area; and reaffirm the Federal interest by recommending a plan that is economically feasible.

1.4 Consultation History

The USACE previously consulted the USFWS in preparation of an Environmental Impact Statement (EIS) (2017) based on the scope of the Ala Wai Flood Risk Management Study at that time (reference number: 01EPIF00-2016-F-0157). A biological opinion analyzed the 2017 proposed project specifically in the Waihi and Waiakeakua Streams and its effects on the Hawaiian blackline damselfly (*Megalagrion nigrohamatum nigrolineatum*). An informal consultation for the proposed project and its effects on listed species was also conducted. Species included in the informal consultation for the 2017 proposed project included the federally endangered Hawaiian hoary bat *(Lasiurus cinereus semotus*), Oahu elepaio (*Chasiempis ibidis*), Hawaiian stilt (*Himantopus mexicanus knudseni*), Hawaiian coot (*Fulica alai*), Hawaiian common gallinule (*Galinula chloropus sandvicensis*), and the Hawaiian duck (*Anas wyvilliana*). The USACE made a no-effect determination for project impacts to the federally endangered crimson Hawaiian damselfly (*Megalagrion leptodemas*), oceanic Hawaiian damselfly (*Megalagrion oceanicum*), orangeblack Hawaiian damselfly (*Megalagrion xanthomelas*), Oahu tree snails (*Achatinella sp.*), haha (*Cyanea acuminata*), haha (*Cyanea crispa*), haha (*Cyanea koolauensis*), *Diellia erecta*, nanu (*Gardenia mannii*), *Gouania meyenii*, wawae iole (*Huperzia nutans*), *Lobelia oahuensis*, ihi ihi (*Marsilea villosa*), *Pteris lidgatei*, *Schieda nuttalii*, and *Spermolepis hawaiiensis*.

In 2020, the scope of the 2017 authorized project was reduced in scale and eliminated the construction of several debris catchments and detention basins in the upper watershed. The USFWS via letter dated September 17, 2020, provided a species list and avoidance and minimization measures to the USACE for the reduced scope project (reference number: 01EPIF00-2020-SL-0470). On October 28, 2020, the USACE provided a biological evaluation to

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

the USFWS and reinitiated consultation with the USFWS. In the 2020 BE, USACE requested USFWS's concurrence with the determination that the proposed project may affect, but would not likely adversely affect the endangered Hawaiian petrel (*Pterodroma sandwichensis*), Newell's shearwater (*Puffinus auricularis newelli*), Hawaiian stilt (*Himantopus mexicanus knudseni*), Hawaiian gallinule (*Gallinula galeata sandvicensis*), Hawaiian coot (*Fulica alai*), and Hawaiian hoary bat (*Lasiurus cinereus semotus*). In addition, USACE requested concurrence with the determination that the proposed project would have no effect on the Hawaii distinct population segment of band-rumped storm-petrel (*Oceanodroma castro*). In a letter dated December 24, 2020 (reference number: 01EPIF00-2021-I-0030), USFWS stated that based on the project description that was provided in the 2020 BE along with the proposed avoidance and minimization measures that would be implemented, effects from the actions were discountable. The USFWS concurred with USACE's determination that the proposed action may affect, but is not likely to adversely affect Hawaiian seabirds, Hawaiian waterbirds, and Hawaiian hoary bats.

In compliance with ESA consultation requirements, USACE requested reinitiation of informal consultation for the current effort, and an updated species list via email on November 10, 2022. A list of federally listed species and designated critical habitat that could occur with the action area was ultimately obtained from the USFWS's IPaC website. An initial kick-off meeting with USFWS regarding the General Reevaluation Report on the Ala Wai Canal Flood Risk Management Study was held on October 5, 2021. Follow-up meetings were held with agency staff on February 8, 2022; April 5, 2022; June 9, 2022; August 2, 2022; August 23, 2022; September 27, 2022; October 18, 2022; October 25, 2022; November 15, 2022; December 20, 2022; January 24, 2023; February 28, 2023; March 23, 2023; April 25, 2023; May 2, 2023; June 27, 2023; and July 25, 2023.

Reinitiation of informal consultation was also initiated with NMFS via emailed request from USACE as well as a request for an updated species list on November 10, 2022. A list of federally listed species under NMFS jurisdiction was provided via email on November 10, 2022. An initial kick-off meeting with NMFS regarding the General Reevaluation Report on the Ala Wai Canal Flood Risk Management Study was held on October 5, 2021. Follow-up meetings were held with agency staff on February 8, 2022; April 5, 2022; June 9, 2022; August 2, 2022; August 23, 2022; September 27, 2022; October 25, 2022; October 27, 2022; November 15, 2022; December 20, 2022; January 24, 2023; February 28, 2023; March 23, 2023; April 25, 2023; May 2, 2023; June 27, 2023; July 25, 2023, September 26, 2023, and October 24, 2023.

1.5 Purpose and Need of the Proposed Action

The purpose of the proposed project is to reduce the on-going flood risks throughout the Ala Wai watershed.

The need for the project is due to the high level of flood risk that exists within the Ala Wai Watershed. Extensive urban development throughout the watershed, coupled with the basin's unique topography and hydrology (i.e., steep mountainous terrain and propensity for intense rainfall events within the headwaters) and aging and undersized infrastructure result in elevated flood risk for a large proportion of the population both along the Ala Wai Canal and within the Makiki, Manoa, and Palolo valleys. The population density within the Ala Wai watershed is approximately 200,000 residents. The watershed also contains the University of Hawai'i and the Waikiki District—a prime tourist destination that attracts more than 79,000 visitors per day and accounts for approximately 8% of the gross state product and 11% of all civilian jobs in the state.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

It is estimated that the Ala Wai Canal has the capacity to contain about a 20% annual exceedance probability (AEP) flood event. Overtopping of the Canal has previously flooded Waikiki multiple times, including November 1965 and December 1967 storms and during the passage of Hurricane Iniki in 1992. Upstream areas are also at risk of flooding, as demonstrated by several recent events, including the October 2004 storm that flooded the Manoa Valley and the March 2006 storm that flooded Makiki. The October 2004 event was estimated to have a 4% AEP that caused more than $85 million in damages.

1.6 Threatened, Endangered, Proposed Threatened or Proposed Endangered Species, Designated Critical Habitat

An official species list for the action area (Project Codes: 2023-0048348; 2023-0048319; 2023-0048409; 2023-0048352; 2023-0048400) was obtained from the U.S. Fish and Wildlife Service's Information for Planning and Consultation (IPaC) website (Attachment A). Table 1 contains the federally-listed and proposed species and designated and proposed critical habitat that may be present in the Action Area (defined in Section 1.6). This table includes species that are part of the USACE's informal consultation request for the Proposed Action under Section 7 of the Endangered Species Act (ESA), as well as species for which the USACE has made a no effect determination. Supporting analyses are provided in Chapters 2 and 3 of this document.

Table 1: Federally Endangered, Threatened, Proposed Endangered or Proposed Threatened Species, Designated or Proposed Critical Habitat in the Action Area.

Common Name	Scientific Name	Status
Flowering Plants		
'Aiea	*Nothocestrum latifolium*	Endangered
'Akoko	*Euphorbia celastroides var. kaenana*	Endangered
'ena'ena	*Pseudognaphalium sandwicensium var. molokaiense*	Endangered
Carter's Panicgrass	*Panicum fauriei var. carteri*	Endangered
Ewa Plains 'akoko	*Euphorbia skottsbergii var. skottsbergii*	
Ihi	*Portulaca villosa*	Endangered
Kamanomano	*Cenchrus agrimonioides*	Endangered
No Common Name	*Lobelia monostachya*	Endangered
No Common Name	*Polyscias lydgatei*	Endangered
Popolo	*Solanum nelsonii*	Endangered
Pu'uka'a		Endangered
Ohai	*Sesbania tomentosa*	Endangered
No Common Name	*Vigna o-wahuensis*	Endangered
Ferns and Allies		
Ihi'ihi	*Marsilea villosa*	Endangered
No Common Name	*Microlepia strigose var. mauiensis*	Endangered
Birds		
Band-rumped Storm petrel	*Oceanodroma castro*	Endangered
Hawaii Akepa	*Loxops coccineus*	Endangered
Hawaiian Duck	*Anas wyvilliana*	Endangered
Hawaiian Common Gallinule	*Gallinula galeata sandvicensis*	Endangered
Hawaiian Coot	*Fulica americana alai*	Endangered
Hawaiian Petrel	*Pterodroma sanwichensis*	Endangered
Hawaiian Stilt	*Himantopus mexicanus knudseni*	Endangered

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Common Name	Scientific Name	Status
Newell's Townsend's Shearwater	*Puffinus auricularis newelli*	Threatened
Short-tailed Albatross	*Phoebastria albatrus*	Endangered

Hawaiian Monk Seal	*Neomonachus schauinslandi*	Endangered
Hawaiian Monk Seal Critical Habitat	-	-
Reptiles		
Green Sea Turtle, Central North Pacific Distinct Population	*Chelonia mydas*	Threatened
Green Sea Turtle Critical Habitat	-	-
Hawksbill Sea Turtle	*Eretmochelys imbricata*	Endangered

(-) Not applicable

Critical habitat has been designated within the action area for the Hawaiian monk seal. In addition, critical habitat has been proposed within the action area for the green sea turtle.

2. Description of Proposed Action and Action Area

2.1 Detailed Description of Proposed Action

The Proposed Action includes the following major elements:

Woodlawn Drive Floodwall
An approximately 1,270 feet long, six feet tall, and 12 feet wide at the base concrete floodwall with lava rock fascia would be installed along the right descending bank of Manoa Stream from approximately 270 feet upstream of Woodlawn Drive Bridge to approximately 1,120 feet downstream of Woodlawn Drive Bridge (Figure 2). The concrete floodwall would be an L-wall on macropiles (i.e., an ultra-high-capacity micropile typically drilled in place) (Figure 3). In general, macropiles are installed by methods that cause minimal disturbance to adjacent structures, soil, and the environment. They can be installed in access-restrictive environments and in all soil types and ground conditions. The installation procedure for macropiles causes minimal vibration and noise and can be used in conditions of low headroom. For construction, clearing and grubbing would occur along the right-descending bank of Manoa Stream for the length of the proposed L-wall and approximately 72 feet in width to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the stream. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the L-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the six-foot vertical portion of the L-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

fascia would be placed on both sides of the vertical portion of the L-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the L-wall would occur.

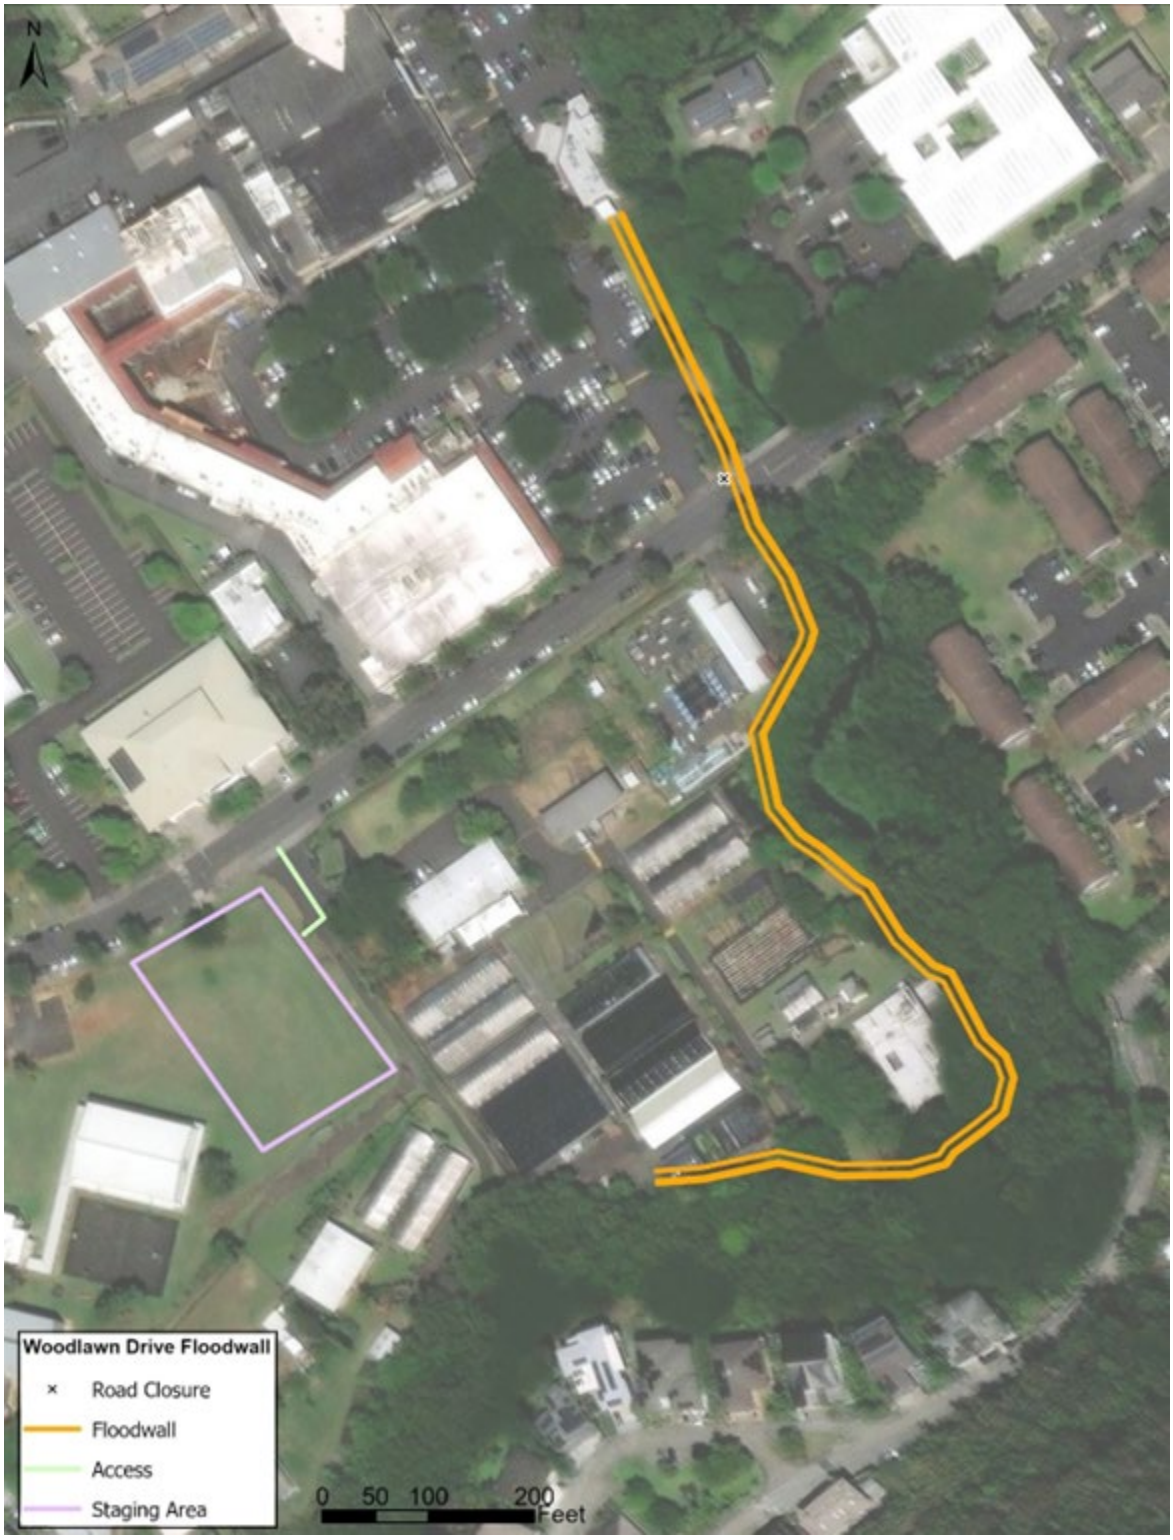

Figure 2: Woodlawn Drive Floodwall Proposed Project Footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

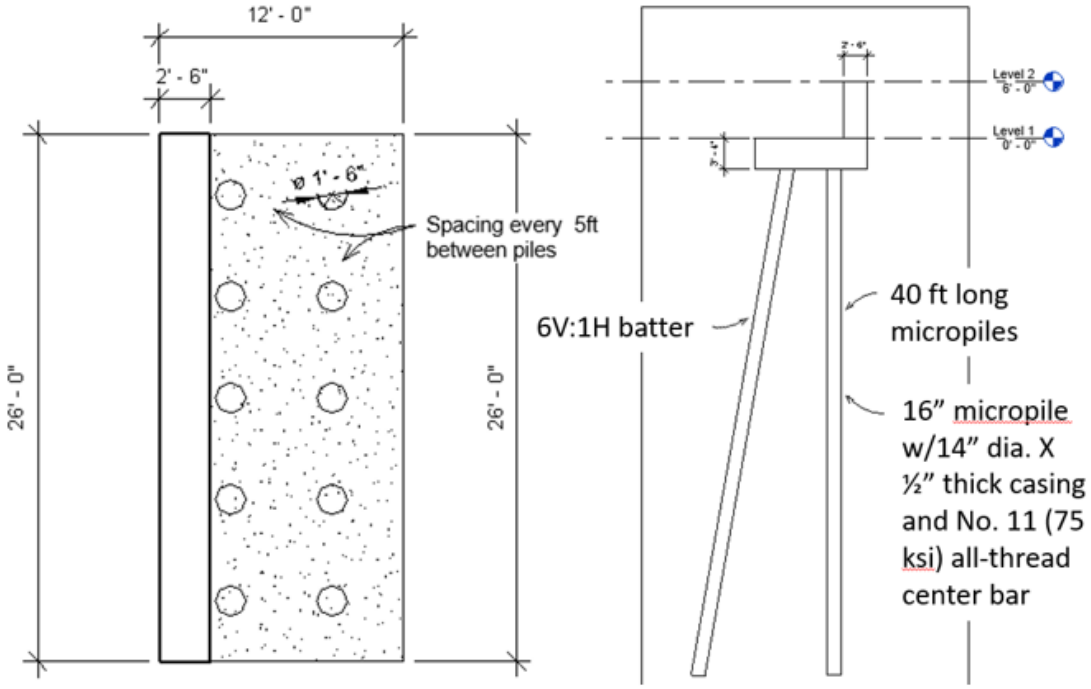

Figure 3: Preliminary L-wall on Macropiles Layout

The Woodlawn Drive Floodwall does not include any new or modification of existing drainage structures. One road closure structure would be constructed across Woodlawn Drive. The road closure structure is assumed to be a swing gate (Figure 4). A swing gate would require hinges to be attached to the floodwall and potentially a removable center post attached to the middle of the roadway if a double gate leaf is necessary (Figure 5). The road closure structure would require minor modifications as described above to the floodwalls for prefab gates. No in-water work is anticipated for the construction of the Woodlawn Drive Floodwall or road closure structure.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

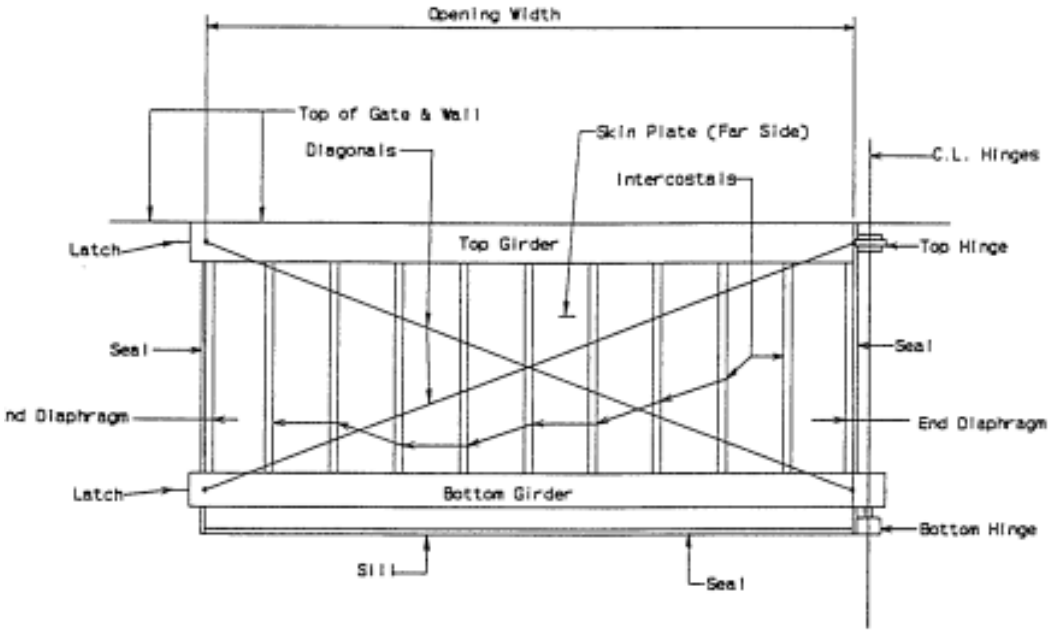

Figure 4: Example of a Single Swing Gate.

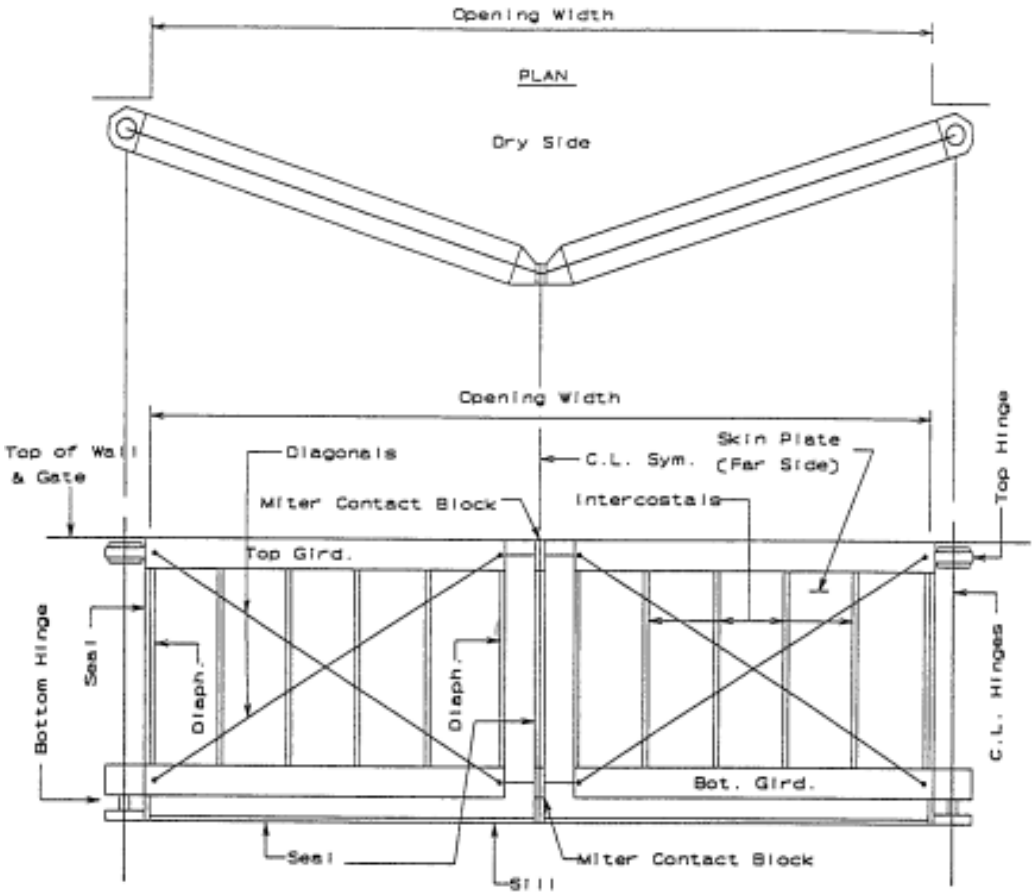

Figure 5: Example of a Double Swing Gate.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Koali Road Floodwall

An approximately 2,510 feet long, six feet tall, and 12 feet wide at the base concrete floodwall with lava rock fascia would be installed along the left descending bank of Manoa Stream from approximately 1,430 feet upstream of Waialae Avenue downstream to the confluence of Manoa Stream with Palolo Stream. The floodwall would then continue along the right descending bank of Palolo Stream from the confluence of Manoa Stream with Palolo Stream upstream to the St. Louis Drive Bridge (Figure 6). The concrete floodwall would be an L-wall on macropiles as described above for the Woodlawn Drive Floodwall (Figure 3). For construction, clearing and grubbing would occur along the left-descending bank of Manoa Stream for the length of the proposed L-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Similarly, clearing and grubbing would occur along the right-descending bank of Palolo Stream for the length of the proposed L-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the streams. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the L-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the six-foot vertical portion of the L-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the L-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the L-wall would occur.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Figure 6: Koali Road Floodwall Proposed Project Footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

For the Koali Road Floodwall, two concrete drainage structures would be constructed to provide interior drainage of stormwater flows from the residential neighborhood behind the Koali Road floodwall. The two concrete drainage structures would be approximately two feet tall by two feet wide by 50 feet long. Each drainage structure is anticipated to impact potentially 50 linear feet of stream. In addition, each drainage structure would require the excavation of approximately 38 cubic yards (CY) of material and the placement of approximately 19 CY of fill material once the concrete structures are put in place. Therefore, these two drainage structures could result in the placement of approximately 38 CY of fill material into waters of the U.S. For visual purposes, concrete drainage structures could be similar in design to that shown in Figure 7. As seen in the figure, in-water work is restricted to where the concrete pipe outlets into the adjacent stream and where the concrete apron (if necessary) extends into the stream. Erosion protection such as the concrete apron and/or riprap may also be placed around the structure where it outlets into the stream channel.

Figure 7: Example of Concrete Drainage Structure.

The Koali Road Floodwall also includes retrofitting two existing smaller stormwater culverts with flap gates. For visual purposes, the flap gates could be like those shown in Figure 8, but would be scaled in size to the existing drainage structure opening. As seen in the figure, the retrofitting of a flap gate requires attachment of the flap gate to an existing drainage structure. No excavation or placement of fill, other than the flap gate, would occur within waters of the U.S.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Figure 8: Example of Flap Gates.

Lastly, the Koali Road Floodwall includes two road closure structures, one across Koali Road and one across a pedestrian bridge that crosses Palolo Stream. The road closure structures are assumed to be swing gates (Figure 4). Swing gates require hinges to be attached to the floodwall and potentially a removable center post attached to the middle of the roadway if a double gate leaf is necessary (Figure 5). The road closure structures would require minor modifications as described above to the floodwalls for prefab gates. No in-water work is anticipated for the construction of the Koali Road Floodwall or the road closure structures.

Ala Wai Golf Course Detention Basin

An approximately 8,315 feet long, nine feet tall, and 66 feet wide at the base (12 feet wide at the crown) earthen berm (i.e., levee) would be constructed around the Ala Wai Golf Course to create a detention basin. The earthen berm would be adjacent to the left descending bank of the Manoa-Palolo Canal and the right descending bank of the Ala Wai Canal (Figure 9). For construction, clearing and grubbing would occur along the entire proposed length of the earthen berm and at a width of up to 126 feet, where space allows, to accommodate construction equipment. Following clearing and grubbing, fill material would be brought via dump trucks and equipment such as bulldozers, skid steers, rollers, and backhoes would be used to place the fill material and form it into an earthen levee. On the left-descending bank of the Manoa-Palolo Canal, there would be an overtopping spillway section approximately 100-feet in length that would be reinforced with erosion protection such as riprap. The erosion protection would be placed on the upland side as the Manoa-Palolo Canal in this area is already lined with erosion protection on the canal side. Once construction of the earthen berm is complete, the earthen berm as well as adjacent upland areas that were temporarily disturbed during construction would be revegetated with a native grass seed mix and/or grass seed mix appropriate for the maintenance of the golf course area. In addition to the overtopping spillway an existing drainage ditch that runs along the north side of the golf course, parallel to Date Street would be used as an inlet for storm waters from the Manoa-Palolo Canal to overflow into the detention basin. The modification of this existing drainage structure would potentially require the excavation of approximately 170 CY of material and the placement of approximately 83 CY of riprap fill material. Approximately 50 linear feet of stream is expected to be temporarily disturbed during construction while approximately 39 linear feet of stream would be within the permanent project footprint. A second small inlet channel would be excavated and lined with erosion control material to further improve storm water flow into the detention basin. This inlet channel would

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

connect to the existing drainage ditch that runs along the north side of the golf course and outlet in the detention basin. The creation of this small inlet channel would require the excavation of approximately 3 CY of material and the placement of approximately 2 CY of riprap material. Approximately 50 linear feet of the existing drainage ditch would be temporarily disturbed by the construction of this inlet channel, with approximately 10 linear feet of the existing drainage ditch remaining within the permanent project footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

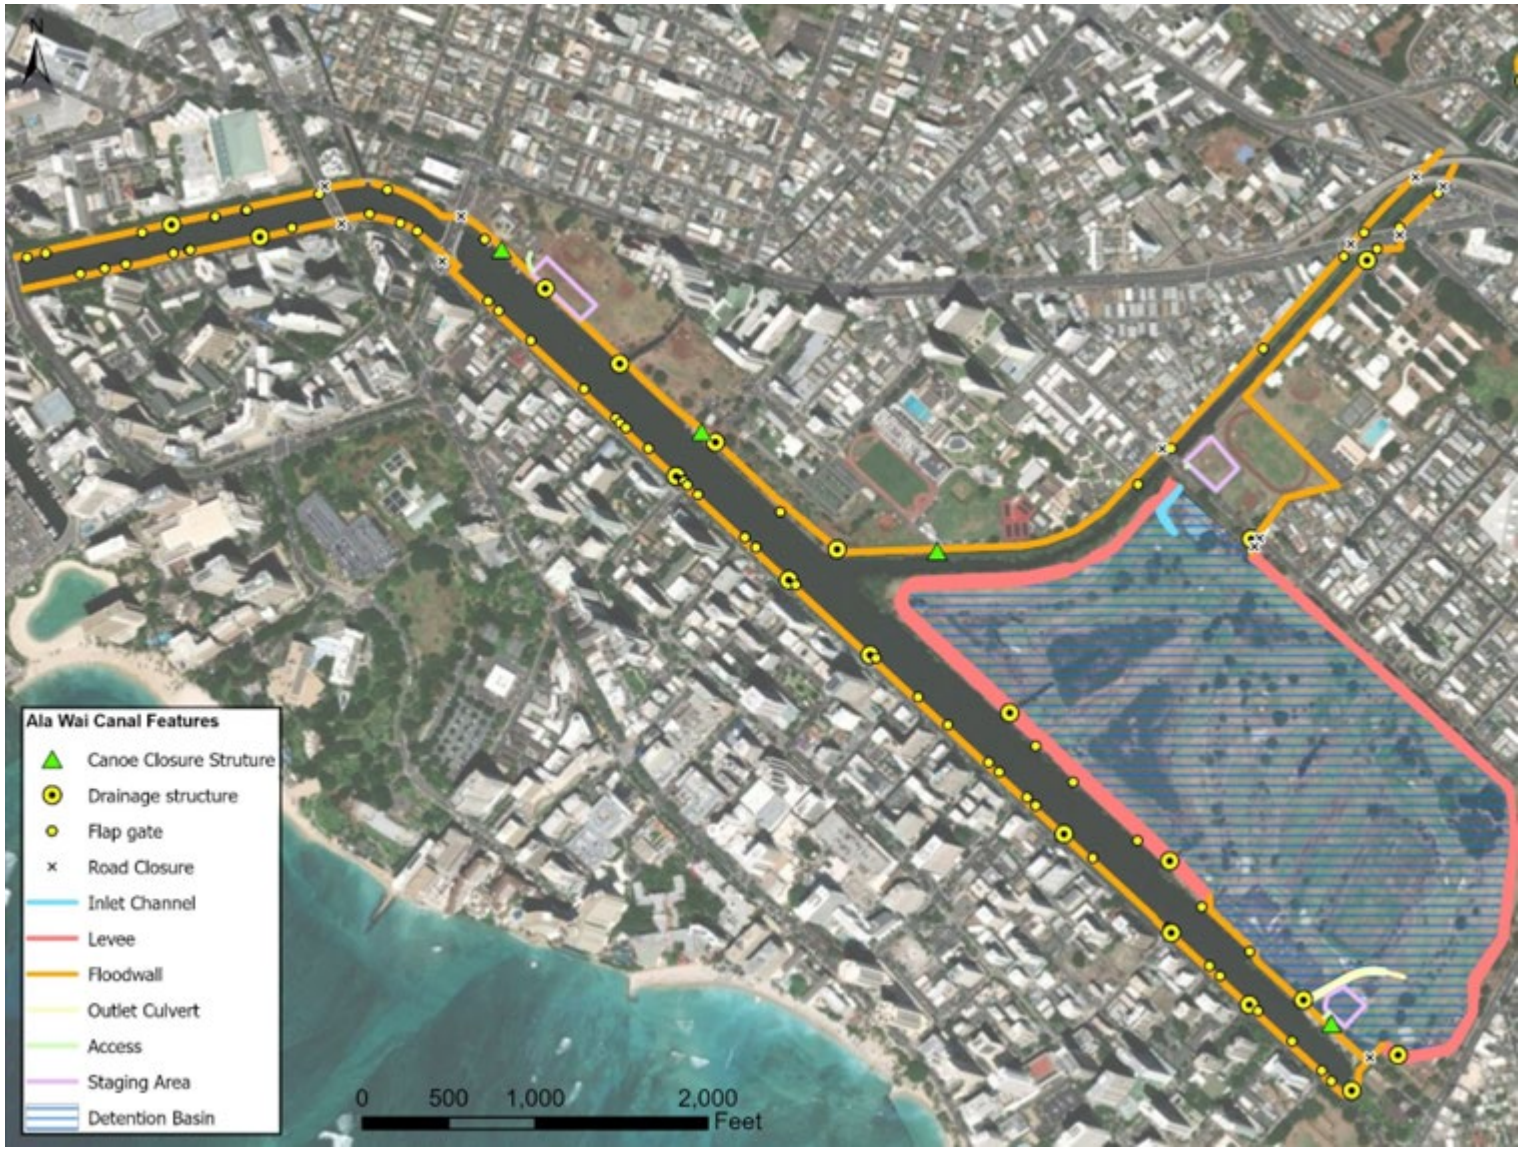

Figure 9: Ala Wai Canal Floodwall and Ala Wai Golf Course Detention Basin Proposed Project Footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The Ala Wai Golf Course Detention Basin also includes an approximately 2,409 feet long, nine feet tall, and 12 feet wide at the base L-wall floodwall. The L-wall floodwall would primarily be located along the front of the Ala Wai Golf Course Clubhouse and would tie into the earthen berm described above (Figure 9). The concrete floodwall would be an L-wall on macropiles as described above for both the Woodlawn Drive and Koali Road Floodwalls (Figure 3). For construction, clearing and grubbing would occur along the right-descending bank of the Ala Wai Canal for the length of the proposed L-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the canal. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the L-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the nine-foot vertical portion of the L-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the L-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the L-wall would occur.

For the golf course detention basin, five existing drainage structures/ditches would be modified. Four of the drainage structures would be concrete weirs with flap gates constructed along the levee alignment to allow collected storm water within the detention basin and from local runoff to slowly drain into the Ala Wai Canal. These four drainage structures combined would potentially impact approximately 200 linear feet of canal with approximately 69 linear feet of canal remaining within the permanent project footprint. In addition, the placement of these four drainage structures would require the excavation of approximately 180 CY of material and the placement of approximately 89 CY of fill into waters of the U.S. after the placement of the concrete drainage structures. For visualization purposes of the concrete drainage structures refer to Figure 7 and Figure 8. The fifth drainage structure would modify the existing drainage outlet near the Golf Course Clubhouse by enclosing this outlet in a concrete box culvert (instead of daylighted as it currently is) and installing flap gates at the downstream end of the concrete box culvert. The modification of this existing drainage structure would require the excavation of approximately 1,179 CY of material and the placement of approximately 571 CY of material around the concrete box culvert once placed. Approximately 505 linear feet of the existing drainage ditch would be temporarily disturbed as well as be within in the permanent project footprint.

Lastly, the Ala Wai Golf Course Detention Basin includes one road closure structure across the Maintenance Driveway for the Ala Wai Golf Course and one outrigger canoe launch access structure. Both of these structures are assumed to be swing gates (Figure 4). A swing gate requires hinges to be attached to the floodwall and potentially a removable center post attached to the middle of the roadway/launch pad if a double gate leaf is necessary (Figure 5). The structure would require minor modifications as described above to the floodwall for prefab gates. No in-water work is anticipated for the construction of the Ala Wai Golf Course earthen berm/L-wall or the road closure/outrigger canoe launch access structures.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Ala Wai Canal Floodwall

An approximately 22,852 feet long, six feet tall, and six to 12 feet wide at the base floodwall would be constructed around the Ala Wai Canal (including Manoa-Palolo Canal). Essentially the floodwall would extend along both banks of the Manoa-Palolo Canal from Lunalilo Freeway downstream to the confluence of the Manoa-Palolo Canal with the Ala Wai Canal (except the area where the earthen berm for the Ala Wai Golf Course Detention Basin would be located along the left-descending bank of the Manoa-Palolo Canal) (Figure 9). The floodwall would then extend along both banks of the Ala Wai Canal from where it begins near the Ala Wai Golf Course (near Kapahulu Avenue) downstream to the Ala Moana Boulevard Bridge (except the area where the earthen berm/L-wall for the Ala Wai Golf Course Detention Basin would be located along the right descending bank of the Ala Wai Canal) (Figure 9). The Ala Wai Canal Floodwall would be comprised of three different types of walls: J-wall on macropiles (17,125 feet), L-wall on macropiles (4,069 feet), and tieback I-wall (1,658 feet).

The L-wall on macropiles is primarily located along both banks of the Manoa-Palolo Canal and a small portion of the Ala Wai Canal near Kapahulu Avenue (Figure 10). The concrete L-wall on macropiles would be the same as that described above for the Woodlawn Drive, Koali Road, and Ala Wai Golf Course floodwalls (Figure 3). For construction, clearing and grubbing would occur along both banks of the Manoa-Palolo Canal and the small section of wall near Kapahulu Avenue for the length of the proposed L-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the canals. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the L-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the six-foot vertical portion of the L-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the L-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the L-wall would occur.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

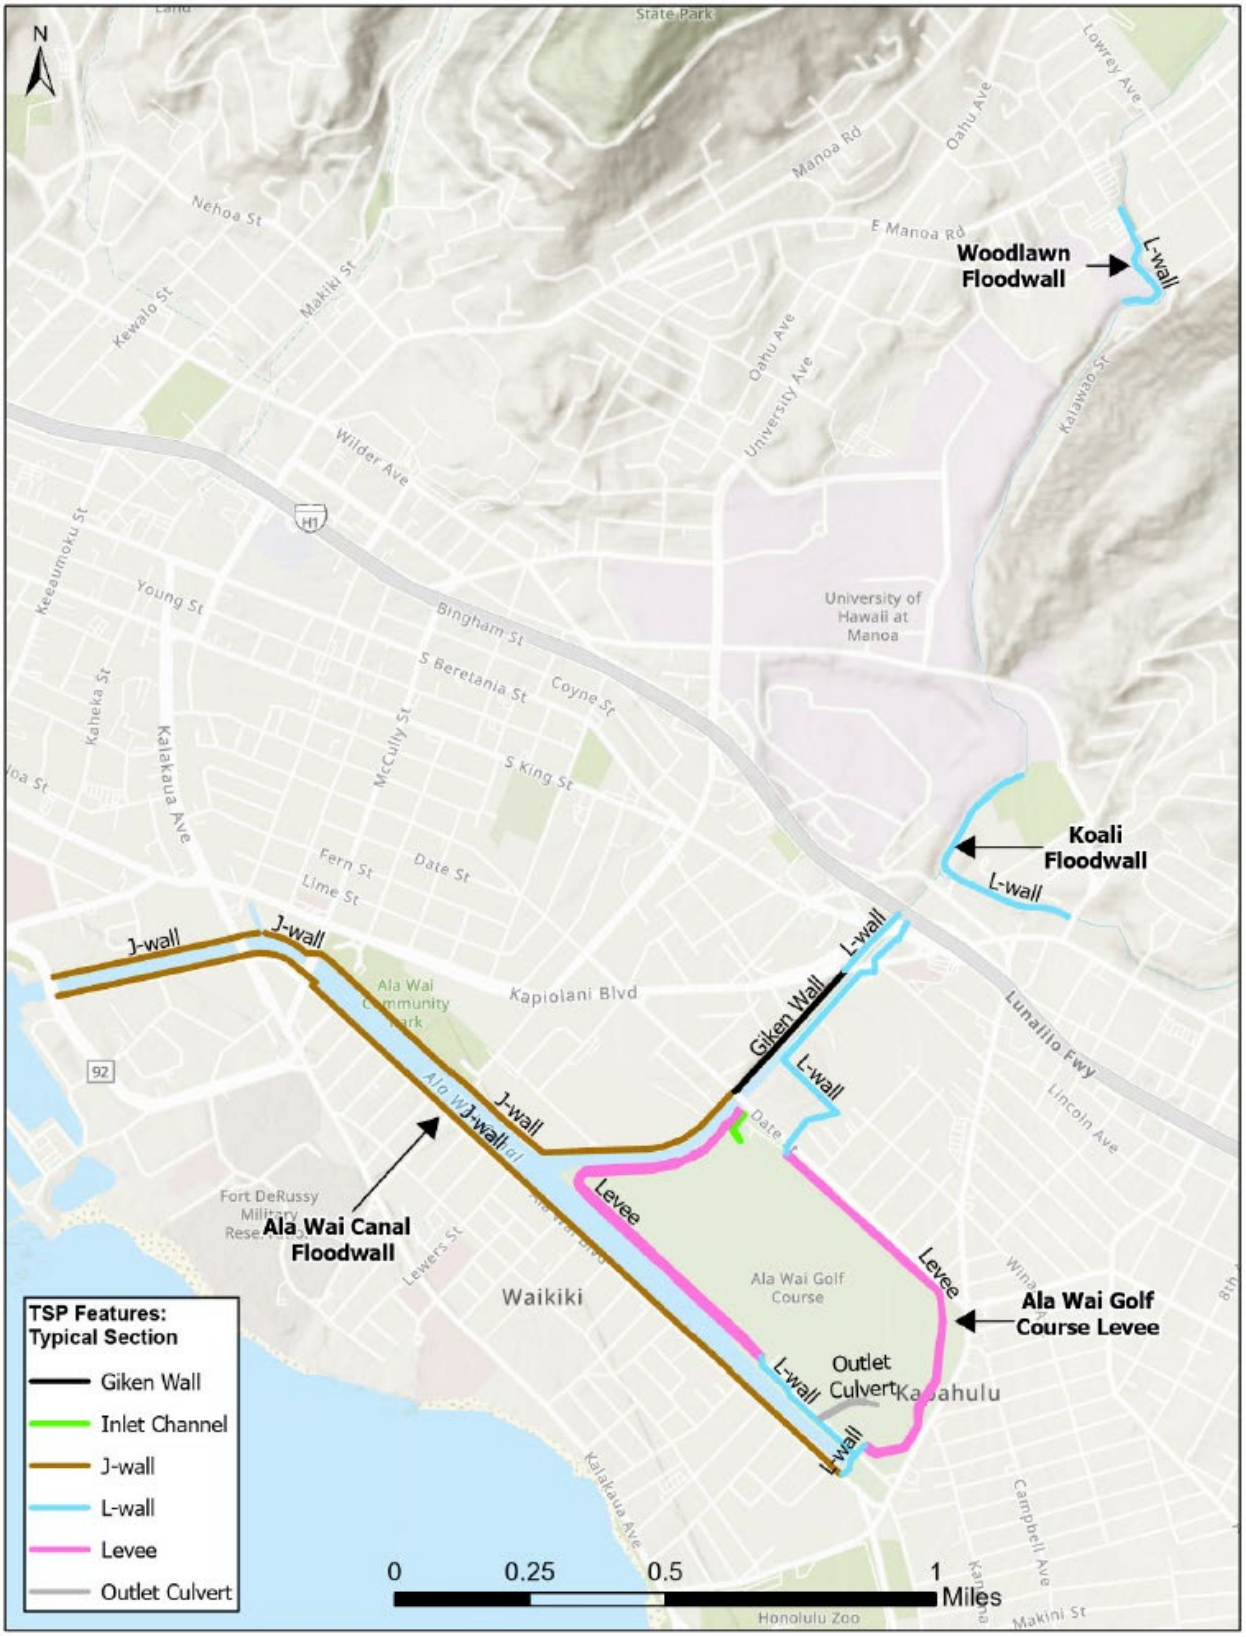

Figure 10: Floodwall Types for Each Measure.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The tieback I-wall is located along the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard downstream to Date Street (Figure 10). For construction, clearing and grubbing would occur along the right-descending bank of the Manoa-Palolo Canal for the length of the proposed tieback I-wall and up to 66 feet in width, where space allows, to accommodate construction equipment. Due to the space constrictions in this area, a 15-feet-wide rock bench would be placed in-stream running parallel to the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard downstream to Date Street (Figure 11). The 15-feet-wide rock bench would provide a work platform for construction equipment. The rock bench would include the placement of temporary fill into waters of the U.S., but this fill would be removed once construction of the tieback I-wall is complete. Following clearing and grubbing and the placement of the temporary rock bench, steel sheetpile would be installed using the press-in method of installation, such as that used by Giken Ltd. Equipment required for the press-in method would be a crane to hold the steel sheetpile and a generator to run the press-in equipment. The steel sheetpile would not be driven into the ground using an impact hammer nor would it be vibrated into the ground using a vibratory hammer. Once the steel sheetpile is in place, tieback soil anchors for stabilization of the wall would be placed six feet below grade. After the tieback I-wall installation is complete, the steel sheetpile wall extending above grade would be encased in concrete and then covered with a lava rock fascia. Lastly, revegetation of disturbed upland areas, minus the area occupied by the tieback I-wall would occur.

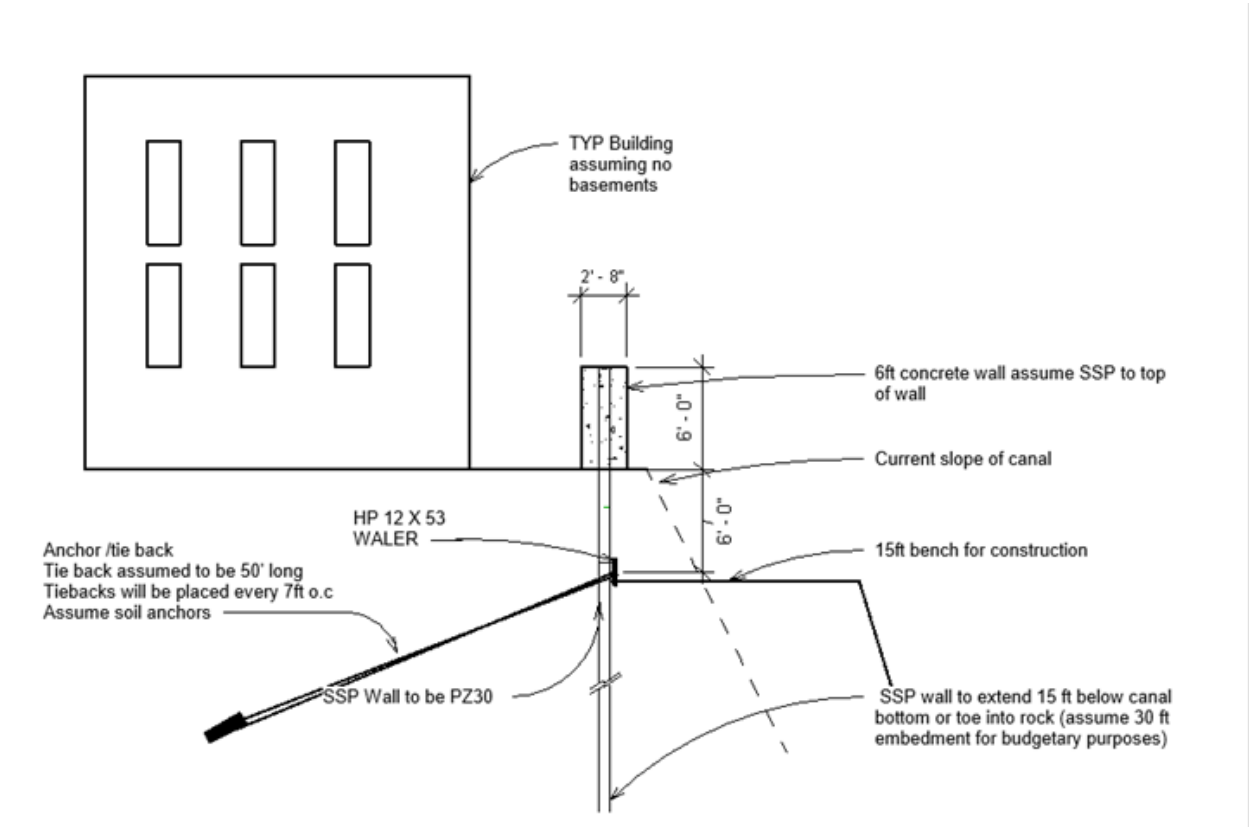

Figure 11: Design Layout of a Tieback I-Wall.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The J-wall (Figure 12) is located along the right-descending bank of the Manoa-Palolo Canal downstream of Date Street and essentially along both banks of the Ala Wai Canal, except the section next to the Ala Wai Golf Course Detention Basin (Figure 10). For construction, clearing and grubbing would occur along the right-descending bank of the Manoa-Palolo Canal and along both banks of the Ala Wai Canal for the length of the proposed J-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the canals. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the J-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the six-foot vertical portion of the J-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the J-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the J-wall would occur.

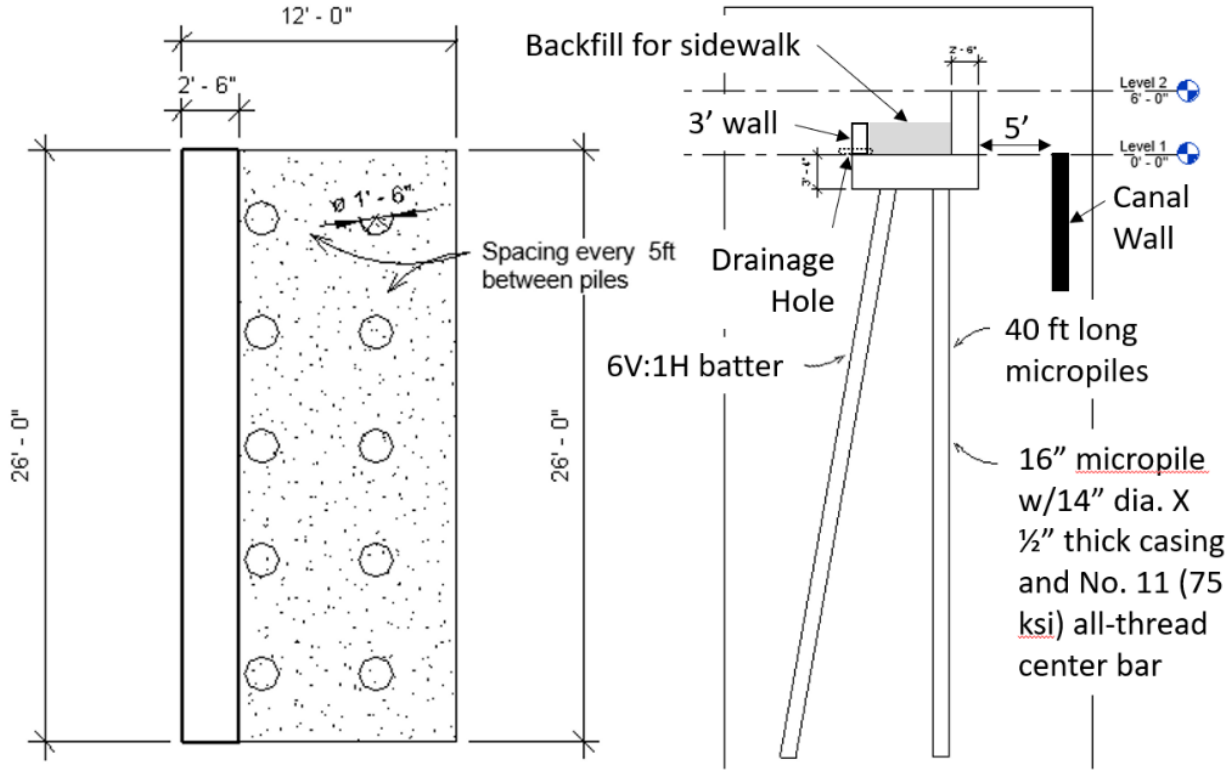

Figure 12: J-wall Typical Cross Section and Layout.

For the Ala Wai Canal Floodwall, 14 concrete drainage structures would be constructed to provide interior drainage of stormwater flows from the areas behind the Ala Wai Canal floodwall. The concrete drainage structures would vary in size. Overall, the 14 drainage structures are expected to potentially impact 700 linear feet of canal during construction with approximately 130 linear feet of canal remaining in the project's permanent footprint. Approximately 76 CY to material would be excavated total for placement of the 14 drainage structures with

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

approximately 46 CY of fill material being placed in waters of the U.S. to fill in around the concrete drainage structures once placed. For visual purposes, concrete drainage structures could be similar in design to that shown in Figure 7. As seen in the figure, in-water work is restricted to where the concrete pipe outlets into the adjacent canal and where the concrete apron (if necessary) extends into the canal. Erosion protection such as the concrete apron and/or riprap may also be placed around the structure where it outlets into the canal.

The Ala Wai Canal Floodwall also includes retrofitting 59 existing smaller stormwater culverts with flap gates. For visual purposes, the flap gates could be like those shown in Figure 8, but would be scaled in size to the existing drainage structure opening. As seen in the figure, the retrofitting of a flap gate requires attachment of the flap gate to an existing drainage structure. No excavation or placement of fill, other than the flap gate, would occur within waters of the U.S.

Lastly, the Ala Wai Canal Floodwall includes 11 road closure structures and 3 outrigger canoe launch access structures. All of these structures are assumed to be swing gates (Figure 4). A swing gate requires hinges to be attached to the floodwall and potentially a removable center post attached to the middle of the roadway/launch pad if a double gate leaf is necessary (Figure 5). The structure would require minor modifications as described above to the floodwall for prefab gates. No in-water work is anticipated for the construction of the Ala Wai Canal Floodwall or the road closure/outrigger canoe launch access structures.

Mitigation Measures

Mitigation measures related to induced flooding include potentially adding permanent pump station(s) of moderate to large size, ranging from 500 to 20,000 cubic feet per second (cfs). At the time of compiling this Draft Report, it is unknown as to the number of pumps that may be necessary to minimize induced flooding, the size of the pumps, or the location of pumps within the watershed. Although likely not to be implemented due to cost, if a pump station were found to be necessary during the Preconstruction Engineering and Design (PED) phase of the project, it would likely be located along Makiki Stream to reduce induced flooding. In general, the pump station would be constructed upland and adjacent to Makiki Stream, but not located within the stream. A permanent pump station would likely consist of a wet well installed in a low-lying area where water naturally flows. The wet well would consist of a concrete inlet box with mesh screens for debris and wildlife protection, hinged lid for pump removal for maintenance, etc. The outlet from the wet well would be routed to the Ala Wai Canal floodwall and would either pass over the wall or through it with a check valve to prevent inflow from the river side. The wet well would connect to a pump house. The pump house would be elevated and would hold the electrical infrastructure and other operating equipment, and a backup generator to minimize pump failure in the event of power disruption. The pump station would only be triggered to begin operating in the event of a storm event; therefore, much of the time the pump station would not be in operation.

Nonstructural measures that are under consideration as potential mitigation measures for induced flooding include floodproofing, elevation, and potentially acquisition. Dry floodproofing involves sealing flood prone structures from water with door and window barriers, small scale rapid deployable floodwalls, or sealants. Dry floodproofing is generally feasible and effective up to a maximum height of three feet above ground level. Floodproofing is only recommended for non-residential structures such as commercial buildings and critical infrastructure that cannot be elevated due to their large size. Elevation of structures is limited to residential structures, largely single-family homes. Whether a structure may be elevated depends on several factors including the foundation type, size of the structure, condition, etc. Elevating a home so that the finished

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

floor is at a height where it is less likely that the structure and/or contents will be damaged by flooding. Due to structural constraints and wind loading concerns, a maximum height for residential structure elevation was established at 12 feet above ground level.

Staging Areas

The staging area for the Woodlawn Drive floodwall is proposed to be at Noelani Elementary School and would be approximately 0.7 acre (Figure 2).

The staging area for the Koali Road floodwall is proposed to be at Kanewai Community Park located at the north end of the project footprint. This staging area would be approximately 0.6 acre (Figure 3).

The Ala Wai Canal Floodwall and the Ala Wai Golf Course Detention Basin three potential staging areas (Figure 9). The staging area for the Ala Wai Canal right bank floodwall is proposed to be at Ala Wai Community Park and would be approximately 1 acre. The staging area for the Ala Wai Canal left bank floodwall is proposed to be at Ala Wai Golf Course and would be approximately 0.7 acre. The staging area on the Ala Wai Golf Course would also be used as the staging area for the Ala Wai Golf Course Detention Basin. The Ala Wai Canal left bank floodwall may also stage construction equipment and materials at the Ala Wai Community Park as described for the Ala Wai Canal right bank floodwall above. Lastly, the staging area for the Manoa-Palolo right bank and left bank floodwalls as well as the Kaimuki High School floodwall is at Kaimuki High School and would be approximately 1 acre. Overall, there are five potential staging areas for the entire Proposed Action equaling a total of 4 acres.

Site Access and Haul Routes

For disposal, the haul route would begin within the action area at a project footprint and end at the commercial landfill for Oahu, Waimanalo Gulch Sanitary Landfill, located approximately 28 miles west of the action (Figure 2); note distance varies depending on project feature location. Construction equipment and haul trucks would utilize temporary construction haul roads and existing roadways (e.g., Interstate H-1).

Organic materials, trees, shrubs, as well as inorganic materials, would be disposed of by hauling to the Waimanalo Gulch Sanitary Landfill (Figure 2). Disposal of these materials by burning or burying at the project footprint would not be permitted. Although it is not anticipated that hazardous substances would be present in the material removed, prior to disposal, the collected material would undergo testing (by the contractor) to determine appropriate disposal techniques.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

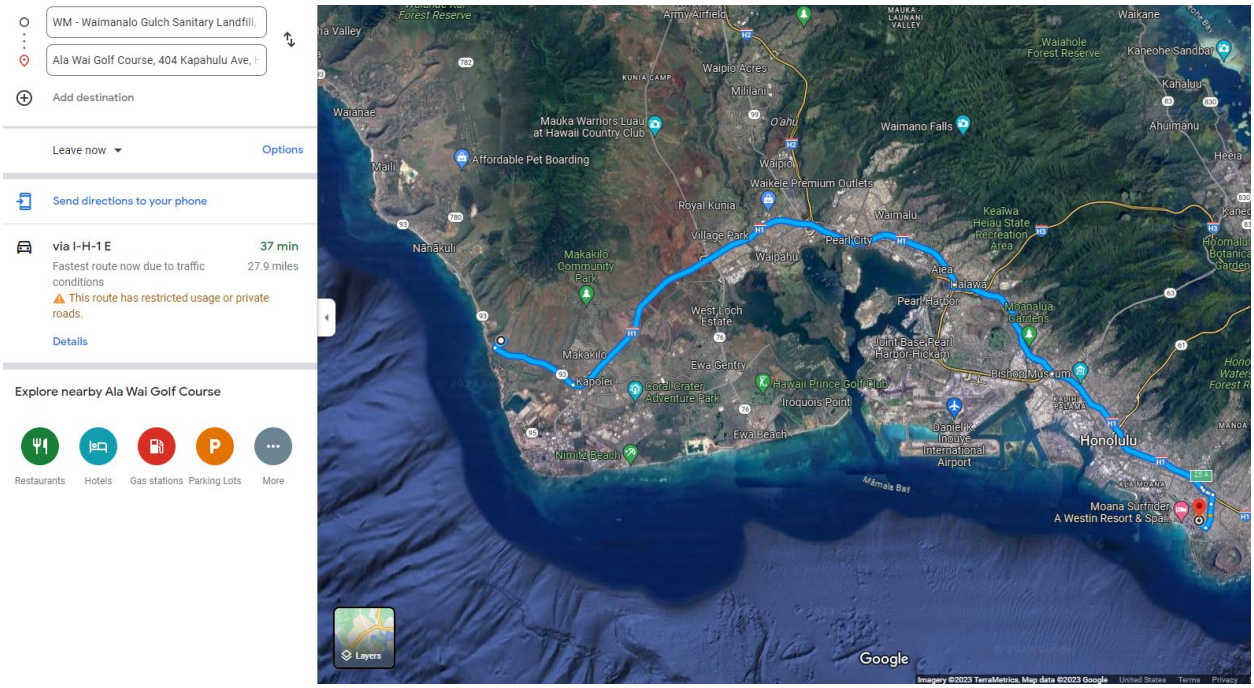

Figure 13: General Haul Route from the Proposed Project Action Area to Nearest Sanitary Landfill.

Construction Equipment

Construction equipment would likely include a combination of water trucks, waste trucks, haul trucks, crawler and front-end loaders, pile driver, dozers, skid-steers, excavators, loaders, and pickup trucks.

Construction Schedule

Construction could begin as early as 2027 and is expected to take approximately four years. It is possible that the Proposed Action would be constructed in stages, with multiple start dates and construction periods for various features depending on funding, environmental windows, and weather delays. Construction phasing may result in an extension of the overall project duration beyond four years.

Proposed construction hours would be 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 7:00 p.m. on Saturday. Occasional overtime work may be required to maintain the construction schedule, but timing would comply with local noise ordinances. Any construction lighting that may be required during dawn and dusk hours to illuminate a work area would use low mounting height, wattage, and lumens. Construction lighting would also be shielded to help direct the light down to the work area where it is needed. Lastly, lights with longer wavelengths (560 nanometers or longer) would be used when feasible.

Future Operation, Maintenance, Repair, Replacement, and Rehabilitation

Maintenance, including routine inspections and minor repairs of the project and its associated features, would be required after construction is completed. The following activities may occur:

- Routine and special inspection with pickup trucks and sport utility vehicles, as needed, and up to daily during flood events.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

- Vegetation management where floodwalls and earthen berms are located. Vegetation management in the areas with floodwalls would be in accordance with Corps of Engineers Engineering Pamphlet 1110-2-18; at a minimum 15-feet down slope of the floodwall would need to be a vegetation free zone (VFZ). The VFZ applies to all vegetation except for grasses for the purpose of erosion control.
- Periodic clearing of debris around inlet/outlet structures.
- Periodic clearing of accumulated sediment and debris from detention basin.
- Periodic vegetation management such as weeding, herbicide application, and re-seeding.
- Periodic graffiti removal and vandalization repair.

Rarely, following large and erosive flood flows, larger-scale maintenance and repairs may be required, which could require access and use of heavy equipment within the floodplain adjacent to the project feature. A temporary work area may need to be established around a repair site. The local sponsor would be required to obtain emergency or standard permits from regulatory agencies, including Corps Regulatory, who would coordinate and consult, if needed, with the USFWS and NMFS. These permits would likely require active habitat restoration of temporary construction and access roads. It is likely that a storm event large enough to damage the detention basins and/or floodwalls would also have removed vegetation in the immediate area, but specific impacts cannot be evaluated until or unless damage occurs, and repair work is defined.

2.2 Action Area and Project Footprint

The action area is defined in 50 CFR § 502.22 as “all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action.” Therefore, the action area includes the project footprint as well as a 400-foot buffer around the project footprint. The 400-foot buffer was chosen as the extent of potential indirect impacts based on 400 feet being the distance at which the noise level from the loudest piece of construction equipment (i.e., pile driver) would attenuate to equal or below 60 dBA. The action area was determined by accounting for direct impacts of the Proposed Action and indirect impacts from the Proposed Action such as noise and vibrations that extend beyond the project footprint. The project footprint is being defined in this BA as the area where direct effects of the Proposed Action could occur. The project footprint includes the areas where construction of project features will occur, as well as staging areas, access areas, and haul routes (Figure 2, Figure 6, and Figure 9).

2.3 Measures Intended to Avoid, Minimize, or Offset Effects of the Proposed Action

Standard Avoidance and Minimization Measures

The U.S. Fish and Wildlife Service and the National Marine Fisheries Service recommends the following measures to be incorporated into project planning to avoid or minimize impacts to fish and wildlife resources, and ESA-listed marine resources:

- Authorized filling-related activities that may result in the temporary or permanent loss of aquatic habitats should be designed to avoid indirect, negative impacts to aquatic habitats beyond the planned project footprint.
- Turbidity and siltation from project-related work should be minimized and contained within the project footprint by silt containment devices and curtailing work during flooding or adverse tidal and weather conditions. Best management practices (BMPs) should be

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

maintained for the life of the construction period until turbidity and siltation within the project footprint is stabilized. All project construction-related debris and sediment containment devices should be removed and disposed of at an approved site.

- All project construction-related materials and equipment (dredges, vessels, backhoes, silt curtains, etc.) to be placed in an aquatic environment should be inspected for pollutants including, but not limited to; marine fouling organisms, grease, oil, etc., and cleaned to remove pollutants prior to use. Project related activities should not result in any debris disposal, non-native species introductions, or attraction of non-native pests to the affected or adjacent aquatic or terrestrial habitats. Implementing both a litter-control plan and a Hazard Analysis and Critical Control Point plan (HACCP – see https://www.fws.gov/policy/A1750fwl.html) can help to prevent attraction and introduction of non-native species.
- Project construction-related materials (fill, revetment rock, pipe, etc.) should not be stockpiled in, or in close proximity to aquatic habitats and should be protected from erosion (e.g., with filter fabric, etc.), to prevent materials from being carried into waters by wind, rain, or high surf.
- Fueling of project-related vehicles and equipment should take place away from the aquatic environment and a contingency plan to control petroleum products accidentally spilled during the project should be developed. The plan should be retained on site with the person responsible for compliance with the plan. Absorbent pads and containment booms should be stored on-site to facilitate the clean-up of accidental petroleum releases.
- All deliberately exposed soil or under-layer materials used in the project near water should be protected from erosion and stabilized as soon as possible with geotextile, filter fabric, or native or non-invasive vegetation matting, hydro-seeding, etc.

Hawaiian Seabird Avoidance and Minimization Measures

The following measures are designed to avoid and minimize potential project impacts to Hawaiian seabirds:

- To the maximum extent practicable, limit construction activities to the time between dawn and dusk to avoid the illumination of adjacent habitat areas.
- If construction activity time restrictions are not possible, use down shielding or directional lighting to avoid light trespass into bird habitat (i.e., use a ‘Cobra’ style light rather than an omnidirectional light system to direct light down to the roadbed). To the maximum extent practicable, while allowing for public safety, low intensity energy saving lighting (e.g., low pressure sodium lamps) will be used.
- Minimize illumination of lighting on associated construction or operation structures by using motion sensors or heat sensors.
- Bright white light, such as metal halide, halogen, fluorescent, mercury vapor, and incandescent lamps should not be used.
- Fully shield all outdoor lights so the bulb can only be seen from below bulb height and only use when necessary.
- Install automatic motion sensor switches and controls on all outdoor lights or turn off lights when human activity is not occurring in the lighted area.
- Avoid nighttime construction during the seabird fledgling period, September 15 through December 15.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Hawaiian Waterbird Avoidance and Minimization Measures

The following measures are designed to avoid and minimize potential project impacts to Hawaiian Waterbirds:

- In areas where waterbirds are known to be present, reduced speed limit signs will be posted to inform project personnel and contractors about the presence of endangered species on-site; and reduced speed limits will be implemented.
- Applicable USFWS BMPs regarding work in aquatic environments will be incorporated and implemented into the project design if water resources are located within or adjacent to the project footprint in order to contain stream sediments to the operational area.
- A biological monitor that is familiar with Hawaiian waterbirds' biology will conduct nest surveys where appropriate habitat occurs within the vicinity of the proposed project footprint prior to project initiation. Surveys will be repeated within three days of project initiation and after any subsequent delay of work of 3 or more days (during which the birds may attempt to nest). If a nest or active brood is found:
    - The USFWS will be contacted within 48 hours for further guidance.
    - A 100-foot buffer will be established and maintained around all active nests and or broods until the chicks have fledged. Potentially disruptive activities will not be conducted, and habitat alteration will not occur within this buffer.
    - A biological monitor that is familiar with the species' biology will be present on the project footprint during all construction or earth moving activities until the chicks fledge to ensure that Hawaiian waterbirds and nests are not adversely impacted.

Hawaiian Hoary Bat Avoidance and Minimization Measures

The following measures are designed to avoid and minimize potential project impacts to Hawaiian Hoary Bat:

- Do not disturb, remove, or trim woody plants greater than 15 feet tall during the bat birthing and pup rearing season (June 1 through September 15).
- Do not use barbed wire for fencing.

Green Sea Turtle / Hawksbill Sea Turtle / Hawaiian Monk Seal Avoidance and Minimization Measures

The following measures are designed to avoid and minimize potential project impacts to the green sea turtle, hawksbill sea turtle, and Hawaiian monk seal:

- Constant vigilance shall be kept for the presence of ESA-listed marine species during all aspects of the proposed action, particularly in-water activities.
- The USACE shall designate an appropriate number of competent trained observers to survey the areas adjacent to the proposed action for ESA-listed marine species.
- Surveys shall be made prior to the start of work each day, and prior to resumption of work following any break of more than one-half hour. Periodic additional surveys throughout the workday are strongly recommended.
    - Special attention will be given to verify that no ESA-listed species are in the area where equipment or material is expected to enter the water where there is a risk of contact with the species.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

    - Certain activities may require additional surveys as advised by NMFS on an *ad hoc* basis as identified during the consultation.
- All work shall be postponed or halted when motile ESA-listed marine species are within 164 feet (50 meters) of the proposed work and shall only begin/resume after the animals have voluntarily departed the area.
    - If ESA-listed motile marine species are noticed within 164 feet (50 meters) after work has already begun, that work may continue only if the activity will not adversely affect the animal(s). For example, divers performing underwater work such as monitoring or surveys would likely be permissible, whereas operation of heavy equipment is likely not.
- All objects will be lowered to the bottom (or installed) in a controlled manner to avoid contact with ESA-listed species. This can include the use of buoyancy controls such as lift bags, or the use of cranes, winches, or other equipment that affect positive control over the rate of descent.
- Do not attempt to feed, touch, ride, or otherwise intentionally interact with any ESA-listed marine species.
- Report any monk seal sightings:
    - Email NMFS at pifsc.monksealsighting@noaa.gov or
    - Call the Marine Animal Stranding, Entanglement, and Reporting Hotline at: 888-256-9840.
- No contamination of the marine environment shall result from project-related activities.
- A contingency plan to control toxic materials is required.
- Appropriate materials to contain and clean potential spills shall be stored at the work site, and be readily available.
- Heavy equipment in and near water bodies shall consider the use of biofuels and non-petroleum-based hydraulic fluids.
- All project-related materials and equipment placed in the water shall be free of pollutants.
- The contractor and heavy equipment operators shall perform daily pre-work equipment inspections for cleanliness and leaks. All heavy equipment operations shall be postponed or halted should a leak be detected and shall not proceed until the leak is repaired and equipment cleaned.
- Fueling of land-based vehicles and equipment shall take place at least 164 feet (50 meters) away from the water, preferably over an impervious surface.
- Turbidity and siltation from project-related work shall be minimized and contained through the appropriate use of erosion control practices, effective silt containment devices, and the curtailment of work during adverse weather and tidal/flow conditions.
- A plan shall be developed to prevent debris and other wastes from entering or remaining in the marine environment during the project.
- All work shall be postponed or halted when motile ESA-listed marine species are within 164 feet (50 meters) of the proposed work and shall only begin/resume after the animals have voluntarily departed the area.
- Minimize direct contact to corals, seagrass, or other sessile ESA-listed resources.
- All work shall be postponed or halted when motile ESA-listed marine species are within 164 feet (50 meters) of the proposed work and shall only begin/resume after the animals have voluntarily departed the area.
- Unauthorized Take – If a listed marine mammal is determined by the PSO to have been disturbed, harassed, harmed, injured, or killed (e.g., a listed marine mammal(s) is injured or killed or is observed entering a shutdown zone before operations can be shut down),

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

it will be reported to NMFS within one business day to Ron.Dean@noaa.gov. These PSO records, submitted in digital and quervable format to NMFS, will include:

  - Information to be provided in the final report;
  - Number and species of listed animals affected;
  - The date, time, and location of each event (provide geographic coordinates);
  - Description of the event;
  - The time the animal(s) was first observed or entered the shutdown zone, and, if known, the time the animal was last seen or exited the zone, and the fate of the animal;
  - Mitigation measures implemented prior to and after the animal was taken;
  - If a vessel struck a marine mammal, the contact information for the PSO on duty, or the contact information for the individual piloting the vessel if there was no PSO on duty;
  - Photographs or video footage of the animal(s) (if available).

- Stranded, Injured, Sick, or Dead Marine Mammal (not associated with the project);
  - If PSOs observe an injured, sick, or dead marine mammal (i.e., stranded marine mammal), they will notify the Pacific Islands Marine Mammal Stranding Hotline at 888-256-9840. The PSOs will submit photos and data that will aid NMFS in determining how to respond to the stranded animal. Data submitted to NMFS in response to stranded marine mammals will include date/time, location of stranded marine mammal, species and number of stranded marine mammals, description of the stranded marine mammal's condition, event type (e.g., entanglement, dead, floating), and behavior of live-stranded marine mammals.
- All areas of temporary waterway or wetland fill will be restored to their original contour and character upon completion of the project. Temporary fill includes both fill that received authorization and fill that inadvertently enters a water of the U.S. (i.e., from slope failures, accidental broken sandbag cofferdams, etc.). All temporary fills and structures in waters of the U.S. will be removed in their entirety upon completion of use. This AMM will ensure restoration of flow to waterbodies for fish migration and avoids creation of potential sources of sedimentation and erosion that may elevate turbidity and adversely impair water quality conditions of downstream waters where federally listed marine species may occur.
- All in-water excavation will be conducted within a cofferdam or other sediment containment device extending from the water surface to the substrate intended to isolate and contain in the work area. All in-water sediment containment devices will be placed to isolate the minimum area necessary to complete the work and will be removed upon completion of in-water work only after the water quality in the enclosed area has returned to ambient and would not release a turbidity plume. This AMM isolates and contains sediments to the in-water work area and reduces potential for adverse impairment of water quality conditions with the risk of degrading water quality conditions of downstream waters where federally listed marine species may occur. Additionally, in navigable waters where federally listed marine species may approach the in-water work area (i.e., Ala Wai Canal), the sediment containment device will create a physical barrier preventing interaction and potential physical impact to federally listed marine species.
- All upland areas of disturbed soil will be mulched and seeded with an approved native or noninvasive herbaceous seed mix following construction and/or planted with native or noninvasive woody vegetation and trees appropriate during the first available planting season. In areas where there is little to no slope and erosion and invasive species establishment is unlikely, the native woody vegetation on the site will be allowed to regenerate naturally. This AMM avoids creation of potential sources of sedimentation

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

and erosion that may elevate turbidity and adversely impact water quality conditions of downstream waters where federally listed marine species may occur.

- Temporary access roads placed in the riparian area will be constructed in a manner that they do not allow erosion into waters of the U.S. during construction. This AMM avoids creation of potential sources of sedimentation and erosion that may elevate turbidity and adversely impair water quality conditions of downstream waters where federally listed marine species may occur.
- All off-road equipment and vehicles operating from existing open and maintained roads must be cleaned prior to entering the construction site to remove all soil, seeds, vegetation, or other debris that could contain seeds or reproductive portions of plants. All equipment will be inspected prior to off-loading to ensure that they are clean. This AMM minimizes the spread of invasive plants that may degrade riparian habitats and erode sediments, resulting in reduced water quality conditions that may negatively affect green and hawksbill sea turtles and the Hawaiian monk seal.
- During construction, any disturbed soils will be temporarily stabilized with materials such as hay, mulch, plastic sheeting, erosion control mix, or other appropriate measures. This AMM reduces the risk of erosion and exposure to reduced water quality conditions that may otherwise negatively affect green and hawksbill sea turtles and the Hawaiian monk seal.
- Cofferdam materials will be fully removed from the stream immediately following completion of in-water work, minimizing delays due to high stream flows following heavy precipitation. All areas of temporary bottom disturbance will be restored to their original contour and character upon completion of the project. This AMM removes obstacles and barriers to fish passage and returns benthic habitat to its original composition, limiting sediment disturbance and the temporary effects of degraded water quality conditions to green and hawksbill sea turtles and the Hawaiian monk seal.
- All cofferdams will be removed using techniques to minimize turbidity releases. This includes allowing for the slow reintroduction of water into the work area and utilizing dirty water treatment systems for turbid water. This AMM avoids degrading water quality conditions that may negatively affect green and hawksbill sea turtles and the Hawaiian monk seal.
- No equipment, materials, or machinery will be stored, cleaned, fueled, or repaired within any water of the U.S. All vehicle and equipment refueling activities will occur more than 100 feet from any water course and if not, all refueling areas will require fuel spill containment structures. A spill prevent and response plan will be prepared and implemented by the construction contractor. This AMM avoids creation of a pollutant source that may degrade downstream water quality conditions where federally listed marine species may occur.
- All pumps and generators will have appropriate spill containment structures and/or spill remediation materials available, such as absorbent pads. This AMM reduces the risk of green and hawksbill sea turtle and Hawaiian monk seal exposure to petroleum products and other contaminants.
- All equipment used for in-stream work will be cleaned of external oil, grease, dirt, and mud such that turbid water does not enter any water of the U.S. Any leaks or accumulations of these materials will be correlated before entering streams of areas that drain directly to streams or wetlands. All releases into surface waters or wetlands will be reported immediately to the appropriate regulatory body. This AMM reduces the risk of green and hawksbill sea turtles and the Hawaiian monk seal exposure to petroleum products and other contaminants.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

3. Environmental Baseline and Special Status Species

Environmental baseline refers to the condition of the listed species or its designated critical habitat in the Action Area, without the consequences to the listed species or designated critical habitat caused by the Proposed Action. The environmental baseline includes the past and present impacts of all Federal, State, or private actions and other human activities in the Action Area, the anticipated impacts of all proposed Federal projects in the Action Area that have undergone Section 7 consultation, and the impacts of State and private actions which are contemporaneous with the consultation in progress. The consequences to listed species or designated critical habitat from ongoing agency activities or existing agency facilities that are not within the agency's discretion to modify (like flood risk management operations) are part of the environmental baseline (50 CFR § 402.02).

The project action area has been previously surveyed by the USFWS and AECOS in October 2015, and January 2016, respectively. In addition, USFWS conducted a survey specific to the current effort in January 2023 to document the presence and locations of biological resources and sensitive species. The section summarizes the results of these surveys to provide an up to date and thorough description of the environmental baseline.

3.1 Habitat Conditions in the Action Area

Habitat conditions within the action area are a direct result of previous projects within the area as well as modifications of the Ala Wai watershed as a whole. The Ala Wai watershed encompasses 19 square miles and extends from the ridge of the Koolau Mountains to the near-shore waters of Mamala Bay. It includes the Makiki, Manoa, and Palolo streams as well as the Ala Wai Canal.

Makiki Stream is a relatively small stream originating near 1,850 feet on the southwestern flank of Mt. Tantalus in the Koolau Mountains and flows southwestwards for approximately 3.5 miles to its terminus in the Ala Wai Canal (USFWS, 2016). The stream has three major branches, these being from west to east the Kanaha, Kanealoloe, and Moleka streams, the latter two of which join prior to their confluence with the Kanaha. The upper half of the Makiki catchment lies in steep, forested terrain on the slopes of Mt. Tantalus and Round Top, an area that receives up to 134 inches of rain annually. The stream in this section flows in natural, unmodified channels, heavily shaded by a forest of introduced tree species, and is fed by two major springs, the Makiki Spring on the Kanealoloe branch, and the Herring Spring on the Moleka branch. At approximately 150 feet elevation, just downstream from Makiki Street, the stream channel is artificially confined within a concrete box culvert, which runs under the streets and neighborhoods of Honolulu before re-emerging at sea level near the intersection of Philip Street and Kalakaua Avenue. From this point the stream runs in an open concrete channel for another 0.4 miles to the Ala Wai Canal. There are no historic or active ditch diversions in the Makiki Stream catchment. Makiki Stream has an active USGS gauge located at 21° 17'48" N, 157° 50'12" W, at an elevation of 10 feet, and has 69 years of record. Based on this time series, the stream at the gauge has a median discharge of 0.56 cfs (USFWS, 2016).

Manoa Stream is a large stream in a bowl-like catchment, originating near 2,800 feet on the southwestern flank of Konahuanui peak and adjacent ridgelines in the Koolau Mountains, and flows southwestwards for approximately 5.75 miles to its terminus in the Ala Wai Canal (USFWS, 2016). The stream has two major branches, these being the Waihi on the west side of the basin, and the Waiakeakua on the east. The upper half of the Manoa catchment lies in steep, forested terrain on the slopes of the Koolau Mountains, in a very wet area that receives

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

up to 151 inches, or 12.6 feet, of rain annually at the headwaters of the Waihi branch, and 140 inches, or 11.6 feet, annually at the headwaters of the Waiakeakua branch. The stream in its upper reaches flows in natural unmodified channels for approximately 2.25 miles, being heavily shaded by a forest of introduced tree species, with some native vegetation on the upper slopes. Below Paradise Park, the stream passes through suburban neighborhoods in a partially modified channel for about 1 mile. At the Manoa District Park, near 160 feet elevation the stream becomes confined within an artificial concrete channel, which continues downstream to the East Manoa Road bridge. Downstream from this bridge the stream flows in a re-aligned but partially natural channel, mostly following the base of the steep eastern wall of Manoa Valley. Downstream from Kanewai Park, at approximately 30 feet elevation, the stream channel has been straightened, but not concrete-lined, and continues in this fashion for 1.4 miles, passing below the H-1 freeway and then continuing to its confluence with the Ala Wai Canal (USFWS, 2016).

Both the Waihi and Waiakeakua branches of Manoa Stream also have active USGS stream gauges (USFWS, 2016). The Waihi gauge is located at 21° 19’42” N, 157° 48’03”, at an elevation of 290 feet, and has 69 years of record. Based on this time series, the stream at the gauge has a median discharge of two cfs. The Waiakeakua gauge is located at 21° 19’41” N, 157° 47’59” W, at an elevation of 294 feet, and has 97 years of record. Based on this time series, the stream at the gauge has a mean discharge of 3.6 cfs. The median of the combined flows of the two branches is therefore on the order of 5.6 cfs (approximately 10 times the discharge volume of Makiki Stream), which is reflective of the current conditions (USFWS, 2016).

Palolo Stream is another large stream in a somewhat more tightly confined catchment than adjacent Manoa Stream and originates near 2,665 feet on the southwestern flank of Mt. Olympus and adjacent ridgelines in the Koolau Mountains and flows southwestwards for approximately 4.4 miles before joining with Manoa Stream just upslope of the H-1 freeway (USFWS, 2016). The stream has two major branches, these being the Pukele on the west side of the basin, and the Waiomao on the east. The upper third of the Palolo catchment lies in steep, forested terrain on the slopes of the Koolau Mountains, in a wet area that receives up to 120 inches, or 10 feet, of rain annually at the headwaters of the Pukele branch, and 104 inches annually at the headwaters of the Waiomao branch. The stream headwaters in these upper reaches traverse unmodified channels for approximately 2 miles, being shaded by a forest of introduced tree species, with some native vegetation on the upper slopes. At approximately 530 feet elevation both stream branches begin to traverse the suburban neighborhoods of Palolo Valley, with their channels becoming progressively more straightened and modified. Pukele Stream appears to be intermittent in its upper reaches but receives significant spring inflow just upstream of the 10th Avenue bridge. No far downstream of this bridge, at 250 feet elevation, the stream becomes confined within a concrete channel, and retains this artificial character for the remaining 0.30 miles of its length, until its confluence with Waiomao Stream at 225 feet elevation. The Waiomao Stream exhibits higher volume in its headwaters, receiving perennial inflow from the outlet of a perched wetland in Kaau Crater. This branch also retains a more natural character to its channel until just before its confluence with the Pukele Stream, at which point it is confined within an artificial concrete channel, which then continues for the remaining 2-mile length of stream until its confluence with Manoa Stream just downslope of Kanewai Park (USFWS, 2016).

The Pukele branch of Palolo Stream has an active USGS gauge located at 21° 18’24” N, 157° 47’18” W, at an elevation of 345 feet, and has 65 years of record. Based on this time series, the

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

stream at the gauge has a median discharge of 0.60 cfs (USFWS, 2016) The Waiomao branch of Palolo Stream has an existing gauge structure located at 21° 18'24" N, 157° 46'50" W, at an elevation of 400 feet, which formerly operated from 1911 to 2014; this gauge is no longer actively maintained. Based on historical records, it appears that the median discharge from the Waiomao branch is approximately 0.80 cfs, giving Palolo Stream below the confluence a combined median discharge volume of 1.40 cfs (USFWS, 2016).

Woodlawn Ditch is an intermittent, artificial ditch; the Pukele Stream is considered to represent a naturally interrupted stream midreach; and all other stream reaches described above are considered to represent continuously perennial stream midreach ecosystems possessing riffle and pool habitat (USFWS, 2016).

The Ala Wai Canal is a man-made waterway, approximately 2 miles in length that was created for land reclamation purposes between 1920 and 1924. The depth of the canal ranges from about 10 to 25 feet deep (USFWS, 2016). The Ala Wai Harbor was originally constructed during the early 1900s by the United States military. The entire watershed drains through the Ala Wai Canal into Mamala Bay. Mamala Bay encompasses the ocean area offshore of southern Oahu from Diamond Head Crater to Barbers Point (Kalaeloa) Deep Draft Harbor. Complex coral reef communities have been described throughout Mamala Bay (USFWS, 2016).

3.2 Water Quality

The State of Hawaii, Division of Aquatic Resources (DAR), in their Oahu volume of the Atlas of Hawaiian Watersheds series (Parham et al., 2008) assigned the Ala Wai catchment an overall ranking of 8 on a scale of 1 to 10, with larger numbers equating to higher watershed quality based on land cover classes, size, wetness, reach diversity, and biological resources (USFWS, 2016). This is a relatively high statewide ranking for a drainage system on Oahu and is reflective of the relatively natural conditions prevailing in the upper catchment, despite the urbanization in the lower catchment (USFWS, 2016).

Although the Ala Wai catchment has been assigned an overall ranking of 8, certain reaches within the watershed have been placed on the State's 303(d) List of Water Quality Limited Segments. Figure 14 and Table 2 show the pollutants for which Makiki, Palolo, Manoa, Ala Wai Canal, and Ala Wai Boat Harbor have been placed on the 303(d) List. In general, Manoa Stream (State Waterbody ID: HI3-3-07.01) is listed as impaired for aquatic life and other due to murky water, nitrogen and/or phosphorus, and pesticides (USEPA, 2022b). Makiki Stream (State Waterbody ID: HIALWS06) is listed as impaired for aquatic life due to nitrogen and/or phosphorus. Palolo Stream (State Waterbody ID: HI3-3-07.01.1) is listed as impaired for aquatic life due to trash. Ala Wai Canal and Harbor (Palolo Stream Fork) (State Waterbody ID: HIW00034) is listed as impaired for aquatic life, swimming and boating, and other due to bacteria and other microbes, murky water, and nitrogen and/or phosphorus. Ala Wai Canal and Boat Harbor (State Waterbody ID: HIW00050) is listed as impaired for aquatic life, swimming and boating, and other due to bacteria and other microbes, metals, murky water, nitrogen and/or phosphorus, pesticides, and other unknown causes. The following three Total Maximum Daily Loads (TMDLs) have been developed to protect and restore water quality within the Ala Wai Canal: Ala Wai Canal Phosphorus (January 1, 2002 – addresses algal growth and nutrient impairments), Ala Wai Canal Suspended Solids (February 21, 1986 – addresses suspended solids impairments), and Ala Wai Canal Toxic Pollutants (February 21, 1986 – addresses unlisted impairments). It's important to note that nearby beaches are also listed as impaired on the 303(d)(List). Kahanamoku Lagoon (State Waterbody ID: HIW00003) is listed as impaired for swimming and boating due to bacteria and other microbes. Kahanamoku Beach (State

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Waterbody ID: HI366432) is listed as impaired for aquatic life due to algae and murky water. Royal-Moana Beach (State Waterbody ID: HI898947) is listed as impaired for aquatic life due to algae, ammonia, murky water, and nitrogen and/or phosphorus. Lastly, Waikiki Beach Center (State Waterbody ID: HI244505) is listed as impaired for aquatic life due to murky water (USEPA, 2022b).

Figure 14: Location of 303(d) Listed Water Quality Limited Segments within the Ala Wai Canal Watershed.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Regarding Manoa Stream specifically, the USGS has described a variety of contaminants found within stream sediments (USFWS, 2016). Elevated levels of nutrients (e.g., nitrates, phosphates), organochlorine pesticides (e.g., aldrin, chlordane, dieldrin, DDT, and heptachlor) and semivolatile organic compounds, herbicides, and polyaromatic hydrocarbons (PAHs) have all been detected in stream sediments of the Manoa Watershed (USFWS, 2016). As shown in Figure 14, most of the reaches within Manoa Stream are currently listed on the 303(d) List of Water Quality Limited Segments due to the presence of elevated nutrient levels, organochlorine pesticides, and semivolatile organic compounds. Organochlorine pesticides became distributed within Manoa Stream sediments and adjacent upland habitats due to their wide and heavy use in agriculture and to control termites and mosquitoes from the mid-1940s to the mid-1980s (Brasher and Anthony, 2000). For the United States, most organochlorine pesticide use was discontinued in the 1970s for agriculture and in the 1980s for termite control. These types of organochlorine pesticides were replaced by more acutely toxic but less persistent in the environment organophosphate compounds such as chlorpyrifos and carbamate pesticides. Organochlorine pesticides are transported from agricultural and urban sources primarily through soil erosion and surface runoff, and to a lesser extent, through groundwater and atmospherically. Transported organochlorine pesticides are then able to accumulate in stream bed sediments and in tissues of aquatic invertebrates and fish. These organochlorine pesticides continue to persist in Manoa Stream even though most are no longer used. Although not specific to Manoa Stream, a 1998 study collected sediments from various streams on Oahu and analyzed these samples for the presence of organochlorine pesticides. The study then compared the level of organochlorine pesticides within the sediments of Oahu streams and compared them to levels of the same pesticides found in other states where these types of pesticides were heavily used in the past. The study found that in general, concentrations of most organochlorine compounds in stream bed sediments and fish tissues across Oahu and the contiguous states declined following the ban on their agricultural use in the early 1970s and then appeared to level off during the 1980s. However, even though concentrations of organochlorine compounds in fish and sediment from Oahu streams have decreased since the 1970s, some concentrations remain high compared to other regions of the country. Results from sediment samples and fish tissue collected between 1992 and 1994 across the United States indicated Oahu had levels of DDT in sediment and fish tissue comparable to other places, with concentrations measured at agricultural sites lower than at agricultural areas in other parts of the country. Conversely, levels of dieldrin and chlordane at urban Oahu sites were found to be much higher than those measured at other urban sites in other parts of the country (Brasher and Anthony 2000). Therefore, despite use restrictions, these compounds continue to be detected in sediment samples within Manoa Stream currently.

Overall, water quality in the lower Ala Wai watershed is likely impacted by urban stormwater input. Urban stormwater, including runoff from residential, industrial, and construction sites, is documented to be a source of organic matter, nitrogen, phosphorus, metals, bacteria, and other pollutants (National Research Council, 2008). It is likely that the 303(d) list impairments detailed above are related to the urban nature of the study area. The proposed project will not influence the existing stormwater quality nor the stream and canal water quality. The proposed project does not limit existing stormwater runoff inputs to the streams and canal and will not treat existing conditions. To the extent that temporary water storage at the Ala Wai Golf Course detention basin allows for settlement, there may be a slight reduction in suspended solids discharged with the stormwater, however, any impacts are expected to be minor.

3.3 Vegetation

Vegetation communities in the upper watershed include shrubland, wet forest, and mesic forest

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

habitats, which generally occur along a decreasing precipitation gradient, ranging from the highest elevations in the watershed down to the interface with the urban areas. The steeper slopes at and below the Koolau ridgeline to roughly about the 1500-foot contour are relatively undisturbed and mostly dominated by native vegetation; these windswept ridge areas support what has been classified as “Montane Wet Shrubland” (Gagne and Cuddihy, 1990), or specifically on Oahu as “Mixed Fern Shrubland.” Below the shrubland is a wet forest, which grades into a mesic forest at lower elevations just above the urban zone. Introduced species dominate these habitats, particularly trees and shrubs such as albizia (*Falcateria moluccana*), eucalyptus (*Eucalyptus globulus* and *E. robusta*), Chinese banyan (*Ficus microcarpa*), octopus tree (*Schefflera actinophylla*), guava, java plum (*Syzgium cumini*), Christmas berry (*Schinus terebinthefolius*), mango (*Mangifera indica*), and shoebutton ardisia (*Ardisia elliptica*).

Riparian vegetation is present along all of the upper stream reaches, and is generally dominated by non-native species (many of which are considered invasive), including large trees such as Chinese banyan, kukui (*Aleurites moluccana*), mango, octopus tree, hau (*Hibiscus tiliaceus*), fiddlewood (*Citharexylum spinosum*), mountain apply (*Syzygium malaccense*), gunpowder tree (*Trema orientalis*), and gum (*Eucalyptus sp.*), as well as smaller herbaceous species such as exotic ginger (*Hedychium sp.*) and Job’s tears (*Coix lachrymal-jobi*) (Kido, 2006; Kido, 2007; Kido, 2008a, Oceanit, 2004). Within the urbanized portion of the watershed, riparian vegetation is generally limited to unchannelized stream reaches, such as long portions of Manoa stream (for example, near the Dole Street Bridge). A majority of Palolo and Makiki streams are channelized and lack a riparian zone (Oeanit, 2004; Englund and Arakaki, 2004; Kido, 2008a). Mangrove trees (*Rhizophora mangle*) are present in some areas in the lower estuarine reaches of the Manoa-Palolo Drainage Canal and the Ala Wai Canal, although most of these reaches are comprised of concrete and riprap.

As further described in Section 4, the occurrence of federally listed plant species is generally restricted to the higher elevations of the upper watershed. These areas, as well as the slopes of Diamond Head, have been designated as critical habitat for the conservation of these species. However, not all of the listed species are presently known to occupy the designated critical habitat; some have not been recorded from the watershed since early in the last century and some are possibly extinct (Federal Register, 2012). No federally listed plant species (or designated critical habitat) are known to occur in the action area.

A summary of the existing vegetation at each feature location is provided in Table 3.

3.4 Terrestrial Wildlife

A variety of terrestrial wildlife species occur throughout the watershed, including mammals, birds, invertebrates, and insects (Mitchell et al., 2005). Many of these species are non-native, many of which are considered invasive and pose a significant management concern (e.g., feral pig [*Sus scrofa*], mongoose [*Herpestes aruopunctatus*], and various bird species). However, there are several federally listed species that could potentially occur within the watershed.

The forested areas of the watershed provide habitat for native bird populations, including the federally listed Oahu ‘elepaio (*Chasiempis sandwichensis ibidis*); the upper-most portion of the watershed is designated as critical habitat for this species, although it is not believed to be currently occupied. Other federally listed species that are known from the upper watershed include endemic tree snails (*Achatinella sp.*) and the blackline Hawaiian damselfly species (*Megalagrion nigrohamatum nigrolineatum*). In addition, the Hawaiian hoary bat (*Lasiurus*

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

cinereus semotus), the only land mammal native to Hawaii, could potentially occur in the watershed.

In the lower portions of the watershed, federally listed waterbird species could potentially occur; these include the Hawaiian coot, Hawaiian stilt, Hawaiian duck (*Ana wyvilliana*), and Hawaiian moorhen. Although unlikely given their known distribution, these species could possibly use estuarine areas within the watershed as resting habitat.

Federally listed species, including those described above, are further discussed in Section 4.

3.5 Aquatic Resources

Native freshwater fish in Hawaii are limited to five gobiid species, including one indigenous (*Awaous guamensis*) and three endemic (*Lentipes concolor*, *Sicyopterus stimpsoni*, and *Stenogobius hawaiiensis*) gobies, and one endemic eleotrid (*Eleotris sandwicensis*) (Kinzie, 1990). The native stream macrofaunca assemblage also includes several shrimp species (*Atyoida bisulcata* and *Macrobrachium grandimanus*), and mollusk species (*Neritina vespertina* and *Neritina granosa*). As part of their lifecycle, the adults of each of these species live and breed in freshwater streams; newly hatched larvae drift to the ocean, remaining there for several months before migrating back to freshwater habitat, cued by freshets (Yamamoto and Tagawa, 2000). None of the native stream species are federally listed under the Endangered Species Act.

All of these native species have been recently documented in the Ala Wai watershed, with the exception of o'opu alamo'o and hihiwai (Parnham et al., 2008; Kido, 2008a). The presence of native species of stream macrofauna can often be used as an indicator of stream ecosystem health (Kido, 2008b). In this context, portions of the watershed display signs of good stream habitat. However, the overall watershed lacks healthy populations of native fishes and aquatic invertebrates, likely because of degradation and fragmentation of usable habitat in the urban zone (Oceanit, 2004). Recent observations of native species are typically limited to only a few individuals in the higher reaches of the upper watershed and in the estuarine environment. With these notable exceptions, the extant aquatic macrofauna is dominated by non-native species (Englund and Arakaki, 2004; Kido, 2008a).

Table 3: Existing Conditions at Flood Risk Management Measure Locations

Measure	General Location	Existing Environmental Conditions
Woodlawn Drive Floodwall	Manoa Stream downstream of Woodlawn Bridge	Land in the surrounding area is developed, but the stream is within a forested riparian zone. Some of the common species encountered during a 2016 survey (AECOS, 2016) include wedelia (*Sphagneticola trilobata*), laua'e (*Phymatosorus grossus*), Java plum (*Syzigium cumini*), Guinea grass (*Megathyrsus maximus*).
Koali Road Floodwall	Manoa Stream along Koali Road and Palolo Stream from confluence with Manoa upstream to pedestrian bridge.	Land in the surrounding area is developed. Manoa Stream right descending bank has a forested riparian zone. Manoa Stream left descending bank has a very narrow forested riparian zone and/or no riparian zone. Palolo Stream on both banks has no forested riparian area. Trees

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

		sporadically occur on both sides with most trees found in residential back yards.
Ala Wai Golf Course Detention Basin	Ala Wai Canal	Landscaped vegetation for golf course greens and fairways; site also includes two shallow basins and a ditch that are identified as seasonally flooded wetland features on the National Wetlands Inventory (USFWS, 2023a).
Ala Wai Canal Floodwall	Ala Wai Canal	Vegetation along the Canal is generally limited to landscaping, with a single row of trees lining most of both sides of Canal, including niu (*Cocos nucifera*), with some mile (*Thespesia populnea*) and monkeypod.
Makiki Stream Pump Station (Potential Mitigation Measure for Induced Flooding)	Makiki Stream from Fern Street downstream to Ala Wai Canal confluence	Land in the surrounding area is developed, and the stream has no forested riparian area. Trees sporadically occur on both sides of the concrete lined channel.
Nonstructural Measures such as dry/wet floodproofing, elevation, and acquisition (Potential Mitigation Measure for Induced Flooding)	Various Locations (Undefined currently)	The area for these potential mitigation measures is generally known but precise locations are unknown currently. However, the general vegetation would be landscaped and minimal since nonstructural measures would occur on existing structures.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

4. Potentially Affected Listed Species and Critical Habitat

In order to identify whether any of the listed species potentially occurring in the watershed could be affected by the project, the species habitat requirements and known distribution was assessed relative to the action area. In addition, the location of designated critical habitat was mapped to identify any potential overlap with the action area. Following is a summary of the potentially affected species within the watershed, and the effects analysis for each. Due to the action area being generally comprised of either low density vegetated non-native riparian/forest habitat (such as that associated with the floodwalls along the middle watershed), turf grass (such as that associated with the detention basins), or developed areas (such as that associated with the floodwalls along the lower watershed), federally endangered or threatened plant species that have the potential to occur in the area are not expected to occur due to the lack of suitable habitat. Because of the lack of suitable habitat present for these species within the action area, the proposed project is expected to have no effect on these species, or their designated critical habitat and they are not discussed further.

4.1 Band-rumped Storm Petrel (*Oceanodroma castro*)

The Hawaii DPS of band-rumped storm-petrel is a listed federally endangered species. No critical habitat has been designated for this species.

Current Species Status

Historically, band-rumped storm-petrels were abundant and occurred throughout the main Hawaiian Islands (USFWS, 2021h). There is thought to be one single population that breeds within the Hawaiian Islands across several colonies. Currently, band-rumped storm-petrels are confirmed or likely breeding on Lehua Islet, Kauai, Lanai, and the island of Hawaii. The species may potentially breed on Maui, but no nesting sites have been confirmed. Population estimates for Hawaii DPS of band-rumped storm-petrel are unknown, but a study estimated between 171 and 221 nesting pairs on Kauai in 2002 (USFWS, 2021h).

Biology and Ecology of Species – Reproduction and Forage Requirements

Band-rumped storm-petrels are ground nesting seabirds, which predominantly nest in cliffs or rocky lava fields (USFWS, 2021h). Eggs are laid in May through June and chicks fledge around October. Band-rumped storm-petrels typically do not begin to breed until between ages three to seven years old. The species can live up to 20 years old. Band-rumped storm-petrels feed while sitting on the water or by dipping prey while flapping just above the surface of the ocean. It is suspected that their diet consists of small fish, squid, and perhaps some crustaceans.

Factors Affecting Species Activity and Survival

Threats to band-rumped storm-petrels include introduced predators such as pigs, rats, feral cats, and mongoose, goats, and sheep degrade nesting habitat (USFWS, 2021h). Artificial lighting may cause fall-out, causing collisions and injuries to individuals that make them vulnerable to predators. Also vulnerable to collisions with towers and utility lines while in flight (USFWS, 2021h).

Potential to Occur in the Action Area

Nesting habitat for the band-rumped storm-petrel is not present within the proposed action footprint, nor is the species known to breed on Oahu. The species could be present foraging or flying over the island as fallout of band-rumped storm-petrels has been recorded on Oahu (USFWS, 2021h).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Potential Effects of the Proposed Action

No direct effects due to implementation of the proposed action are expected to band-rumped storm-petrel since the species is not known to nest on Oahu. Therefore, there would be no direct impacts to band-rumped storm-petrel nesting habitat. During construction of the project, artificial lighting could be used during pre-dawn and pre-dusk hours within staging areas. Band-rumped storm-petrels, like several other seabirds in the order Procellariiformes, show a strong attraction to light sources, including artificial lights. Artificial lights can act as an attractant causing disorientation, confusion, and eventual grounding. The effects of artificial lights lead to a condition known as fallout, where fledgling young and adults are grounded and unable to regain flight, making them vulnerable to depredation or dehydration. Though uncommon, fallout of band-rumped storm-petrels on Oahu has been recorded (USFWS, 2021h). Avoidance and minimization measures regarding artificial lighting would be implemented to reduce potential indirect impacts to band-rumped storm-petrels that may be flying over the action area.

Effects Determination

Given the above, coupled with the nature of activities proposed in these areas, impacts to band-rumped storm-petrels are expected to be insignificant, such that the proposed action **may affect, but is not likely to adversely affect** the species.

4.2 Hawaii Akepa (*Loxops coccineus*)

Hawaii akepa is a listed federally endangered species. No critical habitat has been designated for this species.

Current Species Status

The historical range of the Hawaii akepa once included much of the island of Hawaii (USFWS, 2010b). At the most recent 5-year review of the species, Hawaii akepa occurred as five disjunct populations in the north and central windward Hawaii, Kau, Kona, and Hualalai regions on Hawaii (USFWS, 2020b). In 1977, the total population of Hawaii akepa was estimated to be 13,892 birds. In 2016, the total population was estimated to be 16,248 birds. Hawaii akepa is known for distributional anomalies across apparently suitable habitat particularly between open canopy montane woodland and old-growth closed-canopy *Metrosideros polymorpha* (ohia) forest, likely due to differences in nest-site and food availability. Overall, recent surveys and population estimates suggest that the Hawaii akepa population is stable and possibly increasing especially in Hakalau Forest National Wildlife Refuge (USFWS, 2020).

Biology and Ecology of Species – Reproduction and Forage Requirements

The Hawaii akepa is a small, sexually dichromatic Hawaiian honeycreeper endemic to Hawaii island (USFWS, 2010b). Hawaii akepas form monogamous pairs during July and August and bonds last several years. The breeding period of akepas begins in March and ends by September. Females typically lay one to two eggs which are incubated for 14 to 16 days. Females brood the hatchlings for up to 8 days. Juveniles develop plumage by day 12 and young akepas leave the nest around 16 to 20 days after hatching. They remain dependent on their parents for up to 10 weeks post hatching (USFWS, 2010b).

Hawaii akepa are birds of old growth ohia or ohia/koa forest (USFWS, 2010b). Their density depends in part on the density of large trees because only large trees provide the cavities required for nesting. The average size of trees used for nesting is three feet in diameter at breast height. Large ohia trees provide cavities for nest-sites and the preferred foraging substrate for Hawaii akepa. Large koa trees provide mainly cavities for nest sites but not

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

preferred foraging substrate. Hawaii akepa are not typically found below 4,300 feet elevation (USFWS, 2010b).

Hawaii akepa feed on insects and spiders, though their main diet consists of caterpillars. They have been observed feeding on nectar to a lesser extent (USFWS, 2010b).

Factors Affecting Species Activity and Survival
Threats to the survival of this species primarily include modification and loss of habitat and avian disease (USFWS, 2010b). Predation by introduced mammals may also play a role in this species survival. The species is especially sensitive to the loss of old growth forest due to their dependence on large trees with cavities for nesting (USFWS, 2010b).

Potential to Occur in the Action Area
The action area is generally comprised of either low density vegetated non-native riparian/forest habitat (such as that associated with the floodwalls along the middle watershed), turf grass (such as that associated with the detention basins) or developed areas (such as that associated with the floodwalls along the lower watershed). No portion of the action area supports old growth ohia or ohia/koa forest. As such, suitable habitat is not present, and this species is expected to not have the potential to occur within the action area.

Potential Effects of the Proposed Action
The proposed action is not expected to directly or indirectly affect Hawaii akepa.

Effects Determination
The proposed action is expected to have **no effect** on Hawaii Akepa.

4.3 Hawaiian Duck (*Anas wyvilliana*)

Hawaiian duck is a listed federally endangered species. No critical habitat has been designated for this species.

Current Species Status
The Hawaiian duck historically occurred throughout the main Hawaiian Islands except the island of Lanai and Kahoolawe (USFWS, 2021i). Today, these birds are only found on Kauai and Niihau and were reintroduced on Oahu, Hawaii, and Maui. During the most recent 5-year review of the species, genomic research indicated that duck populations on the islands of Oahu, Maui, Molokai, and Hawaii are Hawaiian duck-mallard hybrids due to genetic intermixing with feral mallards. However, ducks sampled on Kauai appear to be pure or nearly pure. There are believed to be fewer than 2,000 pure Hawaiian duck remaining statewide, with most of these occurring on Kauai (USFWS, 2021i).

Biology and Ecology of Species – Reproduction and Forage Requirements
Hawaiian duck are found in a variety of wetland habitats including freshwater marshes and ponds, coastal estuaries and ponds, artificial reservoirs, kalo or taro (*Colocasia esculenta*) lo'i or patches, irrigation ditches, sewage treatment ponds, montane streams, and marshlands (USFWS, 2011d). This species is visible from sea level up to 10,827 feet (3,300 meters) of elevation (USFWS, 2021i). The Hawaiian duck was found to occupy wetlands greater than 1,969 feet (600 meters) more likely from a house in areas of low building densities and are more likely to occupy medium to large wetlands (greater than 10,764 square feet [1,000 square meters]) in areas of high wetland densities (USFWS, 2009).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Hawaiian ducks are serially monogamous (USFWS, 2021i). Some pairs nest year-round, but the main breeding season takes place from December to May. The female lays 2 to 10 eggs and incubation lasts about 4 weeks. Ducklings are precocial and can take to the water soon after hatching but cannot fly until about 9 weeks of age. They become reproductively mature enough to reproduce after a year of age (USFWS, 2021i).

Hawaiian ducks are omnivorous birds (USFWS, 2021i). Their diet consists of freshwater vegetation, mollusks, insects, and other aquatic invertebrates (USFWS, 2021i).

Factors Affecting Species Activity and Survival

Major threats affecting the survival of this species include hybridization with feral mallards (*Anas platyrhynchos*); loss and degradation of wetland habitat including alteration of hydrology, and invasion of habitat by nonnative plants; predation and avian disease; and environmental contaminants (USFWS, 2009).

Potential to Occur in the Action Area

The only suitable habitat that could support this species within the action area are very small pockets of wetland habitat; these are limited to isolated features within the Ala Wai golf course, and possibly Hausten Ditch and the upper reaches of the Ala Wai Canal. However, these areas are in high building densities and are small, and therefore are expected to provide very minimal habitat value in comparison to other nearby wetland areas (e.g., Pearl Harbor National Wildlife Refuge). Overall, these areas are not expected to provide suitable nesting habitat but could be used for resting habitat by Hawaiian ducks. As such, it is possible (though unlikely), that Hawaiian ducks could occur in the action area.

Potential Effects of the Proposed Action

As described above, the extent and quality of potentially suitable habitat within the action area is very limited and is likely to only be used as resting habitat (if at all). In the unlikely event that Hawaiian ducks are present within the action area, it is expected that they would readily disperse to nearby areas with higher quality habitat (e.g., Pearl Harbor National Wildlife Refuge) in response to disturbance; as such, the potential effects of the proposed action are expected to be limited to temporary construction-related disturbance (e.g., noise). Injury or mortality of Hawaiian ducks (or their nests) is not expected.

Areas of potentially suitable wetland habitat may be temporarily unavailable during construction (due to increased levels of disturbance), but sufficient habitat is expected to be available in nearby areas (e.g., Pearl Harbor National Wildlife Refuge). Following construction, the extent and quality of habitat is expected to be the same as the existing condition. During large-scale flood events, the detention basins would be inundated for short periods of time (i.e., about 1 day for Manoa Valley and Makiki Park District detention basins and about 2 days for the Ala Wai Golf Course detention basin), which could temporarily increase the extent of potential habitat. Although increased habitat may be viewed as a benefit, in heavily urbanized areas (such as the Ala Wai watershed), it can also create an attractive nuisance for waterbird species. Specifically, areas of increased habitat may attract waterbirds, which are then vulnerable to predator species that are prevalent in an urban environment (e.g., feral cats, mongoose). However, given the low probability of species occurrence and the infrequent recurrence and short-term duration of flooding, these conditions are not expected to significantly affect Hawaiian ducks.

Effects Determination

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Based on the minimal extent and quality of suitable habitat, there is a low probability of species occurrence in the action area. Given the above, coupled with the nature of activities proposed in these areas, impacts to the Hawaiian duck are expected to be insignificant, such that the proposed action **may affect, but is not likely to adversely affect** the species.

4.4 Hawaiian Common Gallinule (*Gallinula galeata sandvicensis*)

Hawaiian common gallinule is a listed federally endangered species. Critical habitat has not been designated for this species.

Current Species Status

Hawaiian gallinule (Alae ula) occurs in wetland habitats below 410 feet elevation on the islands of Kauai and Oahu, although there have been reports from Keanae Peninsula on Maui and from the island of Hawaii (USFWS, 2010c). On Oahu, the species is widely distributed with most birds found between Haleiwa and Waimanalo; small numbers occur at Pearl Harbor and the leeward coast at Lualualei Valley. Island-wide population, based on semi-annual waterbird counts conducted by DOFAW, suggests that the population is increasing, but count numbers are variable, about 300 individuals. Currently, the Hawaiian gallinule occurs only on the islands of Kauai and Oahu having been extirpated from Molokai sometime after the 1940s, from Maui after the late 1940s, and from the island of Hawaii in 1887 (USFWS, 2021j). As of the most recent 5-year review for the species, it was estimated that the minimum population is approximately 927 individuals (USFWS, 2021j).

Biology and Ecology of Species – Reproduction and Forage Requirements

Hawaiian gallinules are found in a variety of wetland habitats including freshwater marshes and ponds, coastal estuaries and ponds, artificial reservoirs, kalo or taro (*Colocasia esculenta*) lo'i or patches, irrigation ditches, and sewage treatment ponds (USFWS, 2011d).

Nesting occurs year-round, but most activity occurs between March and August (USFWS, 2010c). Platform nests are constructed in dense vegetation over water. Five to six eggs are laid and hatch after 22 days. Chicks can swim shortly after hatching and are dependent on their parents for several weeks (USFWS, 2010c).

Hawaiian gallinules are thought to be opportunistic feeders, so their diet may vary with the habitat (USFWS, 2010c). They generally forage in dense emergent vegetation and along the edges of habitat (USFWS, 2010c).

Factors Affecting Species Activity and Survival

Threats to survival for this species include loss and degradation of wetland habitat; predation by introduced animals; modification of hydrology; alteration of habitat structure and vegetation composition by invasive nonnative plants; loss of riparian vegetation; and water quality degradation due to grazing, disease, and possibly environmental contaminants (USFWS, 2011d).

Potential to Occur in the Action Area

The only suitable habitat that could support this species within the action area are very small pockets of wetland habitat; these are limited to isolated features within the Ala Wai golf course, and possibly Hausten Ditch and the upper reaches of the Ala Wai Canal. However, these areas lack some of the key habitat features, and therefore are expected to provide very minimal habitat value in comparison to other nearby areas (e.g., Pearl Harbor National Wildlife Refuge); these areas are not expected to provide suitable nesting habitat but could be used for resting

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

habitat. As such, it is possible (though unlikely), that Hawaiian gallinule could occur in the action area.

Potential Effects of the Proposed Action
As described above, the extent and quality of potentially suitable habitat within the action area is very limited and is likely to only be used as resting habitat (if at all). In the unlikely event that Hawaiian gallinule are present within the action area, it is expected that they would readily disperse to nearby areas with higher quality habitat (e.g., Pearl Harbor National Wildlife Refuge) in response to disturbance; as such, the potential effects of the proposed action are expected to be limited to temporary construction-related disturbance (e.g., noise). Injury or mortality of Hawaiian gallinule (or their nests) is not expected.

Areas of potentially suitable wetland habitat may be temporarily unavailable during construction (due to increased levels of disturbance), but sufficient habitat is expected to be available in nearby areas (e.g., Pearl Harbor National Wildlife Refuge). Following construction, the extent and quality of habitat is expected to be the same as the existing condition. During large-scale flood events, the detention basins would be inundated for short periods of time (i.e., about 1 day for Manoa Valley and Makiki Park District detention basins and about 2 days for the Ala Wai Golf Course detention basin), which could temporarily increase the extent of potential habitat. Although increased habitat may be viewed as a benefit, in heavily urbanized areas (such as the Ala Wai watershed), it can also create an attractive nuisance for waterbird species. Specifically, areas of increased habitat may attract waterbirds, which are then vulnerable to predator species that are prevalent in an urban environment (e.g., feral cats, mongoose). However, given the low probability of species occurrence and the infrequent recurrence and short-term duration of flooding, these conditions are not expected to significantly affect Hawaiian gallinule.

Effects Determination
Based on the minimal extent and quality of suitable habitat, there is a low probability of species occurrence in the action area. Given the above, coupled with the nature of activities proposed in these areas, impacts to the Hawaiian gallinule are expected to be insignificant, such that the proposed action **may affect, but is not likely to adversely affect** the species.

4.5 Hawaiian Coot (Fulica americana alai)

Hawaiian coot is a listed federally endangered species. Critical habitat has not been designated for this species.

Current Species Status
Hawaiian coot (ala keokeo) occurs statewide, although Kauai, Oahu, and Maui collectively support 80 percent of birds detected during the annual waterbird surveys (USFWS, 2021k). On Oahu, coots are observed at Lake Wilson and Nuuanu Reservoir, Kahuku Point and along the windward shore. The most recent minimum population estimate of Hawaiian coot is 1,815 individuals (USFWS, 2021k).

Biology and Ecology of Species – Reproduction and Forage Requirements
Hawaiian coot are found in a variety of wetland habitats including freshwater marshes and ponds, coastal estuaries and ponds, artificial reservoirs, kalo or taro (*Colocasia esculenta*) lo'i or patches, irrigation ditches, and sewage treatment ponds (USFWS, 2011d). Hawaiian coot are omnivores, feeding on seeds and leaves, snails, crustaceans, insects, tadpoles, and small fish. The species will travel long distances, including between islands, when local food sources are depleted. Nesting habitat includes freshwater and brackish ponds, irrigation ditches, and taro

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

fields. Floating nests are constructed of aquatic vegetation and found in open water or anchored to emergent vegetation. Open water nests are usually composed of mats of water hyssop and Hilo grass. Nests in emergent vegetation are typically platforms constructed from buoyant stems of species such as bulrush. Nesting occurs year-round, but most activity occurs between March and September. Clutch size ranges from three to ten eggs, and chicks may hatch after a 25-day incubation period (USFWS, 2011d).

Factors Affecting Species Activity and Survival

Threats to survival for this species include loss and degradation of wetland habitat; predation by introduced animals; modification of hydrology; alteration of habitat structure and vegetation composition by invasive nonnative plants; loss of riparian vegetation; and water quality degradation due to grazing, disease, and possibly environmental contaminants (USFWS, 2011d).

Potential to Occur in the Action Area

The only suitable habitat that could support this species within the action area are very small pockets of wetland habitat; these are limited to isolated features within the Ala Wai golf course and possibly along the upper edges of the Ala Wai Canal. However, these areas are very small and provide very minimal habitat value in comparison to other nearby areas (e.g., Pearl Harbor National Wildlife Refuge); they are not expected to provide suitable nesting habitat but could be used for resting habitat. As such, it is possible (though unlikely), that Hawaiian coots could occur in the action area.

Potential Effects of the Proposed Action

As described above, the extent and quality of potentially suitable habitat within the action area is very limited and is likely to only be used as resting habitat (if at all). In the unlikely event that coots are present within the action area, it is expected that they would readily disperse to nearby areas with higher quality habitat (e.g., Pearl Harbor National Wildlife Refuge) in response to disturbance; as such, the potential effects of the proposed action are expected to be limited to temporary construction-related disturbance (e.g., noise). Injury or mortality of coots (or their nests) is not expected.

Area of potentially suitable wetland habitat may be temporarily unavailable during construction (due to increased levels of disturbance), but sufficient habitat is expected to be available in nearby areas (e.g., Pearl Harbor National Wildlife Refuge). Following construction, the extent and quality of habitat is expected to be the same as the existing condition. During large-scale flood events, the detention basins would be inundated for short periods of time (i.e., about 1 day for Manoa Valley and Makiki Park District detention basins and about 2 days for the Ala Wai Golf Course detention basin), which could temporarily increase the extent of potential habitat. Although increased habitat may be viewed as a benefit, in heavily urbanized areas (such as the Ala Wai watershed), it can also create an attractive nuisance for waterbird species. Specifically, areas of increased habitat may attract waterbirds, which are then vulnerable to predator species that are prevalent in an urban environment (e.g., feral cats, mongoose, etc.). However, given the low probability of species occurrence and the infrequent recurrence and short-term duration of the flooding, these conditions are not expected to significantly affect coots.

Effects Determination

Based on the minimal extent and quality of suitable habitat, there is low probability of species occurrence in the action area. Given the above, coupled with the nature of activities proposed in

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

the action area, impacts to the Hawaiian coot are expected to be insignificant, such that the proposed action **may affect, but is not likely to adversely affect** the species.

4.6 Hawaiian Petrel (Pterodroma sandwichensis)

Hawaiian petrel is a listed federally endangered species. No critical habitat has been designated for this species.

Current Species Status

Historically, the Hawaiian petrel was believed to have had well established breeding populations on all the major Hawaiian Islands (USFWS, 1983). Currently, the Hawaiian petrel (Uau) breeds on several main Hawaiian Islands, including Maui, Hawaii Island, and Kauai and possibly on Molokai, Lanai, the sea stacks off Kahoolawe and Lehua Island (USFWS, 2011e). However, approximately 85 percent of the known population of Hawaiian petrel nests on Maui (USFWS, 2011e). Since the last 5-year review in 2017, Pacific Rim Conservation continues to conduct surveys and burrow searching in the northern Koolau Mountains and near the summit of Mount Kaala on Oahu (USFWS, 2022). No burrows have been located yet, but Hawaiian petrel calls continue to be detected on acoustic monitors at both sites (USFWS, 2022). An analysis of at-sea surveys conducted between 1998 and 2011 estimated the Hawaiian petrel population to be 52,186 individuals including juveniles and subadults (USFWS, 2022).

Biology and Ecology of Species – Reproduction and Forage Requirements

Hawaiian petrels currently are known to nest only at elevations above 7,200 feet (USFWS, 1983). Vegetation in nesting areas is often sparse and consists predominantly of grass and bracken fern. Adults form nests by excavating burrows or crevices that are generally three to six feet deep and reaching a length up to 15 feet or more. Nesting burrows are commonly located among large rock outcrops, talus slopes, or along edges of lava flows with suitable underlying soil for the excavation of tunnels. Hawaiian petrels form long-term pair bonds and return to the same nest site each year during breeding season. Eggs are laid in May through June and chicks generally fledge by December. Both parents incubate, brood, and feed a single chick. Hawaiian petrels begin breeding at about age 5 or 6 (USFWS, 1983).

Hawaiian petrels may feed hundreds of miles (thousands of kilometers) from their colonies, preying upon marine organisms, such as squid, goatfish, lantern fish and in some cases, crustaceans. Petrels feed by capturing prey with their beaks while sitting on the water or flapping just above the surface.

Factors Affecting Species Activity and Survival

Threats to the survival of Hawaiian petrels include historic hunting and introduced predators, such as dogs, pigs, rats, feral cats, and mongoose (USFWS, 1983).

Potential to Occur in the Action Area

Nesting habitat for the Hawaiian petrel is not present within the proposed action footprint. Therefore, no direct impacts to Hawaiian petrel or their nesting/foraging habitat is expected to occur. The species could be present foraging or flying over the action area.

Potential Effects of the Proposed Action

No direct effects due to implementation of the proposed action are expected to Hawaiian petrel since the action area does not provide suitable nesting habitat for this species. During construction of the project, artificial lighting could be used during pre-dawn and pre-dusk hours within staging areas. Hawaiian petrel show a strong attraction to light sources, including artificial

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

lights. Artificial lights can act as an attractant causing disorientation, confusion, and eventual grounding. Nesting adults and fledglings may traverse the action area while flying between their nesting grounds and the ocean. Although the amount of time spent by the birds in the action area would be limited, there is the potential for construction lighting to attract fledglings and cause fallout. Avoidance and minimization measures regarding artificial lighting would be implemented to reduce potential indirect impacts to Hawaiian petrel that may be flying over the action area.

Effects Determination
Given the above, coupled with the nature of activities proposed in these areas, impacts to Hawaiian petrel are expected to be insignificant, such that the proposed action **may affect, but is not likely to adversely affect** the species.

4.7 Hawaiian Stilt (Himantopus mexicanus knudseni)

Hawaiian stilt is a listed federally endangered species. Critical habitat has not been designated for this species.

Current Species Status
Hawaiian stilts were historically known from all of the major islands except Lanai and Kahoolawe (USFWS, 2011d). Currently, Hawaiian stilts are found on all the main Hawaiian Islands except Kahoolawe. Regarding Oahu, large concentrations of Hawaiian stilts can be found at the James Campbell National Wildlife Refuge, the Kahuku aquiculture ponds, the Honouliuli and Waiawa units of the Pearl Harbor National Wildlife Refuge, and on Nuupia Ponds in Kaneohe. Populations also exist at the Chevron Refinery, the fishponds at Kualoa Beach Park, at Salt Lake District Park, and at scattered locations along the northern and eastern coasts. From 2006 to 2011, Oahu accounted for 35 to 50 percent of the State's Hawaiian stilt population (USFWS, 2011d). The most recent winter and summer surveys for Hawaiian stilt show a fluctuating population, which generally increased from 1985 to 2004 and since then has been roughly stable at 1,500 to 2,000 individuals (USFWS, 2020c).

Biology and Ecology of Species – Reproduction and Forage Requirements
Hawaiian stilts are found in a variety of wetland habitats including freshwater marshes and ponds, coastal estuaries and ponds, artificial reservoirs, kalo or taro (*Colocasia esculenta*) lo'i or patches, irrigation ditches, and sewage treatment ponds (USFWS, 2011d). Foraging habitat consists of ephemeral fresh, brackish, or saltwater habitats. Hawaiian stilts prefer sites with a water depth of less than nine inches, limited and low growing vegetation, or exposed tidal flats and opportunistically prey upon polychaete worms, small crabs, insects, and small fish. Hawaiian stilts frequently move among wetland habitats in search of food (USFWS, 2011d).

Breeding habitat differs from foraging habitat and individuals move between the two habitats daily (USFWS, 2011d). Nesting occurs on freshly exposed mudflats and some low growing vegetation, also will nest on islands in fresh and brackish ponds or artificial floating nest structures. Nesting occurs between March and August and peaks in May and June. Three to four eggs are typically laid, and chicks hatch approximately 24 days later. Both parents incubate eggs and brood young, and fledglings remain with their parents for several months (USFWS, 2011d).

Factors Affecting Species Activity and Survival
Threats to survival for this species include loss and degradation of wetland habitat; predation by introduced animals; modification of hydrology; alteration of habitat structure and vegetation

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

composition by invasive nonnative plants; loss of riparian vegetation; and water quality degradation due to grazing, disease, and possibly environmental contaminants (USFWS, 2011d).

Potential to Occur in the Action Area
A small amount of potentially suitable habitat occurs within the action area; these areas include the aquatic features within the Ala Wai golf course, Hausten Ditch, and possibly the upper reaches of the Ala Wai Canal. However, these areas are limited in size and provide very minimal habitat value in comparison to other nearby areas (e.g., Pearly Harbor National Wildlife Refuge); they are not expected to provide suitable nesting habitat but could be used for resting habitat. As such, it is possible (though relatively unlikely), that Hawaiian stilts could occur in the action area.

Potential Effects of the Proposed Action
As described above, the extent and quality of potentially suitable habitat within the action area is very limited and is likely to only be used as resting habitat (if at all). In the unlikely event that stilts are present within the action area, it is expected that they would readily disperse to nearby areas with higher quality habitat (e.g., Pearl Harbor National Wildlife Refuge) in response to disturbance; as such, the potential effects of the proposed action are expected to be limited to temporary construction-related disturbance (e.g., noise). Injury or mortality of stilts (or their nests) is not expected.

Areas of potentially suitable wetland habitat may be temporarily unavailable during construction (due to increased levels of disturbance), but sufficient habitat is expected to be available in nearby areas (e.g., Pearl Harbor National Wildlife Refuge). Following construction, the extent and quality of habitat is expected to be the same as the existing condition. During large-scale flood events, the detention basins would be inundated for short periods of time (i.e., about 1 day for Manoa Valley and Makiki Park District detention basins and about 2 days for the Ala Wai Golf Course detention basin), which could temporarily increase the extent of potential habitat. Although increased habitat may be viewed as a benefit, in heavily urbanized areas (such as the Ala Wai watershed), it can also create an attractive nuisance for waterbird species. Specifically, areas of increased habitat may attract a larger number of waterbirds, which are then vulnerable to predator species that are prevalent in an urban environment (e.g., feral cats, mongoose). However, given the low probability of species occurrent and the infrequent recurrence and short-term duration of flooding, these conditions are not expected to significant affect stilts.

Effects Determination
Based on the minimal extent and quality of suitable habitat, there is a low probability that Hawaiian stilts would occur in the action area. Given this fact, coupled with the nature of the proposed activities, impacts to the Hawaiian stilt are expected to be insignificant, such that the proposed action **may affect, but is not likely to adversely affect** the species.

4.8 Newell's Townsend's Shearwater (*Puffinis auricularis newelli*)

The Newell's shearwater is a listed federally threatened species.

Current Species Status
Newell's shearwater's historical range is thought to include Hawaii, Maui, Molokai, Oahu, and Kauai. Young et al., (2019) have identified sites on the leeward slopes of Mount Kaala in the Waianae Mountains and at Poamoho, Koolau Mountains, that may serve as breeding sites on Oahu. Since the publication of the 5-year review in 2011, results from analysis of at-sea surveys

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

conducted between 1998 and 2011 estimated the Newell's shearwater population to be about 27,011 (95 percent confidence interval [CI] 18,254 – 37,125) individuals, including juveniles and subadults. The previous at-sea population estimate from surveys conducted between 1980 and 1994 estimated 84,000 (95 percent confidence interval: 57,000 – 115,000) birds, including subadults and juveniles.

Biology and Ecology of Species – Reproduction and Forage Requirements

Newell's shearwaters are colonial and nesting habitat is typically within steep mountainous terrain between 500 and 2,300 feet in elevation (USFWS, 1983). The species appears to have an affinity for dense fern habitat with moderate to light tree cover. To take flight, the species requires an open downhill flight path through which it can become airborne; therefore, the species favors ridge crests or embankments for its nesting burrows. Females typically lay a single egg in cavities and burrows, often located at the base of a tree. Breeding is highly synchronous, and eggs are laid in early June, and most young fledge by November. Both parents incubate the egg, and brood and feed the nestling. Parents forage tens of miles (hundreds of kilometers) offshore and return to the colony at night to feed their chick. No post-fledging care is provided by the parents. Newell's shearwater first breed typically between six and seven years old (USFWS, 1983).

Newell's shearwater often forages in large, mixed species flocks associated with schools of large, predatory fishes, which drive prey to the surface (USFWS, 1983). The species feeds mainly by pursuit-plunging; individuals dive into water and swim using their partly folded wings for propulsion. Diet may consist of fish and squid (USFWS, 1983).

Factors Affecting Species Activity and Survival

Threats to Newell's shearwater include historical hunting, introduced predators such as dogs, pigs, rats, barn owls, feral cats, and mongoose. Habitat loss and degradation has resulted in the loss of 75 percent of forest habitat over the last 150 years, with much of the remaining forest degraded by invasive plants. Artificial lighting disorients fledglings, causing "fallout" and collision with vertical structures. When grounded, fledglings become susceptible to predators. Overfishing and catastrophes, such as hurricanes, may result in injury and mortality to individuals.

Potential to Occur in the Action Area

Nesting habitat for Newell's shearwater is not present within the proposed action area. Therefore, no direct impacts to Newell's shearwater or their nesting/foraging habitat is expected to occur. The species could be present foraging or flying over the action area.

Potential Effects of the Proposed Action

No direct effects due to implementation of the proposed action are expected to Newell's shearwater since the action area does not provide suitable nesting habitat for this species. During construction of the project, artificial lighting could be used during pre-dawn and pre-dusk hours within staging areas. Artificial lighting has resulted in substantial problems for fledgling Newell's shearwaters during their first flight to the ocean from their nesting grounds. Fledgling shearwaters have a normal attraction towards light and when attracted to man-made lighting, fledglings may become confused and suffer temporary night blindness (USFWS, 1983). This often causes the fledglings to fly into obstructions such as utility wires, poles, trees, and buildings where they then fall to the ground. Most fallen shearwaters are only stunned, but they may be hit by automobiles, killed by dogs or cats, or simply be unable to get to a suitable space to get airborne again. Many perish of broken wings, concussion, paralysis, and other injuries

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

received from their fall. A small number of adults may also experience fallout due to artificial lighting (USFWS, 1983). Although the amount of time spent by the birds in the action area would be limited, there is the potential for construction lighting to attract fledglings and cause fallout. Avoidance and minimization measures regarding artificial lighting would be implemented to reduce potential indirect impacts to Newell's shearwater that may be flying over the action area.

Effects Determination
Given the above, coupled with the nature of activities proposed in these areas, impacts to Newell's shearwater are expected to be insignificant, such that the proposed action **may affect, but is not likely to adversely affect** the species.

4.9 Short-tailed Albatross (Phobastria (=Diomedea) albatrus)

The short-tailed albatross is a listed federally endangered species. No critical habitat has been designated for this species.

Current Species Status
Historically, the short-tailed albatross is believed to have once nested on Midway Atoll at the northwestern end of the Hawaiian Archipelago (USFWS, 2008). Since 1938, approximately 50 observations of about 17 different short-tailed albatrosses have been noted in the vicinity of the Northwestern Hawaiian Islands, typically between November and April (USFWS, 2008). During the most recent 5-year review it was noted that in the Northwestern Hawaiian Islands, a short-tailed albatross pair was present on Eastern Island at Midway Atoll from 2008 to 2015 and successfully fledged chicks in 2011, 2012, and 2014 (USFWS, 2020d). During 2016, a new pair formed on Sand Island, Midway Atoll. During the 2018-2019 breeding season, the same pair returned and successfully raised their own chick to fledge. A suspected female-female pair has been attempting to breed at Kure Atoll, Hawaii, since 2010 (USFWS, 2020d). The most recent 5-year review of the species estimated the population at 7,365 birds.

Biology and Ecology of Species – Reproduction and Forage Requirements
Breeding habitat for the species is isolated, windswept, offshore islands, with restricted human access (USFWS, 2008). Nest sites may be flat or slopes, with sparse or full vegetation. The short-tailed albatross is a colonial, annual breeding species; each breeding cycle lasts about eight months. Nests consist of a divot on the ground lined with sand and vegetation. Birds may breed at 5 years of age, but first year of breeding is more commonly six. A single egg is laid in late October to late November with hatching occurring from late December through January. Chicks begin to fledge in late May into June (USFWS, 2008).

Non-breeding habitat is the North Pacific marine environment which is most heavily used by short-tailed albatross (USFWS, 2008). The area is characterized by regions of upwelling and high productivity along the northern edge of the Gulf of Alaska, along the Aleutian Chain, and along the Bering Sea shelfbreak from the Alaska Peninsula out towards St. Matthew Island (USFWS, 2008).

The diet of short-tailed albatross during breeding is not well-known, but observations of food brought to nestlings and of regurgitated material indicate that the diet includes squid, shrimp, fish, flying fish eggs, and other crustaceans (USFWS, 2008).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Factors Affecting Species Activity and Survival
Major threats to short-tailed albatross include habitat alteration and loss due to catastrophic events; climate change; commercial fishing; contaminants; disease and parasites; predation; natural competition; invasive species; air strikes; and other human activities (USFWS, 2008).

Potential to Occur in the Action Area
The action area is generally comprised of either low density vegetated non-native riparian/forest habitat (such as that associated with the floodwalls along the middle watershed), turf grass (such as that associated with the detention basins) or developed areas (such as that associated with the floodwalls along the lower watershed). No portion of the action area supports suitable breeding habitat for short-tailed albatross. As such, suitable habitat is not present, and this species is expected to not have the potential to occur within the action area.

Potential Effects of the Proposed Action
The proposed action is not expected to affect short-tailed albatross directly or indirectly.

Effects Determination
The proposed action is expected to have **no effect** on short-tailed albatross, or critical habitat designated for this species.

4.10 Hawaiian Hoary Bat (*Lasiurus cinereus semotus*)

The Hawaiian hoary bat is a listed federally endangered species.

Current Species Status
The hoary bat is the most widely distributed bat in North America. In Hawaii, the Hawaiian hoary bat (opeapea) has been reported from all the main Hawaiian Islands, except for Niihau, although the specimen records only exist for Kauai, Oahu, Maui, Molokai, and Hawaii Island. On Oahu, the species is thought to be widely distributed however, the highest concentrations of acoustic detections for Hawaiian hoary bat are from northern Koolau and Waianae Mountain ranges (USFWS, 2021l). Additional acoustic detections for the species have been documented on lands in Waikiki, Ford Island, the north shore of Oahu, and the National Wildlife Refuge complex that includes the James Campbell NWR, the Kalaeloa Unit of the Pearl Harbor NWR, and the Oahu Forest NWR (USFWS, 2021l).

Biology and Ecology of Species – Reproduction and Forage Requirements
Hawaiian hoary bats roost alone or with dependent young in native and nonnative trees, typically more than 15 feet tall (USFWS, 2021l). Hoary bats begin foraging before or after sunset depending on the time of year, feed on a variety of native and non-native night-flying insects, including moths, beetles, crickets, mosquitoes, and termites; and like other insectivorous bats, prey is located using echolocation (USFWS, 1998). Water courses and edges (e.g., coastlines and forest/pasture boundaries) appear to be important foraging areas; the species also is attracted to insects that congregate near lights. Breeding has only been documented on the islands of Hawaii and Kauai. Mating most likely occurs between September and December, and females give birth to twins during May or June. Mother bats likely stay with their pups until they are six to seven weeks old (USFWS, 1998).

Factors Affecting Species Activity and Survival
Threats to hoary bats include habitat loss, pesticides, predation, and roost disturbance. A reduction in tree cover might be the primary reason for the species decline in Hawaii and pesticides may have reduced populations (USFWS, 1998).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Potential to Occur in the Action Area
Little is known about the species' occurrence across the island of Oahu, including the Ala Wai watershed. However, based on the habitat preferences, it is possible that it could occur within the action area. Specifically, the Manoa Valley Park District detention basin, Woodlawn Drive Bridge floodwall, and Koali Road floodwall include forested habitat with tall trees that may be used for roosting. The Makiki Park District detention basin, Kanaha floodwall, Kaimuki High School floodwall, Ala Wai Golf Course detention basin, and portions of the Ala Wai Canal floodwall (especially in the vicinity of the Manoa-Palolo Canal) may also provide suitable foraging habitat; however, the habitat value of these sites is likely diminished by the extensive urbanization in the surrounding areas.

Potential Effects of the Proposed Action
Should they occur, Hawaiian hoary bats could be directly or indirectly impacted by the proposed action. Direct effects could include mortality or other forms of take (e.g., harm or harassment) to individual bats because of heavy equipment used for clearing and grubbing of the project footprints and construction of the flood risk management structures. The use of heavy equipment would also generate noise, which could disrupt bats that are present within the action area. To avoid and minimize the potential for these impacts, vegetation clearing for the project would be performed during times of the year when Hawaiian hoary bats are not expected to be breeding to avoid potential for harm or disruption of juvenile bats that are unable to fly; specifically trees greater than 15 feet in height would not be cleared between June 1 and September 15. In addition, all construction activities would be scheduled to occur during daytime hours, thus avoiding potential bat foraging activities, which typically occur in the evening hours.

Other effects could include permanent loss or temporary impacts to habitat. However, given the amount of habitat available throughout the upper watershed, tree clearing within the action area is not expected to measurably decrease the amount of forest available to the local population of bats for roosting. In addition, on Oahu roost trees are plentiful and are not expected to be a limiting factor for the species. The forest habitat in the upper portions of the watershed is homogenous and does not vary significantly in composition or structure between adjacent patches. For these reasons, it is expected that any bats displaced by the clearing would readily find alternate roost sites in surrounding undisturbed forest.

Effects Determination
As described above, seasonal restrictions for tree trimming/clearing and enforcement of construction hours will be incorporated to avoid and/or minimize the potential for impacts to the Hawaiian hoary bat, should the species be present in the action area. With implementation of these measures, impacts to the Hawaiian hoary bat are expected to be insignificant, such that the proposed action **may affect, but is not likely to adversely** affect the species.

4.11 Hawaiian Monk Seal (*Monachus schauinslandi*)

The Hawaiian monk seal is a listed federally endangered species. Critical habitat has been designated for Hawaiian monk seal. Specific to Oahu, designated marine critical habitat includes the seafloor and all subsurface waters within 33 feet (10 meters) of the seafloor, out to the 656-foot (200 meter) depth contour line. At specific points around Oahu, critical habitat for Hawaiian monk seal extends inland through the water's edge 16 feet (five meters) into the terrestrial environment from the shoreline. However, no terrestrial critical habitat is designated within the vicinity of the action area.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Current Species Status

Hawaiian monk seals are found in the Hawaiian archipelago which includes both the main and Northwestern Hawaiian Islands and rarely at Johnston Atoll which lies nearly 1,000 miles southwest of Hawaii (NOAA, 2023a). The monk seals are endemic to these islands, occurring nowhere else in the world. The Hawaiian monk seal population is estimated to be around 1,570 seals—nearly 1,200 seals in the northwestern Hawaiian Islands and 400 seals in the main Hawaiian Islands. In general, the Hawaiian monk seal population has been declining overall for six decades and current numbers, though increasing, are only about one-third of historic population levels (NOAA, 2023a).

Biology and Ecology of Species – Reproduction and Forage Requirements

Hawaiian monk seals are “generalist” feeders, which means they eat a wide variety of foods depending on what’s available (NOAA, 2023a). They eat many types of common fishes, squids, octopuses, eels, and crustaceans (crabs, shrimps, and lobsters). Diet studies indicate that they forage at or near the seafloor and prefer prey that hide in the sand or under rocks. Hawaiian monk seals are mostly solitary and don’t live in colonies like sea lions or other seals. But they do sometimes lie near each other—usually not close enough to make physical contacts—in small groups. They usually sleep on beaches, sometimes for days at a time. They also occasionally sleep in small underwater caves. Monk seals do not migrate seasonally, but some seals have traveled hundreds of miles in the open ocean. Individual seals often frequent the same beaches over and over, but they do not defend territories. When on land, monk seals haul-out to rest, molt, give birth and nurse on sand, coral rubble, and volcanic rock shorelines. They generally prefer sandy, protected beaches surrounded by shallow waters for pupping. When not on land, Hawaiian monk seals use waters surrounding atolls and islands and areas further offshore on reefs and submerged banks; they also use deepwater coral beds as foraging habitat (NOAA, 2023a).

Mating occurs during the spring and summer months at sea (76 FR 32026, June 2, 2011). Most females mate once a year. Females and males typically reach sexual maturity between the ages of 5 to 6 years of age in the main Hawaiian Islands and age 7 to 10 in the Northwestern Hawaiian Islands (NOAA, 2023a). The youngest documented female to give birth was 4 years old. Gestation is about 11 months with most pup births occurring between February and August. Nursing lasts for about 6 weeks and pups and moms stay on shore until a pup is weaned (76 FR 32026, June 2, 2011).

Factors Affecting Species Activity and Survival

Historically, humans and disturbance from government installations in the Northwestern Hawaiian Islands threatened Hawaiian monk seal. Today, Hawaiian monk seal are negatively affected by food limitation, shark predation, marine debris entanglement, male seal aggression, habitat loss, fishery interactions (i.e., commercial longline fishing including hook and nets), disease (e.g., canine distemper, Leptospirosis, and Brucellosis) and contaminants, human-seal interactions, and intentional killing (NOAA, 2023a).

Potential to Occur in the Action Area

The Hawaiian monk seal is unlikely to occur within the action area; however, a Hawaiian monk seal was observed swimming in the Ala Wai Canal on March 6, 2023 (Moore, 2023). It is believed that the presence of the Hawaiian monk seal in the canal is potentially related to recent dredging of canal sediments by the Hawaii DLNR and Genki balls that have been thrown into the canal as part of the Genki Ala Wai Project. In addition, a Hawaiian monk seal known as RK96 (also known as Kaiwi) has pupped on Kaimana beach in Waikiki twice (i.e., 2021 and

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

2023) (NOAA, 2023b). Therefore, there is the potential for Hawaiian monk seals to occur within the action area. It is important to note that the proposed action is focused on stream-related flood risk reduction and does not include any direct impacts to marine or coastal habitat. The proposed action does not extend into the marine critical habitat for the Hawaiian monk seal, and no terrestrial critical habitat is designated within the vicinity of the action area. Overall, there is the potential for Hawaiian monk seal to occur within the action area.

Potential Effects of the Proposed Action

Activities associated with the proposed action could reasonably be expected to interact directly or indirectly with Hawaiian monk seal through:

1. Collision with vessels;
2. Direct physical impact;
3. Disturbance from human activity and equipment operation;
4. Exposure to elevated noise levels;
5. Exposure to elevated turbidity;
6. Exposure to wastes and discharges; and
7. Loss of forage habitat.

Collision with vessels:

Activities associated with the proposed action do not include the use of vessels in nearshore marine waters or lower reaches of rivers and streams. All work is anticipated to occur from upland with equipment staged upland.

Direct physical impact:

Physical impact to Hawaiian monk seal is not expected to occur. At this time, all construction work would occur from upland with no construction equipment (i.e., push barge, vessel, etc.) anticipated to be present within the aquatic habitat. The exception is construction of the Ala Wai Canal floodwall which includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area. The placement of cofferdam materials could potentially physically impact Hawaiian monk seal should these animals be present when cofferdam materials strike the bottom. Potential injuries and their severity will depend on the animal's proximity to the bottom when struck, the angle of the strike, and the body part impacted, but may include cuts, bruises, broken bones, and amputations, any of which could result in the animal's death. Hawaiian monk seal could also be pinned to the bottom and drowned. To minimize potential physical impacts to Hawaiian monk seal during cofferdam material placement, avoidance and minimization measures listed in Section 2.3 would be implemented. Some of these avoidance and minimization measures require surveys for ESA-listed species in the area to occur prior to the start of each workday and prior to resumption of work following any break of more than one-half hour. They also require that all work be postponed or halted when motile ESA-listed marine species are within 164 feet of proposed work and resumption of activities should only occur after the animals have voluntarily left the area. These types of avoidance and minimization measures (refer to Section 2.3 for the complete list) would minimize the potential physical impact to Hawaiian monk seal during the placement and removal of cofferdam material.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Disturbance from human activity and equipment operation:

Although construction of the floodwalls would occur upland, work would occur near marine habitat where ESA-listed marine species may be directly exposed to project-related activity. Hawaiian monk seal may experience a startle reaction and resulting stress should they encounter site preparation and construction activities. The reaction could range from one extreme where an animal calmly approaches and investigates the activity, to an opposite reaction of panicked flight, where an animal injures itself in an attempt to flee. However, marine mammals such as Hawaiian monk seal typically avoid human activity. Thus, the most likely effect of this interaction will be moderate level stress with a moderate to high energy avoidance behavior leading to the Hawaiian monk seal rapidly leaving the project footprint without injury.

Exposure to elevated noise levels:

Activities such as pile-driving may produce in-air and in-water sound levels capable of injury or adverse behavioral modifications for Hawaiian monk seal. Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. For example, construction of the floodwalls along Manoa-Palolo Canal and the Ala Wai Canal would occur upland. In addition, most of the floodwalls being constructed do not include pile driving; the exception being the reach along the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard and Date Street. In this reach, the upland area is constricted to such a degree that a steel sheet pile wall (i.e., I-wall) would need to be installed in this location. A 15-foot-wide rock bench would be placed in-water along the right-descending bank of the Manoa-Palolo Canal parallel to the bank. Equipment for construction of the I-wall would be staged along this rock bench. Upon completion of the I-Wall, the rock bench would be permanently removed. Although equipment for constructing of the floodwall would be staged along the 15-foot-wide rock bench, inserting the steel sheet pile for the floodwall would be into the adjacent upland area. The method to be used would be push in place instead of impact pile driving. The push in place method pushes the steel sheet pile into the ground without an impact hammer or vibration. The operation, except for a crane engine (to hold the steel sheet pile) and the generator to power the machine for pushing in the pile, is almost silent. For reference, a crane and a generator typically produce airborne noise levels of 87 dBA at 50 feet from the source. Therefore, using the push in place method would reduce airborne noise levels typically associated with pile driving as well as in water noise levels. In addition, installation of pile would be upland where it is in the dry. Pile installation in the dry is typically a minimization measure designed to reduce the amount of sound that is transmitted through water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since pile installation would occur upland, this would be like pile driving occurring in the dry; therefore, installing the pile upland is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

The floodwall along the Ala Wai Canal does not include the installation of steel sheet pile. Instead, floodwalls along the Ala Wai Canal would be either J-walls or L-walls on macropiles. The macropiles require the use of a drill rig and associated drilling equipment to create a hole to design depth. The drill rig and drilling of the macropile hole would likely create the most noise during construction of these types of floodwalls. However, like the pile installation along the reach of Manoa-Palolo Canal, drilling would occur upland which is effective at minimizing the effects of sound in the water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

soil. Since drilling of the macropile holes would occur upland, this is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

In addition to construction of floodwall, the Ala Wai Canal floodwall also includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose Hawaiian monk seals to project-related activity. However, Hawaiian monk seals typically avoid human interaction, so exposure to the project-related activity detailed above would be infrequent and non-injurious. The presence of the cofferdam would allow work on the stormwater drainage structures to be completed in the dry. As stated previously, working in the dry is a minimization measure designed to reduce the amount of sound that is transmitted through the water. Therefore, upgrading existing stormwater outlet structures would occur in the dry which is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

Exposure to elevated turbidity and sedimentation:

In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed in Section 2.3. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon Hawaiian monk seal.

As described in Section 2.3, USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to marine habitat occupied by the Hawaiian monk seal due to water quality degradation. The project includes the construction of floodwalls primarily along the Ala Wai Canal (including Manoa-Palolo Canal). Floodwalls would increase the capacity of the Ala Wai Canal to hold more storm water as well as increase storm flow velocities in the canal. Increased storm flow velocities in the canal could in turn disturb and/or resuspend sediments in the water column creating a turbidity plume that could affect water quality in the canal, the Ala Wai Small Boat Harbor, and the nearshore marine environment. Changes to velocities within the Ala Wai Canal were modeled with project features constructed and are compared against velocities within the canal under existing conditions in Table 4. Although the project would result in increased velocities and likely a large turbidity plume during a storm event, it is important to note that increased velocities and turbidity plumes already occur under the existing condition during a storm event.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Currently, under existing conditions, high rainfall events disturb sediments in the upper reaches of the Ala Wai watershed and cause these sediments to become suspended in the water column. There are also three general areas in the Ala Wai Canal where previously suspended sediments have sedimented out and built up within the canal: Kalakaua Avenue Bridge, mouth of the Manoa-Palolo Canal, and the terminus of the Ala Wai Canal (Montgomery et al., 2009). These built-up sediments within the canal at these locations can become resuspended in the water column during a storm event due to increased water velocities within the canal. The combination of these suspended sediments in the water column cause turbidity plumes during storm events which can extend beyond the canal and degrade water quality within the nearshore marine environment. Predicting how far turbidity plumes could extend during a storm event is difficult and can in turn make it difficult to predict where impacts to the nearshore marine environment could occur. However, PacIOOS has developed a turbidity plume forecast model for the Ala Wai Canal allowing the tracking of potential turbidity levels and extent of turbidity plumes along the nearshore marine environment. As an example of how a turbidity plume might extend out of the Ala Wai Small Boat Harbor and into the nearshore marine environment, PacIOOS conducted a model run of a turbidity plume for a storm event that occurred December 25 through December 27, 2017, in the Honolulu area. Figure 15 shows selected time progressions of this storm's modeled turbidity plume.

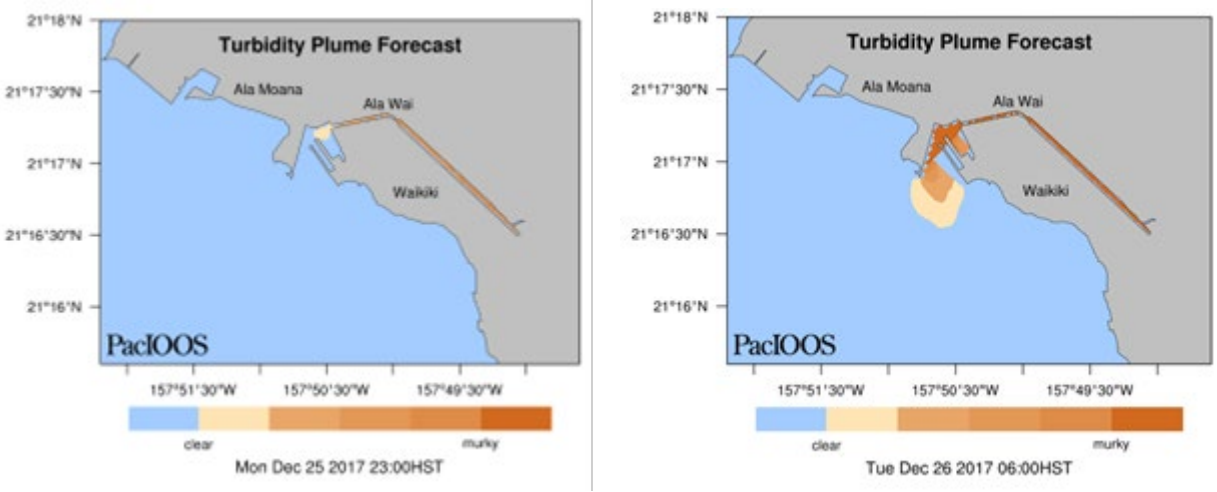

Figure 15: Modeled Turbidity Plume Forecast for December 25-27, 2017, High Rainfall Event.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

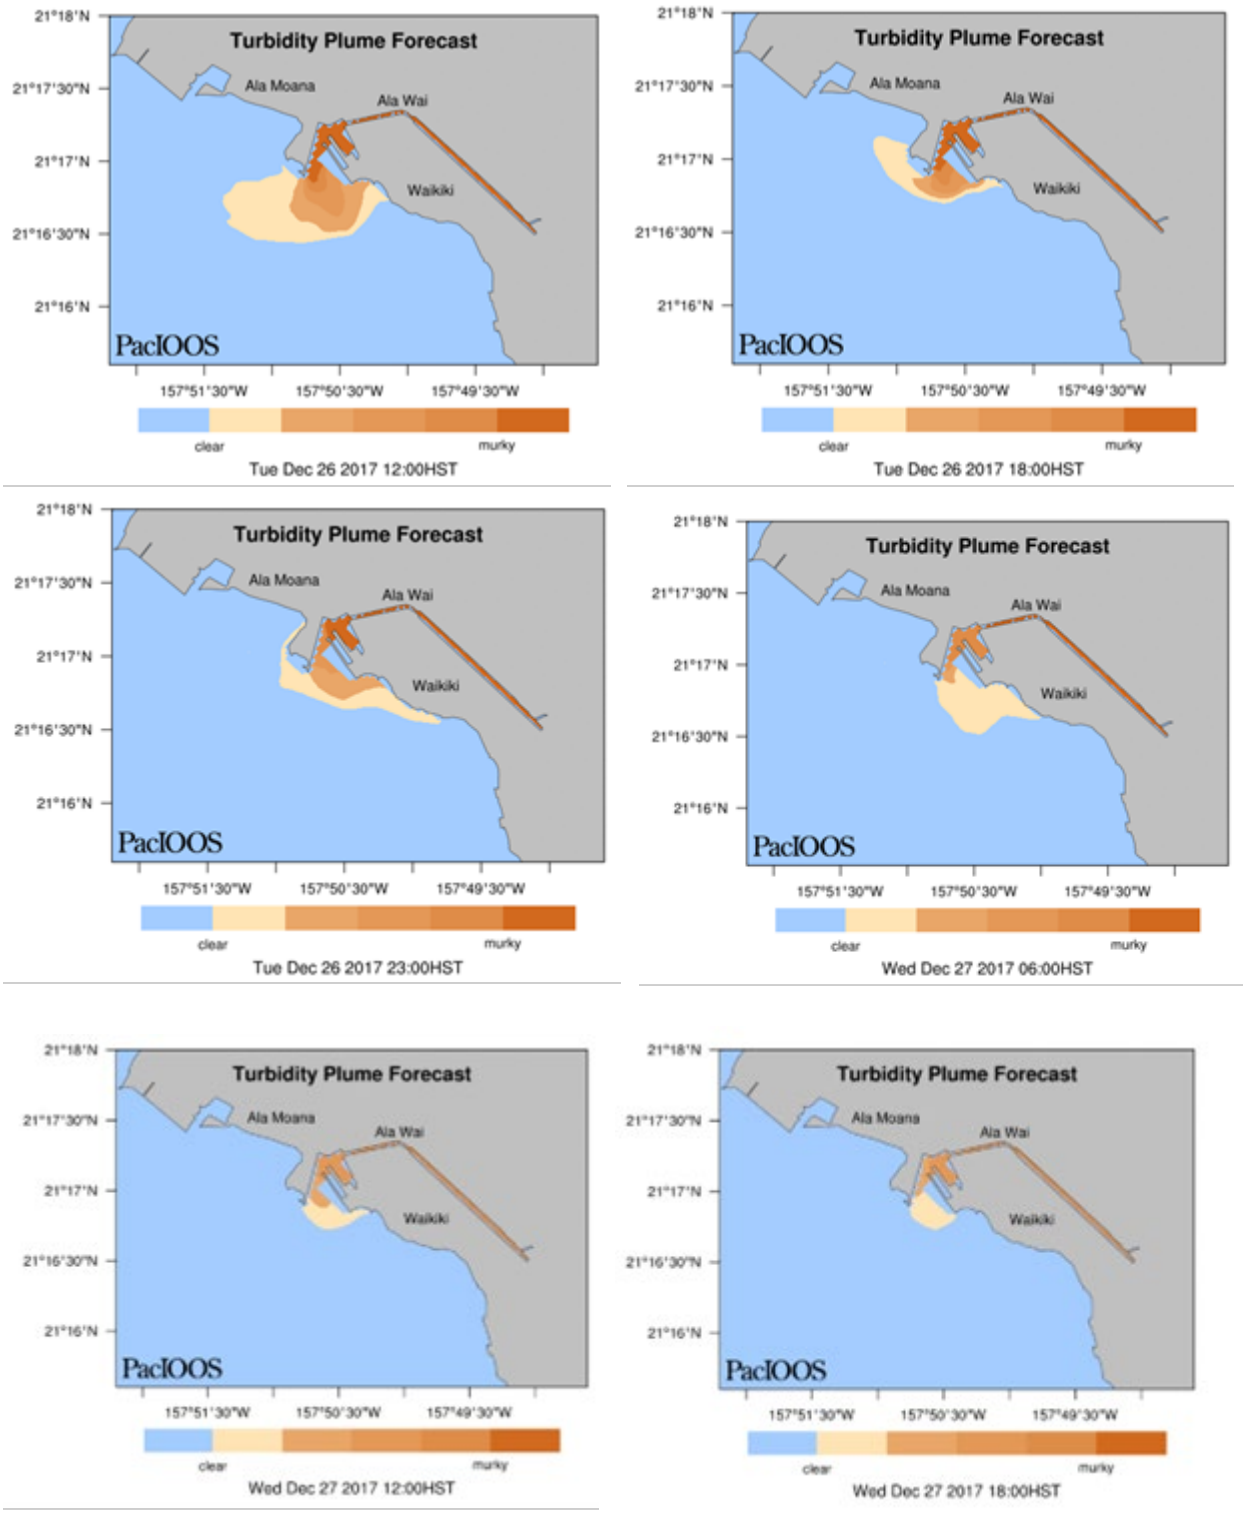

Figure 15, cont'd: Modeled Turbidity Plume Forecast for December 25-27, 2017, High Rainfall Event.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

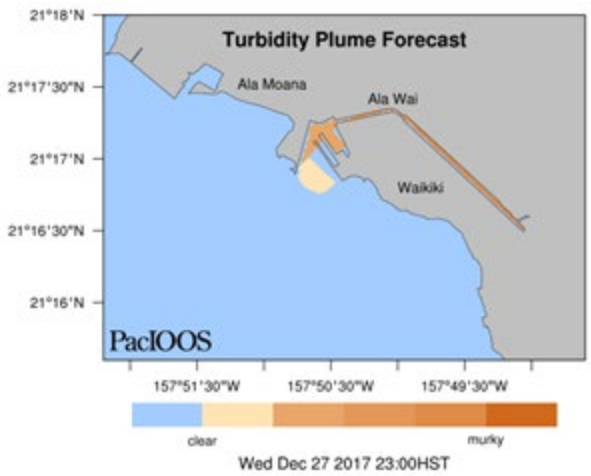

Figure 15, cont'd: Modeled Turbidity Plume Forecast for December 25-27, 2017, High Rainfall Event.

As seen in the above time progressions, at the beginning of the storm event (i.e., December 25; 23:00 HST) the Ala Wai Canal begins to experience high turbidity with low turbidity beginning to occur within the Ala Wai Small Boat Harbor. Following approximately 12 hours (i.e., December 26, 2017; 12:00 HST), high turbidity is experienced throughout Ala Wai Canal and Ala Wai Small Boat Harbor, while low to medium turbidity is beginning to occur along the reef flat area outside of Ala Wai Harbor and within the vicinity of the Atlantis Submarines harbor. Following the passage of another 12 hours (i.e., December 26, 2017; 23:00 HST), high turbidity continues to be experienced throughout the Ala Wai Canal, but high turbidity within the Ala Wai Boat Harbor is beginning to dissipate. Similarly, medium turbidity is still being experienced within the vicinity of the Atlantis Submarines Harbor and low turbidity is being experienced along the nearshore marine area (reef flat)—within the vicinity of the Sheraton Hotel on Waikiki. Following the passage of another 6 hours (i.e., December 27, 201; 06:00 HST), the turbidity plume begins to dissipate along the nearshore marine area, although low turbidity is still being experienced. Turbidity within the Ala Wai Boat Harbor has also begun to dissipate currently with moderate turbidity occurring in the harbor. Over the course of the following 18 hours, from 12:00 HST to 23:00 HST on December 27, 2017, the turbidity plume further dissipates, although low/medium turbidity is still being experienced within the Ala Wai Boat Harbor and the harbor channel. In addition, the Ala Wai Canal is experiencing medium turbidity still after approximately 48 hours has passed from the beginning of the storm event. The above details a potential turbidity plume under the future without project condition. This means that even under the future without project condition, marine habitat located within Ala Wai Harbor generally experiences high turbidity during a storm event while marine habitat located outside the Ala Wai Boat Harbor and along Waikiki Beach experiences medium to low turbidity during a storm event.

During a storm event under the future without project condition, marine habitat in the harbor (Ala Wai Small Boat Harbor and Atlantis Submarines Harbor), reef flat (adjacent to Ala Wai Small Boat Harbor), reef crest (near Ala Wai Small Boat Harbor), fore reef (near Ala Wai Small Boat Harbor), and bank/shelf (near Ala Wai Small Boat Harbor) zones experiences medium to high turbidity for approximately 24 hours (depending on the size of the storm event) before turbidity begins to dissipate. Low turbidity during this same time occurs in the shoreline intertidal and reef flat zones between the Atlantis Submarines Harbor and the Sheraton Hotel in Waikiki. Between approximately 24 and 48 hours (depending on the size of the storm event) following a storm

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

event, turbidity within the harbor zone has been reduced to medium levels while turbidity along shoreline intertidal, reef flat, reef crest, fore reef, and bank/shelf zones has been reduced to low or clear levels.

Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced at the harbor, reef flat, reef crest, fore reef, and bank/shelf zones sooner than under the without project condition. Turbidity plumes extending into the nearshore marine environment may also take longer than approximately 24 hours for dissipation to begin. Elevated turbidity and sedimentation may impact Hawaiian monk seal. However, given that Hawaiian monk seal breathe air instead of water, increased turbidity should not adversely affect their respiration or other biological function.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to marine habitat utilized by Hawaiian monk seal from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment. The operation of the detention basin could also help avoid and minimize the potential impact of the proposed project on accelerated discharge of freshwater to the nearshore marine environment.

Exposure to wastes and discharges:

Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, construction waste may end up in the aquatic environment if not properly disposed of. Construction wastes may include plastic trash and bags that may be ingested and cause digestive blockage or suffocation, or if large enough, along with discarded sections of ropes and lines, may entangle Hawaiian monk seal. Equipment spills and discharges likely consist of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, which could expose Hawaiian monk seal to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects, from avoidance of an area to death. Local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed in Section 2.3 include measures intended to prevent or reduce exposure of Hawaiian monk seal to wastes and discharges in the marine environment.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Loss of forage habitat:

Short-term, the loss of forage habitat could occur with the upgrading/modification of stormwater drainage structures which has the potential to be in habitat where Hawaiian monk seal may forage. The upgrading/modification of drainage structures includes the temporary placement of cofferdam materials within the Ala Wai Canal which may impact forage species through damage or destruction. At the level of the individual, the loss of significant levels of available forage may lead to lower growth rates, reduced fitness, reduced reproductive success, and potential death by starvation. At the population level, significantly reduced forage opportunities may eventually cause local extirpation through the death or emigration of members of that population.

The upgrading and/or modification of stormwater drainage structures would occur from upland if the structure is located above the water level of the canal. If the stormwater drainage structure is located at water level or below water level a cofferdam would need to be constructed so that upgrading and/or modification of the drainage structure could occur in the dry. The placement of cofferdam material would occupy the smallest footprint possible, therefore, limited in-water substrate disturbance is anticipated to occur. Once upgrading/modification of the drainage structure is complete the cofferdam would be removed in its entirety. Therefore, the loss of potential forage habitat located within the cofferdam footprint would be temporary because epibenthic life would likely re-colonize the area once the structure is removed.

Long-term, the operation of the proposed action could cause sediment mobilization that has the potential to smother forage resources. An increase in suspended sediments during a storm event, above that experienced under the future without project condition, would likely result in increased deposition rates within the canal and nearshore marine areas. According to the Ala Wai Canal Watershed Water Quality Improvement Project (City and County of Honolulu, 1998), sedimentation in the Ala Wai Canal occurs at the rate of about 10,300 CY per year. Sedimentation is also prevalent in the Manoa-Palolo Canal which receives the first flush from storm waters. Increased sedimentation in nearshore marine waters could smother Hawaiian monk seal foraging habitat. Although the proposed project is expected to potentially increase sediment delivery to the nearshore marine environment, the degree of increase is not expected to be substantially different from the existing condition; therefore, Hawaiian monk seal foraging habitat in the action area is not expected to substantially decrease from its current abundance within the action area.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to Hawaiian monk seal foraging habitat from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur and in turn minimize the potential impact on Hawaiian monk seal foraging habitat within the nearshore marine environment. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment and thereby minimize the potential for resulting habitat degradation of Hawaiian monk seal foraging habitat.

Critical Habitat

Activities associated with the proposed action that could reasonably be expected to impact designated marine critical habitat for the Hawaiian monk seal include:

1. Exposure to elevated turbidity and sedimentation; and
2. Exposure to wastes and discharges.

Exposure to elevated turbidity and sedimentation:

In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area which could include proposed designated critical habitat for the green sea turtle. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed in Section 2.3. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat, green sea turtle proposed designated critical habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon designated critical habitat for the Hawaiian monk seal.

As described in Section 2.3, USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The long-term operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to designated critical habitat for the Hawaiian monk seal from potential water quality degradation. Under the proposed project,

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced primarily at nearby designated critical habitat for the Hawaiian monk seal sooner than under the without project condition. Turbidity plumes extending into nearby designated critical habitat for the Hawaiian monk seal may also take longer than approximately 24 hours for dissipation to begin. The degraded water quality caused by the turbidity plumes could stimulate and sustain algae growth within the action area. Currently, frondose algae, crustose coralline algae, and turf algae are common but not dominant in the action area. Filamentous algae or cyanobacteria are also present primarily seaward of Waikiki beaches but do not dominate the habitat. While the proposed project is likely to increase nutrient and sediment concentrations reaching the nearshore marine environment during a storm event, the degree of increase in concentrations is not expected to stimulate algae growth in such a way that algae would be expected to become dominant in the action area and smoother corals that provide habitat for Hawaiian monk seal prey. Hawaiian monk seals are “generalist” feeders, meaning they eat a wide variety of foods depending on availability. Hawaiian monk seals eat many species of common fishes, squids, octopuses, eels, and crustaceans (crabs, shrimps, and lobsters). There could be slight increases in algae growth observed due to increased nutrient and sediment concentrations and turbidity taking longer to begin to dissipate, but the increase in algae growth would not be expected to be substantial to cause a loss of foraging habitat for the Hawaiian monk seal in the action area. Overall, the proposed project is not expected to substantially affect foraging habitat for the Hawaiian monk seal; therefore, the proposed project is not expected to destroy or adversely modify designated critical habitat for the Hawaiian monk seal.

Exposure to discharges:

Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, equipment spills and discharges likely consisting of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, could enter the nearshore marine environment and designated critical habitat for the Hawaiian monk seal to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects. Regarding foraging habitat for the Hawaiian monk seal (i.e., designated critical habitat), inadvertent spills and discharges from construction equipment has the potential to quickly kill Hawaiian monk seal prey. Highly motile prey such as fish, squid, octopus, and eels may be able to avoid harm by moving out of the area. Highly motile prey is also expected to be able to recolonize the affected area faster once contamination is contained and/or dissipates. Less motile prey such as crabs, shrimps, and lobsters are likely to be killed. Less motile prey is also expected to take longer to recolonize the affected area once contamination is contained and/or dissipates. Although inadvertent spills and discharges from construction equipment have the potential to kill Hawaiian monk seal prey, motile prey are expected to be able to avoid harm and recolonize the area quickly. Less motile prey species would likely take longer to recolonize the area, but since Hawaiian monk seals eat a wide variety of foods depending on availability, diet for the seals would likely consist of more motile species until less motile species are able to recolonize the area. It is important to note that local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed in Section 2.3 include measures intended to prevent or reduce exposure of the marine environment to wastes and discharges from construction equipment. Based on the above and the implementation of measures in Section 2.3, the proposed project is not expected to substantially affect foraging habitat for the Hawaiian monk seal; therefore, the proposed project is not expected to destroy or adversely modify designated critical habitat for the Hawaiian monk seal.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Effects Determination
The proposed action involves minor in-water work which could expose Hawaiian monk seal to project-related activity. However, with the implementation of avoidance and minimization measures listed in Section 2.3 potential impacts to Hawaiian monk seal due to project-related activity is expected to be minimized such that the proposed action **may affect, but is not likely to adversely affect** Hawaiian monk seal or designated critical habitat for Hawaiian monk seal.

4.12 Green Sea Turtle (*Chelonia mydas*)

The green sea turtle, Central North Pacific Distinct Population Segment is a listed federally threatened species. The National Marine Fisheries Service has proposed to designate specific areas in the marine environment as critical habitat for six distinct population segments (DPSs) of the green sea turtle, including the Central North Pacific DPS, under the Endangered Species Act of 1973, as amended. Proposed critical habitat includes nearshore areas from the mean high-water line to 66-foot (20 meters) depth located along the coasts of Florida, North Carolina, Texas, Puerto Rico, U.S. Virgin Islands, California (which also includes nearshore areas from the mean high-water line to 6 miles [10 kilometers] offshore), Hawaii, American Samoa, Guam, and the Commonwealth of Northern Marian Islands. It also includes Sargassum habitat, from 33-foot (10 meters) depth to the outer boundary of the U.S. Exclusive Economic Zone, in the Gulf of Mexico and Atlantic Ocean (NOAA-NMFS-2023-0087). The proposed designated critical habitat includes the mouth of the Ala Wai Canal, the Ala Wai Canal Boat Harbor, and the nearshore marine environment within the vicinity of Waikiki which could experience indirect impacts from the proposed action.

Current Species Status
The green sea turtle occurs throughout the Hawaiian Islands and are most conspicuous at French Frigate Shoals (NMFS and USFWS, 1998). Green sea turtles also inhabit the nearshore waters around the main Hawaiian Islands, including Oahu. The Hawaiian green turtle population (i.e., the Central North Pacific DPS) has been increasing at a rate of 5 percent per year over the past two decades (NMFS and USFWS, 1998).

Biology and Ecology of Species – Reproduction and Forage Requirements
Adult green sea turtles reside in nearshore benthic environments and have a nearly exclusive herbivorous diet consisting of macroalgae and sea grasses (NMFS and USFWS, 1998). Green sea turtles are commonly observed to forage for sea grass (*Halophila decipiens*) at Ala Moana Beach Park, Oahu Island. Adult male and female green sea turtles have been observed to haul out and bask on the shoreline at French Frigate shoals. About 90 percent of the nesting occurs on French Frigate Shoals of the Northwestern Hawaiian Islands. Between 200 and 700 females nest at French Frigate Shoals annually with a modest amount of nesting at Laysan Island, Lisianski Atoll, and Peal and Hermes Reef. Green sea turtles in Hawaii may lay up to six clutches of eggs per season and each clutch may consist of about 100 eggs (NMFS and USFWS, 1998).

Factors Affecting Species Activity and Survival
Threats to the survival of GST include the loss of foraging habitat to nearshore development in the main Hawaiian Islands (e.g., marina construction, artificial beach development, siltation from agricultural runoff, contamination of forage areas from toxic spills, resort development, and increased vessel traffic), entanglement and ingestion of marine debris, incidental take during fisheries, poaching, and disease (e.g., fibropapillomas) (NMFS and USFWS, 1998).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Potential to Occur in the Action Area

The green sea turtle is likely to occur within the action area, specifically the Ala Wai Canal and potentially as far upstream as the Manoa-Palolo Canal. Green sea turtle has been observed as recently as 2021 in the Ala Wai Canal.

Potential Effects of the Proposed Action

Species

Activities associated with the proposed action could reasonably be expected to interact directly or indirectly with green sea turtle through:

1. Collision with vessels;
2. Direct physical impact;
3. Disturbance from human activity and equipment operation;
4. Exposure to elevated noise levels;
5. Exposure to elevated turbidity;
6. Exposure to wastes and discharges; and
7. Loss of forage habitat.

Collision with vessels:

Activities associated with the proposed action do not include the use of vessels in nearshore marine waters or lower reaches of rivers and streams. All work is anticipated to occur from upland with equipment staged upland.

Direct physical impact:

Activities associated with the proposed action do not include the use of vessels in nearshore Physical impact to green sea turtle is not expected to occur. At this time, all construction work would occur from upland with no construction equipment (i.e., push barge, vessel, etc.) anticipated to be present within the aquatic habitat. The exception is construction of the Ala Wai Canal floodwall which includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area. The placement of cofferdam materials could potentially physically impact green sea turtle should these animals be present when cofferdam materials strike the bottom. Potential injuries and their severity will depend on the animal's proximity to the bottom when struck, the angle of the strike, and the body part impacted, but may include cuts, bruises, broken bones, and amputations, any of which could result in the animal's death. Green sea turtle could also be pinned to the bottom and drowned. To minimize potential physical impacts to green sea turtle during cofferdam material placement, avoidance and minimization measures listed in Section 2.3 would be implemented. Some of these avoidance and minimization measures require surveys for ESA-listed species in the area to occur prior to the start of each workday and prior to resumption of work following any break of more than one-half hour. They also require that all work be postponed or halted when motile ESA-listed marine species are within 164 feet of proposed work and resumption of activities should only occur after the animals have voluntarily left the area. These types of avoidance and minimization measures (refer to Section 2.3 for the complete list) would minimize the potential physical impact to green sea turtle during the placement and removal of cofferdam material.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. Construction of the Ala Wai Canal floodwall, however, includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose green sea turtles to project-related activity. However, sea turtles typically avoid human activity, so exposure to the project-related activity detailed above would be infrequent and non-injurious. In addition, avoidance and minimization measures would be implemented during construction such that in insignificant effects on the green sea turtle are anticipated.

Exposure to elevated noise levels:

Activities such as pile-driving may produce in-air and in-water sound levels capable of injury or adverse behavioral modifications for green sea turtle. Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. For example, construction of the floodwalls along Manoa-Palolo Canal and the Ala Wai Canal would occur upland. In addition, most of the floodwalls being constructed do not include pile driving; the exception being the reach along the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard and Date Street. In this reach, the upland area is constricted to such a degree that a steel sheet pile wall (i.e., I-wall) would need to be installed in this location. A 15-foot-wide rock bench would be placed in-water along the right-descending bank of the Manoa-Palolo Canal parallel to the bank. Equipment for construction of the I-wall would be staged along this rock bench. Upon completion of the I-Wall, the rock bench would be permanently removed. Although equipment for constructing of the floodwall would be staged along the 15-foot-wide rock bench, inserting the steel sheet pile for the floodwall would be into the adjacent upland area. The method to be used would be push in place instead of impact pile driving. The push in place method pushes the steel sheet pile into the ground without an impact hammer or vibration. The operation, except for a crane engine (to hold the steel sheet pile) and the generator to power the machine for pushing in the pile, is almost silent. For reference, a crane and a generator typically produce airborne noise levels of 87 dBA at 50 feet from the source. Therefore, using the push in place method would reduce airborne noise levels typically associated with pile driving as well as in water noise levels. In addition, installation of pile would be upland where it is in the dry. Pile installation in the dry is typically a minimization measure designed to reduce the amount of sound that is transmitted through water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since pile installation would occur upland, this would be like pile driving occurring in the dry; therefore, installing the pile upland is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting green sea turtle from potential noise-related impacts.

The floodwall along the Ala Wai Canal does not include the installation of steel sheet pile. Instead, floodwalls along the Ala Wai Canal would be either J-walls or L-walls on macropiles. The macropiles require the use of a drill rig and associated drilling equipment to create a hole to design depth. The drill rig and drilling of the macropile hole would likely create the most noise

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

during construction of these types of floodwalls. However, like the pile installation along the reach of Manoa-Palolo Canal, drilling would occur upland which is effective at minimizing the effects of sound in the water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since drilling of the macropile holes would occur upland, this is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting green sea turtle from potential noise-related impacts.

In addition to construction of floodwall, the Ala Wai Canal floodwall also includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose green sea turtle to project-related activity. However, green sea turtles typically avoid human interaction, so exposure to the project-related activity detailed above would be infrequent and non-injurious. The presence of the cofferdam would allow work on the stormwater drainage structures to be completed in the dry. As stated previously, working in the dry is a minimization measure designed to reduce the amount of sound that is transmitted through the water. Therefore, upgrading existing stormwater outlet structures would occur in the dry which is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting green sea turtle from potential noise-related impacts.

Exposure to elevated turbidity and sedimentation:

In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed in Section 2.3. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon green sea turtle.

As described in Section 2.3, USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to marine habitat occupied by the green sea turtle due to water quality degradation. The project includes the construction of floodwalls primarily along the Ala Wai Canal (including Manoa-Palolo Canal). Floodwalls would increase the capacity of the Ala Wai Canal to hold more storm water as well as increase storm flow velocities in the canal. Increased storm flow velocities in the canal could in turn disturb and/or resuspend sediments in the water column creating a turbidity plume that could affect water quality in the canal, the Ala Wai Small Boat Harbor, and the nearshore marine environment. Changes to velocities within the Ala Wai Canal were modeled with project features constructed and are compared against velocities within the canal under existing conditions in Table 4. Although the project would result in increased velocities and likely a large turbidity plume during a storm event, it is important to note that increased velocities and turbidity plumes already occur under the existing condition during a storm event.

Currently, under existing conditions, high rainfall events disturb sediments in the upper reaches of the Ala Wai watershed and cause these sediments to become suspended in the water column. There are also three general areas in the Ala Wai Canal where previously suspended sediments have sedimented out and built up within the canal: Kalakaua Avenue Bridge, mouth of the Manoa-Palolo Canal, and the terminus of the Ala Wai Canal (Montgomery et al., 2009). These built-up sediments within the canal at these locations can become resuspended in the water column during a storm event due to increased water velocities within the canal. The combination of these suspended sediments in the water column cause turbidity plumes during storm events which can extend beyond the canal and degrade water quality within the nearshore marine environment. Predicting how far turbidity plumes could extend during a storm event is difficult and can in turn make it difficult to predict where impacts to the nearshore marine environment could occur. However, PacIOOS has developed a turbidity plume forecast model for the Ala Wai Canal allowing the tracking of potential turbidity levels and extent of turbidity plumes along the nearshore marine environment. As an example of how a turbidity plume might extend out of the Ala Wai Small Boat Harbor and into the nearshore marine environment, PacIOOS conducted a model run of a turbidity plume for a storm event that occurred December 25 through December 27, 2017, in the Honolulu area. Figure 15 shows selected time progressions of this storm's modeled turbidity plume.

As seen in Figure 15, at the beginning of the storm event (i.e., December 25; 23:00 HST) the Ala Wai Canal begins to experience high turbidity with low turbidity beginning to occur within the Ala Wai Small Boat Harbor. Following approximately 12 hours (i.e., December 26, 2017; 12:00 HST), high turbidity is experienced throughout Ala Wai Canal and Ala Wai Small Boat Harbor, while low to medium turbidity is beginning to occur along the reef flat area outside of Ala Wai Harbor and within the vicinity of the Atlantis Submarines harbor. Following the passage of another 12 hours (i.e., December 26, 2017; 23:00 HST), high turbidity continues to be experienced throughout the Ala Wai Canal, but high turbidity within the Ala Wai Boat Harbor is beginning to dissipate. Similarly, medium turbidity is still being experienced within the vicinity of

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

the Atlantis Submarines Harbor and low turbidity is being experienced along the nearshore marine area (reef flat)—within the vicinity of the Sheraton Hotel on Waikiki. Following the passage of another 6 hours (i.e., December 27, 201; 06:00 HST), the turbidity plume begins to dissipate along the nearshore marine area, although low turbidity is still being experienced. Turbidity within the Ala Wai Boat Harbor has also begun to dissipate currently with moderate turbidity occurring in the harbor. Over the course of the following 18 hours, from 12:00 HST to 23:00 HST on December 27, 2017, the turbidity plume further dissipates, although low/medium turbidity is still being experienced within the Ala Wai Boat Harbor and the harbor channel. In addition, the Ala Wai Canal is experiencing medium turbidity still after approximately 48 hours has passed from the beginning of the storm event. The above details a potential turbidity plume under the future without project condition. This means that even under the future without project condition, marine habitat located within Ala Wai Harbor generally experiences high turbidity during a storm event while marine habitat located outside the Ala Wai Boat Harbor and along Waikiki Beach experiences medium to low turbidity during a storm event.

During a storm event under the future without project condition, marine habitat in the harbor (Ala Wai Small Boat Harbor and Atlantis Submarines Harbor), reef flat (adjacent to Ala Wai Small Boat Harbor), reef crest (near Ala Wai Small Boat Harbor), fore reef (near Ala Wai Small Boat Harbor), and bank/shelf (near Ala Wai Small Boat Harbor) zones experiences medium to high turbidity for approximately 24 hours (depending on the size of the storm event) before turbidity begins to dissipate. Low turbidity during this same time occurs in the shoreline intertidal and reef flat zones between the Atlantis Submarines Harbor and the Sheraton Hotel in Waikiki. Between approximately 24 and 48 hours (depending on the size of the storm event) following a storm event, turbidity within the harbor zone has been reduced to medium levels while turbidity along shoreline intertidal, reef flat, reef crest, fore reef, and bank/shelf zones has been reduced to low or clear levels.

Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced at the harbor, reef flat, reef crest, fore reef, and bank/shelf zones sooner than under the without project condition. Turbidity plumes extending into the nearshore marine environment may also take longer than approximately 24 hours for dissipation to begin. Elevated turbidity and sedimentation may impact green sea turtle. However, given that green sea turtles breathe air instead of water, increased turbidity should not adversely affect their respiration or other biological function.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to marine habitat utilized by green sea turtle from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

reaching the nearshore marine environment could occur. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment. The operation of the detention basin could also help avoid and minimize the potential impact of the proposed project on accelerated discharge of freshwater to the nearshore marine environment.

Exposure to wastes and discharges:

Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, construction waste may end up in the aquatic environment if not properly disposed of. Construction wastes may include plastic trash and bags that may be ingested and cause digestive blockage or suffocation, or if large enough, along with discarded sections of ropes and lines, may entangle green sea turtle. Equipment spills and discharges likely consist of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, which could expose green sea turtles to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects, from avoidance of an area to death. Local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed in Section 2.3 include measures intended to prevent or reduce exposure of green sea turtles to wastes and discharges in the marine environment.

Loss of forage habitat:

Short-term, the loss of forage habitat could occur with the upgrading/modification of stormwater drainage structures which has the potential to be in habitat where green sea turtles may forage. The upgrading/modification of drainage structures includes the temporary placement of cofferdam materials within the Ala Wai Canal which may impact forage species through damage or destruction. At the level of the individual, the loss of significant levels of available forage may lead to lower growth rates, reduced fitness, reduced reproductive success, and potential death by starvation. At the population level, significantly reduced forage opportunities may eventually cause local extirpation through the death or emigration of members of that population.

The upgrading and/or modification of stormwater drainage structures would occur from upland if the structure is located above the water level of the canal. If the stormwater drainage structure is located at water level or below water level a cofferdam would need to be constructed so that upgrading and/or modification of the drainage structure could occur in the dry. The placement of cofferdam material would occupy the smallest footprint possible, therefore, limited in-water substrate disturbance is anticipated to occur. Once upgrading/modification of the drainage structure is complete the cofferdam would be removed in its entirety. Therefore, the loss of potential forage habitat located within the cofferdam footprint would be temporary because epibenthic life would likely re-colonize the area once the structure is removed.
Long-term, the operation of the proposed action could cause sediment mobilization that has the potential to smother forage resources. An increase in suspended sediments during a storm event, above that experienced under the future without project condition, would likely result in increased deposition rates within the canal and nearshore marine areas. According to the Ala Wai Canal Watershed Water Quality Improvement Project (City and County of Honolulu, 1998), sedimentation in the Ala Wai Canal occurs at the rate of about 10,300 CY per year. Sedimentation is also prevalent in the Manoa-Palolo Canal which receives the first flush from

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

storm waters. Increased sedimentation in nearshore marine waters could smother green sea turtle foraging habitat. Although the proposed project is expected to potentially increase sediment delivery to the nearshore marine environment, the degree of increase is not expected to be substantially different from the existing condition; therefore, green sea turtle foraging habitat in the action area is not expected to substantially decrease from its current abundance within the action area.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to green sea turtle foraging habitat from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur and in turn minimize the potential impact on green sea turtle foraging habitat within the nearshore marine environment. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment and thereby minimize the potential for resulting habitat degradation of green sea turtle foraging habitat.

Critical Habitat

Activities associated with the proposed action that could reasonably be expected to impact proposed designated habitat for the green sea turtle include:

1. Exposure to elevated turbidity and sedimentation; and
2. Exposure to wastes and discharges.

Exposure to elevated turbidity and sedimentation:

In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area which could include proposed designated critical habitat for the green sea turtle. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed in Section 2.3. The Ala Wai Canal is generally subjected to low

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat, green sea turtle proposed designated critical habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon proposed designated critical habitat for the green sea turtle.

As described in Section 2.3, USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The long-term operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to proposed designated critical habitat for the green sea turtle from potential water quality degradation. Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced primarily at nearby proposed designated critical habitat for the green sea turtle sooner than under the without project condition. Turbidity plumes extending into nearby proposed designated critical habitat for the green sea turtle may also take longer than approximately 24 hours for dissipation to begin. The degraded water quality caused by the turbidity plumes could stimulate and sustain algae growth within the action area. Currently, frondose algae, crustose coralline algae, and turf algae are common but not dominant in the action area (USFWS, 2023b). Filamentous algae or cyanobacteria are also present primarily seaward of Waikiki beaches but do not dominate the habitat (USFWS, 2023b). While the proposed project is likely to increase nutrient and sediment concentrations reaching the nearshore marine environment during a storm event, the degree of increase in concentrations is not expected to stimulate algae growth in such a way that algae would be expected to become dominant in the action area. Green sea turtles are herbivores and eat mostly seagrasses and algae. Although the project is not expected to significantly stimulate algae growth, the project is also not expected to substantially decrease algae growth beyond that which currently occurs in the action area. Overall, the proposed project is not expected to substantially affect foraging habitat for the green sea turtle; therefore, the proposed project is not expected to destroy or adversely modify proposed designated critical habitat for the green sea turtle.

Exposure to discharges:

Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, equipment spills and discharges likely consisting of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, could enter the nearshore marine environment and proposed designated critical habitat for the green sea turtle to toxic chemicals. Depending on

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

the chemicals and their concentration, exposure could result in a range of effects. Regarding foraging habitat for the green sea turtle (i.e., proposed designated critical habitat), inadvertent spills and discharges from construction equipment has the potential to quickly kill algae filaments; however, populations may recover rapidly by growth and vegetative reproduction of any unharmed fragments or spores (O'Brien and Dixon, 1976). Although inadvertent spills and discharges from construction equipment have the potential to kill algae, hydrocarbon-based chemicals generally have a greater adverse impact on algal grazers than algae (O'Brien and Dixon, 1976). Therefore, inadvertent spills and discharges would likely kill algal grazers and result in a temporary increase in algae until algal grazers are able to recolonize the impacted area (O'Brien and Dixon, 1976). It is important to note that local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed in Section 2.3 include measures intended to prevent or reduce exposure of the marine environment to wastes and discharges from construction equipment. Based on the above and the implementation of measures in Section 2.3, the proposed project is not expected to substantially affect foraging habitat for the green sea turtle; therefore, the proposed project is not expected to destroy or adversely modify proposed designated critical habitat for the green sea turtle.

Effects Determination

The proposed action involves minor in-water work which could expose green sea turtle to project-related activity. However, with the implementation of avoidance and minimization measures listed in Section 2.3 potential impacts to green sea turtle due to project-related activity is expected to be minimized such that the proposed action **may affect, but is not likely to adversely affect** green sea turtle or proposed designated critical habitat for green sea turtle.

4.13 Hawksbill Sea Turtle (*Eretmochelys imbricata*)

The hawksbill sea turtle is a listed federally endangered species. Critical habitat has been designated in the waters surrounding Mona and Monito Islands, Puerto Rico. No critical habitat is present within the action area.

Current Species Status

Hawksbill sea turtles may occur throughout the main Hawaiian Islands but are considered rare except for common observations of individuals around West Maui. Approximately 60 female adults have been documented within Hawaiian waters with no estimate of population size.

Biology and Ecology of Species – Reproduction and Forage Requirements

Adult hawksbill sea turtles forage on sponges and certain species of algae. They are observed in shallow reefs and bays. Nesting has been documented along Halawa River Valley of east Molokai Island, Kamehameha Beach, Hawaii Island, and various beaches around Maui Island. Hawksbill turtles display slow growth rates with an average annual growth rate of approximately 0.79 to 1.97 inches (two to five centimeters) per year for juveniles that slows to almost no somatic growth in adults.

Factors Affecting Species Activity and Survival

Threats to hawksbill sea turtle include the loss of nesting beaches due to construction and human presence, beach erosion, artificial lighting, nest predation, exotic vegetation, marine debris, incidental take during from fisheries, poaching, and disease (e.g., fibropapillomas).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Potential to Occur in the Action Area

The hawksbill sea turtle is less likely to occur within the action area when compared to the green sea turtle; however, the possibility exists that the species could be present in the Ala Wai Canal and potentially as far upstream as the Manoa-Palolo Canal.

Potential Effects of the Proposed Action

Activities associated with the proposed action could reasonably be expected to interact directly or indirectly with hawksbill sea turtle through:

1. Collision with vessels;
2. Direct physical impact;
3. Disturbance from human activity and equipment operation;
4. Exposure to elevated noise levels;
5. Exposure to elevated turbidity;
6. Exposure to wastes and discharges; and
7. Loss of forage habitat.

Collision with vessels:

Activities associated with the proposed action do not include the use of vessels in nearshore marine waters or lower reaches of rivers and streams. All work is anticipated to occur from upland with equipment staged upland.

Direct physical impact:

Activities associated with the proposed action do not include the use of vessels in nearshore Physical impact to hawksbill sea turtle is not expected to occur. At this time, all construction work would occur from upland with no construction equipment (i.e., push barge, vessel, etc.) anticipated to be present within the aquatic habitat. The exception is construction of the Ala Wai Canal floodwall which includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area. The placement of cofferdam materials could potentially physically impact hawksbill sea turtles should these animals be present when cofferdam materials strike the bottom. Potential injuries and their severity will depend on the animal's proximity to the bottom when struck, the angle of the strike, and the body part impacted, but may include cuts, bruises, broken bones, and amputations, any of which could result in the animal's death. Hawksbill sea turtle could also be pinned to the bottom and drowned. To minimize potential physical impacts to hawksbill sea turtle during cofferdam material placement, avoidance and minimization measures listed in Section 2.3 would be implemented. Some of these avoidance and minimization measures require surveys for ESA-listed species in the area to occur prior to the start of each workday and prior to resumption of work following any break of more than one-half hour. They also require that all work be postponed or halted when motile ESA-listed marine species are within 164 feet of proposed work and resumption of activities should only occur after the animals have voluntarily left the area. These types of avoidance and minimization measures (refer to Section 2.3 for the complete list) would minimize the potential physical impact to hawksbill sea turtle during the placement and removal of cofferdam material.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. Construction of the Ala Wai Canal floodwall, however, includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose hawksbill sea turtles to project-related activity. However, sea turtles typically avoid human activity, so exposure to the project-related activity detailed above would be infrequent and non-injurious. In addition, avoidance and minimization measures would be implemented during construction such that in insignificant effects on the hawksbill sea turtle are anticipated.

Exposure to elevated noise levels:

Activities such as pile-driving may produce in-air and in-water sound levels capable of injury or adverse behavioral modifications for hawksbill sea turtle. Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. For example, construction of the floodwalls along Manoa-Palolo Canal and the Ala Wai Canal would occur upland. In addition, most of the floodwalls being constructed do not include pile driving; the exception being the reach along the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard and Date Street. In this reach, the upland area is constricted to such a degree that a steel sheet pile wall (i.e., I-wall) would need to be installed in this location. A 15-foot-wide rock bench would be placed in-water along the right-descending bank of the Manoa-Palolo Canal parallel to the bank. Equipment for construction of the I-wall would be staged along this rock bench. Upon completion of the I-Wall, the rock bench would be permanently removed. Although equipment for constructing of the floodwall would be staged along the 15-foot-wide rock bench, inserting the steel sheet pile for the floodwall would be into the adjacent upland area. The method to be used would be push in place instead of impact pile driving. The push in place method pushes the steel sheet pile into the ground without an impact hammer or vibration. The operation, except for a crane engine (to hold the steel sheet pile) and the generator to power the machine for pushing in the pile, is almost silent. For reference, a crane and a generator typically produce airborne noise levels of 87 dBA at 50 feet from the source. Therefore, using the push in place method would reduce airborne noise levels typically associated with pile driving as well as in water noise levels. In addition, installation of pile would be upland where it is in the dry. Pile installation in the dry is typically a minimization measure designed to reduce the amount of sound that is transmitted through water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since pile installation would occur upland, this would be like pile driving occurring in the dry; therefore, installing the pile upland is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

The floodwall along the Ala Wai Canal does not include the installation of steel sheet pile. Instead, floodwalls along the Ala Wai Canal would be either J-walls or L-walls on macropiles. The macropiles require the use of a drill rig and associated drilling equipment to create a hole to design depth. The drill rig and drilling of the macropile hole would likely create the most noise

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

during construction of these types of floodwalls. However, like the pile installation along the reach of Manoa-Palolo Canal, drilling would occur upland which is effective at minimizing the effects of sound in the water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since drilling of the macropile holes would occur upland, this is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

In addition to construction of floodwall, the Ala Wai Canal floodwall also includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose hawksbill sea turtle to project-related activity. However, Hawaiian monk seals typically avoid human interaction, so exposure to the project-related activity detailed above would be infrequent and non-injurious. The presence of the cofferdam would allow work on the stormwater drainage structures to be completed in the dry. As stated previously, working in the dry is a minimization measure designed to reduce the amount of sound that is transmitted through the water. Therefore, upgrading existing stormwater outlet structures would occur in the dry which is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting hawksbill sea turtle from potential noise-related impacts.

Exposure to elevated turbidity and sedimentation:

In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed in Section 2.3. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon hawksbill sea turtle.

As described in Section 2.3, USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to marine habitat occupied by the hawksbill sea turtle due to water quality degradation. The project includes the construction of floodwalls primarily along the Ala Wai Canal (including Manoa-Palolo Canal). Floodwalls would increase the capacity of the Ala Wai Canal to hold more storm water as well as increase storm flow velocities in the canal. Increased storm flow velocities in the canal could in turn disturb and/or resuspend sediments in the water column creating a turbidity plume that could affect water quality in the canal, the Ala Wai Small Boat Harbor, and the nearshore marine environment. Changes to velocities within the Ala Wai Canal were modeled with project features constructed and are compared against velocities within the canal under existing conditions in Table 4. Although the project would result in increased velocities and likely a large turbidity plume during a storm event, it is important to note that increased velocities and turbidity plumes already occur under the existing condition during a storm event.

Currently, under existing conditions, high rainfall events disturb sediments in the upper reaches of the Ala Wai watershed and cause these sediments to become suspended in the water column. There are also three general areas in the Ala Wai Canal where previously suspended sediments have sedimented out and built up within the canal: Kalakaua Avenue Bridge, mouth of the Manoa-Palolo Canal, and the terminus of the Ala Wai Canal (Montgomery et al., 2009). These built-up sediments within the canal at these locations can become resuspended in the water column during a storm event due to increased water velocities within the canal. The combination of these suspended sediments in the water column cause turbidity plumes during storm events which can extend beyond the canal and degrade water quality within the nearshore marine environment. Predicting how far turbidity plumes could extend during a storm event is difficult and can in turn make it difficult to predict where impacts to the nearshore marine environment could occur. However, PacIOOS has developed a turbidity plume forecast model for the Ala Wai Canal allowing the tracking of potential turbidity levels and extent of turbidity plumes along the nearshore marine environment. As an example of how a turbidity plume might extend out of the Ala Wai Small Boat Harbor and into the nearshore marine environment, PacIOOS conducted a model run of a turbidity plume for a storm event that occurred December 25 through December 27, 2017, in the Honolulu area. Figure 15 shows selected time progressions of this storm's modeled turbidity plume.

As seen in Figure 15, at the beginning of the storm event (i.e., December 25; 23:00 HST) the Ala Wai Canal begins to experience high turbidity with low turbidity beginning to occur within the Ala Wai Small Boat Harbor. Following approximately 12 hours (i.e., December 26, 2017; 12:00 HST), high turbidity is experienced throughout Ala Wai Canal and Ala Wai Small Boat Harbor, while low to medium turbidity is beginning to occur along the reef flat area outside of Ala Wai Harbor and within the vicinity of the Atlantis Submarines harbor. Following the passage of another 12 hours (i.e., December 26, 2017; 23:00 HST), high turbidity continues to be experienced throughout the Ala Wai Canal, but high turbidity within the Ala Wai Boat Harbor is beginning to dissipate. Similarly, medium turbidity is still being experienced within the vicinity of

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

the Atlantis Submarines Harbor and low turbidity is being experienced along the nearshore marine area (reef flat)—within the vicinity of the Sheraton Hotel on Waikiki. Following the passage of another 6 hours (i.e., December 27, 201; 06:00 HST), the turbidity plume begins to dissipate along the nearshore marine area, although low turbidity is still being experienced. Turbidity within the Ala Wai Boat Harbor has also begun to dissipate currently with moderate turbidity occurring in the harbor. Over the course of the following 18 hours, from 12:00 HST to 23:00 HST on December 27, 2017, the turbidity plume further dissipates, although low/medium turbidity is still being experienced within the Ala Wai Boat Harbor and the harbor channel. In addition, the Ala Wai Canal is experiencing medium turbidity still after approximately 48 hours has passed from the beginning of the storm event. The above details a potential turbidity plume under the future without project condition. This means that even under the future without project condition, marine habitat located within Ala Wai Harbor generally experiences high turbidity during a storm event while marine habitat located outside the Ala Wai Boat Harbor and along Waikiki Beach experiences medium to low turbidity during a storm event.

During a storm event under the future without project condition, marine habitat in the harbor (Ala Wai Small Boat Harbor and Atlantis Submarines Harbor), reef flat (adjacent to Ala Wai Small Boat Harbor), reef crest (near Ala Wai Small Boat Harbor), fore reef (near Ala Wai Small Boat Harbor), and bank/shelf (near Ala Wai Small Boat Harbor) zones experiences medium to high turbidity for approximately 24 hours (depending on the size of the storm event) before turbidity begins to dissipate. Low turbidity during this same time occurs in the shoreline intertidal and reef flat zones between the Atlantis Submarines Harbor and the Sheraton Hotel in Waikiki. Between approximately 24 and 48 hours (depending on the size of the storm event) following a storm event, turbidity within the harbor zone has been reduced to medium levels while turbidity along shoreline intertidal, reef flat, reef crest, fore reef, and bank/shelf zones has been reduced to low or clear levels.

Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced at the harbor, reef flat, reef crest, fore reef, and bank/shelf zones sooner than under the without project condition. Turbidity plumes extending into the nearshore marine environment may also take longer than approximately 24 hours for dissipation to begin. Elevated turbidity and sedimentation may impact hawksbill sea turtles. However, given that hawksbill sea turtles breathe air instead of water, increased turbidity should not adversely affect their respiration or other biological function.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to marine habitat utilized by hawksbill sea turtle from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

reaching the nearshore marine environment could occur. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment. The operation of the detention basin could also help avoid and minimize the potential impact of the proposed project on accelerated discharge of freshwater to the nearshore marine environment.

Exposure to wastes and discharges:

Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, construction waste may end up in the aquatic environment if not properly disposed of. Construction wastes may include plastic trash and bags that may be ingested and cause digestive blockage or suffocation, or if large enough, along with discarded sections of ropes and lines, may entangle hawksbill sea turtle. Equipment spills and discharges likely consist of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, which could expose hawksbill sea turtle to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects, from avoidance of an area to death. Local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed in Section 2.3 include measures intended to prevent or reduce exposure of hawksbill sea turtle to wastes and discharges in the marine environment.

Loss of forage habitat:

Short-term, the loss of forage habitat could occur with the upgrading/modification of stormwater drainage structures which has the potential to be in habitat where hawksbill sea turtle may forage. The upgrading/modification of drainage structures includes the temporary placement of cofferdam materials within the Ala Wai Canal which may impact forage species through damage or destruction. At the level of the individual, the loss of significant levels of available forage may lead to lower growth rates, reduced fitness, reduced reproductive success, and potential death by starvation. At the population level, significantly reduced forage opportunities may eventually cause local extirpation through the death or emigration of members of that population.

The upgrading and/or modification of stormwater drainage structures would occur from upland if the structure were located above the water level of the canal. If the stormwater drainage structure is located at water level or below water level a cofferdam would need to be constructed so that upgrading and/or modification of the drainage structure could occur in the dry. The placement of cofferdam material would occupy the smallest footprint possible, therefore, limited in-water substrate disturbance is anticipated to occur. Once upgrading/modification of the drainage structure is complete the cofferdam would be removed in its entirety. Therefore, the loss of potential forage habitat located within the cofferdam footprint would be temporary because epibenthic life would likely re-colonize the area once the structure is removed.

Long-term, the operation of the proposed action could cause sediment mobilization that has the potential to smother forage resources. An increase in suspended sediments during a storm event, above that experienced under the future without project condition, would likely result in increased deposition rates within the canal and nearshore marine areas. According to the Ala Wai Canal Watershed Water Quality Improvement Project (City and County of Honolulu, 1998),

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

sedimentation in the Ala Wai Canal occurs at the rate of about 10,300 CY per year. Sedimentation is also prevalent in the Manoa-Palolo Canal which receives the first flush from storm waters. Increased sedimentation in nearshore marine waters could smother hawksbill sea turtle foraging habitat. Although the proposed project is expected to potentially increase sediment delivery to the nearshore marine environment, the degree of increase is not expected to be substantially different from the existing condition; therefore, hawksbill sea turtle foraging habitat in the action area is not expected to substantially decrease from its current abundance within the action area.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to hawksbill sea turtle foraging habitat from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur and in turn minimize the potential impact on hawksbill sea turtle foraging habitat within the nearshore marine environment. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment and thereby minimize the potential for resulting habitat degradation of hawksbill sea turtle foraging habitat.

Effects Determination

The proposed action involves minor in-water work which could expose hawksbill sea turtle to project-related activity. However, with the implementation of avoidance and minimization measures listed in Section 2.3 potential impacts to hawksbill sea turtle due to project-related activity is expected to be minimized such that the proposed action **may affect, but is not likely to adversely affect** hawksbill sea turtle.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

5. Effects Determination

Based on the information presented in Section 4, the effects determination for the species addressed in this BA are summarized in Table 5. As no critical habitat occurs within the action area, there will be no effect on any critical habitat.

Table 5: Summary of Effects Determination

Common Name	Scientific Name	Potential to Occur in Action Area	Potential Effects	Effects Determination
ʻAiea	*Nothocestrum latifolium*	No; no suitable habitat	None	No Effect
ʻAkoko	*Euphorbia celastroides var. kaenana*	No; no suitable habitat	None	No Effect
ʻena'ena	*Pseudognaphalium sandwicensium var. molokaiense*	No; no suitable habitat	None	No Effect
Carter's Panicgrass	*Panicum fauriei var. carteri*	No; no suitable habitat	None	No Effect
Ewa Plains ʻakoko	*Euphorbia skottsbergii var. skottsbergii*	No; no suitable habitat	None	No Effect
Ihi	*Portulaca villosa*	No; no suitable habitat	None	No Effect
Kamanomano	*Cenchrus agrimonioides*	No; no suitable habitat	None	No Effect
No Common Name	*Lobelia monostachya*	No; no suitable habitat	None	No Effect
No Common Name	*Polyscias lydgatei*	No; no suitable habitat	None	No Effect
Popolo	*Solanum nelsonii*	No; no suitable habitat	None	No Effect
Pu'uka'a	*Cyperus trachysanthos*	No; no suitable habitat	None	No Effect
Ohai	*Sesbania tomentosa*	No; no suitable habitat	None	No Effect
No Common Name	*Vigna o-wahuensis*	No; no suitable habitat	None	No Effect
Ihi'ihi	*Marsilea villosa*	No; no suitable habitat	None	No Effect
No Common Name	*Microlepia strigose var. mauiensis*	No; no suitable habitat	None	No Effect

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Common Name	Scientific Name	Potential to Occur in Action Area	Potential Effects	Effects Determination
Band-rumped Storm petrel	*Oceanodroma castro*	Unlikely given the minimal extent/quality of habitat and current species distribution	Temporary attractive nuisance from artificial lighting during construction	May Affect, Not Likely to Adversely Affect
Hawaii Akepa	*Loxops coccineus*	No; no suitable habitat	None	No Effect
Hawaiian Duck	*Anas wyvilliana*	Unlikely given the minimal extent/quality of habitat and current species distribution	Temporary disturbance during construction; short-term habitat increase (and attractive nuisance) during flood events	May Affect, Not Likely to Adversely Affect
Hawaiian Common Gallinule	*Gallinula galeata sandvicensis*	Unlikely given the minimal extent/quality of habitat and current species distribution	Temporary disturbance during construction; short-term habitat increase (and attractive nuisance) during flood events	May Affect, Not Likely to Adversely Affect
Hawaiian Coot	*Fulica americana alai*	Unlikely given the minimal extent/quality of habitat and current species distribution	Temporary disturbance during construction; short-term habitat increase (and attractive nuisance) during flood events	May Affect, Not Likely to Adversely Affect
Hawaiian Petrel	*Pterodroma sanwichensis*	Unlikely given the minimal extent/quality of habitat and current species distribution	Temporary attractive nuisance from artificial lighting during construction	May Affect, Not Likely to Adversely Affect

Project Code: 2023-0048348
Project Name: Ala Wai Canal Flood Risk Management Project General Reevaluation Report

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened and endangered species, as well as designated critical habitat that may occur within the boundary of your proposed project and that may be affected by project related actions. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*). Please contact the Service's Pacific Islands Fish and Wildlife Office (PIFWO) at 808-792-9400 if you have any questions regarding your IPaC species list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may adversely affect threatened and endangered species and/or designated critical habitat.

Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a Biological

Evaluation, similar to a Biological Assessment, be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment or Biological Evaluation are described at 50 CFR 402.12.

Due to the significant number of listed species found on each island within PIFWO's regulatory jurisdiction, and the difficulty in accurately mapping ranges for species that we have limited information about, your species list may include more species than if you obtained the list directly from a Service biologist. We recommend you use the species links in IPaC to view the life history, habitat descriptions, and recommended avoidance and minimization measures to assist with your initial determination of whether the species or its habitat may occur within your project area. If appropriate habitat is present for a listed species, we recommend surveys be conducted to determine whether the species is also present. If no surveys are conducted, we err on the side of the species, by regulation, and assume the habitat is occupied. Updated avoidance and minimization measures for plants and animals, best management practices for work in or near aquatic environments, and invasive species biosecurity protocols can be found on the PIFWO website at: https://www.fws.gov/office/pacific-islands-fish-and-wildlife/library.

If a Federal agency determines, based on the Biological Assessment or Biological Evaluation, that a listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at: http://www.fws.gov/endangered/esa-library/index.

Non-federal entities can also use the IPaC generated species list to develop Habitat Conservation Plans (HCP) in accordance with section 10(a)(1)(B) of the Act. We recommend HCP applicants coordinate with the Service early during the HCP development process. For additional information on HCPs, the Habitat Conservation Planning handbook can be found at https://www.fws.gov/sites/default/files/documents/habitat-conservation-planning-handbook-entire.pdf.

Please be aware that wind energy projects should follow the Service’s wind energy guidelines (http://www.fws.gov/windenergy) for minimizing impacts to migratory birds. Listed birds and the Hawaiian hoary bat may also be affected by wind energy development and we recommend development of a Habitat Conservation Plan for those species, as described above. Guidance for minimizing impacts to migratory birds for projects including communications towers can be found at:

- http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers
- http://www.towerkill.com
- http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation actions that benefit threatened and endangered species into their project planning to further the purposes of the Act in accordance with section 7(a)(1). Please include the Consultation Tracking Number associated with your IPaC species list in any

request for consultation or correspondence about your project that you submit to our office. Please feel free to contact us at PIFWO_admin@fws.gov or 808-792-9400 if you need more current information or assistance regarding the potential impacts to federally listed species and federally designated critical habitat.

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Pacific Islands Fish And Wildlife Office
300 Ala Moana Boulevard, Box 50088
Honolulu, HI 96850-5000
(808) 792-9400

PROJECT SUMMARY

Project Code: 2023-0048348
Project Name: Ala Wai Canal Flood Risk Management Project General Reevaluation Report
Project Type: Flooding
Project Description: Evaluation of flood risk management measures for the Ala Wai Watershed in Oahu, Hawaii.
Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@21.30655265,-157.80839329399933,14z

Counties: Honolulu County, Hawaii

ENDANGERED SPECIES ACT SPECIES

There is a total of 17 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

MAMMALS

NAME	STATUS
Hawaiian Hoary Bat *Lasiurus cinereus semotus* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/770 General project design guidelines: https://ipac.ecosphere.fws.gov/project/UYJUOQCQBFHUNA7V7S5U3YBY2I/documents/generated/6477.pdf	Endangered

BIRDS

NAME	STATUS

Band-rumped Storm-petrel *Hydrobates castro* — Endangered
- Population: USA (HI)
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/1226
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/UYJUOQCQBFHUNA7V7S5U3YBY2I/documents/generated/6939.pdf

Hawaiian Common Gallinule *Gallinula galeata sandvicensis* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/6612
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/UYJUOQCQBFHUNA7V7S5U3YBY2I/documents/generated/6934.pdf

Hawaiian Coot (alae Ke`oke`o) *Fulica alai* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/7233
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/UYJUOQCQBFHUNA7V7S5U3YBY2I/documents/generated/6934.pdf

Hawaiian Duck *Anas wyvilliana* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/7712
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/UYJUOQCQBFHUNA7V7S5U3YBY2I/documents/generated/6934.pdf

Hawaiian Petrel *Pterodroma sandwichensis* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/6746
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/UYJUOQCQBFHUNA7V7S5U3YBY2I/documents/generated/6939.pdf

Hawaiian Stilt *Himantopus mexicanus knudseni* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/2082
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/UYJUOQCQBFHUNA7V7S5U3YBY2I/documents/generated/6934.pdf

Newell"s Shearwater *Puffinus newelli* — Threatened
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/2048
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/UYJUOQCQBFHUNA7V7S5U3YBY2I/documents/generated/6939.pdf

REPTILES

NAME	STATUS
Hawksbill Sea Turtle *Eretmochelys imbricata*	Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/3656

FLOWERING PLANTS

NAME	STATUS
`aiea *Nothocestrum latifolium*	Endangered

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/1061

`akoko *Euphorbia celastroides var. kaenana*	Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/3842

`ena`ena *Pseudognaphalium sandwicensium var. molokaiense*	Endangered

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/5993

Kamanomano *Cenchrus agrimonioides*	Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/2928

Lobelia monostachya	Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/4334

Polyscias lydgatei	Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/2751

Vigna o-wahuensis	Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/8445

FERNS AND ALLIES

NAME	STATUS
Microlepia strigosa var. mauiensis	Endangered

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/4737

CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

USFWS NATIONAL WILDLIFE REFUGE LANDS AND FISH HATCHERIES

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS OR FISH HATCHERIES WITHIN YOUR PROJECT AREA.

BALD & GOLDEN EAGLES

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act[1] and the Migratory Bird Treaty Act[2].

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats[3], should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

---

1. The Bald and Golden Eagle Protection Act of 1940.
2. The Migratory Birds Treaty Act of 1918.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

THERE ARE NO BALD AND GOLDEN EAGLES WITHIN THE VICINITY OF YOUR PROJECT AREA.

MIGRATORY BIRDS

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats[3] should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

---

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Apapane *Himatione sanguinea* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9659	Breeds Dec 1 to Jul 31
Black Noddy *Anous minutus melanogenys* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10559	Breeds Apr 1 to Nov 30
Bristle-thighed Curlew *Numenius tahitiensis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/3913	Breeds elsewhere
Bulwer's Petrel *Bulweria bulwerii* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10579	Breeds May 1 to Sep 30
Christmas Shearwater *Puffinus nativitatis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9636	Breeds Apr 1 to Oct 31
Laysan Albatross *Phoebastria immutabilis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9669	Breeds Nov 15 to Jun 15
Oahu 'amakihi *Hemignathus flavus* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9592	Breeds Apr 1 to Jul 1
Red-tailed Tropicbird *Phaethon rubricauda melanorhynchos* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10563	Breeds Dec 15 to Oct 15

PROBABILITY OF PRESENCE SUMMARY

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read the supplemental information and specifically the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

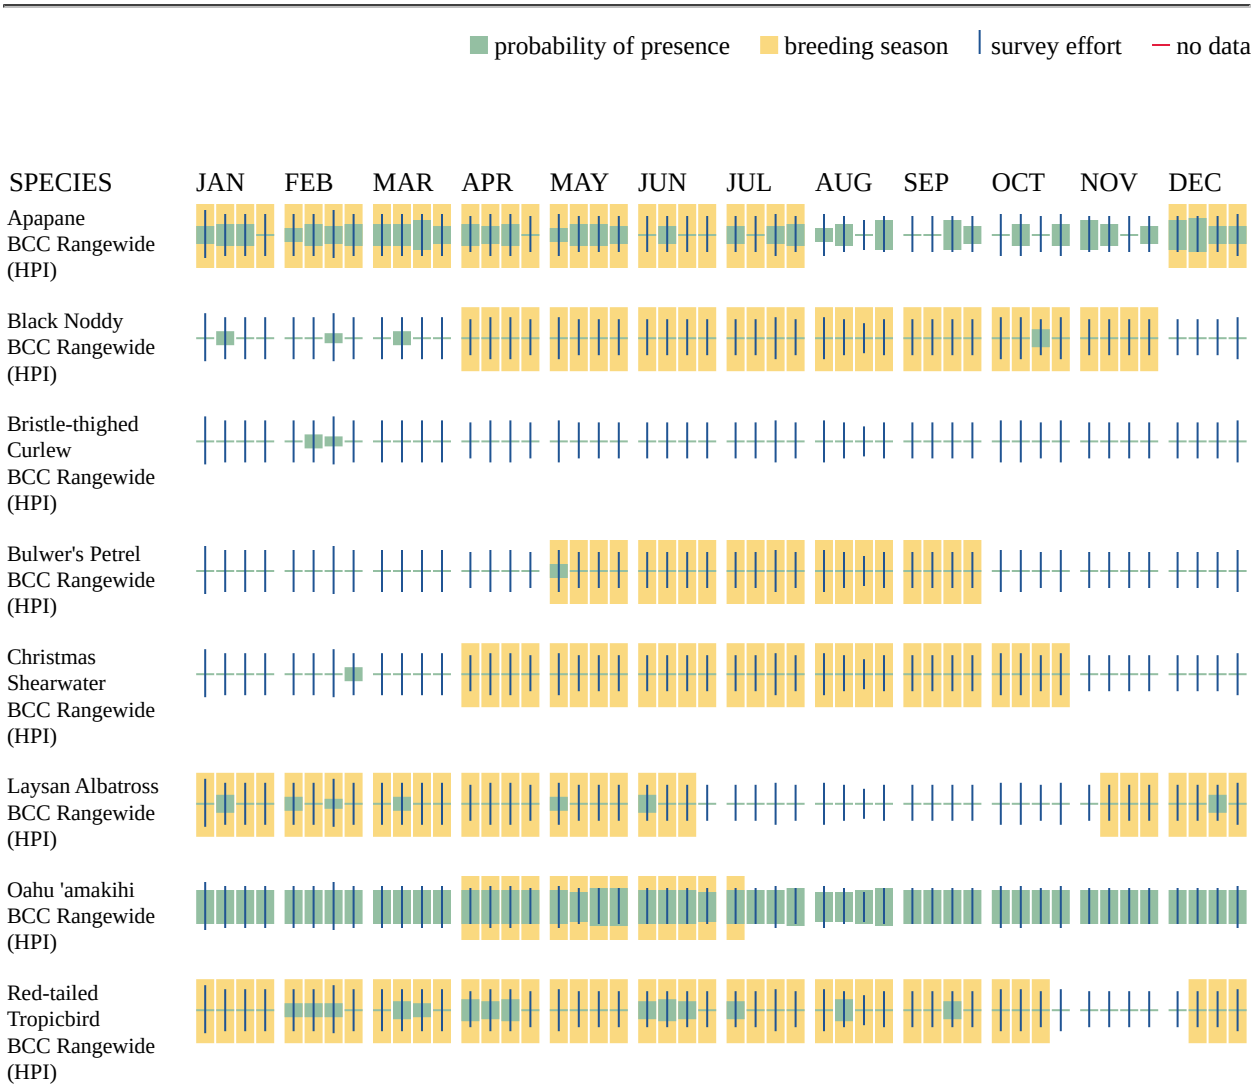
Probability of Presence (■)

Green bars; the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during that week of the year.

Breeding Season (▪)
Yellow bars; liberal estimate of the timeframe inside which the bird breeds across its entire range.

Survey Effort (|)
Vertical black lines; the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data (–)
A week is marked as having no data if there were no survey events for that week.



Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management

- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

WETLANDS

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

Project Name: Ala Wai Canal Flood Risk Management Project General Reevaluation Report

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened and endangered species, as well as designated critical habitat that may occur within the boundary of your proposed project and that may be affected by project related actions. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*). Please contact the Service's Pacific Islands Fish and Wildlife Office (PIFWO) at 808-792-9400 if you have any questions regarding your IPaC species list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may adversely affect threatened and endangered species and/or designated critical habitat.

Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a Biological

Evaluation, similar to a Biological Assessment, be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment or Biological Evaluation are described at 50 CFR 402.12.

Due to the significant number of listed species found on each island within PIFWO's regulatory jurisdiction, and the difficulty in accurately mapping ranges for species that we have limited information about, your species list may include more species than if you obtained the list directly from a Service biologist. We recommend you use the species links in IPaC to view the life history, habitat descriptions, and recommended avoidance and minimization measures to assist with your initial determination of whether the species or its habitat may occur within your project area. If appropriate habitat is present for a listed species, we recommend surveys be conducted to determine whether the species is also present. If no surveys are conducted, we err on the side of the species, by regulation, and assume the habitat is occupied. Updated avoidance and minimization measures for plants and animals, best management practices for work in or near aquatic environments, and invasive species biosecurity protocols can be found on the PIFWO website at: https://www.fws.gov/office/pacific-islands-fish-and-wildlife/library.

If a Federal agency determines, based on the Biological Assessment or Biological Evaluation, that a listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at: http://www.fws.gov/endangered/esa-library/index.

Non-federal entities can also use the IPaC generated species list to develop Habitat Conservation Plans (HCP) in accordance with section 10(a)(1)(B) of the Act. We recommend HCP applicants coordinate with the Service early during the HCP development process. For additional information on HCPs, the Habitat Conservation Planning handbook can be found at https://www.fws.gov/sites/default/files/documents/habitat-conservation-planning-handbook-entire.pdf.

Please be aware that wind energy projects should follow the Service’s wind energy guidelines (http://www.fws.gov/windenergy) for minimizing impacts to migratory birds. Listed birds and the Hawaiian hoary bat may also be affected by wind energy development and we recommend development of a Habitat Conservation Plan for those species, as described above. Guidance for minimizing impacts to migratory birds for projects including communications towers can be found at:

- http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers
- http://www.towerkill.com
- http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation actions that benefit threatened and endangered species into their project planning to further the purposes of the Act in accordance with section 7(a)(1). Please include the Consultation Tracking Number associated with your IPaC species list in any

request for consultation or correspondence about your project that you submit to our office. Please feel free to contact us at PIFWO_admin@fws.gov or 808-792-9400 if you need more current information or assistance regarding the potential impacts to federally listed species and federally designated critical habitat.

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Pacific Islands Fish And Wildlife Office
300 Ala Moana Boulevard, Box 50088
Honolulu, HI 96850-5000
(808) 792-9400

PROJECT SUMMARY

Project Code: 2023-0048352
Project Name: Ala Wai Canal Flood Risk Management Project General Reevaluation Report
Project Type: Flooding
Project Description: Evaluation of flood risk management measures to be implemented in the Ala Wai Watershed.
Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@21.291413650000003,-157.81449396340298,14z

Counties: Honolulu County, Hawaii

ENDANGERED SPECIES ACT SPECIES

There is a total of 17 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

MAMMALS

NAME	STATUS
Hawaiian Hoary Bat *Lasiurus cinereus semotus*	Endangered

No critical habitat has been designated for this species.

Hawaiian Common Gallinule *Gallinula galeata sandvicensis* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/6612
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/F6MRZRCZBZE6ZN2B4X5FT43EYI/documents/generated/6934.pdf

Hawaiian Coot (alae Ke`oke`o) *Fulica alai* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/7233
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/F6MRZRCZBZE6ZN2B4X5FT43EYI/documents/generated/6934.pdf

Hawaiian Duck *Anas wyvilliana* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/7712
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/F6MRZRCZBZE6ZN2B4X5FT43EYI/documents/generated/6934.pdf

Hawaiian Petrel *Pterodroma sandwichensis* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/6746
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/F6MRZRCZBZE6ZN2B4X5FT43EYI/documents/generated/6939.pdf

Hawaiian Stilt *Himantopus mexicanus knudseni* — Endangered
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/2082
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/F6MRZRCZBZE6ZN2B4X5FT43EYI/documents/generated/6934.pdf

Newell"s Shearwater *Puffinus newelli* — Threatened
- No critical habitat has been designated for this species.
- Species profile: https://ecos.fws.gov/ecp/species/2048
- General project design guidelines: https://ipac.ecosphere.fws.gov/project/F6MRZRCZBZE6ZN2B4X5FT43EYI/documents/generated/6939.pdf

REPTILES

NAME STATUS

Hawksbill Sea Turtle *Eretmochelys imbricata* Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/3656

FLOWERING PLANTS

NAME STATUS

`akoko *Euphorbia celastroides var. kaenana* Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/3842

`ena`ena *Pseudognaphalium sandwicensium var. molokaiense* Endangered

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/5993

Carter's Panicgrass *Panicum fauriei var. carteri* Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/5578

Ihi *Portulaca villosa* Endangered

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/4886

Ohai *Sesbania tomentosa* Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/8453
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/F6MRZRCZBZE6ZN2B4X5FT43EYI/documents/generated/7050.pdf

Pu`uka`a *Cyperus trachysanthos* Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/7749

Vigna o-wahuensis Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/8445

FERNS AND ALLIES

NAME STATUS

Ihi`ihi *Marsilea villosa* Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/2169

CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

USFWS NATIONAL WILDLIFE REFUGE LANDS AND FISH HATCHERIES

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS OR FISH HATCHERIES WITHIN YOUR PROJECT AREA.

BALD & GOLDEN EAGLES

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act[1] and the Migratory Bird Treaty Act[2].

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats[3], should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

---

1. The Bald and Golden Eagle Protection Act of 1940.
2. The Migratory Birds Treaty Act of 1918.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

THERE ARE NO BALD AND GOLDEN EAGLES WITHIN THE VICINITY OF YOUR PROJECT AREA.

MIGRATORY BIRDS

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats[3] should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

---

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE

SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Apapane *Himatione sanguinea* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9659	Breeds Dec 1 to Jul 31
Black Noddy *Anous minutus melanogenys* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10559	Breeds Apr 1 to Nov 30
Bristle-thighed Curlew *Numenius tahitiensis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/3913	Breeds elsewhere
Bulwer's Petrel *Bulweria bulwerii* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10579	Breeds May 1 to Sep 30
Christmas Shearwater *Puffinus nativitatis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9636	Breeds Apr 1 to Oct 31
Laysan Albatross *Phoebastria immutabilis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9669	Breeds Nov 15 to Jun 15
Oahu 'amakihi *Hemignathus flavus* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9592	Breeds Apr 1 to Jul 1
Red-tailed Tropicbird *Phaethon rubricauda melanorhynchos* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10563	Breeds Dec 15 to Oct 15

PROBABILITY OF PRESENCE SUMMARY

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read the supplemental information and specifically the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Green bars; the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during that week of the year.

Breeding Season (■)
Yellow bars; liberal estimate of the timeframe inside which the bird breeds across its entire range.

Survey Effort (|)
Vertical black lines; the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Additional information can be found using the following links:

- Eagle Management https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf
- Supplemental Information for Migratory Birds and Eagles in IPaC https://www.fws.gov/media/supplemental-information-migratory-birds-and-bald-and-golden-eagles-may-occur-project-action

WETLANDS

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

Project Name: Ala Wai Canal Flood Risk Management Project General Reevaluation Report

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened and endangered species, as well as designated critical habitat that may occur within the boundary of your proposed project and that may be affected by project related actions. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*). Please contact the Service's Pacific Islands Fish and Wildlife Office (PIFWO) at 808-792-9400 if you have any questions regarding your IPaC species list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may adversely affect threatened and endangered species and/or designated critical habitat.

Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a Biological

Evaluation, similar to a Biological Assessment, be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment or Biological Evaluation are described at 50 CFR 402.12.

Due to the significant number of listed species found on each island within PIFWO's regulatory jurisdiction, and the difficulty in accurately mapping ranges for species that we have limited information about, your species list may include more species than if you obtained the list directly from a Service biologist. We recommend you use the species links in IPaC to view the life history, habitat descriptions, and recommended avoidance and minimization measures to assist with your initial determination of whether the species or its habitat may occur within your project area. If appropriate habitat is present for a listed species, we recommend surveys be conducted to determine whether the species is also present. If no surveys are conducted, we err on the side of the species, by regulation, and assume the habitat is occupied. Updated avoidance and minimization measures for plants and animals, best management practices for work in or near aquatic environments, and invasive species biosecurity protocols can be found on the PIFWO website at: https://www.fws.gov/office/pacific-islands-fish-and-wildlife/library.

If a Federal agency determines, based on the Biological Assessment or Biological Evaluation, that a listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at: http://www.fws.gov/endangered/esa-library/index.

Non-federal entities can also use the IPaC generated species list to develop Habitat Conservation Plans (HCP) in accordance with section 10(a)(1)(B) of the Act. We recommend HCP applicants coordinate with the Service early during the HCP development process. For additional information on HCPs, the Habitat Conservation Planning handbook can be found at https://www.fws.gov/sites/default/files/documents/habitat-conservation-planning-handbook-entire.pdf.

Please be aware that wind energy projects should follow the Service’s wind energy guidelines (http://www.fws.gov/windenergy) for minimizing impacts to migratory birds. Listed birds and the Hawaiian hoary bat may also be affected by wind energy development and we recommend development of a Habitat Conservation Plan for those species, as described above. Guidance for minimizing impacts to migratory birds for projects including communications towers can be found at:

- http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers
- http://www.towerkill.com
- http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation actions that benefit threatened and endangered species into their project planning to further the purposes of the Act in accordance with section 7(a)(1). Please include the Consultation Tracking Number associated with your IPaC species list in any

request for consultation or correspondence about your project that you submit to our office. Please feel free to contact us at PIFWO_admin@fws.gov or 808-792-9400 if you need more current information or assistance regarding the potential impacts to federally listed species and federally designated critical habitat.

PROJECT SUMMARY

Project Code: 2023-0048400
Project Name: Ala Wai Canal Flood Risk Management Project General Reevaluation Report
Project Type: Flooding
Project Description: Evaluation of flood risk management measures for implementation within the Ala Wai watershed.
Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@21.2815565,-157.82130335332727,14z

Counties: Honolulu County, Hawaii

ENDANGERED SPECIES ACT SPECIES

There is a total of 20 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

MAMMALS

NAME	STATUS
Hawaiian Hoary Bat *Lasiurus cinereus semotus*	Endangered

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/770
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6477.pdf

BIRDS

NAME STATUS

Band-rumped Storm-petrel *Hydrobates castro* Endangered
Population: USA (HI)
No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/1226
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6939.pdf

Hawaiian Common Gallinule *Gallinula galeata sandvicensis* Endangered
No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/6612
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6934.pdf

Hawaiian Coot (alae Ke`oke`o) *Fulica alai* Endangered
No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/7233
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6934.pdf

Hawaiian Duck *Anas wyvilliana* Endangered
No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/7712
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6934.pdf

Hawaiian Petrel *Pterodroma sandwichensis* Endangered
No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/6746
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6939.pdf

Hawaiian Stilt *Himantopus mexicanus knudseni* Endangered
No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/2082
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6934.pdf

Newell"s Shearwater *Puffinus newelli* Threatened
No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/2048
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6939.pdf

NAME	STATUS
Short-tailed Albatross *Phoebastria (=Diomedea) albatrus*	Endangered

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/433

REPTILES

NAME	STATUS
Green Sea Turtle *Chelonia mydas*	Threatened

Population: Central North Pacific DPS
There is **proposed** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/6199
General project design guidelines:
https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/6929.pdf

Hawksbill Sea Turtle *Eretmochelys imbricata*	Endangered

There is **final** critical habitat for this species. Your location does not overlap the critical habitat.
Species profile: https://ecos.fws.gov/ecp/species/3656

FLOWERING PLANTS

NAME	STATUS
`akoko *Euphorbia celastroides var. kaenana*	Endangered
There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/3842	
`akoko *Euphorbia skottsbergii var. skottsbergii*	Endangered
There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/6793	
`ena`ena *Pseudognaphalium sandwicensium var. molokaiense*	Endangered
No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5993	
Carter's Panicgrass *Panicum fauriei var. carteri*	Endangered
There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/5578	
Ihi *Portulaca villosa*	Endangered
No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/4886	
Ohai *Sesbania tomentosa*	Endangered
There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/8453 General project design guidelines: https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/7050.pdf	
Popolo *Solanum nelsonii*	Endangered
No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/2281 General project design guidelines: https://ipac.ecosphere.fws.gov/project/XFANLQQKVNEAVJX4SNBXOA3FBE/documents/generated/7050.pdf	
Pu`uka`a *Cyperus trachysanthos*	Endangered
There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/7749	

FERNS AND ALLIES

NAME	STATUS
Ihi`ihi *Marsilea villosa*	Endangered
There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/2169	

CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

USFWS NATIONAL WILDLIFE REFUGE LANDS AND FISH HATCHERIES

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS OR FISH HATCHERIES WITHIN YOUR PROJECT AREA.

BALD & GOLDEN EAGLES

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act[1] and the Migratory Bird Treaty Act[2].

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats[3], should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

---

1. The Bald and Golden Eagle Protection Act of 1940.
2. The Migratory Birds Treaty Act of 1918.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

THERE ARE NO BALD AND GOLDEN EAGLES WITHIN THE VICINITY OF YOUR PROJECT AREA.

MIGRATORY BIRDS

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats[3] should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

---

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.
3. 50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE

SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Apapane *Himatione sanguinea* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9659	Breeds Dec 1 to Jul 31
Black Noddy *Anous minutus melanogenys* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10559	Breeds Apr 1 to Nov 30
Bristle-thighed Curlew *Numenius tahitiensis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/3913	Breeds elsewhere
Bulwer's Petrel *Bulweria bulwerii* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10579	Breeds May 1 to Sep 30
Christmas Shearwater *Puffinus nativitatis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9636	Breeds Apr 1 to Oct 31
Laysan Albatross *Phoebastria immutabilis* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9669	Breeds Nov 15 to Jun 15
Oahu 'amakihi *Hemignathus flavus* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/9592	Breeds Apr 1 to Jul 1
Red-tailed Tropicbird *Phaethon rubricauda melanorhynchos* This is a Bird of Conservation Concern (BCC) throughout its range in Hawaii and the Pacific Islands. https://ecos.fws.gov/ecp/species/10563	Breeds Dec 15 to Oct 15

PROBABILITY OF PRESENCE SUMMARY

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read the supplemental information and specifically the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Green bars; the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during that week of the year.

Breeding Season (■)
Yellow bars; liberal estimate of the timeframe inside which the bird breeds across its entire range.

Survey Effort (|)
Vertical black lines; the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

WETLANDS

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

4. Section 7(a)(2) Consultation with the National Marine Fisheries Service

The Corps has determined that the planned flood risk management project may affect, but is not likely to adversely affect federally listed species under the authority of the National Marine Fisheries Service. Consultation letters and communications with the Service are contained in this section (attached).

- Corps' Consultation Initiation Letter (refer to Section 3 for the Biological Assessment)

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Corps Request to Reinitiate Informal Section 7 Consultation and Official Species List

Herleth-King, Shawna S CIV USARMY CELRC (USA)

From: Herleth-King, Shawna S CIV USARMY CELRC (USA)
Sent: Thursday, November 10, 2022 10:54 AM
To: Ron Dean - NOAA Federal; joel.moribe@noaa.gov
Subject: Reinitiation of Section 7 Consultation for the Ala Wai Canal GRR
Attachments: Final Array Visuals.pptx

Importance: High

Hi Mr. Dean and Mr. Moribe,

The Corps would like to reinitiate informal Section 7 consultation for the Ala Wai Canal GRR study. As discussed during our coordination calls on the subject project, the GRR that the Corps is preparing is a reevaluation of the previous 2017 study and will ultimately result in a recommendation from the Corps that will either update and confirm the 2017 authorized project or make a new recommendation. Currently the Corps is evaluating six alternatives that make up the final array (please see the attached powerpoint for the final array visuals). Further analysis of these alternatives/measures may still result in further screening. Please note that since our last discussion the Corps has screened the Kapiolani Park Detention Basin measure from Alternative 1 – Storage Cornerstone. The remaining measures/alternatives are still being further evaluated, and it is still likely that additional measures/alternatives could be screened out of the final array (including Alternative 2C – Conveyance Cornerstone). However, the only measure that has been for sure screened from the attached final array of alternatives is the Kapiolani Park Detention Basin.

This email is a request for an updated official species list for the study area. It appears from previous consultation on the subject project that the official list from USFWS included the following species as recent as 2020: green sea turtle, Central North Pacific Distinct Population Segment (*Chelonia mydas*); Hawksbill sea turtle (*Eretmochelys imbricata*), and Hawaiian monk seal (*Monachus schauinslandi*).

If you could please provide an updated species list or confirm the above species should still be considered in our analysis we would appreciate it.

Thank you,
Shawna

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1. Introduction

1.1 Preface

Many aquatic habitats are critical to the productivity and sustainability of marine fisheries. Essential Fish Habitat (EFH) is defined as “those waters and substrates necessary to fish for spawning, breeding, feeding, or growth to maturity (16 U.S.C. 1802(10)). “Waters” include aquatic areas and their associated physical, chemical, and biological properties that are used by fish, and may include aquatic areas historically used by fish where appropriate. “Substrate” includes sediment, hard bottom, structures underlying the waters, and associated biological communities.

The Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act), as amended by the Sustainable Fisheries Act (SFA) of 1996 (Public Law 104-267), set forth a mandate for the National Marine Fisheries Service (NMFS), regional Fishery Management Councils (FMCs), and other Federal agencies to identify, conserve, and enhance EFH for those species regulated under a federal fisheries management plan (FMP). Federal agencies that fund, permit, or undertake activities that may adversely affect EFH are required to consult with NMFS regarding the potential effects of their actions on EFH and respond in writing to NMFS recommendations.

1.2 Project Authority

The Ala Wai Canal Flood Risk Management Study (Proposed Project) is authorized under Section 209 of the Flood Control Act of 1962. Section 209 is a general authority that authorizes surveys in harbors and rivers in Hawaii “with a view to determining the advisability of improvements in the interest of navigation, flood control, hydroelectric power development, water supply, and other beneficial water uses, and related land resources.”

1.3 Project History

In response to a request from the State of Hawaii Department of Land and Natural Resources (DLNR), the reconnaissance phase of the Ala Wai Canal Project was initiated in April 1999. At that time, Federal, State, and local agencies sought a comprehensive management and restoration plan to restore aquatic habitat and biological diversity in the canal and upstream tributaries. The reconnaissance report was submitted in August 1999 and recommended that the U.S. Army Corps of Engineers (USACE) assist the State with restoration of the canal. Approval by USACE for continuation into the feasibility phase was granted in September 1999.

Independently, the Ala Wai Flood Study was initiated in September 1998 under the Planning Assistance to States (PAS) Program (Section 22 of the Water Resources Development Act [WRDA] of 1974) to determine the potential flood risk to the Waikiki area, in response to a request by the DLNR Land Division. The study was completed in October 2001 and documented a high flood hazard associated with potential overtopping of the Ala Wai Canal. This study identified several mitigative measures and conceptual alternatives that could potentially minimize flood damages to Waikiki and surrounding areas. The results of this technical study were used to establish that the USACE could be involved in the investigation of flood risk management in the canal. As a result, a flood risk management objective was added to the Ala Wai Canal Project, thus expanding the project focus to both ecosystem restoration and flood risk management in the canal area.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The Feasibility Cost Sharing Agreement (FCSA) was executed between USACE and the non-Federal sponsor, DLNR Engineering Division, in 2001. The feasibility phase of the project was initiated in July 2002, and an EIS scoping meeting was held in June 2004. Subsequently, in October 2004, heavy rains caused Manoa Stream to overtop its banks, resulting in significant damages. In response, the USACE temporarily ceased work on the feasibility study, such that the project could be expanded to include the upstream portions of the Ala Wai watershed. While the cost-share agreement was being amended to address a more comprehensive scope, the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) received Federal funds to identify specific actions to address flooding in Manoa Valley. The Manoa Watershed Project was initiated in 2006 and resulted in detailed topographic mapping, hydrologic and hydraulic modeling, and identification of potential measures to address specific flood problems. However, because of insufficient Federal funding to complete the project, the Manoa Watershed Project was terminated before implementation.

Information developed through the Manoa Watershed Project by NRCS was subsequently incorporated into the Ala Wai Canal Project, which was restarted in 2007. A second EIS scoping meeting was held in October 2008. Project-related efforts were primarily focused on bringing the technical information for the entire watershed up to the same level of detail as produced for Manoa under the Manoa Watershed Project.

In October 2012, a charette was held to re-scope the study as part of the USACE Civil Works Planning Modernization process. The purpose of the charette was to bring together the USACE project delivery team (PDT), Pacific Ocean Division, and Headquarters staff with the non-Federal sponsor and other cooperating agencies, to determine the path forward for completing the feasibility study in compliance with current USACE planning requirements. Key outcomes of the charette included consensus on the problems and opportunities, objectives and constraints, screening and decision criteria, the initial array of alternatives, and a framework for identification of the recommended plan. Based on the project review at the charette, ecosystem restoration was eliminated as a study objective, as it was determined that the biological resources within the watershed did not have enough national significance to adequately justify ecosystem restoration as an objective.

The feasibility study was completed in 2017 and resulted in a recommendation that was subsequently authorized for construction under Section 1401 of the Water Resources Development Act of 2018. The 2017 recommended plan consisted of six in-stream debris and detention basins of varying height in the upper reaches of the watershed, one standalone debris catchment structure, three multi-purpose detention basins, floodwalls along the Ala Wai Canal averaging four feet in height and an earthen levee at the perimeter of an adjacent golf course averaging seven feet in height, two pump stations to reduce the threat of interior flooding, and a flood warning system. The record of decision (ROD) was signed on September 18, 2018, initiating the next phase of the study, Preconstruction Engineering and Design (PED). In 2020, an Engineering Documentation Report (EDR) provided the technical basis for modifications necessary to the Authorized Project. Subsequent analysis found that the modifications in the 2020 EDR were not cost effective and lacked the economic justification necessary for continued federal involvement.

In 2021, acknowledging the need to reduce the risk to life, safety, and economic damages from flooding throughout the Ala Wai Watershed in Oahu, Hawaii, the USACE began reevaluating the previously completed Ala Wai Canal Flood Risk Management Study in a General Reevaluation Report (GRR) using current planning criteria and policies. The GRR that is being developed will

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

redefine the flood problems and risks in the Ala Wai watershed by updating hydrology, physical, biological, and socioeconomic conditions; reevaluate alternatives for reducing flood damages in the area; and reaffirm the Federal interest by recommending a plan that is economically feasible.

1.4 Consultation History

An initial kick-off meeting with the National Marine Fisheries Service (NMFS) regarding the General Reevaluation Report on the Ala Wai Canal Flood Risk Management Study was held on October 5, 2021. Follow-up meetings were held with agency staff on February 8, 2022; April 5, 2022; June 9, 2022; August 2, 2022; August 23, 2022; September 27, 2022; October 25, 2022; October 27, 2022; November 15, 2022; December 20, 2022; January 24, 2023; February 28, 2023; March 23, 2023; April 25, 2023; May 2, 2023; June 27, 2023; July 25, 2023, and September 26, 2023.

1.5 Project Purpose and Need

The purpose of the proposed project is to reduce the on-going flood risks throughout the Ala Wai watershed.

The need for the project is due to the high level of flood risk that exists within the Ala Wai Watershed. Extensive urban development throughout the watershed, coupled with the basin's unique topography and hydrology (i.e., steep mountainous terrain and propensity for intense rainfall events within the headwaters) and aging and undersized infrastructure result in elevated flood risk for a large proportion of the population both along the Ala Wai Canal and within the Makiki, Manoa, and Palolo valleys. The population density within the Ala Wai watershed is approximately 200,000 residents. The watershed also contains the University of Hawai'i and the Waikiki District—a prime tourist destination that attracts more than 79,000 visitors per day and accounts for approximately 8% of the gross state product and 11% of all civilian jobs in the state.

It is estimated that the Ala Wai Canal has the capacity to contain about a 20% annual exceedance probability (AEP) flood event. Overtopping of the Canal has previously flooded Waikiki multiple times, including November 1965 and December 1967 storms and during the passage of Hurricane Iniki in 1992. Upstream areas are also at risk of flooding, as demonstrated by several recent events, including the October 2004 storm that flooded the Manoa Valley and the March 2006 storm that flooded Makiki. The October 2004 event was estimated to have a 4% AEP that caused more than $85 million in damages.

1.6 Project Action Area Description

The Ala Wai watershed is located on the southeastern side of the island of Oahu. The watershed encompasses 19 square miles (12,064 acres) and extends roughly 5 miles from the ridge of the Ko'olau Mountains to the near-shore waters of Mamala Bay. It includes the drainage of Makiki, Mano, and Palolo streams, which flow to the Ala Wai Canal, a 2-mile long, man-made waterway constructed during the 1920s to drain extensive coastal wetlands. This construction and subsequent draining allowed the development of the Waikiki District. The study area is shown in Figure 1.

The Ala Wai watershed contains approximately 200,000 residents and is the most densely populated watershed in Hawaii. The upper portion (approximately 7.5 square miles, or 40 percent of the watershed) is zoned as Conservation District, which is intended to protect natural

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

and cultural resources, including the island's aquifer. The remaining approximately 11 square miles of the middle and lower watershed is heavily urbanized, supporting a high density of single-family residences, condominiums, hotels, businesses, and schools.

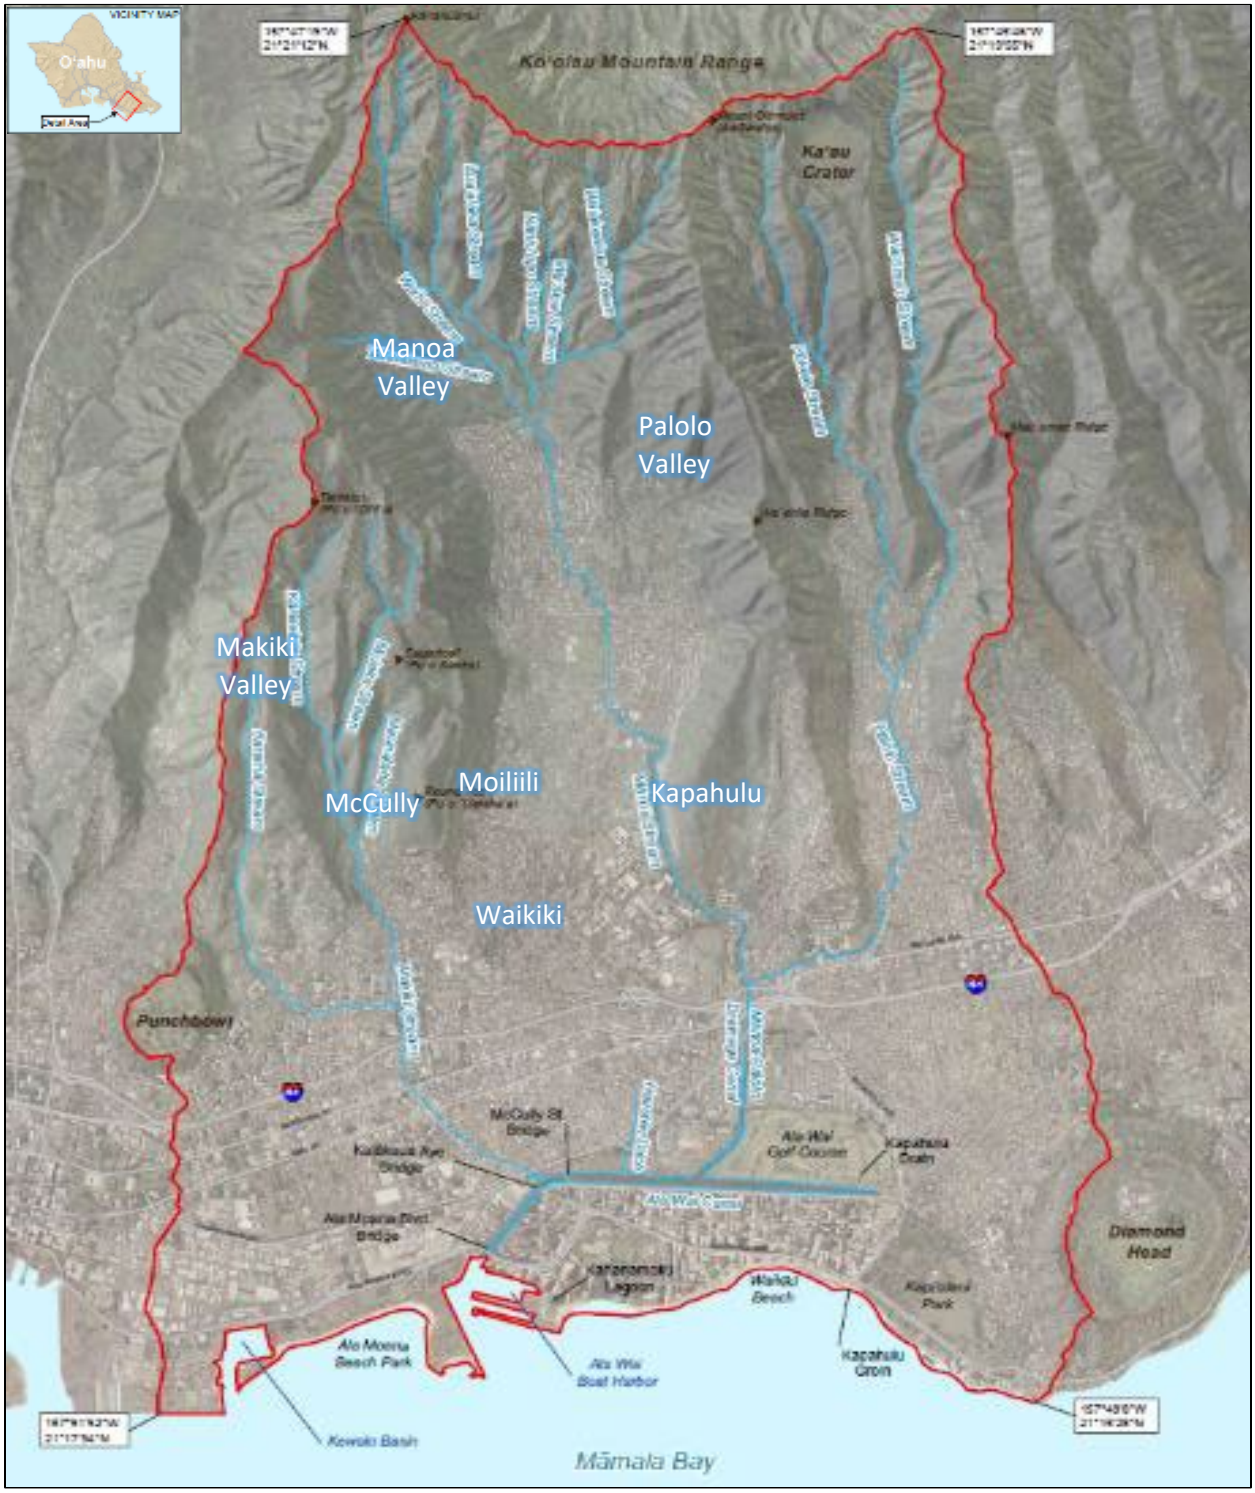

Figure 1: Regional Location of the Project Action Area.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

2. Description of Proposed Action and "Project Action Area"

The Ala Wai Canal Flood Risk Management Study ("The Project") purpose is to reduce riverine flood risks in the Ala Wai Watershed. Flooding associated with a 1-percent AEP rainfall event would affect approximately 3,111 structures with an estimated $905,327,000 in structural damages alone (2023 price levels). In response to identified flood-related problems and opportunities, a series of flood risk management measures were identified and formulated into five alternatives including the No Action alternative. The alternatives were evaluated through an iterative screening and reformulation process, resulting in the tentative selection of a plan for implementation. The tentatively selected plan would reduce flood risks by constructing one detention basin and concrete floodwalls averaging six feet high along Woodlawn Drive, Koali Road, and Kaimuki High School. In addition, concrete floodwalls averaging six feet high would be constructed on both sides of the Manoa-Palolo and Ala Wai canals. The proposed activities associated with the Project and that constitute the Federal action are described below in Section 2.2 Proposed Action, and construction details are provided in Section 2.3.

2.1 "Project Action Area" Defined

The scope of USACE's "Project Action Area" for the purposes of EFH consultation under Section 305(b)(2) of the MSA consists of the marine aquatic habitat in the Ala Wai Small Boat Harbor as well as the marine aquatic habitat within 1,640 feet (500 meters) of the mouth of the Ala Wai Small Boat Harbor. The total area of EFH waters and substrate (waters of the U.S.) within the defined project action area boundary is 171 acres. It is important to note that there is no proposed in-water work areas within the defined project action area for the purposes of EFH consultation. Potential in-water work areas would be located within Ala Wai Canal, Manoa-Palolo Canal, Makiki Stream, Manoa Stream, and Palolo Stream, all of which do not contain designated EFH.

2.2 Proposed Action

The Project includes constructing four floodwalls located along Woodlawn Drive, Koali Road, Kaimuki High School, and the Ala Wai Canal (including Manoa-Palolo Canal); constructing a detention basin at the Ala Wai Golf Course; and construction of potential mitigation measures to offset impacts due to induced flooding.

Approximately 1,505 linear feet of waters of the U.S. would be disturbed during project construction/modification of drainage structures; approximately 720 linear feet of waters of the U.S. would remain within the permanent project footprint. Approximately 744 cubic yards (CY) of fill material would be placed within the 1,505 linear feet of waters of the U.S. to be disturbed during construction. It is important to note, however, that the linear feet of waters to be disturbed, to remain in the permanent project footprint, and to include permanent fill are not waters with designated EFH. These waters are located within the Ala Wai Canal, Manoa-Palolo Canal, Manoa Stream, and Palolo Stream which have no designated EFH present. The potential impact to marine waters with EFH would be indirect as EFH designated waters are located immediately adjacent to the project footprint.

2.3 Construction Phases of the Proposed Action

The proposed action is divided into the following five (5) general construction phases:

1. Woodlawn Drive Floodwall
2. Koali Road Floodwall
3. Ala Wai Golf Course Detention Basin

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

4. Ala Wai Canal Floodwall
5. Mitigation Measures

Construction is planned to begin in 2027 and would require approximately four (4) years to complete the overlapping construction phases. A summary of the activities in or affecting waters of the U.S., which comprise each construction phase is described in the following subsections. USACE has identified appropriate and necessary Best Management Practices (BMPs) that are considered part of the proposed action. These measures are detailed in Section 2.5 below.

2.3.1 Woodlawn Drive Floodwall

An approximately 1,270 feet long, six feet tall, and 12 feet wide at the base concrete floodwall with lava rock fascia would be installed along the right descending bank of Manoa Stream from approximately 270 feet upstream of Woodlawn Drive Bridge to approximately 1,120 feet downstream of Woodlawn Drive Bridge (Figure 2). The concrete floodwall would be an L-wall on macropiles (i.e., an ultra-high-capacity micropile typically drilled in place) (Figure 3). In general, macropiles are installed by methods that cause minimal disturbance to adjacent structures, soil, and the environment. They can be installed in access-restrictive environments and in all soil types and ground conditions. The installation procedure for macropiles causes minimal vibration and noise and can be used in conditions of low headroom. For construction, clearing and grubbing would occur along the right-descending bank of Manoa Stream for the length of the proposed L-wall and approximately 72 feet in width to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the stream. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the L-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the six-foot vertical portion of the L-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the L-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the L-wall would occur.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

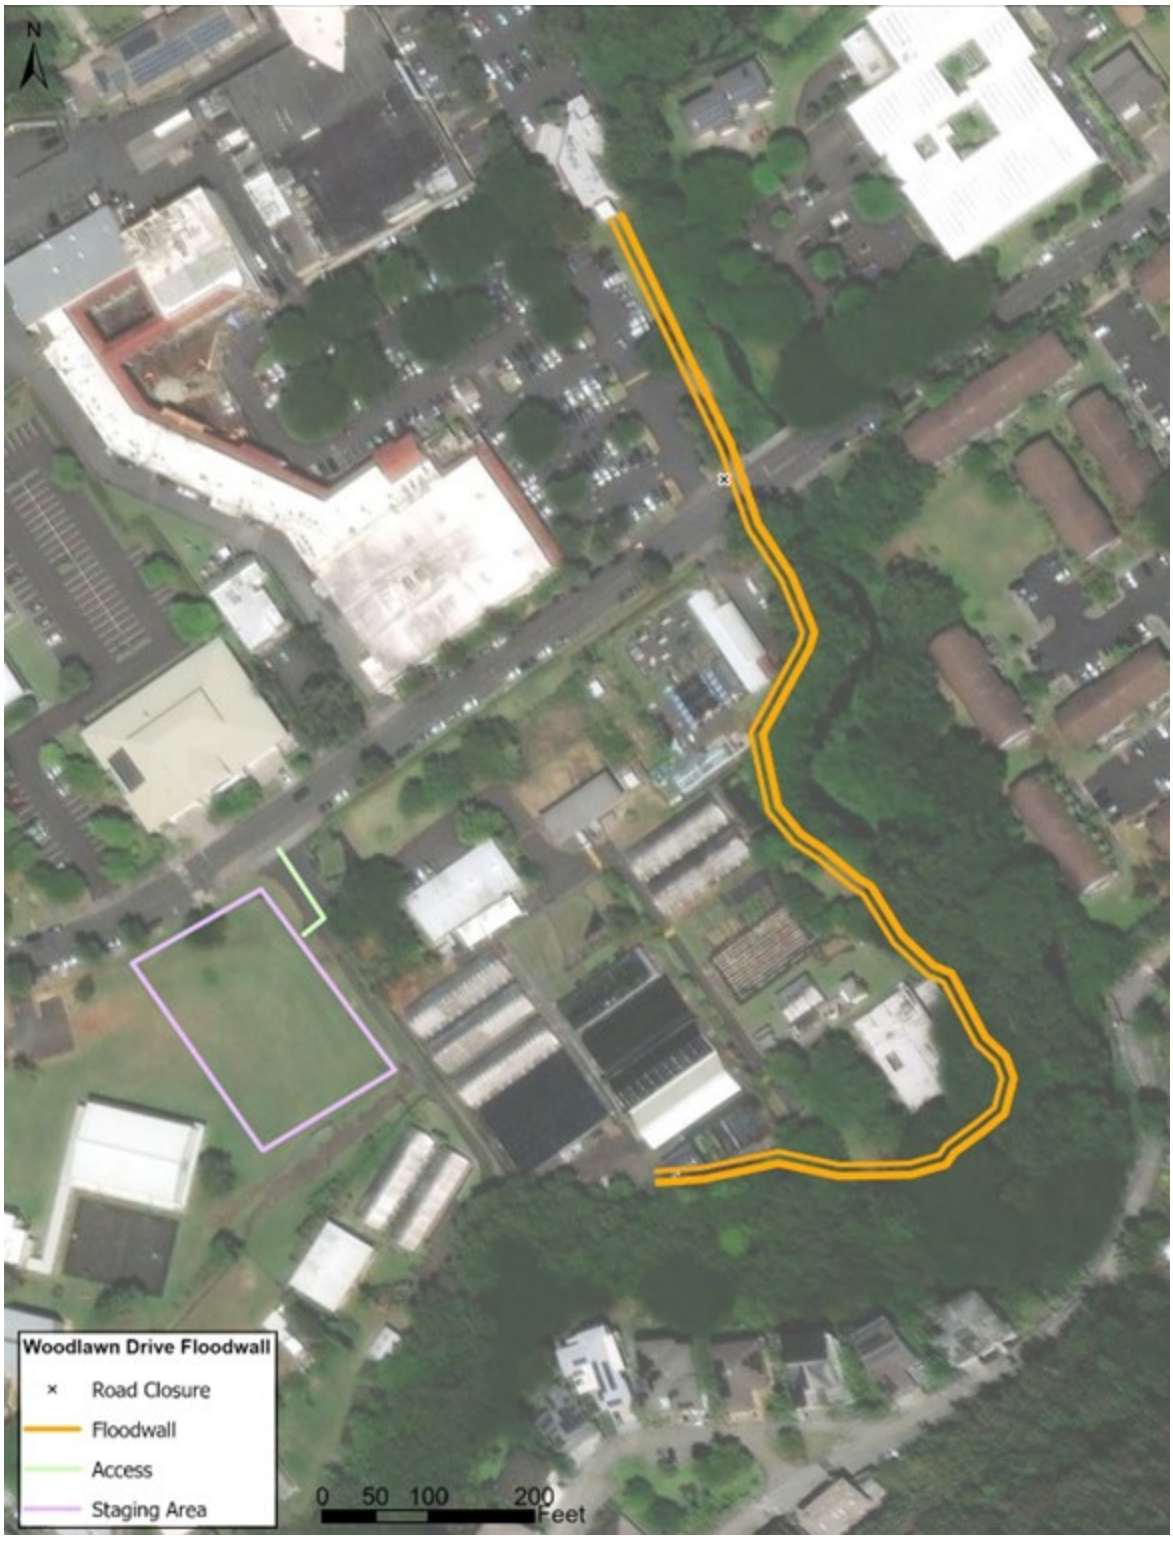

Figure 2: Woodlawn Drive Floodwall Proposed Project Footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

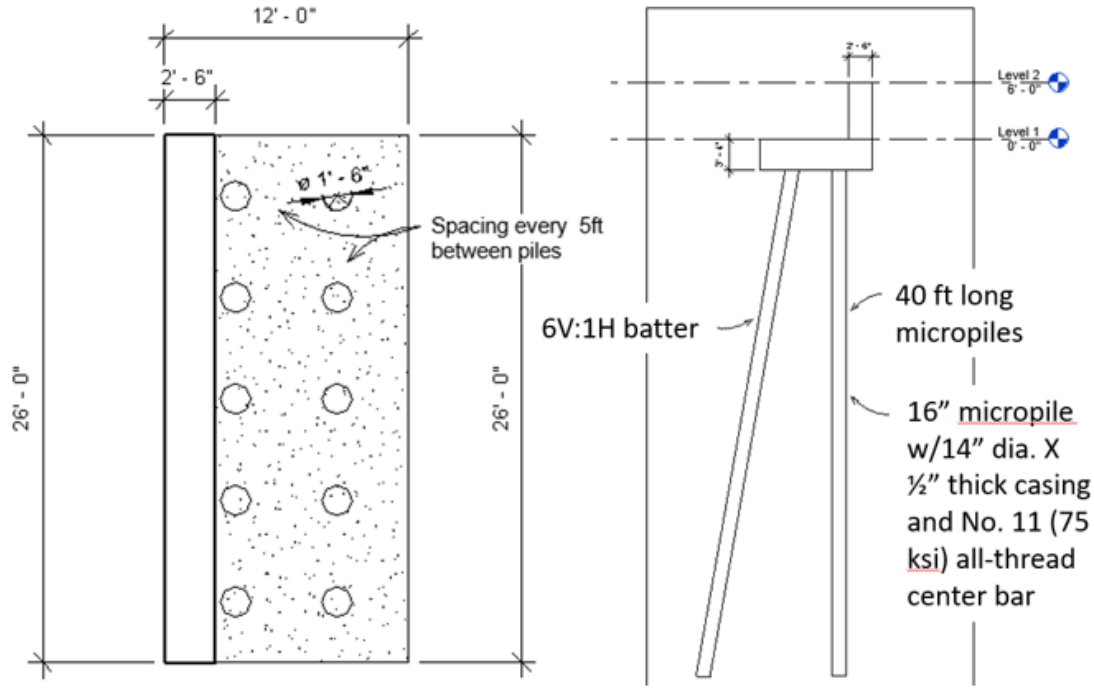

Figure 3: Preliminary L-wall on Macropiles Layout

The Woodlawn Drive Floodwall does not include any new or modification of existing drainage structures. One road closure structure would be constructed across Woodlawn Drive. The road closure structure is assumed to be a swing gate (Figure 4). A swing gate would require hinges to be attached to the floodwall and potentially a removable center post attached to the middle of the roadway if a double gate leaf is necessary (Figure 5). The road closure structure would require minor modifications as described above to the floodwalls for prefab gates. No in-water work is anticipated for the construction of the Woodlawn Drive Floodwall or road closure structure.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

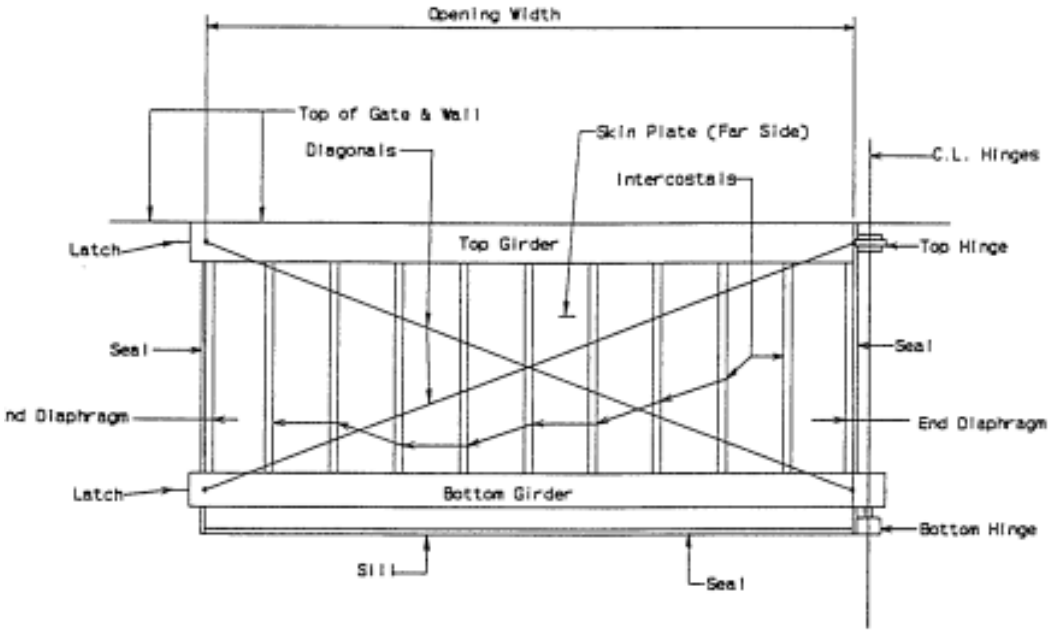

Figure 4: Example of a Single Swing Gate.

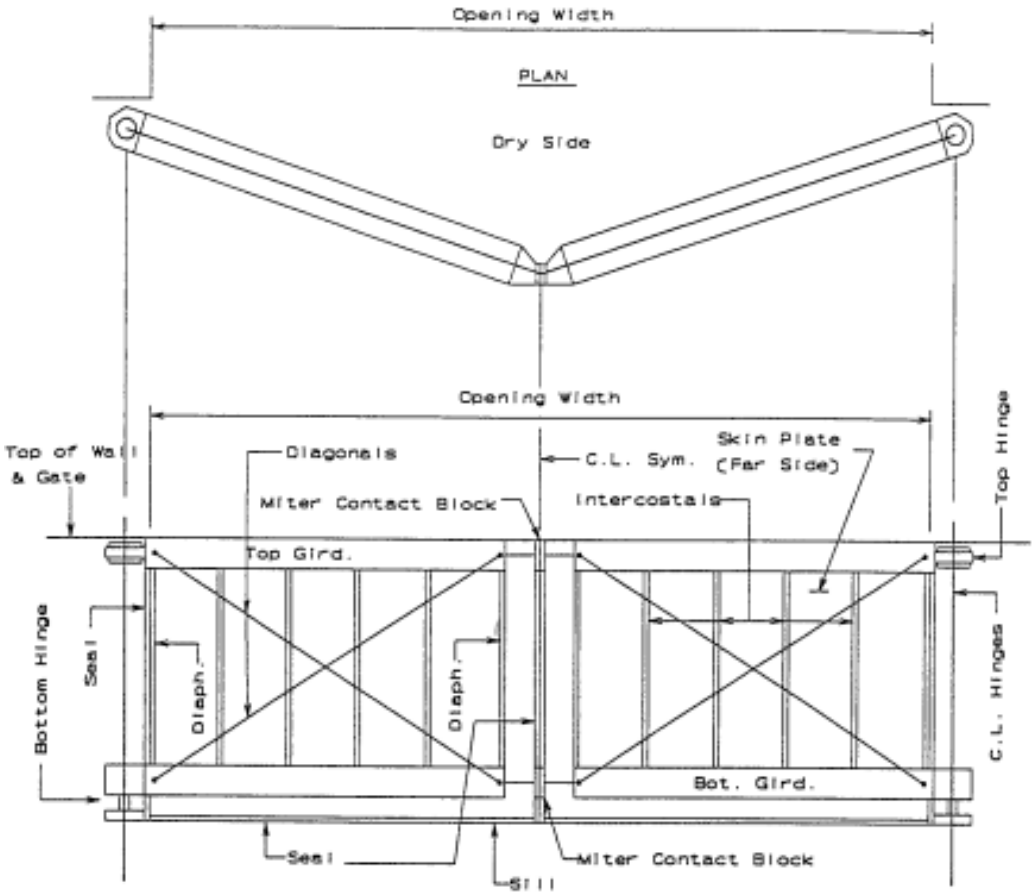

Figure 5: Example of a Double Swing Gate.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

2.3.2 Koali Road Floodwall

An approximately 2,510 feet long, six feet tall, and 12 feet wide at the base concrete floodwall with lava rock fascia would be installed along the left descending bank of Manoa Stream from approximately 1,430 feet upstream of Waialae Avenue downstream to the confluence of Manoa Stream with Palolo Stream. The floodwall would then continue along the right descending bank of Palolo Stream from the confluence of Manoa Stream with Palolo Stream upstream to the St. Louis Drive Bridge (Figure 6). The concrete floodwall would be an L-wall on macropiles as described above for the Woodlawn Drive Floodwall (Figure 3). For construction, clearing and grubbing would occur along the left-descending bank of Manoa Stream for the length of the proposed L-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Similarly, clearing and grubbing would occur along the right-descending bank of Palolo Stream for the length of the proposed L-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the streams. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the L-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the six-foot vertical portion of the L-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the L-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the L-wall would occur.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Figure 6: Koali Road Floodwall Proposed Project Footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

For the Koali Road Floodwall, two concrete drainage structures would be constructed to provide interior drainage of stormwater flows from the residential neighborhood behind the Koali Road floodwall. The two concrete drainage structures would be approximately two feet tall by two feet wide by 50 feet long. Each drainage structure is anticipated to impact potentially 50 linear feet of stream. In addition, each drainage structure would require the excavation of approximately 38 CY of material and the placement of approximately 19 CY of fill material once the concrete structures are put in place. Therefore, these two drainage structures could result in the placement of approximately 38 CY of fill material into waters of the U.S. For visual purposes, concrete drainage structures could be similar in design to that shown in Figure 7. As seen in the figure, in-water work is restricted to where the concrete pipe outlets into the adjacent stream and where the concrete apron (if necessary) extends into the stream. Erosion protection such as the concrete apron and/or riprap may also be placed around the structure where it outlets into the stream channel.

Figure 7: Example of Concrete Drainage Structure.

The Koali Road Floodwall also includes retrofitting two existing smaller stormwater culverts with flap gates. For visual purposes, the flap gates could be like those shown in Figure 8, but would be scaled in size to the existing drainage structure opening. As seen in the figure, the retrofitting of a flap gate requires attachment of the flap gate to an existing drainage structure. No excavation or placement of fill, other than the flap gate, would occur within waters of the U.S.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Figure 8: Example of Flap Gates.

Lastly, the Koali Road Floodwall includes two road closure structures, one across Koali Road and one across a pedestrian bridge that crosses Palolo Stream. The road closure structures are assumed to be swing gates (Figure 4). Swing gates require hinges to be attached to the floodwall and potentially a removable center post attached to the middle of the roadway if a double gate leaf is necessary (Figure 5). The road closure structures would require minor modifications as described above to the floodwalls for prefab gates. No in-water work is anticipated for the construction of the Koali Road Floodwall or the road closure structures.

2.3.3 Ala Wai Golf Course Detention Basin

An approximately 8,315 feet long, nine feet tall, and 66 feet wide at the base (12 feet wide at the crown) earthen berm (i.e., levee) would be constructed around the Ala Wai Golf Course to create a detention basin. The earthen berm would be adjacent to the left descending bank of the Manoa-Palolo Canal and the right descending bank of the Ala Wai Canal (Figure 9). For construction, clearing and grubbing would occur along the entire proposed length of the earthen berm and at a width of up to 126 feet, where space allows, to accommodate construction equipment. Following clearing and grubbing, fill material would be brought via dump trucks and equipment such as bulldozers, skid steers, rollers, and backhoes would be used to place the fill material and form it into an earthen levee. On the left-descending bank of the Manoa-Palolo Canal, there would be an overtopping spillway section approximately 100-feet in length that would be reinforced with erosion protection such as riprap. The erosion protection would be placed on the upland side as the Manoa-Palolo Canal in this area is already lined with erosion protection on the canal side. Once construction of the earthen berm is complete, the earthen berm as well as adjacent upland areas that were temporarily disturbed during construction would be revegetated with a native grass seed mix and/or grass seed mix appropriate for the maintenance of the golf course area. In addition to the overtopping spillway an existing drainage ditch that runs along the north side of the golf course, parallel to Date Street would be used as an inlet for storm waters from the Manoa-Palolo Canal to overflow into the detention basin. The modification of this existing drainage structure would potentially require the excavation of approximately 170 CY of material and the placement of approximately 83 CY of riprap fill material. Approximately 50 linear feet of stream is expected to be temporarily disturbed during construction while approximately 39 linear feet of stream would be within the permanent project footprint. A second small inlet channel would be excavated and lined with erosion control material to further improve storm water flow into the detention basin. This inlet channel would

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

connect to the existing drainage ditch that runs along the north side of the golf course and outlet in the detention basin. The creation of this small inlet channel would require the excavation of approximately 3 CY of material and the placement of approximately 2 CY of riprap material. Approximately 50 linear feet of the existing drainage ditch would be temporarily disturbed by the construction of this inlet channel, with approximately 10 linear feet of the existing drainage ditch remaining within the permanent project footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

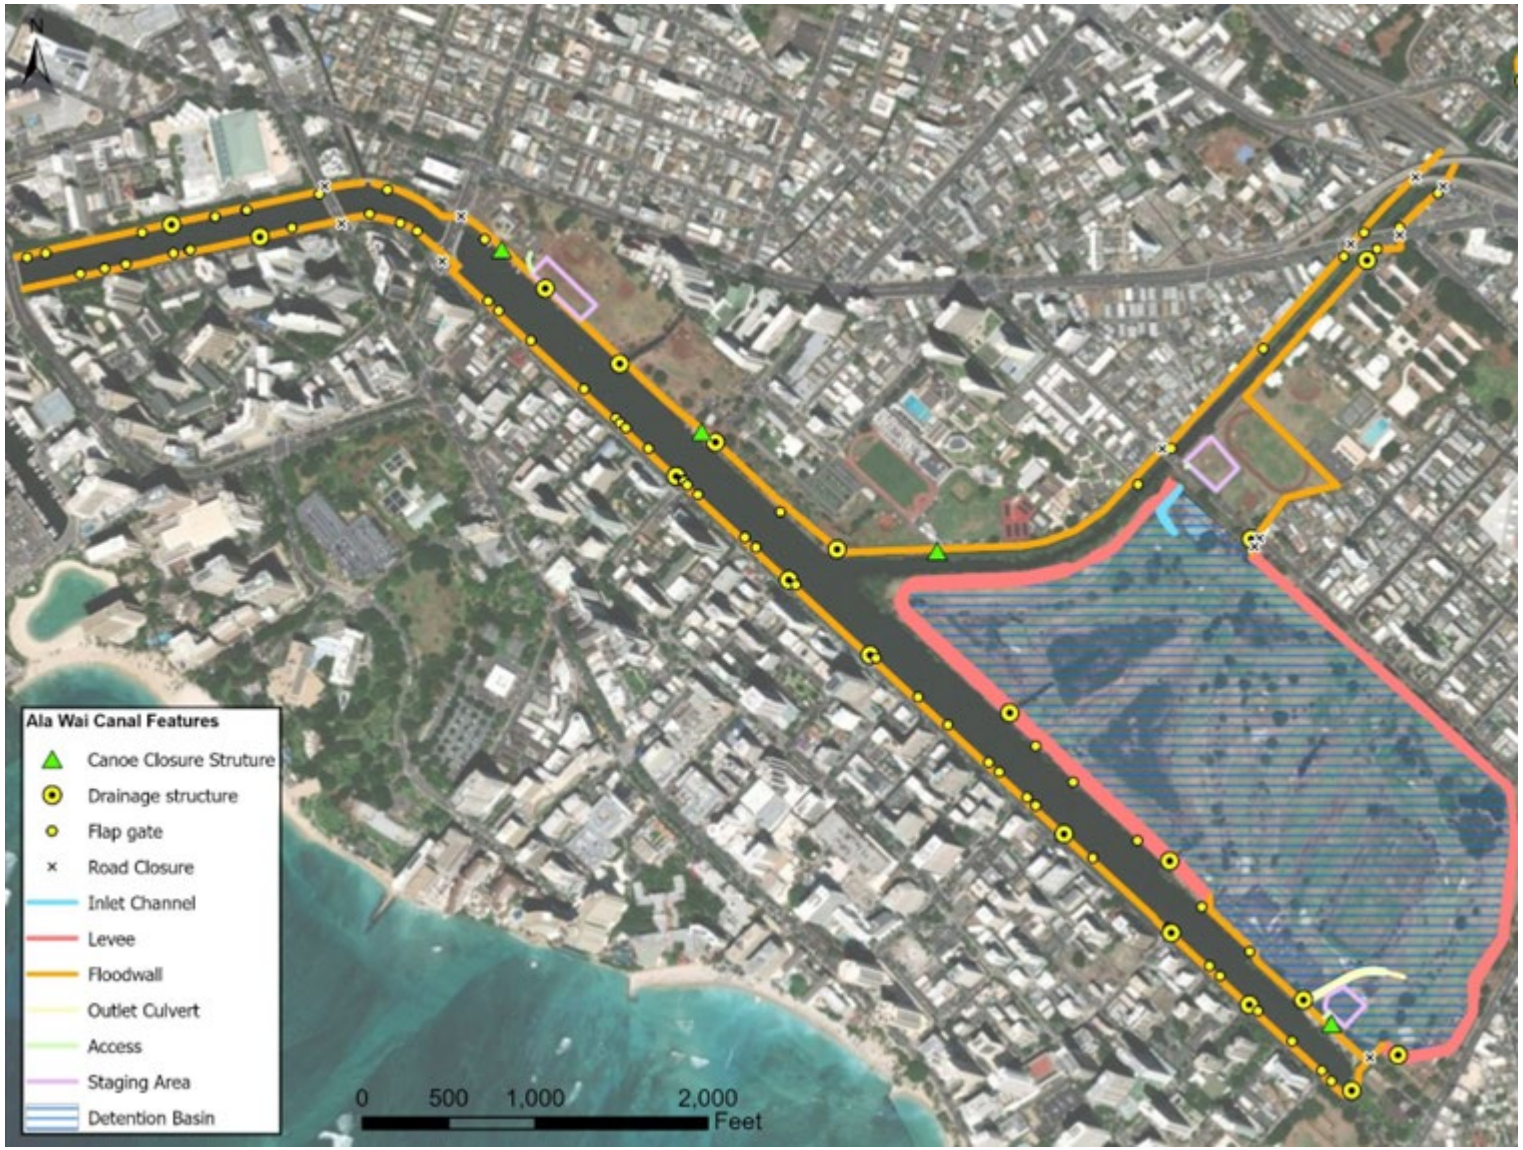

Figure 9: Ala Wai Canal Floodwall and Ala Wai Golf Course Detention Basin Proposed Project Footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The Ala Wai Golf Course Detention Basin also includes an approximately 2,409 feet long, nine feet tall, and 12 feet wide at the base L-wall floodwall. The L-wall floodwall would primarily be located along the front of the Ala Wai Golf Course Clubhouse and would tie into the earthen berm described above (Figure 9). The concrete floodwall would be an L-wall on macropiles as described above for both the Woodlawn Drive and Koali Road Floodwalls (Figure 3). For construction, clearing and grubbing would occur along the right-descending bank of the Ala Wai Canal for the length of the proposed L-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the canal. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the L-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the nine-foot vertical portion of the L-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the L-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the L-wall would occur.

For the golf course detention basin, five existing drainage structures/ditches would be modified. Four of the drainage structures would be concrete weirs with flap gates constructed along the levee alignment to allow collected storm water within the detention basin and from local runoff to slowly drain into the Ala Wai Canal. These four drainage structures combined would potentially impact approximately 200 linear feet of canal with approximately 69 linear feet of canal remaining within the permanent project footprint. In addition, the placement of these four drainage structures would require the excavation of approximately 180 CY of material and the placement of approximately 89 CY of fill into waters of the U.S. after the placement of the concrete drainage structures. For visualization purposes of the concrete drainage structures refer to Figure 7 and Figure 8. The fifth drainage structure would modify the existing drainage outlet near the Golf Course Clubhouse by enclosing this outlet in a concrete box culvert (instead of daylighted as it currently is) and installing flap gates at the downstream end of the concrete box culvert. The modification of this existing drainage structure would require the excavation of approximately 1,179 CY of material and the placement of approximately 571 CY of material around the concrete box culvert once placed. Approximately 505 linear feet of the existing drainage ditch would be temporarily disturbed as well as be within in the permanent project footprint.

Lastly, the Ala Wai Golf Course Detention Basin includes one road closure structure across the Maintenance Driveway for the Ala Wai Golf Course and one outrigger canoe launch access structure. Both of these structures are assumed to be swing gates (Figure 4). A swing gate requires hinges to be attached to the floodwall and potentially a removable center post attached to the middle of the roadway/launch pad if a double gate leaf is necessary (Figure 5). The structure would require minor modifications as described above to the floodwall for prefab gates. No in-water work is anticipated for the construction of the Ala Wai Golf Course earthen berm/L-wall or the road closure/outrigger canoe launch access structures.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

2.3.5 Ala Wai Canal Floodwall

An approximately 22,852 feet long, six feet tall, and six to 12 feet wide at the base floodwall would be constructed around the Ala Wai Canal (including Manoa-Palolo Canal). Essentially the floodwall would extend along both banks of the Manoa-Palolo Canal from Lunalilo Freeway downstream to the confluence of the Manoa-Palolo Canal with the Ala Wai Canal (except the area where the earthen berm for the Ala Wai Golf Course Detention Basin would be located along the left-descending bank of the Manoa-Palolo Canal) (Figure 9). The floodwall would then extend along both banks of the Ala Wai Canal from where it begins near the Ala Wai Golf Course (near Kapahulu Avenue) downstream to the Ala Moana Boulevard Bridge (except the area where the earthen berm/L-wall for the Ala Wai Golf Course Detention Basin would be located along the right descending bank of the Ala Wai Canal) (Figure 9). The Ala Wai Canal Floodwall would be comprised of three different types of walls: J-wall on macropiles (17,125 feet), L-wall on macropiles (4,069 feet), and tieback I-wall (1,658 feet).

The L-wall on macropiles is primarily located along both banks of the Manoa-Palolo Canal and a small portion of the Ala Wai Canal near Kapahulu Avenue (Figure 10). The concrete L-wall on macropiles would be the same as that described above for the Woodlawn Drive, Koali Road, and Ala Wai Golf Course floodwalls (Figure 3). For construction, clearing and grubbing would occur along both banks of the Manoa-Palolo Canal and the small section of wall near Kapahulu Avenue for the length of the proposed L-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the canals. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the L-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the six-foot vertical portion of the L-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the L-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the L-wall would occur.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

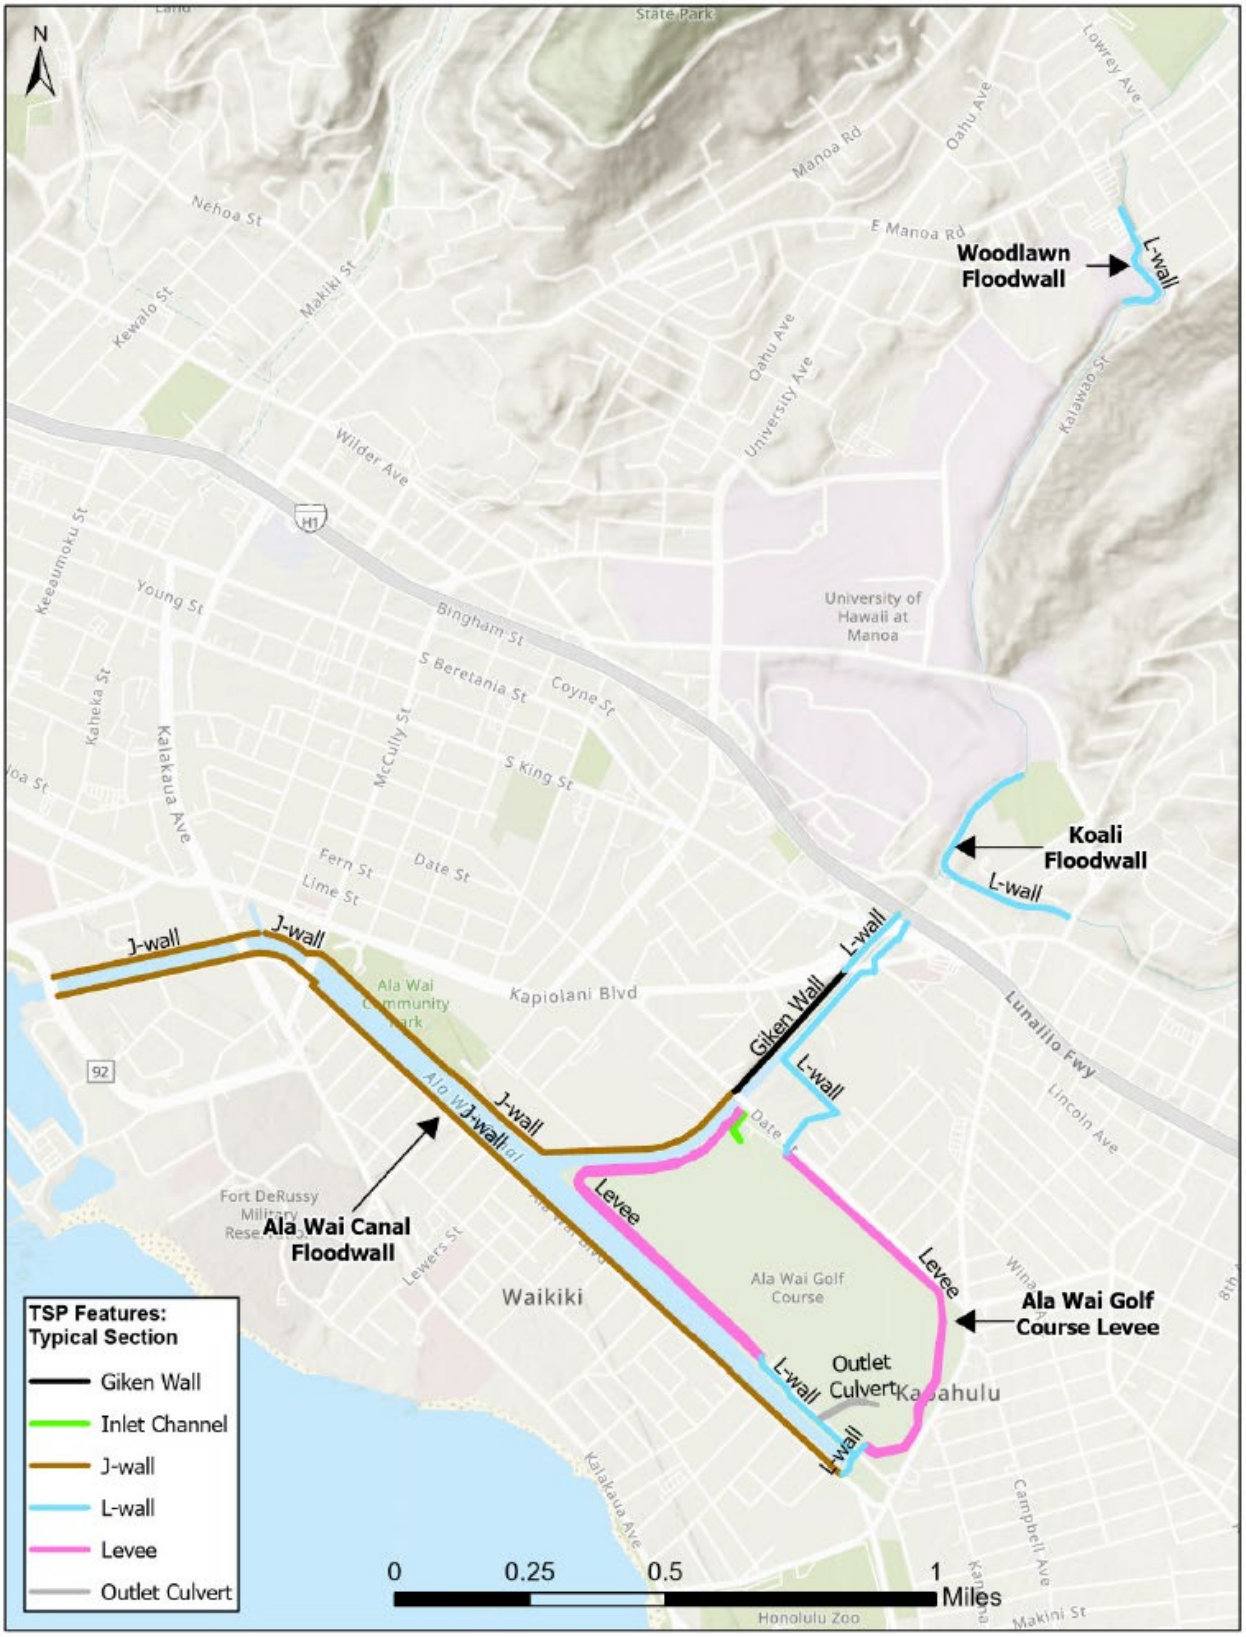

Figure 10: Floodwall Types for Each Measure.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The tieback I-wall is located along the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard downstream to Date Street (Figure 10). For construction, clearing and grubbing would occur along the right-descending bank of the Manoa-Palolo Canal for the length of the proposed tieback I-wall and up to 66 feet in width, where space allows, to accommodate construction equipment. Due to the space constrictions in this area, a 15-feet-wide rock bench would be placed in-stream running parallel to the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard downstream to Date Street (Figure 11). The 15-feet-wide rock bench would provide a work platform for construction equipment. The rock bench would include the placement of temporary fill into waters of the U.S., but this fill would be removed once construction of the tieback I-wall is complete. Following clearing and grubbing and the placement of the temporary rock bench, steel sheetpile would be installed using the press-in method of installation, such as that used by Giken Ltd. Equipment required for the press-in method would be a crane to hold the steel sheetpile and a generator to run the press-in equipment. The steel sheetpile would not be driven into the ground using an impact hammer nor would it be vibrated into the ground using a vibratory hammer. Once the steel sheetpile is in place, tieback soil anchors for stabilization of the wall would be placed six feet below grade. After the tieback I-wall installation is complete, the steel sheetpile wall extending above grade would be encased in concrete and then covered with a lava rock fascia. Lastly, revegetation of disturbed upland areas, minus the area occupied by the tieback I-wall would occur.

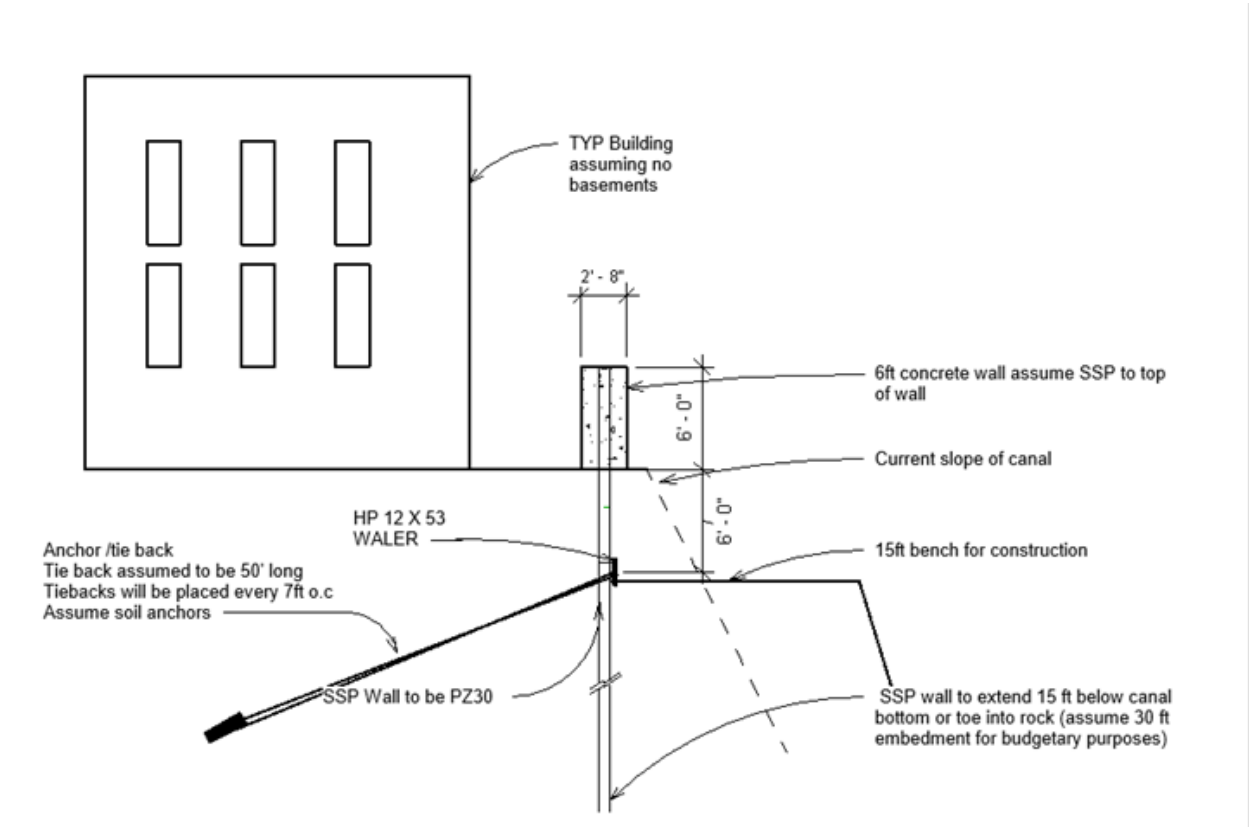

Figure 11: Design Layout of a Tieback I-Wall.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The J-wall (Figure 12) is located along the right-descending bank of the Manoa-Palolo Canal downstream of Date Street and essentially along both banks of the Ala Wai Canal, except the section next to the Ala Wai Golf Course Detention Basin (Figure 10). For construction, clearing and grubbing would occur along the right-descending bank of the Manoa-Palolo Canal and along both banks of the Ala Wai Canal for the length of the proposed J-wall and up to 72 feet in width, where space allows, to accommodate construction equipment. Following clearing and grubbing, macropiles would be drilled into the upland area adjacent to the canals. A drill rig and associated drilling equipment would be staged upland and used to advance the macropile steel casing to the design depth. Where the drill hole can stay open without steel casing, an open hole can be advanced to design depth, and the casing then installed. Reinforcing the steel in the form of an all-thread bar or concentric pipes is inserted into the steel casing pipe, and high-strength grout is then pumped in by tremie. Form work would then occur to establish the 12-foot base of the J-Wall (i.e., the horizontal footing of the wall). Cement trucks would be used to pump cement into the base form. Once set, form work would occur for the six-foot vertical portion of the J-wall and cement trucks would once again be used to bring in the cement and pump it into the vertical form. Once the concrete is set, lava rock fascia would be placed on both sides of the vertical portion of the J-wall. Lastly, revegetation of disturbed upland areas, minus the area occupied by the J-wall would occur.

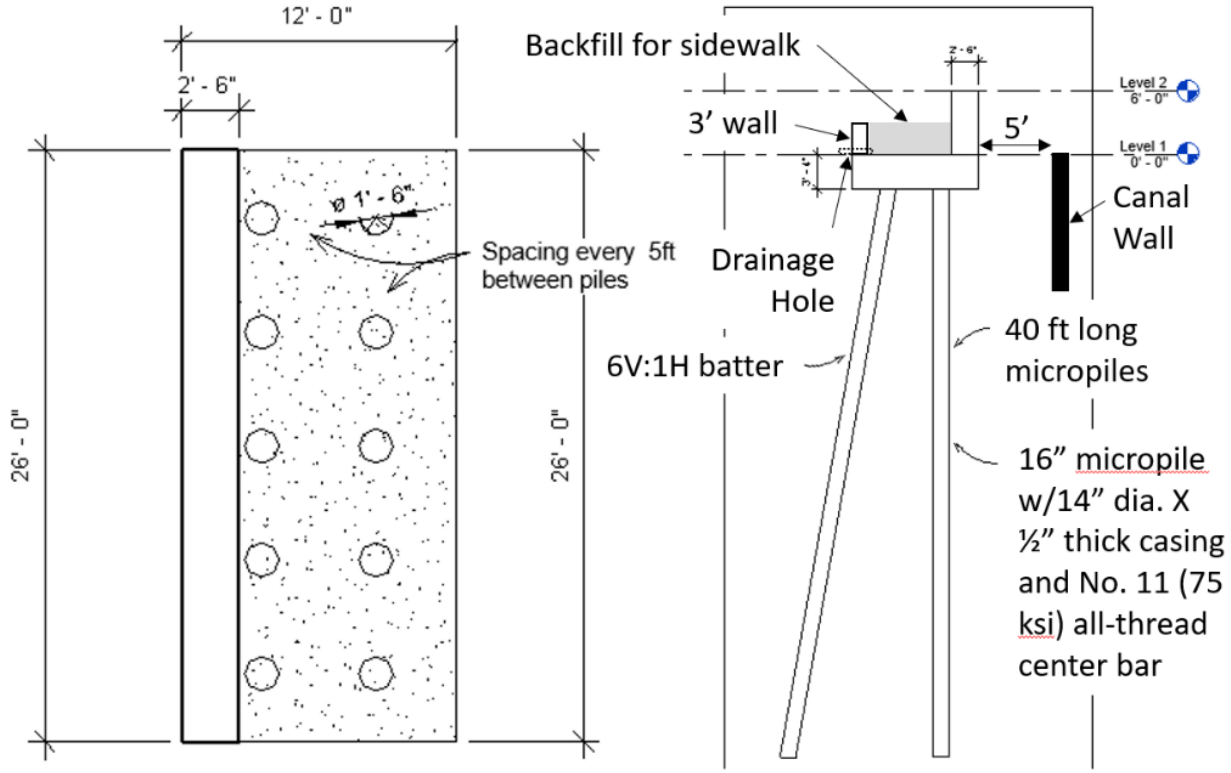

Figure 12: J-wall Typical Cross Section and Layout.

For the Ala Wai Canal Floodwall, 14 concrete drainage structures would be constructed to provide interior drainage of stormwater flows from the areas behind the Ala Wai Canal floodwall. The concrete drainage structures would vary in size. Overall, the 14 drainage structures are expected to potentially impact 700 linear feet of canal during construction with approximately 130 linear feet of canal remaining in the project's permanent footprint. Approximately 76 CY to material would be excavated total for placement of the 14 drainage structures with

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

approximately 46 CY of fill material being placed in waters of the U.S. to fill in around the concrete drainage structures once placed. For visual purposes, concrete drainage structures could be similar in design to that shown in Figure 7. As seen in the figure, in-water work is restricted to where the concrete pipe outlets into the adjacent canal and where the concrete apron (if necessary) extends into the canal. Erosion protection such as the concrete apron and/or riprap may also be placed around the structure where it outlets into the canal.

The Ala Wai Canal Floodwall also includes retrofitting 59 existing smaller stormwater culverts with flap gates. For visual purposes, the flap gates could be like those shown in Figure 8, but would be scaled in size to the existing drainage structure opening. As seen in the figure, the retrofitting of a flap gate requires attachment of the flap gate to an existing drainage structure. No excavation or placement of fill, other than the flap gate, would occur within waters of the U.S.

Lastly, the Ala Wai Canal Floodwall includes 11 road closure structures and 3 outrigger canoe launch access structures. All of these structures are assumed to be swing gates (Figure 4). A swing gate requires hinges to be attached to the floodwall and potentially a removable center post attached to the middle of the roadway/launch pad if a double gate leaf is necessary (Figure 5). The structure would require minor modifications as described above to the floodwall for prefab gates. No in-water work is anticipated for the construction of the Ala Wai Canal Floodwall or the road closure/outrigger canoe launch access structures.

2.3.6 Mitigation Measures

Mitigation measures related to induced flooding include potentially adding permanent pump station(s) of moderate to large size, ranging from 500 to 20,000 cubic feet per second (cfs). At the time of compiling this Draft Report, it is unknown as to the number of pumps that may be necessary to minimize induced flooding, the size of the pumps, or the location of pumps within the watershed. Although likely not to be implemented due to cost, if a pump station were found to be necessary during the Preconstruction Engineering and Design (PED) phase of the project, it would likely be located along Makiki Stream to reduce induced flooding. In general, the pump station would be constructed upland and adjacent to Makiki Stream, but not located within the stream. A permanent pump station would likely consist of a wet well installed in a low-lying area where water naturally flows. The wet well would consist of a concrete inlet box with mesh screens for debris and wildlife protection, hinged lid for pump removal for maintenance, etc. The outlet from the wet well would be routed to the Ala Wai Canal floodwall and would either pass over the wall or through it with a check valve to prevent inflow from the river side. The wet well would connect to a pump house. The pump house would be elevated and would hold the electrical infrastructure and other operating equipment, and a backup generator to minimize pump failure in the event of power disruption. The pump station would only be triggered to begin operating in the event of a storm event; therefore, much of the time the pump station would not be in operation.

Nonstructural measures that are under consideration as potential mitigation measures for induced flooding include floodproofing, elevation, and potentially acquisition. Dry floodproofing involves sealing flood prone structures from water with door and window barriers, small scale rapid deployable floodwalls, or sealants. Dry floodproofing is generally feasible and effective up to a maximum height of three feet above ground level. Floodproofing is only recommended for non-residential structures such as commercial buildings and critical infrastructure that cannot be elevated due to their large size. Elevation of structures is limited to residential structures, largely single-family homes. Whether a structure may be elevated depends on several factors including the foundation type, size of the structure, condition, etc. Elevating a home so that the finished

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

floor is at a height where it is less likely that the structure and/or contents will be damaged by flooding. Due to structural constraints and wind loading concerns, a maximum height for residential structure elevation was established at 12 feet above ground level.

2.3.7 Staging Areas

The staging area for the Woodlawn Drive floodwall is proposed to be at Noelani Elementary School and would be approximately 0.7 acre (Figure 2).

The staging area for the Koali Road floodwall is proposed to be at Kanewai Community Park located at the north end of the project footprint. This staging area would be approximately 0.6 acre (Figure 3).

The Ala Wai Canal Floodwall and the Ala Wai Golf Course Detention Basin three potential staging areas (Figure 9). The staging area for the Ala Wai Canal right bank floodwall is proposed to be at Ala Wai Community Park and would be approximately 1 acre. The staging area for the Ala Wai Canal left bank floodwall is proposed to be at Ala Wai Golf Course and would be approximately 0.7 acre. The staging area on the Ala Wai Golf Course would also be used as the staging area for the Ala Wai Golf Course Detention Basin. The Ala Wai Canal left bank floodwall may also stage construction equipment and materials at the Ala Wai Community Park as described for the Ala Wai Canal right bank floodwall above. Lastly, the staging area for the Manoa-Palolo right bank and left bank floodwalls as well as the Kaimuki High School floodwall is at Kaimuki High School and would be approximately 1 acre. Overall, there are five potential staging areas for the entire Proposed Action equaling a total of 4 acres.

2.3.8 Site Access and Haul Routes

For disposal, the haul route would begin at the project footprint and end at the commercial landfill for Oahu, Waimanalo Gulch Sanitary Landfill, located approximately 28 miles west of the project action area (Figure 13); note distance varies depending on project feature location. Construction equipment and haul trucks would utilize temporary construction haul roads and existing roadways (e.g., Interstate H-1).

Organic materials, trees, shrubs, as well as inorganic materials, would be disposed of by hauling to the Waimanalo Gulch Sanitary Landfill (Figure 13). Disposal of these materials by burning or burying at the project footprint would not be permitted. Although it is not anticipated that hazardous substances would be present in the material removed, prior to disposal, the collected material would undergo testing (by the contractor) to determine appropriate disposal techniques.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

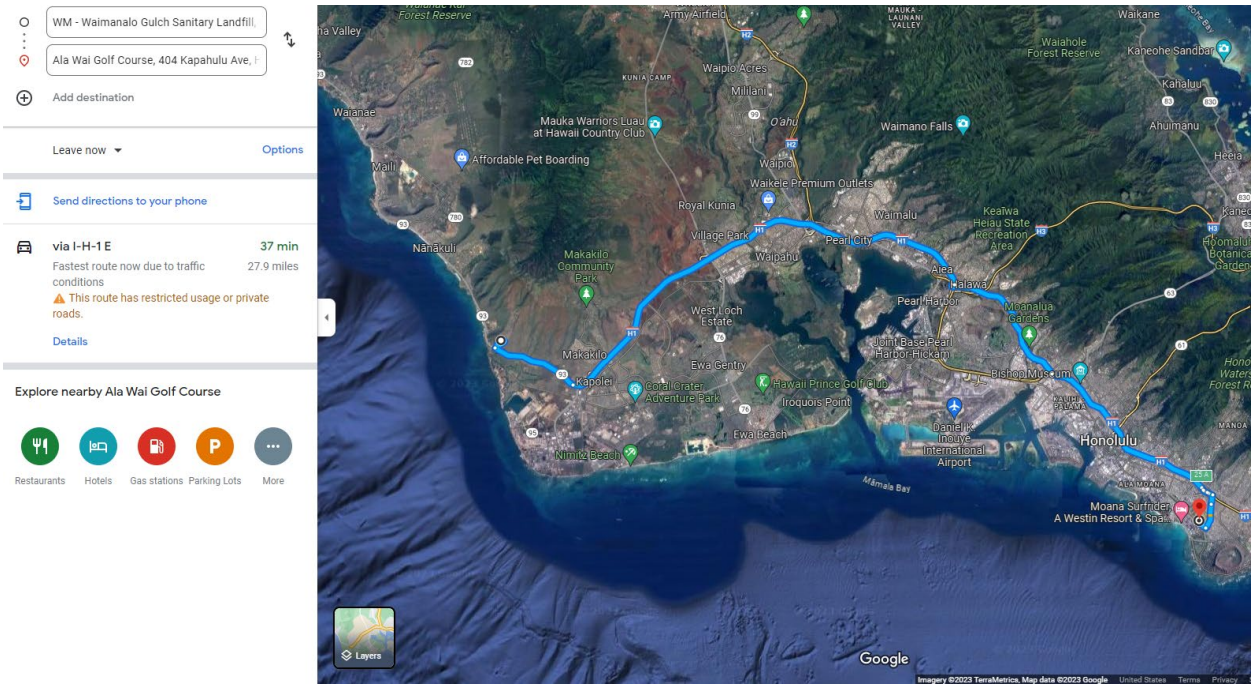

Figure 13: General Haul Route from the Proposed Project Action Area to Nearest Sanitary Landfill.

2.3.9 Construction Equipment

Construction equipment would likely include a combination of water trucks, waste trucks, haul trucks, crawler and front-end loaders, pile driver, dozers, skid-steers, excavators, loaders, and pickup trucks.

2.3.10 Construction Schedule

Construction could begin as early as 2027 and is expected to take approximately four years. It is possible that the Proposed Action would be constructed in stages, with multiple start dates and construction periods for various features depending on funding, environmental windows, and weather delays. Construction phasing may result in an extension of the overall project duration beyond four years.

Proposed construction hours would be 7:00 a.m. to 7:00 p.m., Monday through Friday, and 8:00 a.m. to 7:00 p.m. on Saturday. Occasional overtime work may be required to maintain the construction schedule, but timing would comply with local noise ordinances. Any construction lighting that may be required during dawn and dusk hours to illuminate a work area would use low mounting height, wattage, and lumens. Construction lighting would also be shielded to help direct the light down to the work area where it is needed. Lastly, lights with longer wavelengths (560 nanometers or longer) would be used when feasible.

2.4 Future Operation, Maintenance, Repair, Replacement, and Rehabilitation

Maintenance, including routine inspections and minor repairs of the project and its associated features, would be required after construction is completed. The following activities may occur:

- Routine and special inspection with pickup trucks and sport utility vehicles, as needed, and up to daily during flood events.

- Vegetation management where floodwalls and earthen berms are located. Vegetation management in the areas with floodwalls would be in accordance with Corps of Engineers Engineering Pamphlet 1110-2-18; at a minimum 15-feet down slope of the floodwall would need to be a vegetation free zone (VFZ). The VFZ applies to all vegetation except for grasses for the purpose of erosion control.
- Periodic clearing of debris around inlet/outlet structures.
- Periodic clearing of accumulated sediment and debris from detention basin.
- Periodic vegetation management such as weeding, herbicide application, and re-seeding.
- Periodic graffiti removal and vandalization repair.

Rarely, following large and erosive flood flows, larger-scale maintenance and repairs may be required, which could require access and use of heavy equipment within the floodplain adjacent to the project feature. A temporary work area may need to be established around a repair site. The local sponsor would be required to obtain emergency or standard permits from regulatory agencies, including Corps Regulatory, who would coordinate and consult, if needed, with the U.S. Fish and Wildlife Service (USFWS) and NMFS. These permits would likely require active habitat restoration of temporary construction and access roads. It is likely that a storm event large enough to damage the detention basins and/or floodwalls would also have removed vegetation in the immediate area, but specific impacts cannot be evaluated until or unless damage occurs, and repair work is defined.

2.5 Proposed Avoidance and Minimization Measures Included as Part of the Proposed Action

USACE has formulated a Site-Specific BMP Plan identifying all measures that would be implemented before, during, and after construction to avoid and/or minimize project-related impacts to the natural and human environment. The following BMP's are considered part of the proposed action and would be implemented, as applicable, to avoid and/or minimize adverse impacts, specifically to EFH. Rationale for implementation of each BMP as it relates to EFH is also provided below.

- Restrict turbidity-generating construction activities and remove sediment containment BMPs overnight during specific coral production timeframes (e.g., two to three days, or five days to be conservative, after the full moon in July and August).
    - *Rationale: The majority of larvae are released at night and elevated turbidity has the potential to adversely affect coral spawning activities. Removal of in-water sediment containment BMPs overnight would avoid disruption or restriction of night coral spawning during reproductive months.*

- The use of full length, full-surround silt curtains shall be installed during any in-water construction activities (i.e., Koali Road Floodwall – discharge structures; Ala Wai Golf Course Detention Basin – inlet and discharge structures; Ala Wai Canal Floodwall – discharge structures, etc.) to isolate and contain construction-generated turbidity, where and when such installation is effective and appropriate.
    - *Rationale: to minimize indirect impacts that have the potential to degrade water quality of surrounding harbor/nearshore marine waters and to prevent settling of suspended sediments atop adjacent habitats for coral, macroinvertebrates, and fish communities. Silt curtains are ineffective when deployed in currents,*

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

therefore, any in-water construction activities dependent upon their use would be curtailed during significant storm events when flows from streams entering the harbor/nearshore marine environment generate surface currents.

- Oil absorbent booms shall be readily available during installation of the upland floodwalls/earthen berms.
    - *Rationale: to protect against release of land-based pollutants into the soil at the groundwater interface that could infiltrate harbor/nearshore marine waters.*

- Excavated soils and sediments would be managed to ensure containment of stockpiles and to prevent return flows or run-off from entering waters of the U.S.
    - *Rationale: to avoid degradation of harbor/nearshore water quality resulting from return flow or overflow of excavated spoils.*

- An environmental observer would be on-site daily to monitor all in-water work.
    - *Rationale: this BMP is intended to cover a broad range of potential resource concerns from sea turtle and marine mammal observations to documentation of any turbidity plumes or other construction practices that may result in adverse impacts to the harbor/nearshore marine environment. The observer would play an active role in addressing and resolving environmental concerns and ensuring corrective measures are implemented in a timely matter.*

- Turbidity-generating, in-water construction activities would be halted during periods of heavy precipitation that have the potential to elevate ambient turbidity levels within the harbor.
    - *Rationale: this BMP is intended to avoid compounding construction-generated turbidity levels atop stormwater-related turbidity within the harbor/nearshore marine environment to minimize adverse impacts to EFH.*

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

3. Essential Fish Habitat Designations

EFH in the marine waters surrounding the Hawaiian Islands is described in two fishery ecosystem plans (FEPs) prepared by the Western Pacific Regional Fishery Management Council (WPRFMC). The FEP for the Hawaiian Archipelago (2009; Amendment 4, 2016; Amendment 5, 2019) specifically manages demersal resources and habitats associated with the extended Hawaiian Islands. Fisheries may comprise a group or complex of species. These fishery species are collectively referred to as management unit species (MUS).

The project action area (i.e., adjacent marine waters of Ala Wai Small Boat Harbor and the nearshore marine waters of Honolulu (Figure 14) is within the Hawaii Archipelago Fishery Ecosystem Plan (FEP) boundaries and has been identified as Essential Fish Habitat (EFH) by the Western Pacific Regional Fishery Management Council (the Council). Management unit species (MUS) are those “caught in quantities sufficient to warrant management or specific monitoring by NMFS and the Council,” and are listed in Table 1. The EFH for MUS of the Western Pacific Region (Table 2 and Table 3) are bounded by the shoreline and the seaward boundary of the EEZ, unless otherwise indicated.

Figure 14: Essential Fish Habitat (Yellow) within the Vicinity of the Proposed Project Action Area.

Table 1: Hawaii Archipelago Management Unit Species (MUS).

Scientific Name	Common Name	Local Name
Bottomfish		
Aphareus rutilans	silverjaw jobfish	lehi
Aprion virescens	gray jobfish	uku
Hyporthodus quernus	sea bass	hāpu’upu’u
Etelis carbunculus	red snapper	ehu

	Eggs & Larvae	Juveniles & Adults	
Crustaceans	**Kona crab:** • Water column down to 492 ft (150 m) • Shoreline out to EEZ boundary	**Kona crab:** • Bottom from shoreline down to 328 ft (100 m)	Yes
	Deepwater shrimp: • Outer reef slopes between 1,804 and 2,297 ft (550 and 700 m)	**Deepwater shrimp:** • Outer reef slopes between 984 and 2,297 ft (300 and 700 m)	No
Pelagic	• Water column down to 656 ft (200 m) • Shoreline to EEZ boundary	• Water column down to 3,281 ft (1,000 m) • Shoreline to EEZ boundary	Yes

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

While pelagic MUS can be found within the Hawaii Archipelago FEP boundary, they are managed under a separate Pelagic FEP, which encompasses all areas of pelagic fishing operations in the EEZ or on the high seas, for any domestic vessels that: fish for, possess, or transship Pacific Pelagic MUS (Table 4) within the EEZ waters of the Western Pacific Region or land Pacific Pelagic MUS within the states, territories, commonwealths, or unincorporated U.S. island possessions of the Western Pacific Region.

Table 4: Pacific Pelagic Management Unit Species (PMUS)

Scientific Name	Common Name
Thunnus alalunga	Albacore
Thunnus obesus	Bigeye tuna
Thunnus albacares	Yellowfin tuna
Thunnus thynnus	Northern bluefin tuna
Katsuwonus pelamis	Skipjack tuna
Euthynnus affinis	Kawakawa
Auxis spp.	Other tuna relatives
Scomber spp.	Other tuna relatives
Allothunus spp.	Other tuna relatives
Tetrapturus audax	Striped marlin
Tetrapturus angustirostris	Shortbill spearfish
Xiphias gladius	Swordfish
Istiophorus platypterus	Sailfish
Makaira mazara	Blue marlin
Makaira indica	Black marlin
Alopias pelagicus	Pelagic thresher shark
Alopias superciliousus	Bigeye thresher shark
Alopias vulpinus	Common thresher shark
Carcharhinus falciformis	Silky shark
Carcharhinus longimanus	Oceanic whitetip shark
Prionace glauca	Blue shark
Isurus oxyrinchus	Shortfin mako shark
Isurus paucus	Longfin mako shark
Lamna ditropis	Salmon shark
Coryphaena spp.	Mahimahi (dolphinfish)
Lampris spp.	Moonfish
Acanthocybium solandri	Wahoo
Gempylidae	Oilfish family
Bramidae	Pomfret family
Ommastrephes bartamii	Neon flying squid
Thysanoteuthis rhombus	Diamondback squid
Sthenoteuthis oualaniensis	Purple flying squid

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

4. Environmental Baseline Conditions Within the "Project Action Area"

As described in Section 2.1, the "Project Action Area" is defined as the marine aquatic habitat in the Ala Wai Small Boat Harbor as well as the marine aquatic habitat within 500 meters of the mouth of the Ala Wai Small Boat Harbor. The project action area is defined as the marine aquatic habitat in the Ala Wai Small Boat Harbor as well as the marine aquatic habitat within 500 meters of the Ala Wai Boat Harbor. The project action area also includes the Ala Wai Canal and Manoa-Palolo Canal and portions of adjacent uplands along these areas as well as upland areas along Manoa Stream (Woodlawn Drive floodwall) and Manoa/Palolo streams (Koali Road floodwall) that will be impacted to facilitate construction associated with the Ala Wai Canal FRM project.

4.1 Project Action Area Existing Environment

The Ala Wai Watershed has undergone major land-use changes in the past 100 years. Since 1950 the resident population of the island has more than doubled (State of Hawai'i, 2000). Honolulu, the capital city located on the island of Oahu, is now considered the most densely population city in the Nation (Fulton et al., 2001). Urbanization on Oahu has been accompanied by substantial alterations to stream systems, including changes in water quality, instream habitat, riparian habitat, and the introduction of nonnative species. An extensive study conducted in the 1970s, showed that 57 percent of the streams on the island of Oahu had been channelized, 58 percent had water exported from them, and all had roads crossing over them (Timbol and Maciolek, 1978). Modifications of the stream ecosystems have been most severe at the lower elevations where urban growth is greatest (Timbol and Maciolek, 1978). Artificially straightened reaches with concrete-lined flat-bottomed channels and revetted (reinforced) banks are common in the urban areas of the study area. Such modifications are commonly accompanied by removal of riparian vegetative cover, and a reduction in substrate complexity (removal of large boulders).

4.2 Project Action Area Existing Environment

The Ala Wai Small Boat Harbor is located on the south shore of Oahu between Ala Moana Park and Waikiki Beach (DLNR and DOBAR, 2022). It was first constructed from a barge channel in the 1900s and has been periodically enlarged over time to its current state. It is the largest small boat harbor in Hawaii and is managed and administered by the State of Hawaii Department of Land and Natural Resources (DNLR) Division of Boating and Ocean Recreation (DOBOR). Small boat harbors managed by DOBOR are constructed, maintained, and operated for the purposes of: (1) recreational boating activities; (2) landing of fish; and (3) commercial vessel activities. Currently, the Ala Wai Boat Harbor contains 699 berths with docks, 85 moorings, and 22 dry storage spaces and can accommodate vessels up to 85 feet in length. Water depths within the Ala Wai Small Boat Harbor range down to 15 feet (4.6 meters) (DLNR and DOBAR, 2022).

Ala Wai Small Boat Harbor receives surface runoff via sheet flow and drainage outlets and drainage from Ala Wai Canal which have the potential to convey terrigenous sediments into Ala Wai Small Boat Harbor during precipitation events. During storm events, storm runoff can result in temporary increases in nutrients, pollutants, and sediments in the harbor in addition to a decrease in water clarity. Harbor sediments are continually re-suspended into the water column due to recreational vessel activity (i.e., propeller wash within the harbor). Such inputs contribute to the ambient water quality of Ala Wai Harbor.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Once out of the Ala Wai Small Boat Harbor currents generally push water east/southeast towards Waikiki Beach (Figure 15). Waikiki Beach extends along the shoreline of Mamala Bay on the south shore of Oahu, Hawaii. Waikiki is a predominantly engineered shoreline. Almost the entire length of Waikiki is armored by seawalls that were constructed in the early 1900s. The beaches of Waikiki are primarily man-made and composed almost entirely of sand that has been imported from various terrestrial sources, other beaches, and dredged from offshore deposits. The beaches of Waikiki have tremendous historical, cultural, and recreational value and are the primary amenity that supports the tourism-based economies of Waikiki, the City and County of Honolulu, and the State of Hawaii.

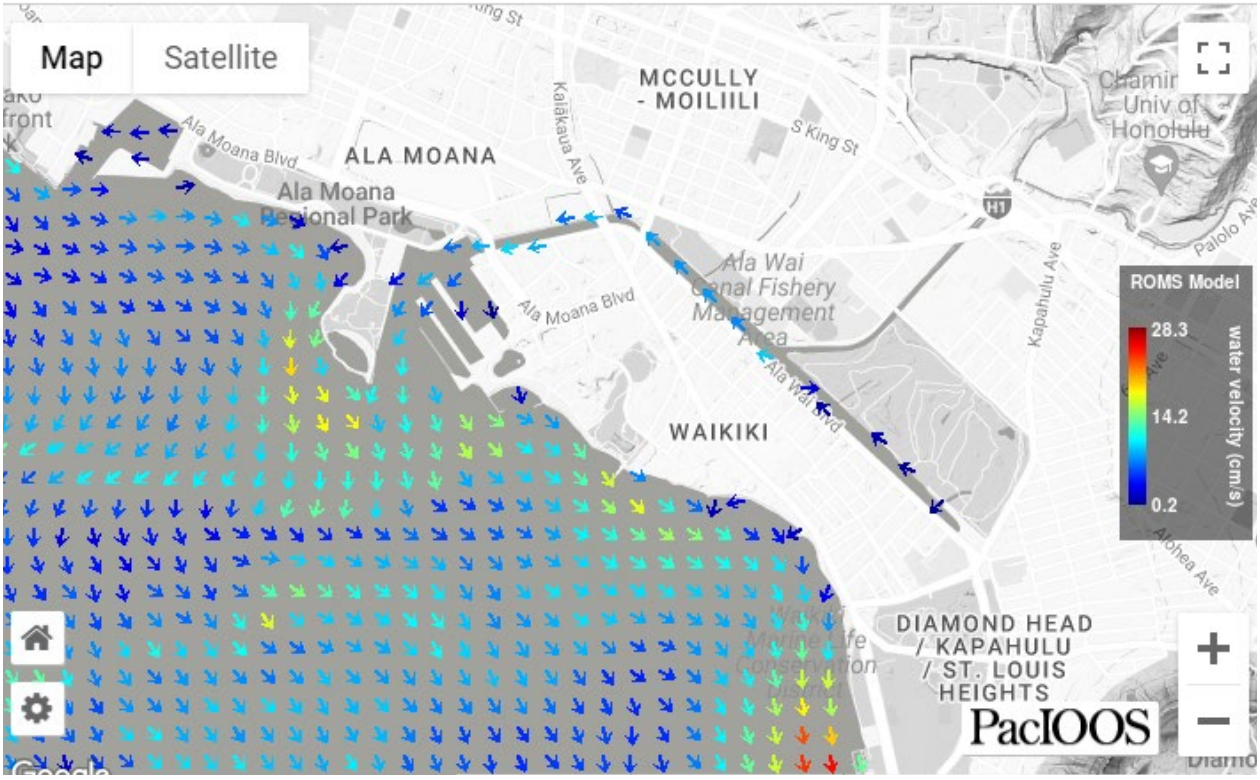

Figure 15: General characterization of current patterns out of Ala Wai Small Boat Harbor (PacIOOS, 2023).

The waters of Ala Wai Small Boat Harbor and nearshore waters from Ala Moana Beach to Waikiki Beach appear on the Hawaii Department of Health (HDOH) 2022 list of impaired waters prepared under Clean Water Act §303(d) (HDOH, 2022). This designation indicates that waters in these areas do not meet certain applicable water quality standards. Nearshore waters from Ala Moana Beach to Waikiki Beach are listed as impaired for turbidity.

The Ala Wai Canal and Ala Wai Small Boat Harbor (State Waterbody ID: HIW00050) are on the 303(d) List of Water Quality Limited Segments. Ala Wai Canal and Boat Harbor (ID: HIW00050) is listed as impaired for aquatic life, swimming and boating, and other due to Enterococci (bacteria), TN, NO_3+NO_2, total phosphorus, turbidity, pathogens, metals, total suspended solids, organochlorine pesticides, and lead. There is also a fish consumption advisory for fish caught within the Ala Wai Canal and Boat Harbor. TMDLs for total nitrogen and total phosphorus were approved in 1996 and revised in 2022 for the Ala Wai Canal and Boat Harbor. Beaches

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

southeast of the Ala Wai Small Boat Harbor that are on the 2022 list of impaired waters include Kahanamoku Beach (State Waterbody ID: HI366432), Kuhio Beach (State Waterbody ID: HI681782), Kuhio Beach (Public Bath) (State Waterbody ID: HI851298), and Waikiki Beach Center (State Waterbody ID: HI244505). Kahanamoku Beach is listed as impaired due to turbidity and chlorophyl *a*. Kuhio Beach is listed as impaired due to NO_3+NO_2, NH_4, turbidity, and chlorophyl *a*. Kuhio Beach (Public Bath) is listed as impaired due to NH_4, turbidity, and chlorophyl a. Lastly, Waikiki Beach Center is listed as impaired due to turbidity.

4.3 U.S. Fish and Wildlife Service's Survey of the "Project Action Area"

The U.S. Fish and Wildlife Service, as part of their Draft Coordination Act Report on the Ala Wai Project (USFWS, 2023), surveyed the geomorphological structure and benthic habitat characteristics at Waikiki Beach from the Ala Wai Canal exit (Ala Moana Bowls) to the jetty at the southeastern end of Ft. DeRussy. Surveys covered approximately 78 miles (125 kilometers) of reef as the crow flies, from shore to the forereef or surf zone. Surveys were limited to the reef flats and intertidal zones in some cases where surf conditions made the reef crest and forereef inaccessible (USFWS, 2023).

The target area, as defined for the Ala Wai Canal Project, included the marine aquatic habitat within 1,640 ft (500 m) of the mouth of Ala Wai Harbor (USFWS, 2023). USFWS biologists considered the harbor mouth to be the discharge site for Ala Wai Canal effluent waters, and marine resources within 1,640 ft (500 m) of the discharge site to be the most likely to be impacted by the proposed project. The project action area included the target area and the surveyed area, plus a 328 ft (100 m) buffer around both (Figure 16). While the project action area was intended to cover the likely area of both direct and indirect effects, it may be larger or smaller than actual potential impacts (USFWS, 2023).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

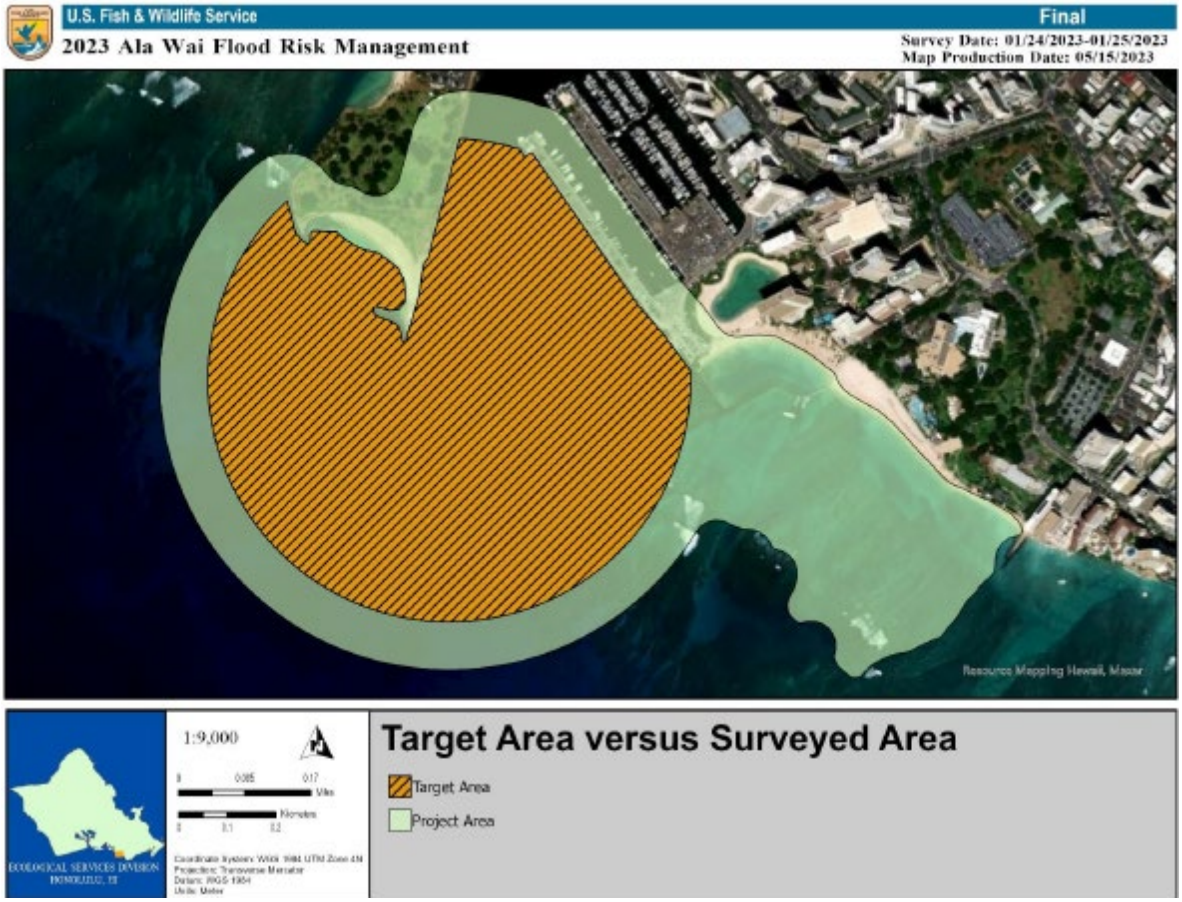

Figure 16: Map of the Target Area (1,640 ft [500-meter] radius from Ala Wai Canal Discharge point) and the Project Action Area (Target and surveyed area plus 100-meter buffer) (USFWS, 2023).

The total area surveyed by USFWS was 7,495,696 ft^2 (696,373 m^2) (USFWS, 2023). The geomorphological habitat structures were made up of Land (0.5 percent), Scattered Coral Rock in Unconsolidated Sediment (15.9 percent), Artificial (0.9 percent) Unconsolidated Sediment (0.1 percent), Pavement (15.0 percent), Pavement with Sand Channels (3.4 percent), Reef Hole (0.2 percent) and Unknown (64.0 percent). Unknown classifications represented areas with insufficient data. The habitat zones included Land (0.5 percent), Harbor (14.9 percent), Reef Flat (19.4 percent), Reef Crest (3.9 percent), Fore Reef (19.7 percent), and Bank/Shelf (41.9 percent). The major geomorphological habitat structures included Land (0.5 percent), Mixed (19.3 percent), Hard Bottom (16.1 percent), and Unconsolidated Sediment (0.1 percent), and Unknown (64 percent). The sediment present was 89.3 percent Sand with Rubble and 10.7 percent sand mixed with Rubble and Cobble (USFWS, 2023).

The surveyed area (Figure 17) primarily included Shoreline Intertidal, Harbor, Reef Flat, and Reef Crest zones seaward of Ala Wai Boat Harbor and Waikiki Beach seaward of Ft. DeRussy (Figure 18) (USFWS, 2023). The observed area included modified intertidal beach and a mix of natural reef flat and reef flat areas that have been modified to provide access to small dug out harbors at Waikiki Beach (USFWS, 2023).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Figure 17: Map of the Project Action Area directly observed during USFWS Surveys (USFWS, 2023).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

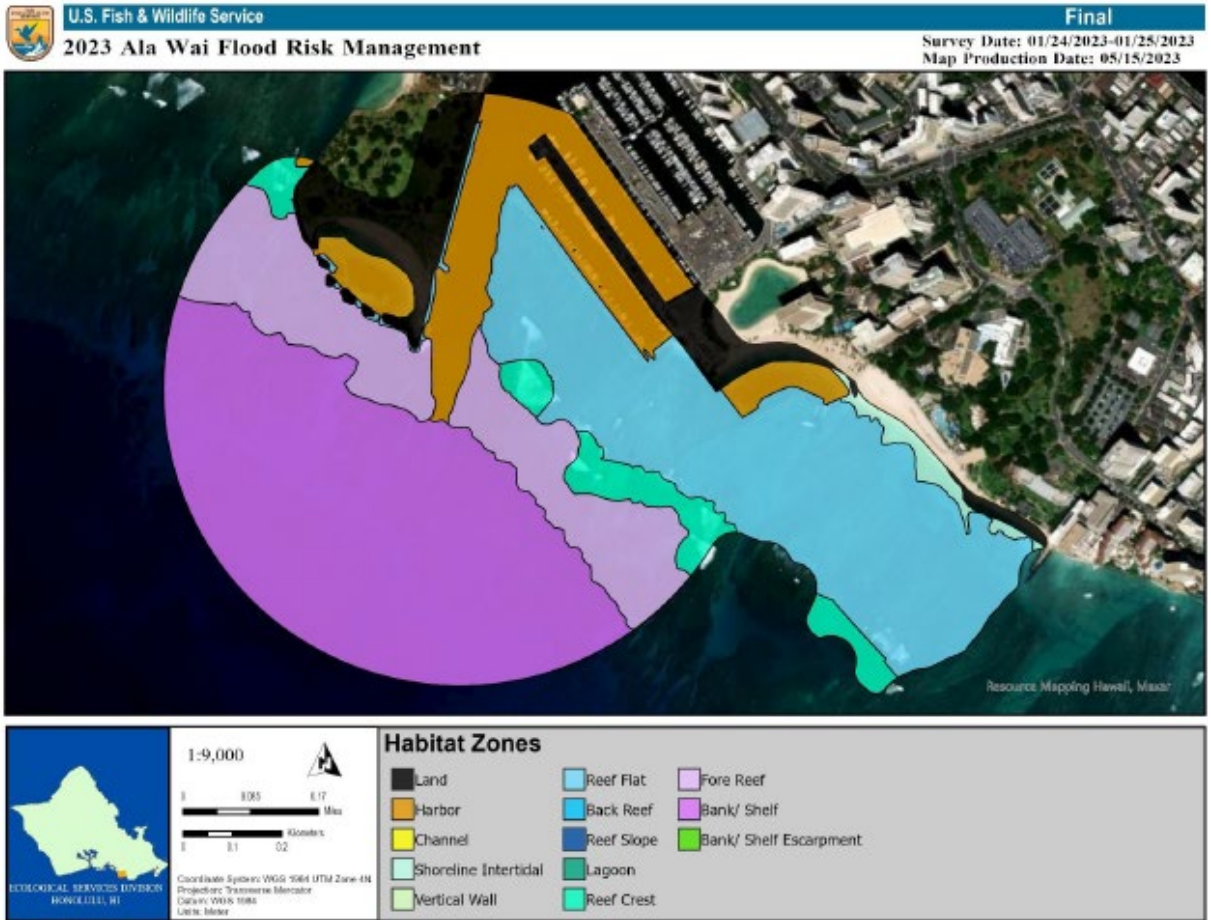

Figure 18: Map of the habitat zones within the Project Action Area (USFWS, 2023).

4.3.1 Benthic Substrate Habitat

The benthic substrate habitat within the project action area is comprised of soft, hard, and mixed substrate habitat (USFWS, 2023). The soft substrate community, found primarily along the Kahanamoku Beach harbor area, makes up approximately 0.1% of the benthos of the marine aquatic area that may be impacted by the project. The project action area was surveyed by USFWS and the soft substrate habitat was found to consist primarily of unconsolidated sediment (Figure 19) made up of sand and rubble (Figure 20) (USFWS, 2023). Soft substrate habitats, in general, support a diverse community likely consisting primarily of polychaetes, crustaceans, mollusks, and burrow-dwelling fish just below the sand surface. Species adapted to this habitat structurally alter the habitat through bioturbation, burrow, and tube building. These activities result in increased water flow and nutrient cycling through the surface layers of sand. Soft bottom habitats can perform ecological functions in marine communities by recycling organic matter up into the food web. Many of the organisms that live in this habitat are adapted to filter feed, increasing the extraction of material from the overlaying water column. Benthic burrowing communities are typically highly resistant to adverse impacts from sedimentation and have a high rate of reproduction and community recovery but would be very susceptible to the wholesale removal of the habitat. Members of this community have the most direct link to managed fishery species. The soft bottom community provides food either directly or in the form of eggs and larvae broadcast into the water column.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The areas seaward of Ala Wai Harbor and Waikiki beaches were generally separated by the small dug out harbor adjacent to Kahanamoku Beach and the Atlantis Submarines dock, and a channel cut through the reef flat many years ago providing access to that harbor (FWS, 2023). The Kahanamoku Beach harbor area consisted of Unconsolidated Sediment (Figure 19) made up of Sand and Rubble (Figure 20). The channel area was classified as Mixed habitat (Figure 19) including Unconsolidated Sediment and Scattered Coral Rock in Unconsolidated Sediment (Figure 20) (FWS, 2023).

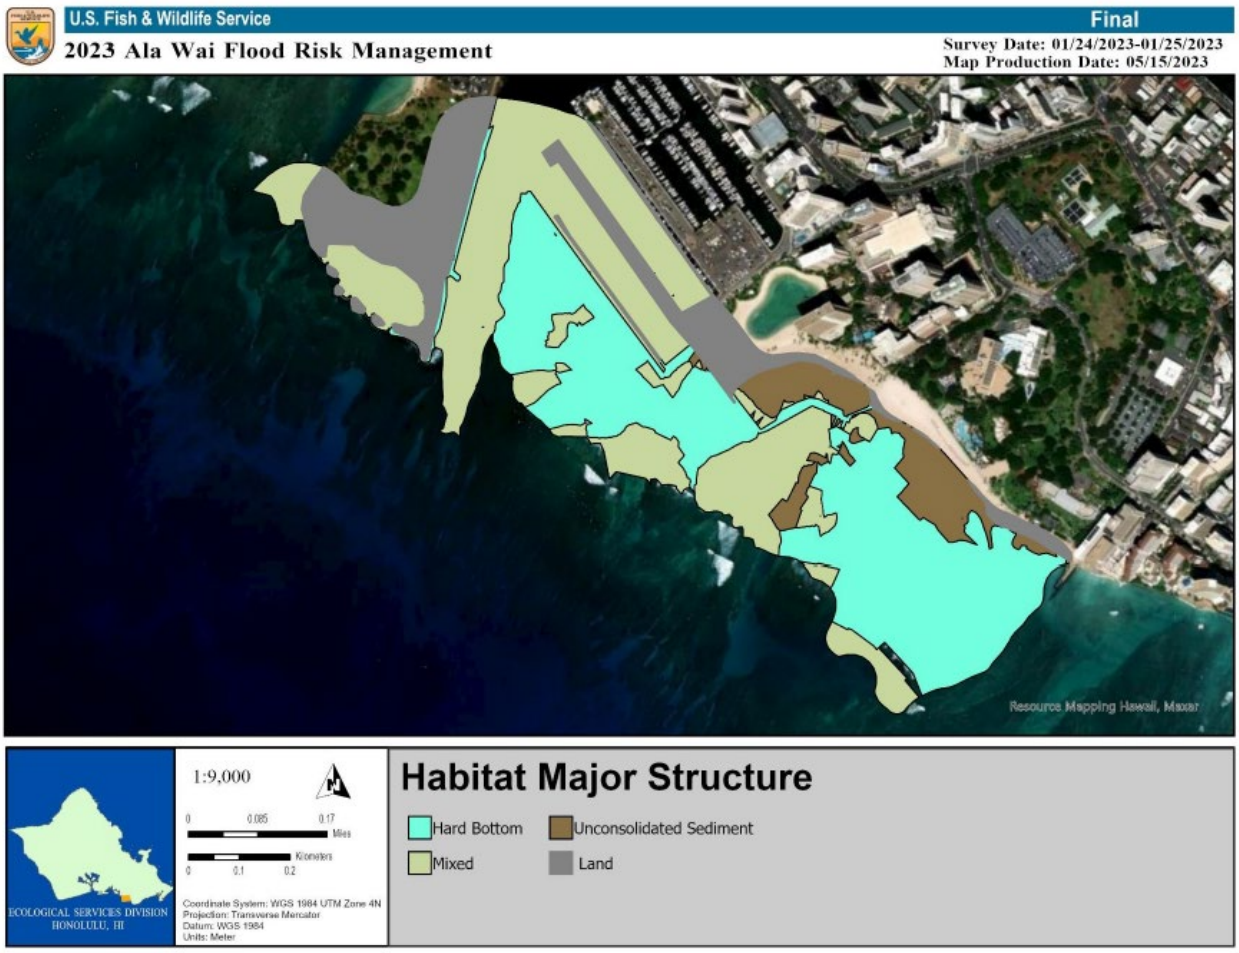

Figure 19: Map of habitat major structure observed within the Project Action Area (USFWS, 2023).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

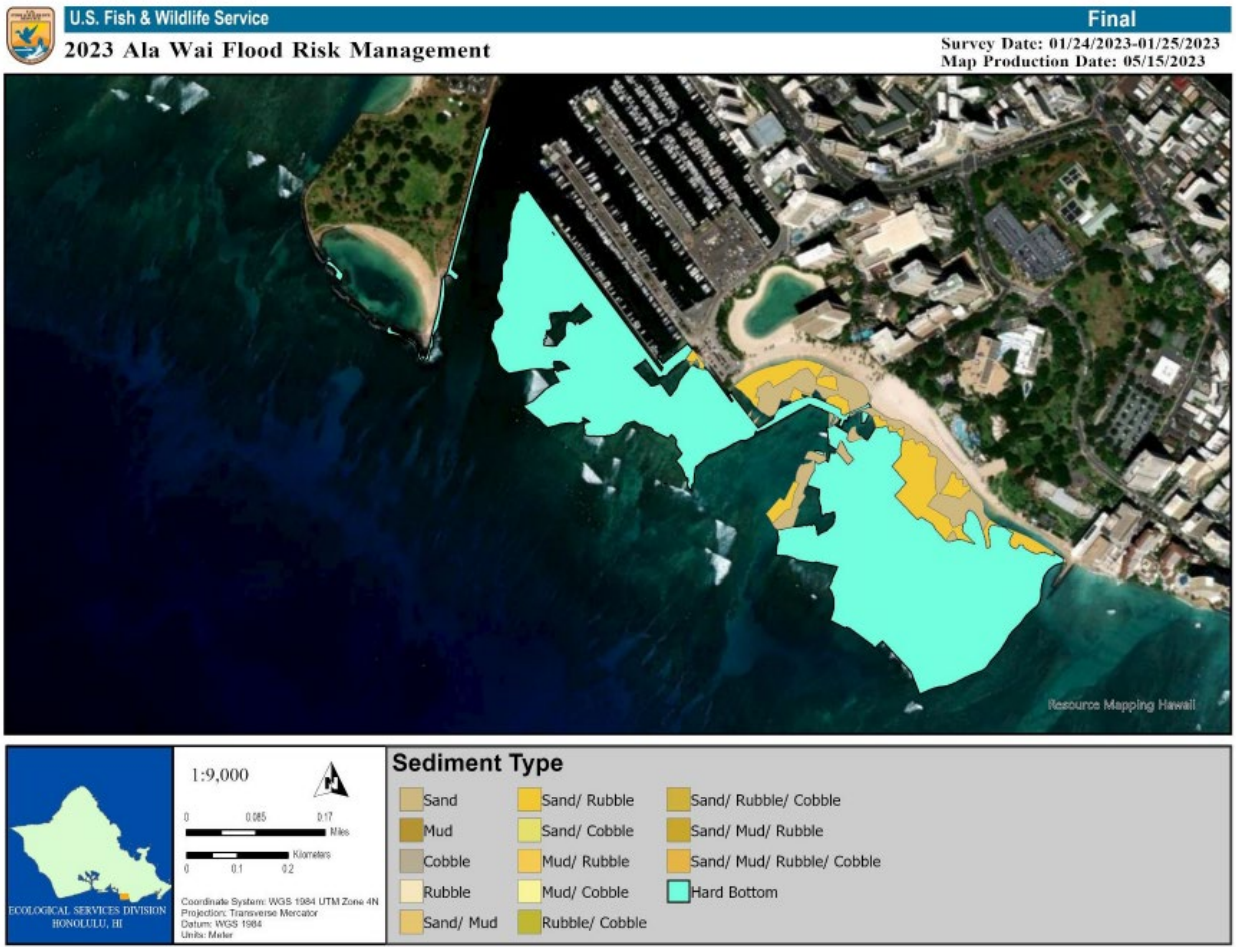

Figure 20: Map of sediment types found within the Project Action Area (USFWS, 2023).

The hard substrate community makes up approximately 16.1% of the benthic aquatic habitat area that may be impacted by the project (USFWS, 2023). The hard substrate community generally extended from the intertidal zone to the surf zone at the reef crest and was characterized as gently sloping reef flat with depths of approximately 0.5 meter to 2 meters. The reef flat substrate in the project action area was characterized by hard bottom pavement with areas of mixed habitat structure including mostly pavement, sand, and rubble with low relief (Figure 20 and Figure 21). The forereef area included steeper spur and grove characteristics (Figure 21), while the area seaward of the fore reef slope appeared to be deeper offshore bank/shelf habitat (Figure 21) (USFWS, 2023).

The hard substrate within the project action area provides habitat that supports certain managed fisheries. In addition to shelter, the habitat provides food for managed fisheries either directly or in the form of eggs and larvae released into the water column.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

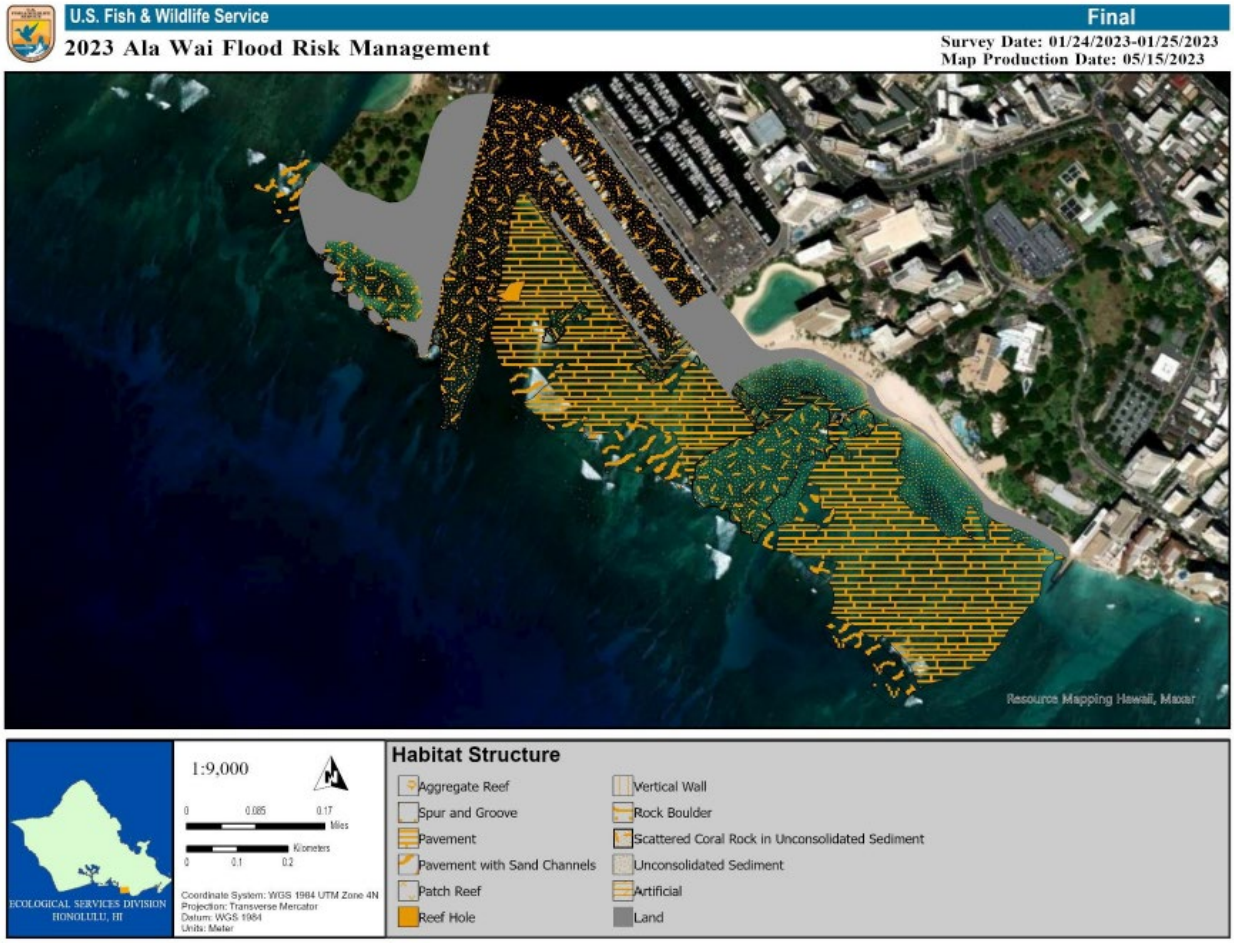

Figure 21: Map of habitat structure observed within the Project Action Area (USFWS, 2023).

Mixed substrate habitat is primarily found in Ala Wai Small Boat Harbor, the channel leading out of the Ala Wai Small Boat Harbor, a small dug out harbor adjacent to Kahanamoku Beach, the Atlantis Submarines dock, and a channel cut through the reef flat many years ago providing access to that harbor. The mixed substrate habitat is primarily composed of scattered coral rock in unconsolidated sediment (Figure 21) (USFWS, 2023). Mixed substrate habitat is a combination of soft and hard substrate habitat. As discussed above, soft substrate habitats in general support a diverse community likely consisting primarily of polychaetes, crustaceans, mollusks, and burrow-dwelling fish just below the sand surface. Members of this community have the most direct link to managed fishery species as the soft bottom community provides food either directly or in the form of eggs and larvae broadcast into the water column. Hard substrate provides habitat that supports certain managed fisheries as well. In addition to shelter, hard substrate habitat provides food for managed fisheries either directly or in the form of eggs and larvae released into the water column.

4.3.2 Water Column Estuary Habitat

The Ala Wai Small Boat Harbor is an artificially deepened, inshore embayment with strong estuary characteristics influenced by inflow from perennial streams, groundwater, and storm drains from the surrounding urban land use area. With an area of 50 acres and an average

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

depth of 25 feet, the volume of the estuary exceeds the average daily flow volume of all inflowing water sources. As described in Laws et al. (1993), the tidal input from the marine environment generally exceeds the freshwater input. The Ala Wai behaves like a type B estuary as the tidal prism is 10 to 20 times the volume of freshwater input. This class of estuary typically has little sediment export to the ocean (Montgomery et al., 2009). These characteristics allow the Ala Wai Canal to function as a physical sink for land-based pollutants as well as act as a biological reaction vessel to transform and incorporate a portion of the land-based nutrients into the marine food web through the production of phytoplankton. The stratified water column provides a variety of micro-habitats defined by light, salinity, nutrient availability, and phytoplankton concentrations. Harbor waters are continually impacted by such terrigenous inputs that adversely affect its water quality.

Table 5: Areas of Habitat Types Across the Target Survey Area (USFWS, 2023).

Area Type	Classification	Area (ft^2)	Area (m^2)	Percent of Area
Waters	Waters of the U.S.	7,456,613	692,742	99.48
Structure	Land	39,084	3,631	0.5

4.3.3 Marine Fauna

4.3.3.1 Coral Species

Coral was present on reef flat although abundance was generally low (< 10% cover) throughout the project action area (Figure 22) (FWS, 2023). Small (< 0.39 inches [< 50 centimeters]) to

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

large (0.39 – 78.74 inches [50 – 200 centimeters]) lobate corals (Figure 22) were most common on the reef flats, followed by small medium-branching (Figure 22), encrusting, and microatoll growth forms (Figure 22). The most common coral species observed included *Porites rus*, *P. compressa*, *P. lobata*, and potentially other species of massive *Porites*, branching *Pocillopora spp.*, and encrusting *Montipora spp*. (USFWS, 2023).

Porites lobata
Lobe coral (*Porites lobata*) is the most common and widespread coral in Hawaii (USACE, 2016). The growth form is most commonly massive but can be encrusting in high wave energy environments or plate-forming on steep calm slopes (or concrete pilings). Lobe coral spawns from July to August two to three days after the full moon and has a moderate 0.46 inch (11.4 millimeters) per year growth rate (USACE, 2016). Lobe coral was one of the most prevalent species within the project action area.

Porites compressa
Finger coral (*Porites compressa*) is often the most common coral in low wave energy environments and has a rapid growth rate (1.10 inches [28 millimeters] per year; Minton, 2013) and tends to be very fragile. Finger coral spawns from June through September on the new moon's 1st quarter from 23:00 to 01:30 (USACE, 2016). Finger coral was one of the most prevalent species within the project action area.

Porites rus
Porites rus is a common coral species in Hawaii that may be dominant in a wide range of habitats, although they are typically found in shallow reef environments. *P. rus* spawns from October through April, five days after the full moon, and about two hours after daybreak. Mean linear growth rates for colonies growing in shallow water (3.3-9.8 feet [1-3 meters]) or close to the reef edge in an undisturbed environment range between 0.34 and 0.48 inch (8.64 and 12.26 millimeters) per year (Dullo et al., n.d.).

Pocillopora spp.
Some of the common *Pocillopora spp.* in Hawaii include *Pocillopora meandrina* (cauliflower coral or rose coral) and *P. damicornis* (lace coral). Cauliflower coral typically spawns from April through May, at full moon and/or two to three days after a full moon, and around 07:30. Lace coral can spawn year-around and under all phases of the moon. Lace coral can release larvae throughout the day, but mostly at night. Growth rates for transplanted *Pocillopora spp.* range from 1.7 to 3.9 inches (4.36 to 9.98 centimeters) per year (Garcia-Medrano, et al., 2023; Fabregat-Male et al., 2023)

Montipora spp.
One of the common *Montipora spp.* in Hawaii is *Montipora verrucosa* (Rice coral). Rice coral spawns from June through August, three to five days after a new moon, and between 20:00 and 22:00. The growth rate for Montipora spp. can range up to 0.55 inch (14 millimeters) per year (Baird, 2023).

Zoanthids were sparsely distributed on the reef flats (Figure 23).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

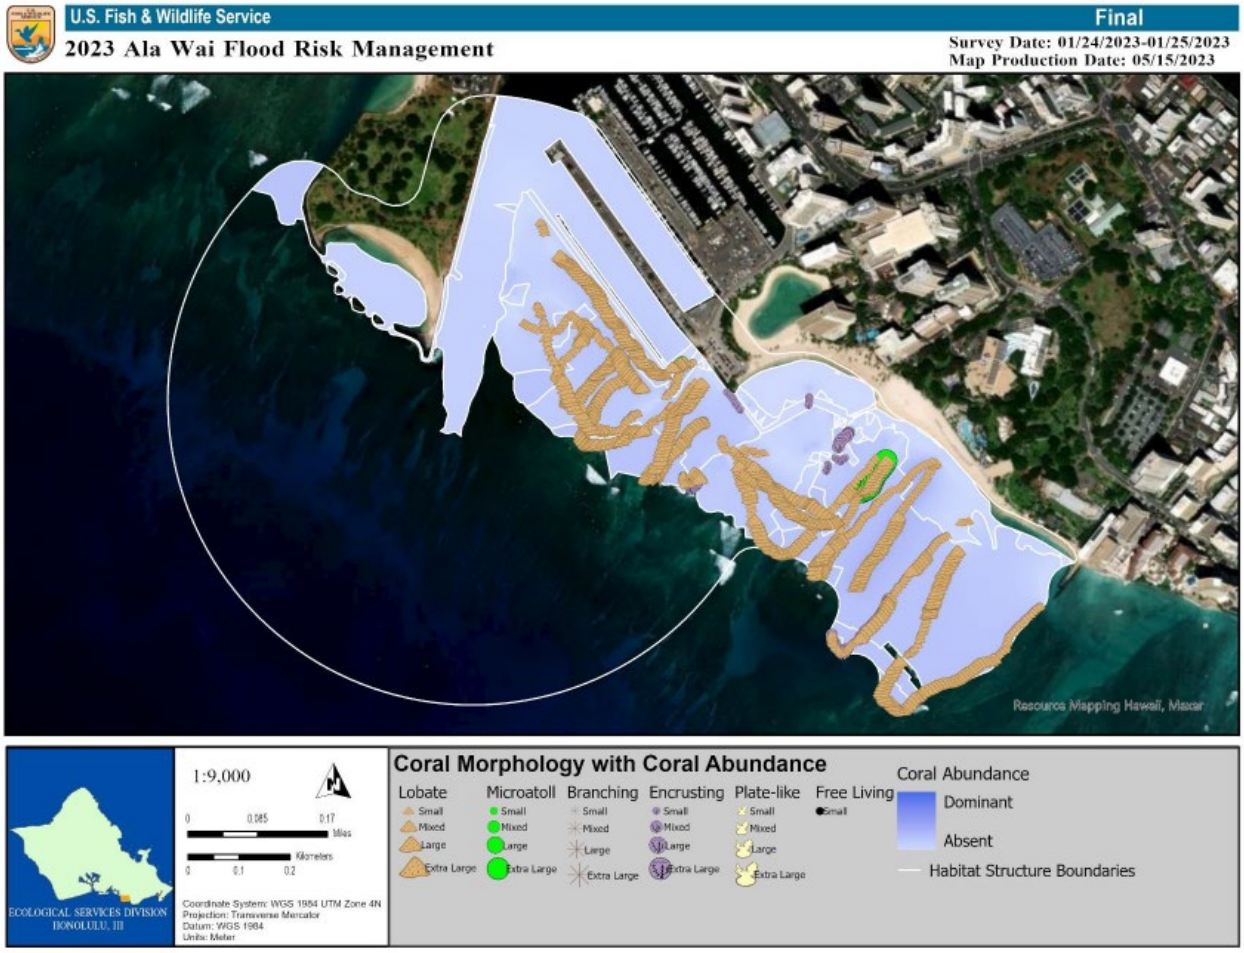

Figure 22: Map of the coral morphology and abundance observed at the Project Action Area (USFWS, 2023).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

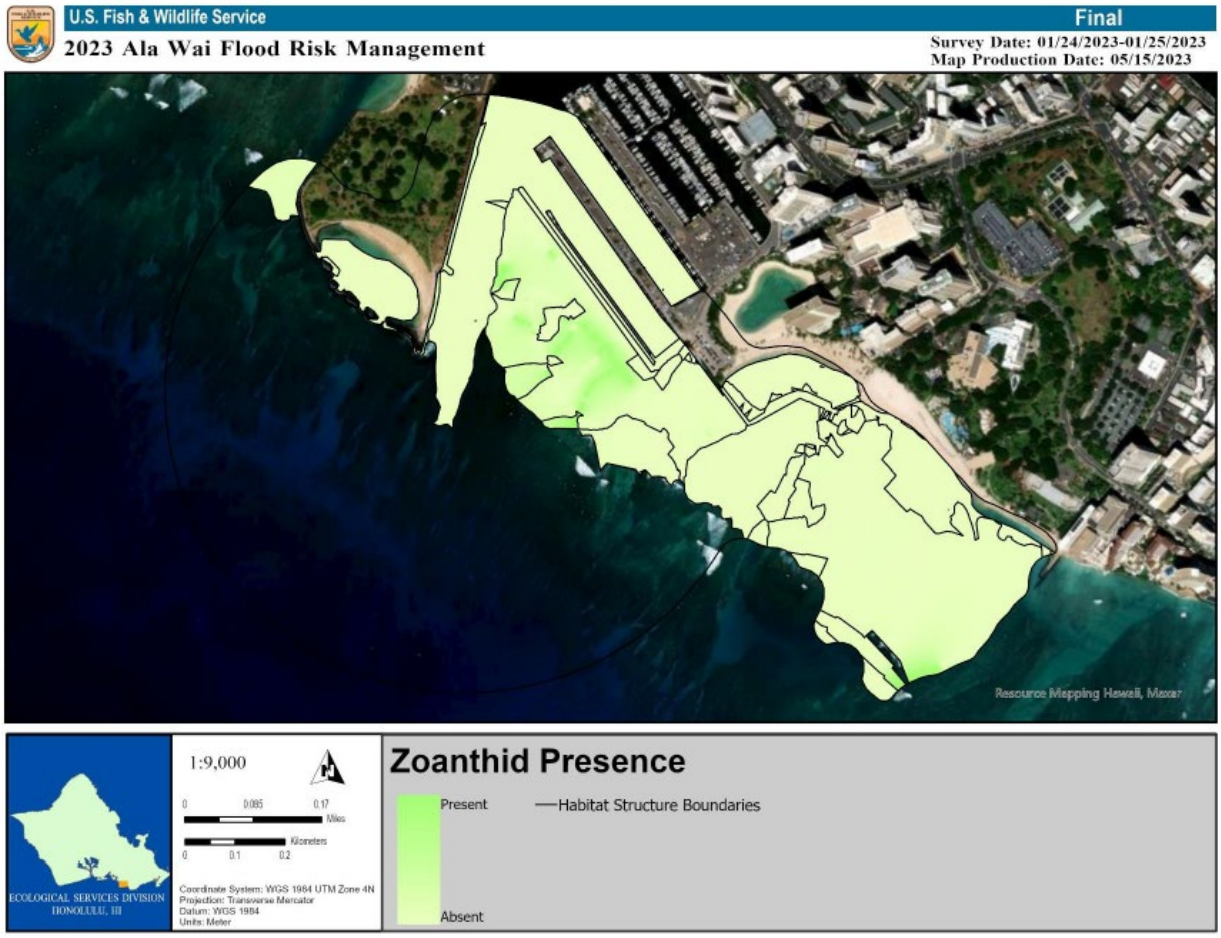

Figure 23: Map of the zoanthid presence observed at the Project Action Area (USFWS, 2023).

4.3.3.2 Macroinvertebrates

Within the area surveyed by USFWS, spiny urchins were common, and rock boring urchins were dominant throughout the surveyed area (USFWS, 2023). Sea cucumbers were observed throughout the area surveyed and occurred in clusters in certain reef flat areas (Figure 24). Mollusks were observed sparsely throughout the surveys. Sponges were observed in clusters, primarily seaward of Ala Wai Harbor. Tunicates were observed primarily in areas directly adjacent to channels and harbor areas (USFWS, 2023).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

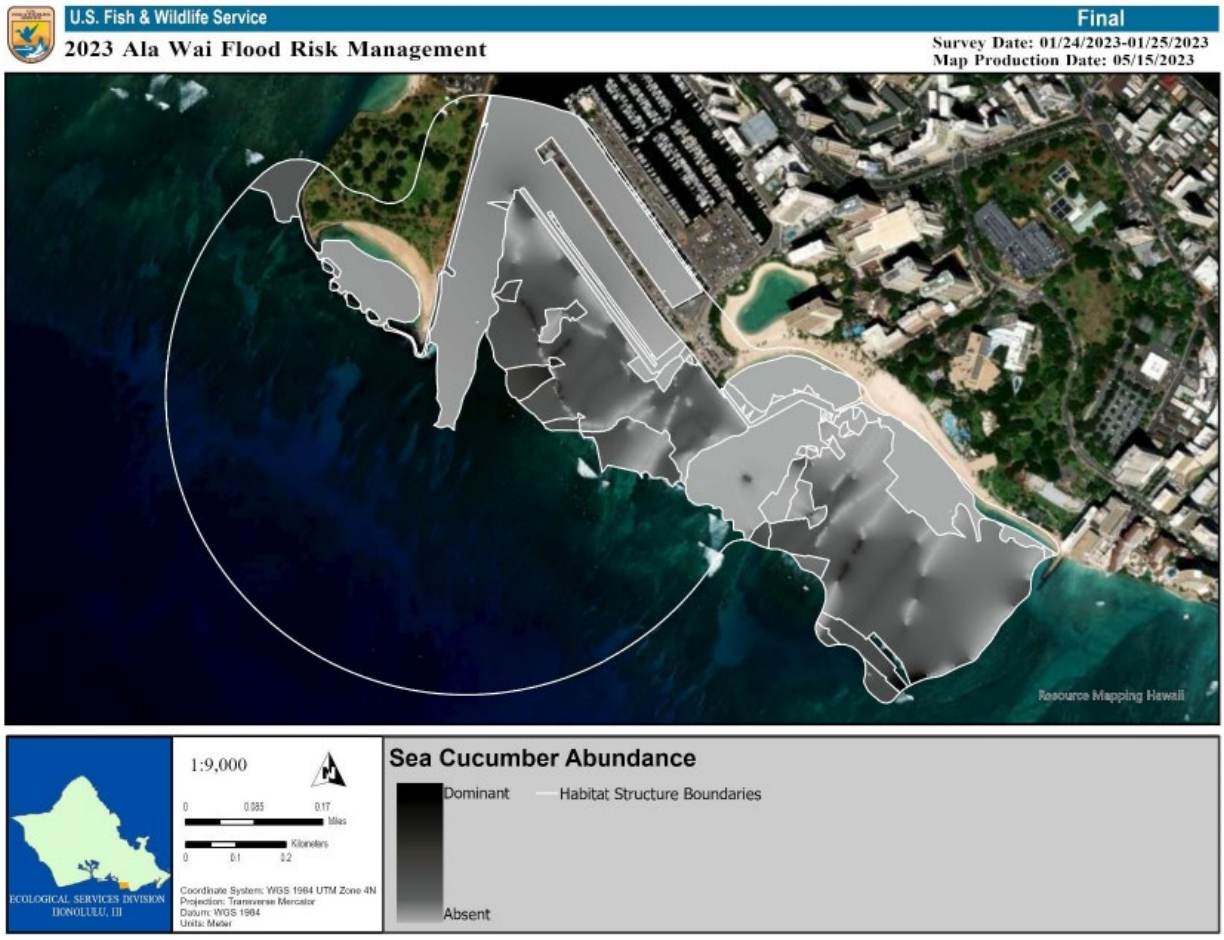

Figure 24: Map of the sea cucumber abundance observed at the Project Action Area (USFWS, 2023).

4.3.3.3 Fish

Although fish species were not specifically surveyed by USFWS, the following species have been caught within the Ala Wai Boat Harbor: Great Barracuda (*Sphyraena barracuda*), Wedge-tail Triggerfish (*Rhinecanthus rectangulus*), Crevalle Jack (*Caranx hippos*), Hawaiian Ladyfish (*Elops hawaiensis*), Doublespotted Queenfish (*Scomberoides lysan*), Skipjack Tuna (*Katsuwonus pelamis*), West Atlantic Bonefish (*Abula vulpes*), Giant Trevally (*Caranx ignobilis*), Southern Puffer (*Sphoeroides nephelus*), Smallmouth Bass, Pacific Barracuda (*Sphryaena argentea*), Bluefin Trevally (*Caranx melampygus*), Eyestripe Surgeonfish (*Acanthurus dussumieri*), Blackchin Tilapia (*Sarotherodon melanotheron*), Stocky Hawkfish (*Cirrhitus pinnulatus*), Manybar Goatfish (*Parupeneus multifasciatus*), Blue Tilapia (*Oreochromis aureus*), Wahoo (*Acanthocybium solandri*), Black Seabass (*Centropristis striata*), Common Dolphinfish (*Coryphaena hippurus*), Orange Goatfish (*Mulloidichthys flavolineatus*), Red Grouper (*Epinephelus morio*), Inshore Lizardfish (*Synodus foetens*), and Leopard Moray Eel (*Enchelycore pardalis*). While the above may not include all the fish species for which EFH has been designated within the project action area, that does not mean that these species and/or their lifestages are not present in the project action area.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

5. Potential Effects of the Action on EFH and MUs

Because of the magnitude and range of activities represented by the project, this section analyzes the potential impacts first by each individual project phase, and second by type of project impact. Each phase varies by construction method and likewise potential vectors for impacts to EFH.

5.1 Effects by Project Phase

The action, anticipated to begin in 2027, would incorporate five construction phases lasting approximately four (4) years, followed by operation of the project. Activities occurring for each project feature are discussed in greater detail below: Woodlawn Drive Floodwall, Koali Road Floodwall, Ala Wai Golf Course Detention Basin, Ala Wai Canal Floodwall, and Mitigation Measures. Impacts from each project feature are discussed in each of the following sections and summarized in Section 5.3.

5.1.1 Woodlawn Drive Floodwall

A floodwall would be constructed along the right descending bank of Manoa Stream downstream of the Woodlawn Drive Bridge. The floodwall would be approximately six feet in height and approximately 1,270 feet in length. The design of the floodwall is an L-wall on macropiles. The macropiles would be drilled in vertically into the ground as a support for the foundation of the L-wall. The vertical part of the L-wall would then extend six feet above the foundation attached to the macropiles. Appropriate BMPs would be implemented at the construction site to prevent storm water runoff and drill effluent from leaving the site. In addition, a single road closure structure would be placed at Woodlawn Drive Bridge. All of the above construction would occur adjacent to Manoa Stream with no in-water work anticipated. Also, Manoa Stream does not contain EFH, so there would be no direct disturbance of EFH due to construction activities. No indirect disturbance of EFH is anticipated either from this single feature. However, there could be a cumulative indirect disturbance to EFH in the project action area once the project is operational. The potential indirect impact to EFH due to project operation will be discussed later. Overall, the activities proposed under this project feature would not reduce the quantity or quality of EFH. Accordingly, the Corps has determined that the Koali Road floodwall would neither adversely affect nor have the potential to cause effect to any MUS or its designated EFH.

5.1.2 Koali Road Floodwall

A floodwall would be constructed along the left descending bank of Manoa Stream and the right descending bank of Palolo Stream in the vicinity of Koali Road. The total length of the floodwalls would be approximately 2,510 feet and the height of the floodwall would be six feet. Construction would be the same as that detailed above for the Woodlawn Drive floodwall. The Koali Road floodwall also includes two road closure structures and the addition of two concrete drainage structures that would provide interior drainage. Two flap gates would also be retrofitted on smaller stormwater culverts already existing along this feature. The addition of the two concrete drainage structures would disturb adjacent stream habitat where the drainage structures allow inflow into the adjacent stream. To minimize impacts at the drainage structure construction sites appropriate sediment containment BMPs would be implemented throughout construction to isolate turbidity within the work area. The degree of indirect impacts from these pollutants depends on the success of BMPs. Suspended materials that may reach the marine environment can directly or indirectly impacts MUS and EFH including potential impacts such as health detriment to swimming MUS or plankton blooms of unknown potential impact. All of the

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

above construction would occur for the most part adjacent to Manoa and Palolo streams with no in-water work anticipated. The only exception to in-water work is connecting the drainage structures to the adjacent streams to allow interior drainage into the streams during a storm event. Since Manoa Stream does not contain EFH, there would be no direct disturbance of EFH due to construction activities. No indirect disturbance of EFH is anticipated either from this single feature. However, there could be a cumulative indirect disturbance to EFH in the project action area once the project is operational. The potential indirect impact to EFH due to project operation will be discussed later. Overall, the activities proposed under this project feature would not reduce the quantity or quality of EFH. Accordingly, the Corps has determined that the Koali Road floodwall would neither adversely affect nor have the potential to cause effect to any MUS or its designated EFH.

5.1.3 Ala Wai Golf Course Detention Basin

At Ala Wai Golf Course, adjacent to the left descending bank of the Manoa-Palolo Canal and the right descending bank of the Ala Wai Canal, an earthen levee approximately six to nine feet in height would be constructed around the perimeter of Ala Wai Golf Course to create a detention basin. The total length of the earthen levee would be approximately 8,315 feet and the height of the earthen levee would range from six to nine feet. On the left descending bank of the Manoa-Palolo Canal, there would be an overtopping spillway section approximately 100 feet in length, that would be reinforced with erosion protection such as riprap. A portion of the existing drainage ditch that runs along the north side of the golf course (parallel to Date Street) would be riprapped and used as an inlet location for overflow into the Ala Wai Golf Course Detention Basin. A small inlet channel would be excavated and lined with erosion control material to improve flow onto the golf course. Three concrete drainage structures and three flap gates would be constructed along the levee alignment of the Ala Wai Golf Course to allow collected stormwater within the basin and from local runoff to slowly drain into Ala Wai Canal. To minimize impacts at the drainage structure construction sites appropriate sediment containment BMPs would be implemented throughout construction to isolate turbidity within the work area. The degree of indirect impacts from these pollutants depends on the success of BMPs. Suspended materials that may reach the marine environment can directly or indirectly impacts MUS and EFH including potential impacts such as health detriment to swimming MUS or plankton blooms of unknown potential impact. The detention basin also includes a floodwall along the golf course parking lot near the Ala Wai Canal, which is nine feet in height. The floodwall has one concrete drainage structure and two flap gates that would be installed. To minimize impacts at the drainage structure construction site appropriate sediment containment BMPs would be implemented throughout construction to isolate turbidity within the work area. The degree of indirect impacts from these pollutants depends on the success of BMPs. Suspended materials that may reach the marine environment can directly or indirectly impacts MUS and EFH including potential impacts such as health detriment to swimming MUS or plankton blooms of unknown potential impact. The original outlet will be enclosed by concrete (instead of daylighted) and will need reconstruction of the vehicle and pedestrian access at this location. A small section of floodwall near the Kapahulu Avenue and Ala Wai Boulevard intersection at the Diamond Hear end of the Ala Wai Canal will tie-in to the golf course levee and Ala Wai Canal floodwall. This section is six feet in height and includes one road closure structure and one drainage structure. Finally, there is one canoe access point in this location. One road closure structure would be constructed across the Ala Wai Golf Course Maintenance Facility driveway.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Construction of the earthen berm around the golf course would require the placement of fill material upland. No macropile drilling or sheetpile driving would be required for the golf course earthen berm. Potential in-water work would be limited to connecting the outlet drainage structures to the adjacent canal, but these connections already exist and would primarily consist of minimal in-water work to allow retrofitting of the concrete drainage structures and flap gates. Placement of erosion protection along the overtopping spillway and existing drainage ditch could involve minor in-water work as placement of these materials would be expected to occur from land and mostly on upland habitat.

Therefore, most construction activities would occur adjacent to the left descending bank of the Manoa-Palolo Canal or adjacent to the right descending bank of the Ala Wai Canal with most of the work occurring from upland (i.e., no in-water work). As mentioned above, adding erosion protection, and retrofitting the existing drainage structures with new concrete drainage structures and flap gates could involve some in-water work, but is anticipated to occur from upland for the most part. Both Manoa-Palolo Canal and the Ala Wai Canal do not contain designated EFH, so there would be no direct disturbance of EFH due to construction activities. No indirect disturbance of EFH is anticipated either from this single feature. However, there could be a cumulative indirect disturbance to EFH in the project action area once the project is operational. The potential indirect impact to EFH due to project operation will be discussed later. Overall, the activities proposed under this project feature would not reduce the quantity or quality of EFH. Accordingly, the Corps has determined that the Ala Wai Golf Course Detention Basin would neither adversely affect nor have the potential to cause effect to any MUS or its designated EFH.

5.1.4 Ala Wai Canal Floodwall

At the Manoa-Palolo Canal and Ala Wai Canal, a floodwall extending six feet above ground (i.e., Ala Wai Canal Floodwall) would be constructed. The floodwall would be approximately 22,852 feet long and would be constructed of a combination of J-wall on macropiles (17,125 ft), L-wall on macropiles (4,069 feet), and I-wall (1,658 feet) with a lava rock fascia. Existing stormwater sewers inletting into the Ala Wai Canal would be modified so that fourteen would be drainage structures and 59 would be retrofitted with flap gates. To minimize impacts at the drainage structure construction sites appropriate sediment containment BMPs would be implemented throughout construction to isolate turbidity within the work area. The degree of indirect impacts from these pollutants depends on the success of BMPs. Suspended materials that may reach the marine environment can directly or indirectly impacts MUS and EFH including potential impacts such as health detriment to swimming MUS or plankton blooms of unknown potential impact. Eleven road closure structures would be constructed: (1) King Street (Manoa-Palolo Canal right descending bank), (2) King Street (Manoa-Palolo Canal left descending bank), (3) Kapiolani Boulevard (Manoa-Palolo Canal right descending bank), (4) Kapiolani Boulevard (Manoa-Palolo Canal left descending bank), (5) Date Street (near the Date Street and Laau Street junction), (6) Date Street (near the vicinity of the Kaimuki High School's discus and shot put throwing area, (7) Ala Wai Golf Course Drive, (8) McCully Street (Ala Wai Canal right descending bank), (9) McCully Street (Ala Wai Canal left descending bank), (10) Kalakaua Avenue (Ala Wai Canal right descending bank), and (11) Kalakaua Avenue (Ala Wai Canal left descending bank). The typical cross section of this feature varies along the alignment, but all are assumed to be 6 ft above ground. The floodwall along the Ala Wai Canal and the lower right descending bank of the Manoa-Palolo Canal will include an elevated walking path. On the left descending bank of the Manoa-Palolo Canal and near Kaimuki High School, there will be a floodwall on macropiles with no walking path. Where space is constricted, along the upper right

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

descending bank of the Manoa-Palolo Canal, the tieback I-wall will be constructed, with no walking path. Construction of the tieback I-wall in this location would occur from equipment staged along a 15-foot-wide rock bench placed temporarily in-stream along the right descending bank of the Manoa-Palolo Canal. The rock bench is temporary fill placed into waters of the U.S., but the waters do not contain designated EFH. Construction of the tieback I-wall would use the press in method of installation such as used by Giken Ltd. Construction of the tieback I-wall would not involve the driving of pile into the ground which could cause potential noise and vibration concerns. Construction methods for the J-wall and L-wall would be the same as those discussed for the Woodlawn Drive, Koali Road, and Kaimuki High School floodwalls. Overall, since most of the construction would occur upland (i.e., not in-water) and there is no designated EFH in the Manoa-Palolo Canal or the Ala Wai Canal, there would be no direct disturbance of EFH due to construction activities. No indirect disturbance of EFH is anticipated either from this single feature. However, there could be a cumulative indirect disturbance to EFH in the project action area once the project is operational. The potential indirect impact to EFH due to project operation will be discussed later. Overall, the activities proposed under this project feature would not reduce the quantity or quality of EFH. Accordingly, the Corps has determined that the Ala Wai Canal floodwall would neither adversely affect nor have the potential to cause effect to any MUS or its designated EFH.

5.1.5 Mitigation Measures

Mitigation measures related to induced flooding include potentially adding permanent pump station(s) of moderate to large size, ranging from 500 to 20,000 cfs. At the time of compiling this Draft Report, it is unknown as to the number of pumps that may be necessary to minimize induced flooding, the size of the pumps, or the location of pumps within the watershed. In addition to considering pumps as potential mitigation for induced flooding within the watershed, nonstructural measures such as dry/wet floodproofing, elevation, and acquisition are also under consideration. Nonstructural measures such as dry/wet floodproofing, elevation, and acquisition involve construction that occurs strictly upland to existing structures and no in-water work. Although unlikely, if found during the Preconstruction Engineering and Design (PED) phase that a permanent pump station may be necessary to minimize induced flooding, construction of the pump station would primarily occur upland and likely adjacent to Makiki Stream. Where the pump station would outlet collected water either over or under the Ala Wai Canal floodwall could potentially require in-water work due to placement of a drainage structure and erosion protection; although this work may be able to be completed from upland with no in-water work.

5.1.6 Operation and Maintenance

5.2 Effects by Type of Impact

In this section, potential adverse impacts upon EFH and MUS by type of impact are discussed. Due to the extensive classification of thousands of managed fishery species collectively considered under several MUS', the following discussions would be generalized to the impact upon each specific fishery type. Project-related impacts to substrate EFH include water quality degradation and habitat quality degradation that could reduce the quality of EFH and EFH production. Impacts to water column EFH include water quality degradation and habitat quality degradation that could reduce the quality of EFH. MUS impacts may include habitat quality degradation that supports MUS' and their prey and that has the potential to reduce the quality of designated EFH.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

5.2.1 Water Quality Degradation

Construction

In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing resuspension of sediments into the water column, thereby raising ambient turbidity levels. It is important to note that no in-water work would occur in EFH designated waters which are outside the project footprints that would be directly impacted.

Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of BMPs. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat).

Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon mobile marine species. The biota currently established and utilizing the canal appear to be resilient to turbidity stress, as observed by their survivorship in such an environment.

As described in Section 2.5, USACE has proposed BMPs (e.g., silt curtains) to contain re-suspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters and adjacent EFH designated waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize potential compounding of adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event.

Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

Operation and Maintenance

The operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to EFH habitat due to water quality degradation. The project includes the construction of floodwalls primarily along the Ala Wai Canal (including Manoa-Palolo Canal). Floodwalls would increase the capacity of the Ala Wai Canal to hold more storm water as well as increase storm flow velocities in the canal. Increased storm flow velocities in the canal could in turn disturb and/or resuspend sediments in the water column creating a turbidity plume that could affect water quality of the nearshore marine environment. Changes to velocities within the Ala Wai Canal were modeled with project features constructed

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

and are compared against velocities within the canal under existing conditions in Table 6. Although the project would result in increased velocities and likely a large turbidity plume during a storm event, it is important to note that increased velocities and turbidity plumes already occur under the existing condition during a storm event.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Currently, under existing conditions, high rainfall events disturb sediments in the upper reaches of the Ala Wai watershed and cause these sediments to become suspended in the water column. There are also three general areas in the Ala Wai Canal where previously suspended sediments have sedimented out and built up within the canal: Kalakaua Avenue Bridge, mouth of the Manoa-Palolo Canal, and the terminus of the Ala Wai Canal (Montgomery et al., 2009). These built-up sediments within the canal at these locations can become resuspended in the water column during a storm event due to increased water velocities within the canal. The combination of these suspended sediments in the water column cause turbidity plumes during storm events which can extend beyond the canal and degrade water quality within the nearshore marine environment. Predicting how far turbidity plumes could extend during a storm event is difficult and can in turn make it difficult to predict where impacts to the nearshore marine environment could occur. However, PacIOOS has developed a turbidity plume forecast model for the Ala Wai Canal allowing the tracking of potential turbidity levels and extent of turbidity plumes along the nearshore marine environment. As an example of how a turbidity plume might extend out of the Ala Wai Small Boat Harbor and into the nearshore marine environment, PacIOOS conducted a model run of a turbidity plume for a storm event that occurred December 25 through December 27, 2017, in the Honolulu area. Figure 26 shows selected time progressions of this storm's modeled turbidity plume.

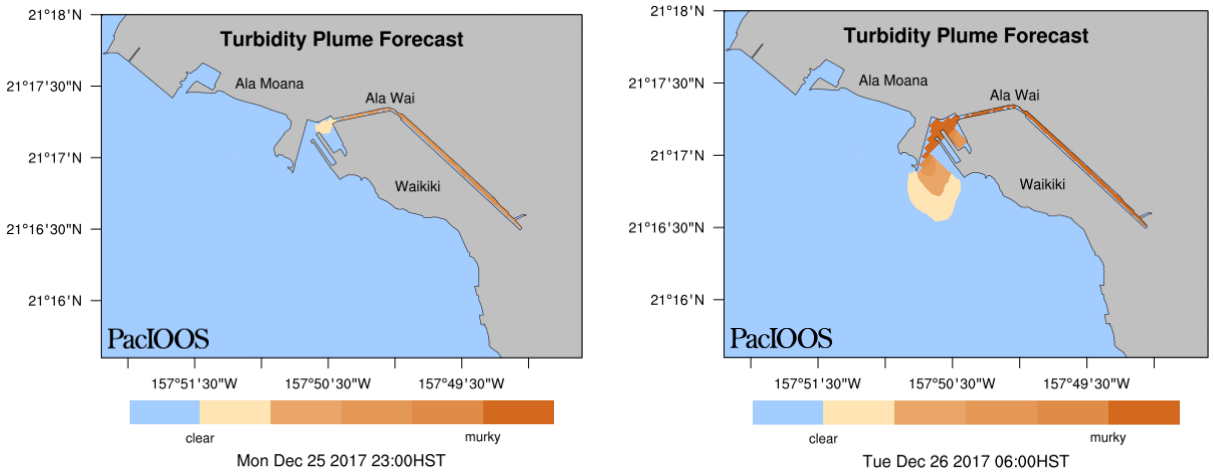

Figure 25: Modeled Turbidity Plume Forecast for December 25-27, 2017, High Rainfall Event.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

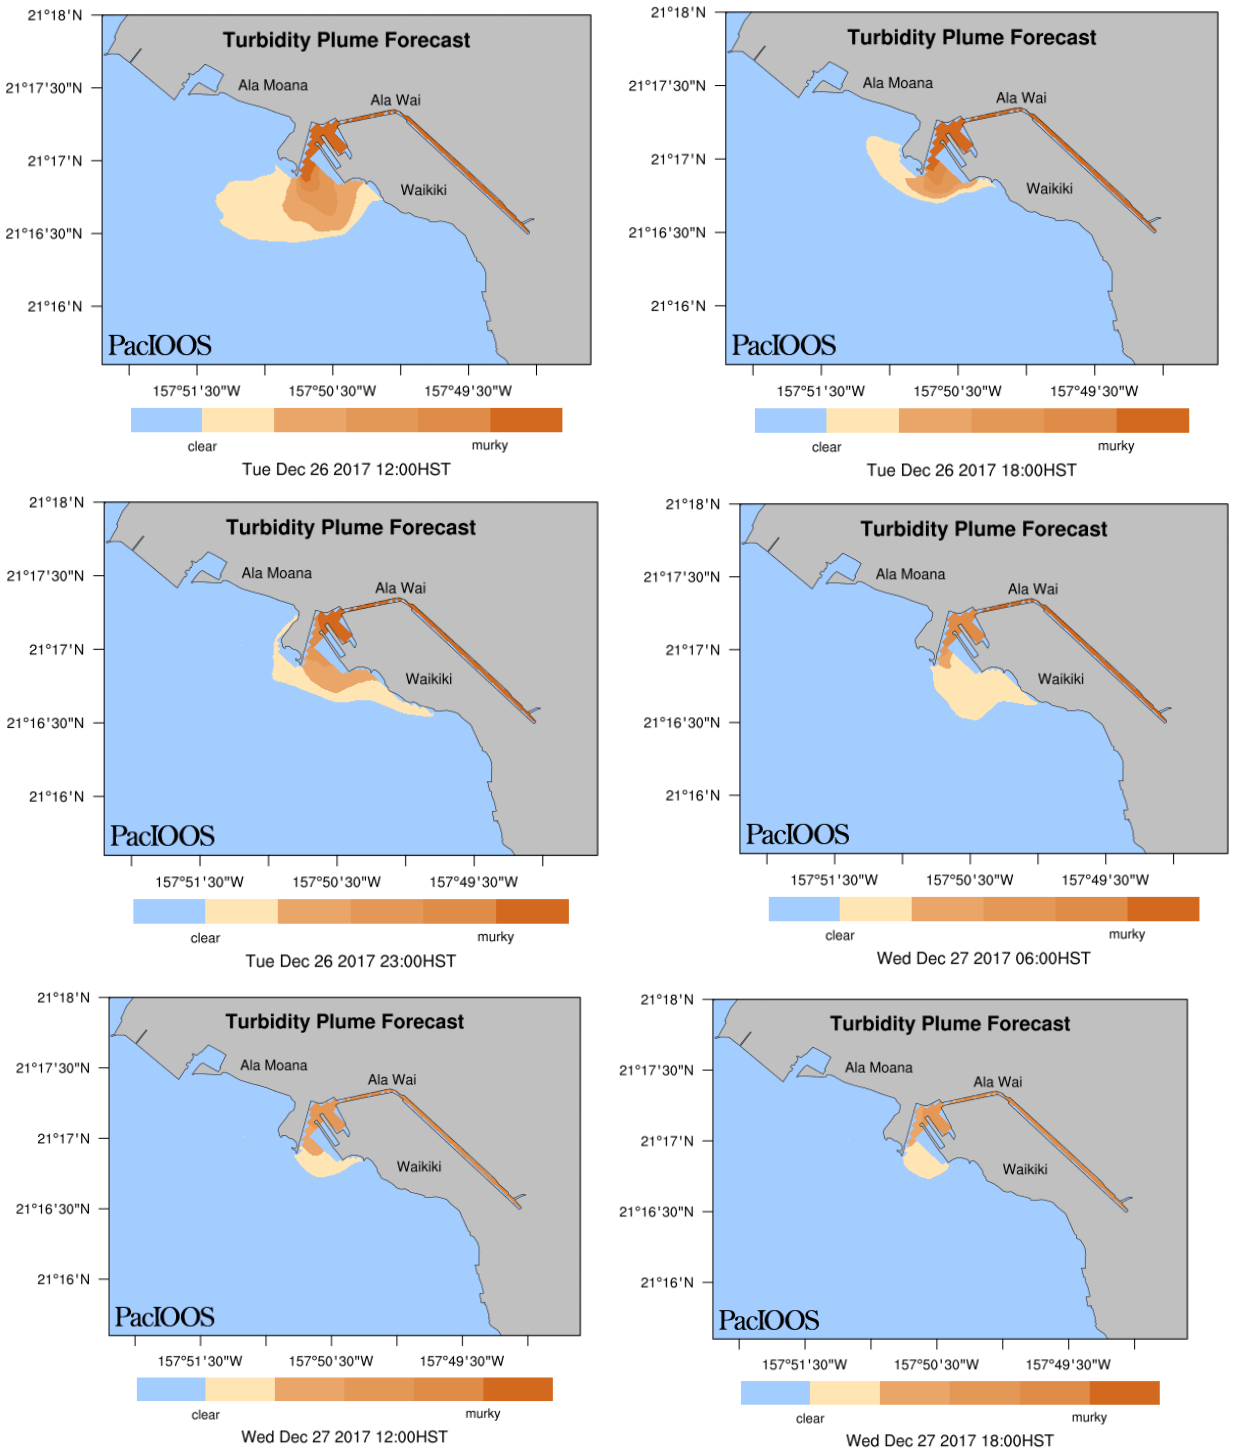

Figure 26, cont'd: Modeled Turbidity Plume Forecast for December 25-27, 2017, High Rainfall Event.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

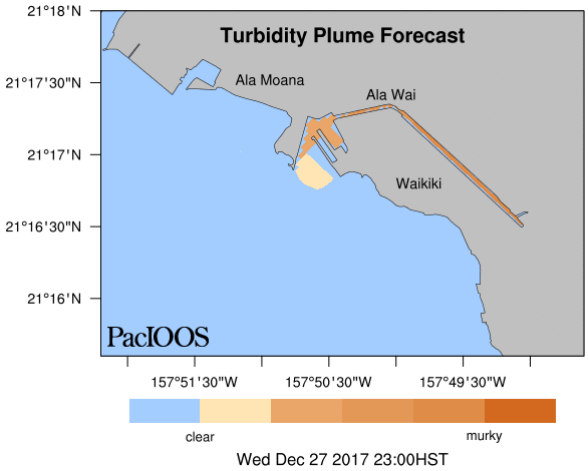

Figure 27, cont'd: Modeled Turbidity Plume Forecast for December 25-27, 2017, High Rainfall Event.

As seen in the above time progressions, at the beginning of the storm event (i.e., December 25; 23:00 HST) the Ala Wai Canal begins to experience high turbidity with low turbidity beginning to occur within the Ala Wai Small Boat Harbor. Following approximately 12 hours (i.e., December 26, 2017; 12:00 HST), high turbidity is experienced throughout Ala Wai Canal and Ala Wai Small Boat Harbor, while low to medium turbidity is beginning to occur along the reef flat area outside of Ala Wai Harbor and within the vicinity of the Atlantis Submarines harbor. Following the passage of another 12 hours (i.e., December 26, 2017; 23:00 HST), high turbidity continues to be experienced throughout the Ala Wai Canal, but high turbidity within the Ala Wai Boat Harbor is beginning to dissipate. Similarly, medium turbidity is still being experienced within the vicinity of the Atlantis Submarines Harbor and low turbidity is being experienced along the nearshore marine area (reef flat)—within the vicinity of the Sheraton Hotel on Waikiki. Following the passage of another 6 hours (i.e., December 27, 201; 06:00 HST), the turbidity plume begins to dissipate along the nearshore marine area, although low turbidity is still being experienced. Turbidity within the Ala Wai Boat Harbor has also begun to dissipate currently with moderate turbidity occurring in the harbor. Over the course of the following 18 hours, from 12:00 HST to 23:00 HST on December 27, 2017, the turbidity plume further dissipates, although low/medium turbidity is still being experienced within the Ala Wai Boat Harbor and the harbor channel. In addition, the Ala Wai Canal is experiencing medium turbidity still after approximately 48 hours has passed from the beginning of the storm event. The above details a potential turbidity plume under the future without project condition. This means that even under the future without project condition, EFH habitat located within Ala Wai Harbor generally experiences high turbidity during a storm event while EFH habitat located outside the Ala Wai Boat Harbor and along Waikiki Beach experiences medium to low turbidity during a storm event.

During a storm event under the future without project condition, EFH present in the harbor (Ala Wai Small Boat Harbor and Atlantis Submarines Harbor), reef flat (adjacent to Ala Wai Small Boat Harbor), reef crest (near Ala Wai Small Boat Harbor), fore reef (near Ala Wai Small Boat Harbor), and bank/shelf (near Ala Wai Small Boat Harbor) zones experiences medium to high turbidity for approximately 24 hours (depending on the size of the storm event) before turbidity begins to dissipate. Low turbidity during this same time occurs in the shoreline intertidal and reef flat zones between the Atlantis Submarines Harbor and the Sheraton Hotel in Waikiki. Between

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

approximately 24 and 48 hours (depending on the size of the storm event) following a storm event, turbidity within the harbor zone has been reduced to medium levels while turbidity along shoreline intertidal, reef flat, reef crest, fore reef, and bank/shelf zones has been reduced to low or clear levels.

Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced at the harbor, reef flat, reef crest, fore reef, and bank/shelf zones sooner than under the without project condition. Turbidity plumes extending into the nearshore marine environment may also take longer than approximately 24 hours for dissipation to begin. The degraded water quality caused by the turbidity plumes could stimulate and sustain algae growth within the project action area. Currently, frondose algae, crustose coralline algae, and turf algae are common but not dominant in the project action area (USFWS, 2023). Filamentous algae or cyanobacteria are also present primarily seaward of Waikiki beaches but do not dominate the habitat (USFWS, 2023). While the proposed project is likely to increase nutrient and sediment concentrations reaching the nearshore marine environment during a storm event, the degree of increase in concentrations is not expected to stimulate algae growth in such a way that algae would be expected to become dominant in the project action area and smother corals that are present. There could be slight increases in algae growth observed due to increased nutrient and sediment concentrations and turbidity taking longer to begin to dissipate, but the increase in algae growth would not be expected to be substantial to cause algae to become dominant in the project action area.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to EFH and MUS from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment. The operation of the detention basin could also help avoid and minimize the potential impact of the proposed project on accelerated discharge of freshwater to the nearshore marine environment.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

5.2.2 Habitat Quality Degradation

Construction

As discussed above under Water Quality Degradation, in-water construction activities have the potential to generate turbidity through disturbance of existing in place sediments causing resuspension of these sediments into the water column, thereby raising ambient turbidity levels. Resuspended sediments within the water column would be anticipated to eventually settle out, but this could result in sedimentation of hard substrate habitat resulting in decreased EFH habitat quality.

Suspended sediments because of in-water construction are expected to settle rather quickly upon completion of the construction activity. Adverse impacts to substrate habitat quality are likely to be very limited in both physical and temporal extent due to the lack of currents in the canal and use of BMPs during in-water construction activities. Ala Wai Canal is usually subject to low velocity currents from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat).

Given that Ala Wai Canal is subject to bouts of high turbidity during periods of storm water runoff, it is not likely that temporary increases in turbidity from constructing/modifying existing drainage structures and the resulting deposition of these suspended sediments would have any measurable impact upon minimally mobile marine organisms. The biota currently established and utilizing the canal appear to be resilient to sedimentation stress, as observed by their survivorship in such an environment.

As described in Section 2.5, USACE has proposed BMPs (e.g., silt curtains) to contain re-suspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, sedimentation impacts to surrounding waters. In addition, the contractor would not conduct in-water construction activities that would compound upon adverse sedimentation impacts resulting from periods of heavy rainfall when flow primarily from the Manoa-Palolo Canal would introduce high turbidity levels.

Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and must implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

Operation

An increase in suspended sediments during a storm event, above that experienced under the future without project condition, would likely result in increased deposition rates within the canal and nearshore marine areas. According to the Ala Wai Canal Watershed Water Quality Improvement Project (City and County of Honolulu, 1998), sedimentation in the Ala Wai Canal occurs at the rate of about 10,300 CY per year. Sedimentation is also prevalent in the Manoa-Palolo Canal which receives the first flush from storm waters. Increased sedimentation in nearshore marine waters could smother living corals in the project action area and prevent recruitment of coral larvae. Currently, coral abundance in the project action area is generally low (< 10% cover) throughout (USFWS, 2023). Although the proposed project is expected to potentially increase sediment delivery to the nearshore marine environment and EFH habitat,

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

the degree of increase is not expected to be substantially different from the existing condition; therefore, coral abundance in the project action area is not expected to substantially decrease from its current abundance within the project action area. The corals found in the project action area are common to Hawaii and are somewhat pollution tolerant since they can survive in an environment that already receives increased sediment loading from the heavily urbanized Ala Wai watershed.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to EFH and MUS from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur and in turn minimize the potential impact on habitat quality within the nearshore marine environment. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment and thereby minimize the potential for resulting habitat degradation.

Table 7: Summary of Direct/Indirect Impacts to Essential Fish Habitat Associated with Each Project Phase.

Summary of Potential Adverse Effects on EFH and MUS From Planned Activities Associated with The Ala Wai Canal Flood Risk Management Project Honolulu, Oahu, Hawaii **Adverse Effect**	**Type of Impact**	**Project Phase**

N/A = Not applicable

5.3 Summary of Short-Term and Long-Term / Permanent Effects

Summary of potential adverse impacts of the proposed project on EFH and MUS are discussed in this section.

The extent of temporary impacts to EFH is dependent upon the following factors:

- The intensity of the impact at the specific site being affected.
- The spatial extent of the impact relative to the availability of the habitat type affected.
- The sensitivity/vulnerability of the habitat to the impact.
- The habitat functions that may be altered by the impact (i.e., shelter from predators).
- The timing of the impact relative to when the species or life stage needs the habitat.
- The degree to which the adverse impacts are avoided or minimized through BMP use.

Some impacts would be avoided or controlled through Project design modification, BMP implementation, or regulatory oversight and are considered negligible. Such impacts are described below.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

- Turbidity would be controlled through the use of silt curtains during construction. The low energy environment within the Ala Wai Canal reduces the spread and movement of plumes by current. Water quality monitoring would measure effectiveness of silt curtains (turbidity control) required as part of the State Water Quality Certification, in accordance with Section 401 of the Clean Water Act.

Short-Term Effects on EFH

Short-term effects result from actions that would cause temporary adverse impact to EFH or associated MUS, but are expected to be substantially restored through natural processes within one year.

- Mobile MUS (i.e., fish and crustaceans) trapped within a cofferdam if required for in-water work related to construction / modification of drainage structures would likely be lost during de-watering of the work area. Most fish in the vicinity during placement of cofferdam materials would swim away from the area. Any lost individual MUS would be negligible to the managed fishery and are expected to quickly recover.

Long-Term Effects on EFH

- Most mobile MUS (i.e., fish and crustaceans) would swim away from areas experiencing a turbidity plume during a storm event. Although unlikely, any lost individual MUS would be negligible to the managed fishery and are expected to recover quickly.
- Impacts on water quality from the addition of nutrients or other growth factors would have temporary biological effects. Unlike particulate turbidity which settles out quickly, nutrients that leach from the sediment particles stay in the water column and would quickly be taken up by phytoplankton in the water. An increase in nutrients has the capacity to result in a plankton bloom with possible indirect impacts. Such impacts would restore to equilibrium naturally.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

6. Proposed Minimization and Offset Measures

6.1 Minimization Measures Internal to the Project

It is USACE's intent that potential adverse impacts to EFH would be avoided or minimized through implementation of Project-specific BMPs before, during, and post-construction. In addition, impact minimization measures incorporated into the project design are intended to provide long-term benefit to EFH in the harbor. Such benefits include:

- Construction and operation of the Ala Wai Golf Course Detention Basin which has the potential to improve water quality of detained water prior to releasing the water slowly into the Ala Wai Canal. The Ala Wai Golf Course Detention Basin would capture water discharging from the Manoa-Palolo Canal and hold detained water for approximately two days prior to the slow release of the water back into the Ala Wai Canal. The detainment time would provide an opportunity for sediments suspended in the water column to settle out on the golf course instead of remaining entrained and settling out in the Ala Wai Canal and/or the nearshore marine environment. The settled-out sediments could contain pollutants the removal of which would improve the quality of the water entering the Ala Wai Canal from the detention basin.

6.2 Best Management Practices

A summary of the construction BMPs to be implemented to avoid and/or minimize adverse impacts to EFH are discussed in Section 2.5.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

7. Determination of Effect

The project would involve potential in-water work within freshwater streams and the Ala Wai Canal to construct/modify drainage structures associated with the project's proposed floodwalls and Ala Wai Golf Course detention basin. The operation of the project would be passive but could have an indirect effect on water quality and habitat quality within the Ala Wai Small Boat Harbor and the nearshore marine environment.

The project would not result in the loss of nearshore marine habitat, nor would the project have any unavoidable adverse impacts on the nearshore marine environment. All construction work either occurs upland or within aquatic habitat not designated as containing EFH. Therefore, the project would have no direct adverse effects to EFH.

Indirect adverse effects to the nearshore marine environment could occur because of project operation. The operation of the project could result in increased water velocities within the Ala Wai watershed which could in turn disturb in-place sediments within the Manoa Stream, Palolo Stream, and the Ala Wai Canal. Disturbance of in-place sediments would result in the resuspension of these sediments within the water column and creation of a turbidity plume which would degrade water quality. It is important to note that a turbidity plume is currently created under the future without project condition that causes degraded water quality, however, the proposed project could increase the degree to which water quality is degraded (i.e., could see greater degradation over a longer period). The construction and operation of the Ala Wai Golf Course detention basin could minimize this potential adverse indirect impact by detaining storm flows from the Manoa and Palolo streams and giving time for entrained sediments to settle out in the golf course prior to detained water entering the Ala Wai Canal. This could be a beneficial improvement in the water quality of storm water from the Manoa and Palolo streams entering the Ala Wai Canal and subsequently the nearshore marine environment.

The Corps has determined that these activities and their resulting impacts, as described in the preceding sections, would potentially reduce the quality of EFH, and accordingly would adversely affect EFH for BMUS, CMUS, and PMUS within the Ala Wai Small Boat Harbor and the nearshore marine environment. However, due to the containment of impacts to the Ala Wai Canal, the comparatively low quality of the EFH within the Ala Wai Small Boat Harbor and the nearshore marine environment, the size and scale of the impacts in comparison to the seemingly infinite expanse of EFH throughout the Pacific, the expected beneficial offsets resulting from the project design, and implementation of temporary avoidance and minimization measures built into the project, the Corps has determined that the anticipated adverse effects do not have the potential to cause substantial adverse effects to EFH.

INTRODUCTION

Authority, Purpose and Scope

The Ala Wai Canal Flood Risk Management Project (Ala Wai Project) is being developed as a cooperative effort between the United States Army Corps of Engineers (USACE) and the City and County of Honolulu. The Ala Wai project is authorized by Section 209 of the Flood Control Act of 1962 (Public Law 87-874) and Section 216 of the Flood Control Act of 1970, as amended. This project will utilize federal funding and requires a Department of the Army Permit, and therefore triggers mandatory consultation under the Fish and Wildlife Coordination Act of 1934 [16 U.S.C. 661 *et seq*.; 48 Stat. 401], as amended (FWCA).

The FWCA provides the basic authority for the Secretary of the Interior, Secretary of Commerce, and the appropriate State fish and game agency to assist and coordinate with Federal, State, and public or private agencies and organizations in the conservation and rehabilitation of aquatic wildlife and habitats. This authority is provided to the Secretary of the Interior and is delegated to the Service, and subsequently to the Ecological Services Program. The authority provided to the Secretary of Commerce is delegated to the National Marine Fisheries Service (NMFS) via Reorganization Plan No. 4. The authority provided to states and territories is delegated to natural resource agencies there (e.g. Department of Land and Natural Resources (DLNR) in Hawaii). The FWCA report acts as one step in informing each of these resource agencies, in addition to the requesting or acting agency, on natural resources present in the proposed project area and potential project impacts to those resources.

The following report is prepared in response to the USACE request that the U.S. Fish and Wildlife Service (Service), Pacific Islands Fish and Wildlife Office (PIFWO) develop a FWCA report to advise Corps on FWCA compliance on the Ala Wai project. This request was received in the document, "Fish and Wildlife Coordination Act Scope of Work: Ala Wai Canal Flood Risk Management Project General Reevaluation Report", dated July 11, 2022 (Appendix A). PIFWO prepared a Scope of Work and subsequently provided the following services: 1) collected and evaluated data; 2) analyzed potential project impacts; 3) provided recommendations for impact avoidance, minimization, and mitigation; 4) maintained coordination with Corps, DLNR, and the NMFS; and 5) drafted the FWCA report to document and present those services. This FWCA report was prepared under the authority of, and in accordance with, provisions of the FWCA; the Clean Water Act of 1977 [33 USC 1251 *et seq*.; 91 Stat. 1566], as amended (CWA); the Endangered Species Act of 1973 [16 U.S.C. 1531 *et seq*.; 87 Stat. 884], as amended (ESA); and other legislation that authorize the Service to provide technical assistance to conserve trust resources.

The Ala Wai Project aims to reduce potential impacts to public and private Honolulu infrastructure in future flood events. The Ala Wai watershed includes a high level of flood risk due to a combination of extensive and outdated urban development, steep topography in the Makiki, Manoa, and Palolo valleys, and a propensity for periodic and sometimes unpredictably severe heavy rain events. The Ala Wai Canal itself has overflowed and flooded Waikiki several times in the past (e.g. storms in November 1965 and December 1967, and Hurricane Iniki in 1992). Upland areas of the watershed have flooded more recently causing extensive damage in

the Manoa valley, impacting residents, businesses, and the University of Hawaii campus facilities (2004; > $85 million in damages), and in Makiki (October 2006).

The scope of the proposed project includes construction of flood mitigation measures throughout the Ala Wai watershed. Primary strategies being considered focus on increasing water storage in new detention basons and enhancing conveyance of floodwaters in streams with newly constructed floodwalls. The proposed measures will likely alter stream flow rates, runoff, and discharge to the Ala Wai Canal and on to the ocean. The scope of aquatic ecosystem impacts could include streams throughout the watershed, the Ala Wai Canal, Ala Wai Harbor, and the nearshore marine environment at Ala Moana and Waikiki.

Description of Project Area and Proposed Action

Oahu, Hawaii is located in the north Pacific Ocean (Figure 1). All proposed project sites are in the Ala Wai watershed on the leeward south shore of Oahu Island (Figures 2 and 3). The Ala Wai watershed is the primary natural drainage unit for the City of Honolulu, Hawaii, and surrounding residential and commercial areas. The Ala Wai watershed includes the southern slopes of the Koolau Range between Punchbowl and Diamond Head craters, the most densely populated and economically important area in the state. The watershed primarily drains to the Ala Wai Canal, where urban Honolulu meets Waikiki, before it flows into the Pacific Ocean via the mouth of the Ala Wai Harbor (Figure 3). Primary streams that feed the Ala Wai Canal originate in the prominent residential neighborhoods of Makiki and the Manoa and Palolo valleys (Figure 3).

Ongoing risk of damaging flooding in Makiki, Manoa, and Palolo, and downstream residential and commercial communities, calls for strategic flood risk mitigation throughout the Ala Wai watershed. The Corps has been planning the Ala Wai Canal Watershed Flood Risk Management project for over a decade and has met many challenges (e.g. social, logistical) in finalizing project plans. At present, the Corps has narrowed approximately 223 initially proposed measures down to three potential active Project Alternatives to reduce flood risk in the Ala Wai watershed, in addition to the possible "No Action Alternative." Current active Alternatives being considered include Alternative 1, primarily focused on increasing storage of floodwaters in detention basins but including some conveyance features; Alternative 2b, primarily focused on floodwall construction to facilitate conveyance of floodwaters but including some detention; and Alternative 5, a hybrid approach including both storage and conveyance strategies.

Each active Alternative includes several potential measures, some of which are still being screened at the time of writing.

Alternative 1

Alternative 1 proposes the Makiki District Park Detention Basin and the Kanaha Floodwall in Makiki, the Manoa Valley District Park Detention Basin and the Woodlawn Drive Floodwall in Manoa Valley, the Koali Road Floodwall near the convergence of Manoa and Palolo streams, the Kaimuki High School Floodwall near the school and adjacent to the Manoa-Palolo Canal, and

the Ala Wai Golf Course Detention Basin (see Figure 4). Schematics of floodwall designs are provided in Figure 5 through 8.

The Makiki District Park Detention Basin would temporarily store stormwater starting at a 20-year flood event and would slowly release water to the Makiki stream to drain by gravity over a period of about 24 hours. Basin capacity would be approximately 22 acre-feet and construction would include excavating down 6-10 ft, building a floodwall around the perimeter of the park (~ 1,200 ft in length), and building a 20 ft high, 4 ft wide, 525 ft long concrete box culvert at the basin inlet along with a 1.75 ft X 1.75 ft X 1.205 ft long concrete culvert at the exit.

The Kanaha Floodwall was designed to work in conjunction with the Makiki District Park Detention Basin to reduce flooding in adjacent and downstream residential communities. The Kanaha Floodwall is expected to be approximately 6 ft high and 2,200 ft long, extending along the right descending bank of Makiki Stream from Mott Smith Drive to Anapuni Street.

The Manoa District Park Detention Basin is designed similarly to the Makiki District Park Detention Basin to reduce flooding in residential areas downstream. The Manoa Park Detention Basin is also designed to store stormwater beginning at the 20-year storm event, would include similar excavation (6-8 ft) and a 6 ft floodwall construction including steel sheetpile and earthen slopes around the perimeter of Manoa District Park (~ 1,580 ft). The Manoa District Park Detention Basin is designed to have storage capacity of 54 acre-feet and would drain naturally over a period of about a day. The entrance concrete culvert box would be 15 ft high X 4.5 ft wide X 445 ft long and a 2 ft deep and 2 ft wide channel would be excavated to allow the basin to drain to Manoa Stream.

The Woodlawn Drive Floodwall would be constructed to reduce potential flooding at the University of Hawaii campus and downstream residential areas due to overflow at the Woodlawn Drive Bridge. This area has flooded severely in the past due to debris collecting at the bridge causing blockage and backup of stormwaters. The proposed structure would be approximately 6 ft high and would extend about 1,625 ft downstream, from a location approximately 320 ft upstream of Woodlawn Drive Bridge, along the right descending bank of Manoa Stream. The Woodlawn Drive Floodwall would be constructed of micropiles and concrete.

The Koali Road Floodwall would be constructed along the left descending bank of Manoa Stream and the right descending bank of Palolo Stream where the two streams meet to reduce threats of residential flooding near Kanewai Community Park. This measure would be constructed of micropiles and concrete, would be 6 ft tall, and would extend approximately 2,485 ft in total. The structure would be constructed where the two streams meet and would extend upstream to about 990 ft downstream from Dole Street Bridge on Manoa Stream, and 690 ft below the Koali Bridge on the Palolo Stream. Two associated box culverts would also be constructed. One would inlet near Kanewai Street with effluent to the Paolo Stream and the other would have influent flow at Kaluawaa Street and effluent flow to the Palolo Stream.

The Kaimuki High School Floodwall would include a similar floodwall construction to the others, to reduce potential flooding of residential structures east of the school. The Kaimuki Floodwall would extend around the perimeter of Kaimuki High athletic fields (4,400 ft).

Modifications to Ala Wai Golf Corse are planned to create Ala Wai Golf Course Detention Basin to reduce flood risk in Waikiki and other nearby communities. This measure would include construction of an earthen levee around the perimeter of the golf course (~ 10,655 acre-feet) to create a storage capacity of approximately 314 acre-feet. A concrete in-stream diversion weir (33ft wide X 147 ft long X 14.5 ft high) would be constructed along the left downstream bank of the Manoa-Palolo Canal and at the end of a drainage ditch that currently runs parallel to Date Street to divert water to the detention basin beginning in the case of a 20-year storm event. Current natural drainage areas along the southwest side of the golf course would be modified to create three concrete drainage structures with flap gates (3 ft wide X 3 ft high) to allow the Ala Wai Golf Course Detention Basin to drain into the Ala Wai Canal over a period of about 48 hours.

Alternative 2B

Alternative 2B (Figure 9) includes the Makiki District Park Detention Basin, Kanaha Floodwall, Woodlawn Drive Floodwall, and Koali Road Floodwall as described above. Alternative 2B also includes the Ala Wai Canal Floodwall and the Kaimuki High School Floodwall (less extensive than described in Alternative 1). The Ala Wai Canal Floodwall would be constructed of micropile, steel sheetpile, and concrete, would be 6 ft high, and extend approximately 24,745 ft along the right descending bank of Manoa-Palolo Stream from H-1 to the Ala Wai Canal, from Kaimuki Highschool Floodwall down Date Street and along the east side of the golf course, and along both banks of the Ala Wai Canal to Ala Moana Blvd. However, there may not be enough space to allow construction of the preferred "L-wall" design along the right descending bank between Kapiolani Boulevard and Date Street. Other design and construction alternatives remain in discussion (e.g. "I-wall" with tie-backs to keep the wall upright) and will likely be finalized during the Pre-Construction Engineering and Design phase of the project. This structure is intended to prevent flooding in Moiliili, Diamond Head, and Waikiki. Stormwater drainage sewers around the golf course would also be modified to allow free drainage to the Ala Wai Canal without backflow. The Kaimuki High School Floodwall proposed in Alternative 2B differs from that proposed in Alternative 1 in that it would join with the Ala Wai Canal Floodwall instead of extending parallel to Date Street.

Alternative 5

Alternative 5 (Figure 10) includes the Woodlawn Drive Floodwall and Koali Road Floodwall as described under Alternative 1. Alternative 5 also includes the Ala Wai Golf Course Detention basin as described below, and an iteration of the Kaimuki High School Floodwall that would differ from the Alternative 2B measure in how it joins the Ala Wai Canal Floodwall.

Alternative 5 proposes a modified design to create the Ala Wai Golf Course Detention Basin. This measure would be similar to that described in Alternative 1 but the earthen levee would join with the Ala Wai Canal Floodwall on the left descending bank of the Ala Wai Canal near the intersection of Kapahulu Ave. and Ala Wai Blvd. The drainage ditch running along the north side of the golf course at Date St. would be reinforced to act as a stormwater overflow into the golf course (detention basin). Drainage from the basin would occur as previously described.

Alternative 5 also includes the Ala Wai Canal Floodwall to extend along both banks of the Manoa-Palolo stream from H-1 to the Ala Wai Canal and Kaimuki High School Floodwall, connect with the earthen berm on the east side of the golf course, and along both banks of the Ala Wai Canal to Ala Moana Blvd. Area stormwater sewers that drain into the canal would be modified to prevent backflow.

Coordination with Federal and State Resource Agencies

Corps notified Service of new project engineering design and reinitiated ESA Consultation in a letter – 20 August 2020

Corps and Service met to discuss FWCA concerns about aquatic species passage, contaminants, and riparian habitat – 28 August 2020

Service provided ESA species list and recommendation to minimize impacts in a letter – 17 September 2020

Corps notified Service of reduced project scope in a letter – 10 November 2020

Service provided questions on project scope and Corps responded – 28 November 2020

Corps provided letter to Service indicating plans for a General Reevaluation Report – 9 August 2021

Service provided letter to USACE with comments and recommendations regarding the GRR – 2 September
2021

Agency Coordination Meeting with NOAA, USEPA, State of Hawaii Dept of Health (DOH), Coastal Zone Management Program (CZMP), Office of Conservation and Coastal Lands (OCCL), Commission on Water Resource Management (CWRM), and DLNR, and the City and County of Honolulu – 8 February 2022

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 5 April 2022

Corps provided Draft SOW for preparation of the FWCA Report – 18 July 2022

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 2 August 2022

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 23 August 2022

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 27 September 2022

USFWS Breakout Coordination Meeting – 18 October 2022

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 25 October 2022

DOH and CZMP Breakout Coordination Meeting – 26 October 2022

Service provided a first draft FWCA SOW and budget to NMFS for review – 8 November 2022

NMFS responded with Essential Fish Habitat (EFH) and ESA concerns on initial SOW draft – 8/10 November 2022

Service responded to NMFS comments on SOW – 14-15 November 2022

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 15 November 2022

Service provided SOW to Hawaii DLNR – 15 November 2022

Service received comments on SOW from DLNR (Department of Aquatic Resources (DAR) & Commission on Water Resource Management (CWRM)) and responded 15-16 November 2022

Service provided SOW to state and federal resource agencies for final review – 22 November 2022

Service provided SOW draft to Corps for initial review – 28 November 2022

Service provided Final Draft SOW to Corps and resource agencies – 6 December 2022

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 20 December 2022

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 24 January 2023

Agency Coordination Meeting with NOAA, USEPA, DOH, CZMP, OCCL, CWRM, DLNR, and the City and County of Honolulu – 28 February 2023

USFWS provided Preliminary Results to USACE – 28 March 2023

USFWS provided Draft FWCA Report to Federal and State Resource Agencies - 28 March 2023

FISH AND WILDLIFE RESOURCE CONCERNS AND PLANNING OBJECTIVES

U.S. Fish and Wildlife Service Planning Objectives

The mission of the Service consists of working with others to conserve, protect, and enhance fish, wildlife, plants, and their habitats for the continuing benefit of the American people. In 2016, the Service updated its 1981 mitigation policy to better meet this mission (USFWS, 2016), but has since rescinded the revised 2016 mitigation policy (USFWS, 2018) leaving the 1981 policy in effect. The Service's 1981 Mitigation Policy (USFWS, 1981) outlines internal guidance for evaluating project impacts affecting fish and wildlife resources. The Mitigation Policy complements the Service's participation under NEPA and the FWCA. The Service's

Mitigation Policy was formulated with the intent of protecting and conserving the most important fish and wildlife resources while facilitating balanced development of this nation's natural resources. The policy focuses primarily on habitat values and identifies four resource categories and mitigation guidelines. The resource categories are shown in Table 2.

Table 2: Resource Categories. **Resource categories and mitigation planning goals.**

Resource Category	Designation Criteria	Mitigation Planning Goal
1	High value for evaluation species and unique and irreplaceable.	No loss of existing habitat value.
2	High value for evaluation species and scarce or becoming scarce.	No net loss of in-kind habitat value.
3	High to medium value for evaluation species and abundant.	No net loss of habitat value while minimizing loss of in-kind habitat value.
4	Medium to low value for evaluation species.	Minimize loss of habitat value.

The proposed Ala Wai Project measures could have secondary impacts on areas that are considered coral reefs and meet the description of Resource Category 2. Other areas that could potentially be impacted by the proposed project meet definitions of Resource Category 3. Coral reef and freshwater stream areas should be considered “high” or “high to medium” value due to the aquatic and marine resources documented and sources cited in this report.

Coral reefs are considered scarce based on the local, national, and global decline of coral reefs (Williams et al., 2009; Walsh et al., 2010; Waddell (ed.), 2005; Waddell and Clarke (eds.), 2008; Wilkinson (ed), 1998; Wilkinson (ed), 2000; Wilkinson (ed), 2004; Wilkinson (ed), 2008) and the geographical constraints of coral reefs in the United States. Coral reefs have also been designated as Special Aquatic Sites under the Clean Water Act (CWA). Special Aquatic Sites are defined as “geographic areas, large or small, possessing special ecological characteristics of productivity, habitat, wildlife protection, or other important and easily disrupted ecological values.” They are further described as “significantly influencing or positively contributing to the general overall environmental health or vitality of the entire ecosystem of a region” (40 CFR Part 230 §230.44/FR v.45n.249).

Oahu’s freshwater streams provide essential habitat for a variety of endemic and threatened species. While these species may not currently occur in project sites, streams of the lower Ala Wai watershed do provide essential passage for indigenous diadromous species and can therefore be considered medium value.

Designations of Resource Category 2 and Special Aquatic Site require the Service to recommend ways for the action agency to mitigate losses, through measures to avoid or minimize significant adverse impacts. In the event losses are unavoidable, measures to rectify immediately, reduce, or eliminate losses commensurate with project permitting or implementation will be recommended

under the FWCA. Recommendations will focus on compensation for the replacement of in-kind habitat values and ecological functions. An effective and verifiable mitigation program planned and executed by the project proponent is required under NEPA and the CWA.

To this end, it is the policy of the Service to provide federal leadership for the conservation, protection, and enhancement of fish, wildlife, and their habitats by seeking to mitigate their losses with a facilitated, balanced approach to proposed water development actions. The Service's 1981 mitigation planning policies achieve this by the following: 1) State-Federal Partnership, 2) Resource Category Determinations, 3) Impact Assessment Principles, 4) Mitigation Recommendations, 5) Mitigation means and Measures, and 6) Follow-up.

Within these planning policies, the key term *evaluation species* is used to describe the fish and wildlife resources selected for impact analysis. There are two basic approaches to the implementation of evaluation species: 1) selection of species with high public interest, economic value, or both, and 2) selection of species that provide a broad ecological perspective of an area. While some species may be appropriate for both approaches, the Service emphasizes using species that provide a broad ecological perspective.

The evaluation species typically used for tropical Pacific marine ecosystems include stony corals, seagrasses, and certain benthic algal groups (*Halimeda* meadows or unique coralline algal communities). Some situations may dictate the use of additional benthic species and key fish species as important evaluation species, but the Service currently does not consider fish species in our assessments.

These evaluation species are important as they also relate to other federal agency policies. Coral reefs are generally considered high value habitat and have been defined in the CWA Section 404(b)(1) guidelines as "skeletal deposits, usually of calcareous or silicaceous materials, produced by the vital activities of anthozoan polyps or other invertebrate organisms present in growing portions of the reef." Stony corals are a foundation species to the development of coral reefs and hence are often the central focus of mitigation within the Pacific Island region. Coral reefs are further considered to be Special Aquatic Sites under the CWA 404(b)(1) guidelines. Finally, the 404(b)(1) guidelines also consider vegetated shallows to be Special Aquatic Sites. Within the Pacific Islands, the Service considers *Halimeda* meadows and seagrass communities to be vegetated shallows. Such Special Aquatic Sites are areas that possess special ecological characteristics and contribute to the overall benefit of the ecosystem.

Some locations within the potential impact area of the proposed project include coral reef and are classified under Category 2. Other areas within the proposed project fall under Category 3-4. This report includes assessment of data collected by the Service in early 2023, specifically to understand the coral reef resources that could potentially be impacted by the Ala Wai Project. The Service previously collected and assessed data and reported on potential project impacts to freshwater systems within the Ala Wai Canal watershed (see Foster et al. 2016 and Kim 2016). Those previous data and reports are still relevant and should be reviewed as appropriate to ongoing project plans. Though representative surveys were completed at marine and freshwater sites that are most likely to be impacted, it is possible that some valuable resources may have

been missed during field surveys. Precautionary plans for mitigation of any potentially present valuable resources should be considered.

Resource Concerns

The primary concerns associated with the proposed project include the potential impacts to coral reef ecosystems in the Ala Moana and Waikiki beach areas. This project is not likely to impact reefs directly. All construction associated with the Ala Wai Project is planned for sites located inland of the coast. However, the proposed construction and results of the project could have secondary impacts to coral reefs and other coastal habitat due to altered stormwater conveyance to the ocean via the Ala Wai Canal and its tributaries. Honolulu stormwaters typically include sediments and chemical contaminants that can harm corals and other living marine habitats and species. Negative impacts to the marine environment can potentially be minimized or avoided with appropriate planning that allows settling, removal, or filtering of sediment and contaminants, however, it remains difficult to quantify how sediments and chemical contaminants will be delivered to the coastal environment at different potential flood levels in relation to implementation of the proposed Project Alternatives.

The Service's specific planning objective is to collect and provide the Corps and federal and state resource agencies with data on the fish and wildlife resources, particularly aquatic species and habitats, that are most likely to be impacted by the proposed project. The Service also aims to interpretate those data and provide minimization and avoidance comments and recommendations for consideration during additional project planning and ongoing coordination among the Corps and resource agencies.

EVALUATION METHODOLOGY

Field Data Collection Protocol

Geomorphological structure and benthic habitat characteristics were surveyed at Waikiki Beach from the Ala Wai Canal exit (Ala Moana Bowls) to the jetty at the southeastern end of Ft. DeRussy. Surveys covered a distance of approximately 1.25 km of reef as the crow flies, from shore to the forereef or surf zone. Surveys were limited to the reef flats and intertidal zones in some cases where surf conditions made the reef crest and forereef inaccessible. Data was collected to map and assess potential impacts to benthic resources by secondary effects of the Ala Wai Project.

Phase I Habitat Mapping

Phase I survey methodology was used to identify and map habitat types, ground truth any information assumed from previously available benthic data sources, and to generally identify benthic habitat and species types present.

A team of two biologists collected qualitative information on the habitats and biological communities within the survey area using snorkeling equipment. The survey teams used various

available benthic data sources, satellite imagery, daily environmental conditions, and previous local experience to predetermine general areas and specific starting points for the surveys. The total number of transects surveyed was based on the time available and the area to be covered. The survey team was equipped with digital cameras, dive watches, floated GPS units, and datasheets attached to clipboards to record data. The team collected habitat and biological information along swim paths while towing a pair of floated GPS units. The floated GPS units were used to mark starting and ending waypoints and were set to automatically record a track log with 5 to 10-second intervals. GPS units were continuously aligned near the team to minimize spatial error between the biologists and the GPS path. The time on digital cameras was synchronized with the GPS units by photographing the time of the GPS unit before entering the water. Any time difference between dive watches and GPS units was recorded for later synchronization. This allowed scientists' observations to be linked to time and approximate locations (GPS coordinates) where the observations were made.

The survey team included a habitat/coral biologist and an algae/invertebrate biologist. All surveyors recorded data on observed habitat zones, debris observations, and protected species, in addition to their assigned focal taxonomic/geomorphologic/ecological groups. Each biologist recorded the estimated distance they were able to effectively observe, as visual assessment range is potentially limited by water clarity, rugosity of habitat, complexity of habitat, water depth, and other environmental conditions that can limit visible distance. One biologist was assigned as the navigator. The navigator followed a pre-determined compass bearing, depth contour, habitat boundary or other criteria used to define the survey transect path. Each biologist collected photographic documentation of significant species and habitat types observed.

Habitat Terminology and Characterization

Terminology used in this report to describe habitat was modified from Battista et al. (2007). Detailed definitions are available from the Pacific Islands Fish and Wildlife Office upon request. Although the classification of Battista et al. (2007) was not developed specifically for impact assessments, the terminology and characterization framework are generally appropriate for the purposes of characterizing habitats for this Phase I survey. The framework described in Battista et al. (2007) included three data layers of habitat information including classification of geographic zones, geomorphological structures, and biological cover. The Service used the terms for geographic zones, geomorphological structures, and major geomorphological structures with slight modification. The "geographic zones" were referred to as "habitat zones", "geomorphological structures" were called "habitat structures", and "major geomorphological structures" were referred to as "major habitat structures."

Habitat zones were generally determined prior to entering the water and verified by the teams during the survey and upon analysis of the qualitative data collected. To verify habitat zones, the habitat/coral surveyor identified habitat structures as accurately as possible while in the water. The navigator led the survey teams along approximated habitat structure boundaries where possible to assist with further delineation between habitat structures. Biological characterization was focused on one side of any observed boundaries to apply appropriately to each specific habitat structure involved in the assessment. This characterization focus was coordinated by the observers and noted on their datasheets. The boundaries between habitat structures were

evaluated or refined during the data processing phase (see Habitat Map Production methods). The types of unconsolidated sediments observed were scored as present or absent and categorized as sand, mud, rubble, and cobble.

In addition to characterizing the habitat structures, the habitat/coral surveyor also characterized habitat complexity. The categories of habitat complexity used were the same as used by NOAA's Pacific Islands Fishery Science Center (Brainard et al. 2008; Brainard et al. 2012) and included six categories recorded on a 0-5 scale: 0 for low, 1 for medium-low, 2 for medium, 3 for medium-high, 4 for high, and 5 for very high. "As examples, low habitat complexity is often associated with flat sand plains or rubble habitats; medium habitat complexity is often associated with small to moderate spur and groove, coral or boulder habitats; and high or very high habitat complexity are often observed as high or extreme vertical relief associated with steep spur-and-groove canyons, pinnacles, and walls" (Brainard et al. 2008).

Biotic Characterization

The biologists inventoried biological groups/categories and species observed along the survey transect. Information on the biological groups/categories was recorded every 10 to 60 seconds depending on the habitat area/complexity and speed of swimming. Visual assessment range was recorded. The biotic characterization included three main survey categories including habitat/coral, algae/invertebrate, and ESA corals, and each main category included multiple data collection components as described in the following sections.

Habitat/Coral Characterization

The habitat/coral surveyor also collected information on six different components of the coral population within each surveyed area. These components included the relative abundance of stony corals, stony coral growth forms observed, estimated stony coral sizes present, and presence of non-stony corals (see components 1–6 below). Each observation, and the time of observations (hh:mm:ss) was recorded to identify approximate GPS coordinates for each observation. Approximate radius (m) of areas assessed for coral abundance was recorded. The observer also photographed representative habitats, coral communities, coral colonies, and/or any other notable features.

Component 1 – Habitat structure and sediment were classified continually and with the same frequency as other data. Habitat zones were classified at the start of the dive or when a change of zone was found.

Component 2 – Relative coral abundance was recorded utilizing a modified DACOR method. DACOR stands for dominant (5), abundant (4), common (3), occasional (2), or rare (1). Categories were recorded on a 1-5 scale with 1 being Rare and 5 being Dominant. Zero was used for coral absence. Each category was approximated to represent a broad range of percent coral cover such as 1 – <1% (scattered corals), 2 – <10%, 3 – 10–50%, 4 – 50–80%, and 5 – >80%.

Component 3 – Stony coral growth forms included: 1) lobate/massive, 2) conical, 3) small-branching, 4) medium-branching, 5) large-branching, 6) digitate, 7) columnar, 8) table, 9) plate,

10) foliaceous, 11) encrusting, 12) free-living, and 13) mixed. Possible mixed growth forms included forms like plates-and-column and plates-and-branched, but if other combinations existed, they were recorded as well. The distinction between small and medium branching colonies was made by using the approximate diameter of a pencil (< 1 cm), while the distinction between medium and large branching colonies was made by using the approximate diameter of a small wrist (< 5 cm). For data analysis, these growth forms were lumped into fewer categories including: 1) lobate, microatoll, branching, encrusting, plate-like, and free-living.

Component 4 – For each growth form observed, the sizes observed were recorded as broad size categories, including: 1) small (less than 50 cm), 2) large (greater than 50 cm), 3) mixed (including both small and large colonies), and 4) extra-large colonies (greater than 2 m).

Component 5 – Non-stony coral groups were recorded as present or absent. The groups include: 1) soft corals, 2) zoanthids, 3) gorgonians or sea fans, and 4) black or wire corals.

Component 6 – If coral disease or bleaching was observed, it was noted in the comments section of the datasheet and recorded in the Access database. It was recorded as coral stress (present or absent), and then logged as disease, pale bleached, partial bleached, or complete bleached.

Algae/Non-Coral Invertebrate Characterization

The algal/invertebrate observer collected information on up to eight different components. These components included relative abundances for seagrass, turf algae, coralline algae, filamentous algae, macroalgae, and several invertebrate groups. The observer also recorded observations on debris. The details for each component are listed below. Locations of each observation were recorded. The visual assessment range was estimated and representative habitats, representative algal and invertebrate communities, algae and invertebrates for species identification, or any other notable feature of interest were photographed.

Component 1 – Relative abundance for seagrass was recorded on a scale of 0–3. Zero was used for seagrass absence. Category 1 represented seagrass abundance that consisted of isolated patches and did not have continuous coverage within an area. Category 2 represented seagrass that has semi-continuous or continuous coverage, but only a low density of blades. Category 3 represented seagrass with continuous coverage and a high density of blades or a tall canopy height. The species of seagrass were recorded.

Component 2 – Relative abundance for turf algae was recorded on a scale of 0–3. Zero was used for turf algae absence. Category 1 represented turf algae that had sparse or patchy coverage and/or low density. Category 2 represented a moderate, semi-continuous coverage and a low to moderate density of turf algae. Category 3 represented continuous coverage and a high density of turf algae. Turf algae were considered to include sparse to thick multi-specific assemblages of diminutive and juvenile algae less than 2–3 cm in canopy height.

Component 3 – Relative abundance for coralline algae was recorded on a scale of 0–3. Zero was used for coralline algae absence. Category 1 represented a sparse or patchy coverage of coralline algae. Category 2 represented a moderate or semi-continuous coverage of coralline algae.

Category 3 represented a continuous coverage of coralline algae. Coralline algae were identified as readily visible red or pink corallines on the reef surface. The observer did not look in holes or under rocks to assess the coralline algae abundance.

Component 4 – Relative abundance of filamentous algae and cyanobacteria was recorded on a scale of 0–3. Zero was used for absence of filamentous algae or cyanobacteria. Category 1 represented a sparse or patchy coverage of filamentous algae or cyanobacteria. Category 2 represented a moderate or semi-continuous coverage of filamentous algae or cyanobacteria. Category 3 represented a continuous coverage and a high density of filamentous algae or cyanobacteria. Filamentous algae were defined here as hair-like plants that do not form a substantial thallus or a coherent tissue (definition modified from Huisman et al. 2007, page 254). Common filamentous algae that are representative of this group include *Cladophora* spp. or *Bryopsis hypnoides* (not *Bryopsis pennata*). Common cyanobacteria that are representative of this category include *Lyngbya* spp. and *Hormothamnion* sp.

Component 5 – Relative abundance of macroalgae was recorded on a scale of 0–3. Zero was used for macroalgae absence. Category 1 classification represented sparse or patchy (even individual plants) and a low density of macroalgae. Category 2 classification represented moderate, semi-continuous coverage and a low to moderate density of macroalgae. Category 3 represented a continuous coverage with a high density of macroalgae. In addition to recording the relative abundance, four forms of macroalgae were recorded as being present or absent and included short frondose, tall frondose, *Halimeda* algae, or invasive macroalgae. Short frondose macroalgae was defined as having a maximum canopy height of 20 cm and tall frondose macroalgae was defined as having a minimum canopy height of 20 cm.

Component 6 – Relative abundance for all non-coral invertebrates was recorded on a scale of 0–3. Zero was used for invertebrate absence. Category 1 classification represented an observation of 1–2 individuals. Category 2 classification represented the observation of 3–10 individuals. Category 3 represented the observation of more than 10 individuals. If an aggregation of significantly more than 10 individuals was observed, this was recorded in the comments section. The invertebrate groups included grazing sea urchins, rock boring sea urchins, crown-of-thorns starfish, lobsters, *Pinctada margaritifera*, giant clams, anemones, sea cucumbers, molluscs (strombids, top or turbin shells, Triton's Trumpet, helmet shells, etc.), octopus, seastars (*Linckia* sp., *Culcita* sp., or others), and crinoids. In addition, the presence and absence (but not relative abundance of) sponges and tunicates in all forms and shapes were recorded.

Component 7 – The observation of marine debris (deb) or remnant structure underwater was recorded as present or absent. The type of structure or debris was also recorded (UXO, tires, misc., etc.).

Component 8 – The final component was the compilation of an overall species list for all algae and invertebrate species observed. Species were identified to the lowest taxonomic level possible, either *in situ* or by subsequent examination of photographs taken on-site.

Post-Field Work Data Processing

Data Preparation

Digital images and GPS data were downloaded using appropriate software. Images were placed into daily folders and GPS data were downloaded using DNRGPS 6.0© as a tab-delimited text file (.txt). Benthic data were entered into a Microsoft Access© database. After all data are entered into the Access database, the GPS data, dive data, habitat/coral data, and algae/invert data were validated for errors or anomalies. All errors were corrected, and the data were processed for geosyncronization. The final, validated, georeferenced data were stored as a database file (.mdb).

Data Processing

Habitat map data layers were produced with a series of Service custom built scripts (Marine_Mapping_Model1_v4.R and Marine_Mapping_Model2_v4.R) using R software (R Core Team, 2020). These custom built scripts used several packages including RODBC (Ripley and Lapsley 2020), sf (Pebesma et al. 2020a), raster (Hijmans et al. 2020), rgdal (Bivand et al. 2020a), dismo (Hijmans et al. 2017), deldir (Turner 2020), maptools (Bivand et al. 2020b), rgeos (Bivand et al. 2020c), smoothr (Strimas-Mackey 2020), spatialEco (Evans et al. 2020), cleangeo (Blondel 2019), sp (Pebesma et al. 2020b), gstat (Pebesma and Graeler 2020), R.utils (Bengtsson 2020), and rmapshaper (Teucher et al. 2020). The first script (Marine_Mapping_Model1_v4.R) processed the raw survey data exported from the database file. External data can be incorporated into the data processing including various other resources such as NOAA's Benthic Habitat Maps (Battista et al. 2007), land classification layers, existing DEM layers, or habitat classification from Feature Analyst©. All available benthic classification data were incorporated into the classification layer produced from this project's field data to provide a comparative option for the final classification. After the individual datasets were processed, they were incorporated and combined into the draft classification layer. This draft layer was processed based on comparative criteria and manual interpretation of the results to produce a final classification layer in the second script (Marine_Mapping_Model2_v4.R). The second script also finalized the geoprocessing steps and incorporated a series of interpolations for all the biological groups as described previously.

Initial input layers used to begin the data processing included area enclosure and Target Area shapefiles, the raw database output file, and NOAA's Benthic Habitat Maps (Battista et al. 2007). The Target Area shapefile represented the coastal marine area anticipated to experience the most direct impacts from the proposed project and associated runoff in future flood events. A 500 m radius from the coastal discharge location (i.e. the mouth of Ala Wai Harbor) was used to define the Target Area. Marine surveys were focused southwestward from the discharge area because previous observations indicated that prevailing ocean currents are expected to direct effluent waters in that direction. The area enclosure shapefile included the entire Ala Wai watershed and nearshore waters but served to clip the spatial data and ensure it could not extend beyond the area of interest. This prevented inclusion of extraneous data. The Project Area was defined by a 100 m buffer of the Target Area and the area directly surveyed by divers and is intended to represent the area of highest likelihood of secondary impacts.

During the classification stage, set classification criteria and manual interpretation of the layer classifications were used to finalize classification. The set classification criteria and manual

interpretation determined the boundaries of the habitat structures by: 1) direct observation, 2) transects that are swum along habitat structure transition boundaries (e.g. scattered rock in unconsolidated sediment on one side and unconsolidated sediment-sand on the other side), 3) utilizing NOAA's Benthic Habitat Maps where deemed appropriate, or 4) other data sources as described previously (e.g. Feature Analyst outputs based on WorldView-2 imagery) that provided information on habitat structures. These boundaries were assumed to represent a best estimate of actual habitat boundaries based on the available information. After the boundaries were drawn for each habitat character, the edited Theissen polygon was validated to reassure all changes were correct and complete.

The models were also used to generate output tables that included all geodetic area calculations for each major habitat structure, habitat structure, sediment type, and habitat zones.

DESCRIPTION OF FISH AND WILDLIFE RESOURCES AND HABITAT

General

The Target Area, as defined for this project, included the marine aquatic habitat within 500 m of the mouth of Ala Wai Harbor. We considered the harbor mouth to be the discharge site for Ala Wai Canal effluent waters, and marine resources within 500 m of the discharge site to be the most likely to be impacted by the proposed project. The Project Area included the Target Area and the surveyed area, plus a 100 m buffer around both. While the Project Area was intended to cover the likely area of both direct and indirect effects, it may be larger or smaller than actual potential impacts.

Appendix B contains 23 maps depicting the habitats and biological resources within the Project Area (see Figure B1). Details of the maps are discussed below. Table 2 shows the breakdown for the Target Area including the surveyed structures, zones, and sediment types. The total area was 696,373 m^2. The geomorphological habitat structures were made up of Land (0.5 percent), Scattered Coral Rock in Unconsolidated Sediment (15.9 percent), Artificial (0.9 percent), Unconsolidated Sediment (0.1 percent), Pavement (15.0 percent), Pavement with Sand Channels (3.4 percent), Reef Hole (0.2 percent) and Unknown (64.0 percent). Unknown classifications represented areas with insufficient data. The habitat zones included Land (0.5 percent), Harbor (14.9 percent), Reef Flat (19.4 percent), Reef Crest (3.9 percent), Fore Reef (19.7 percent), and Bank/Shelf (41.9 percent). The major geomorphological habitat structures included Land (0.5 percent), Mixed (19.3 percent), Hard Bottom (16.1 percent), and Unconsolidated Sediment (0.1 percent), and Unknown (64 percent). The sediment present was 89.3 percent Sand with Rubble and 10.7 percent sand mixed with Rubble and Cobble.

Habitat Characteristics

The surveyed area (Figure B2 and B3) primarily included Shoreline Intertidal, Harbor, Reef Flat, and Reef Crest zones seaward of Ala Wai Harbor and Waikiki Beach seaward of Ft. DeRussy (Figures 11 and B4). The observed area included modified intertidal beach and a mix of natural reef flat and reef flat areas that have been modified to provide access to small dug out harbors at Waikiki Beach.

The areas seaward of Ala Wai Harbor and Waikiki beaches were generally separated by the small dug out harbor adjacent to Kahanamoku Beach and the Atlantis Submarines dock (Figure 12), and a channel cut through the reef flat many years ago providing access to that harbor. The Kahanamoku Beach harbor area consisted of Unconsolidated Sediment made up of Sand and Rubble (Figures 13) and B5 – B7). The channel area was classified as Mixed habitat including Unconsolidated Sediment and Scattered Coral Rock in Unconsolidated Sediment (Figures B5 – B7).

The intertidal zone adjacent to beaches included a seaward progression from Unconsolidated Sediment, consisting of Sand changing to Sand and Rubble, to reef flat habitat (Figures 5 – 7). Waikiki Beach included a deeper trough at the seaward edge of the intertidal zone near Grays Channel before the reef flat began. Progressing seaward from Ala Wai Harbor, habitat transitioned from artificial structure (Figure 14) directly to areas classified as Reef Flat in most cases (Figures B5 – B8). Reef flats were generally gently sloping, with depths of approximately 0.5 m to 2 m, extending from the intertidal zone to the surf zone at the reef crest. The reef flat was characterized by Hard Bottom Pavement with areas of Mixed Habitat Structure including mostly Pavement, Sand, and Rubble with low relief (Figures B4 – B9). The forereef included steeper spur and grove characteristics (Figures B7 – B9). Area seaward of the fore reef slope appeared to be deeper offshore bank/shelf habitat (Figure B4).

Biological Resources

Visual surveys indicated that the Project Area was relatively typical of historically modified urban beaches, harbors, and coral reef environments. Coral abundance was generally low (< 10 percent cover) throughout (Figure B10). Small (< 50 cm) to large (50cm – 200 cm) lobate corals (Figure 15) were most common on the reef flats, followed by small medium-branching (Figure 16), encrusting, and microatoll growth forms (Figure B11). The most common coral species observed included *Porites rus*, *P. compressa*, *P. lobata,* and potentially other species of massive *Porites*, branching *Pocillopora spp*., and encrusting *Montipora spp*. Zoanthids were sparsely distributed on the reef flats (Figure B12). Frondose algae, CCA, and turf algae were common but not dominant throughout the surveyed area (Figures 17 and B13 – B15). Invasive algal species observed included *Gracilaria salicornia*, *Acanthophera spicifera*, and *Avrainvillea* sp. Filamentous algae or cyanobacteria were present, particularly seaward of Waikiki beaches but did not dominate the habitat (Figures 17 and B16). Spiny urchins were common, and rock boring urchins (Figures 16 and 18) were dominant throughout the surveyed area (Figures 17 – 18). Sea cucumbers were observed throughout the Project Area and occurred in clusters in certain reef flat areas (Figure B19). Molluscs were observed sparsely throughout the surveys (Figure B20). Sponges were observed in clusters, primarily seaward of Ala Wai Harbor (Figure B21). Tunicates were observed primarily in areas directly adjacent to channels and harbor areas (Figure B22). Green sea turtles were observed swimming at 16 locations within the Project Area. No marine mammals were observed (Figure B10).

PROJECT IMPACTS

Direct Impacts

The direct environmental impacts on aquatic species and habitats caused by the Ala Wai project are most likely limited to construction areas that will alter streams and freshwater habitats inland of the marine environment. The Service assessed project impacts on streams and freshwater systems previously in Foster et al. (2016) and Kim (2016). The Service also provided relevant comments in a letter in September 2021 responding to the Corps indication of plans for a General Reevaluation Report for the project. These documents can be reviewed for understanding of direct project impacts to aquatic ecosystems.

Indirect Impacts

Impacts of the Ala Wai project on marine ecosystems will possibly be indirect. Impacts to the marine environment can potentially be minimized with appropriate planning and application of Project Alternatives, however, it remains difficult to quantify the complex array of potential impacts and how they will occur at different flood levels and given implementation of the various potential measures associated the Project Alternatives.

Sources of project impacts on marine ecosystems include altered delivery of freshwater, sediments, and chemical contaminants to the nearshore marine environment. Response of marine species to these factors depends on concentration, frequency, and duration of exposure, and different marine species will be impacted differently. Habitat forming organisms such as corals are of primary concern because a wide range of other species depend on them.

Legacy environmental contaminants, particularly termiticides used in older wood frame houses in neighborhoods like Manoa and Palolo, and other contaminants from urban and industrial runoff, have likely accumulated in locations within the watershed based on current flow regimes. It is unclear how accumulated chemical contaminants and sediments would be redistributed by flow alterations proposed by this project, and how those contaminants will be delivered to the sea. Accumulation of contaminants in the Ala Wai Canal could be extensive at this time and could be increased by this project. Additionally, accumulation of contaminants would likely occur in detention basins that are proposed measures. These contaminants ultimately flush to the marine environment and could do so more readily with altered flow of stormwaters. These factors could lead to increased negative impacts on evaluation species.

Concerns about sediment and chemical contaminants could be reduced if the project incorporates measures to allow contaminants to settle out of flood waters (e.g. multiple detention basins), in addition to maintenance plans to remove contaminants from the watershed (e.g. removal of accumulated sediments from detention basins and Ala Wai Canal).

While the Corps has completed hydrologic and hydraulic (H&H) modeling for the project area (Figure D1; Table D1) that helps to understand flood levels, runoff, and freshwater discharge, the ability to predict discharge of sediment and chemical contaminants remains limited. FWCA requires equal consideration of fish and wildlife resources to other project goals. Flood risk reduction measures that can also reduce contamination of the marine environment should be included in this project.

RECOMMENDATIONS

1) *The Service recommends that the Corps refer to previous FWCA assessments and other correspondences to avoid impacts to streams and freshwater aquatic habitats and species:*

The Service has previously assessed potential impacts of the Ala Wai Canal Flood Risk Management project on streams and freshwater ecosystems within the Ala Wai watershed. Please refer to Kim (2016) and Foster (2016) to avoid impacts to freshwater ecosystems.

2) *The Service recommends further consideration of natural mitigation measures at the Makiki District Park Detention Basin and Manoa Valley District Park Detention Basin measures, in addition to the Ala Wai Golf Course Detention Basin, to trap sediments and chemical contaminants originating up stream of those locations:*

Despite the limits to effectiveness of previously screened natural mitigation measures and Makiki District Park Detention Basin and Manoa Valley District Park Detention Basin in meeting flood control goals, FWCA requires equal consideration of fish and wildlife trust resources to other project goals. This calls for a precautionary approach to mitigating the potential impacts. A precautionary approach to mitigation, in this case, may include revitalizing flood risk management measures that have previously been screened out for other reasons. For example, the initially considered measure including natural enhancement of upland native forest was screened due to being limited in overall reduction of flood risk compared to other measures planned to control flow of upland floodwaters (i.e. Makiki District Park Detention Basin and Manoa Valley District Park Detention Basin). Currently, these two detention basins have also been screened. Detention basins are potentially valuable for mitigating both flood risk to infrastructure and expected discharges of sediment and chemical contaminants to nearshore environment and should be considered further for inclusion. Natural enhancement of native upland forests could add additional water retention benefits, combined with detention basins or in their absence, in consideration of fish and wildlife trust resources throughout the watershed and in the marine environment.

3) *The Service recommends regular scheduled maintenance plans be incorporated into this project to remove sediments (likely to contain chemical contaminants) that are present in the Ala Wai Canal, and also sediments/contaminants that are expected to accumulate in the Ala Wai Canal and the detention basins associated with this project over time.*

4) *The Service recommends that the Corps evaluate organochlorine levels in Manoa and Palolo streams and model their delivery to the marine environment prior to finalizing Project measures to be implemented.*

Monitoring chemical contaminants that enter the marine environment alongside trends in the nearshore ecosystem will enhance understanding of impacts of this project to marine ecosystems and inform future similar projects.

5) *The Service recommends that this project incorporate medium-term to long-term monitoring of marine resources and sediment and contaminants (including chlordane and dieldrin) in marine habitats located in the Project Area:*

Monitoring chemical contaminants that enter the marine environment alongside status and trends indicators in the nearshore ecosystem will enhance understanding of impacts of this project to marine ecosystems and inform future similar projects.

6) *The Service recommends the Best Management Practices provided as Appendix C.*

APPENDICES

APPENDIX A: Fish and Wildlife Coordination Act Scope of Work: Ala Wai Canal Flood Risk Management Project General Reevaluation Report

Fish and Wildlife Coordination Act Scope of Work
Ala Wai Canal Flood Risk Management Project
General Reevaluation Report
July 11, 2022

1.0 Purpose

This Scope of Work defines the expectations between the U.S. Corps of Engineers' (Corps) and the U.S. Fish and Wildlife Service (the Service) pursuant to coordination under the Fish and Wildlife Coordination Act for the Ala Wai Canal Flood Risk Management Project, General Reevaluation Study, Honolulu County, Hawaii.

2.0 Study Area

The Ala Wai Canal Flood Risk Management Project (Ala Wai Canal Project) is a joint cooperative effort between the Corps and the City and County of Honolulu. The Ala Wai Canal project was authorized in Section 209 of the Flood Control Act of 1962 (Public Law 87-874) and Section 216 of the Flood Control Act of 1970, as amended.

The study area for the Ala Wai Canal Project is located within the Ala Wai watershed, which is located on the southeastern side of the island of O'ahu, Hawai'i. The watershed encompasses 19 square miles (12,064 acres) and extends from the ridge of the Ko'olau Mountains to the nearshore waters of Māmala Bay (Figure 1). It includes the Makiki, Mānoa, and Pālolo streams, which flow to the Ala Wai Canal, a two mile long, man-made waterway constructed during the 1920's. The project area encompasses conservation areas in the upper reaches of the watershed and highly urbanized areas in the valleys and lower reaches of the watershed.

Figure 1: Regional Map of the Project Area.

3.0 Fish and Wildlife Coordination Act

This Scope of Work is particularly directed at implementing coordination between the Corps and the Service in accordance with the Fish and Wildlife Coordination Act (FWCA) of 1958, as amended (48 Stat. 401; 16 U.S.C. 661 et seq.). The Fish and Wildlife Coordination Act of 1934 included requirements that were the first formal expressions in U.S. law of a duty to minimize the negative environmental impacts of major water resource development projects and to compensate for those impacts that remained (Bean 2016). The duties imposed by the FWCA were reinforced and expanded by the National Environmental Policy Act of 1969 (NEPA) (Bean 2016). Under NEPA and its implementing regulations, all federal agencies have a duty to assess the impacts of the major actions they propose to undertake and to consider reasonable alternatives to reduce or eliminate those impacts (Bean 2016). The Service, as the federal agency charged by Congress in the Fish and Wildlife Act of 1956 with the responsibility for management, conservation, and protection of fish and wildlife resources, routinely recommends mitigation measures to other federal agencies through the NEPA and FWCA processes (Bean 2016).

The FWCA directs and authorizes consultation, reporting, consideration, and installation/implementation of fish and wildlife conservation features. The authorities of the FWCA are considered to be "supplementary legislation" to the various Federal project authorizations, such as the Corps public works authorizations (Smalley and Mueller 2004). The FWCA conditions or supplements other water development statutes to require consideration of recommendations generated under the FWCA procedures, including portions of the Clean Water Act [*Zabel* v. *Tabb*, 430 F2d 199 (5th Cir. 1970) cert. denied 401 U.S. 910 (1972)]. For Federal water resources development projects, the FWCA requires that fish and wildlife conservation receive equal consideration by Federal agencies with other project purposes, and that such conservation be coordinated with other project features. The FWCA authorizes the Federal project implementation of these noted means and measures for both mitigating losses of fish and wildlife resources, and for enhancing these resources beyond the offsetting of project effects (Smalley and Mueller 2004).

4.0 Project Purpose

A high level of flood risk exists within the Ala Wai Watershed. Extensive urban development throughout the watershed, coupled with the basin's unique topography and hydrology (i.e., steep mountainous terrain and propensity for intense rainfall events within the headwaters) and aging and undersized infrastructure result in elevated flood risk for a large proportion of the population both along the Ala Wai Canal and within the Makiki, Mānoa, and Pālolo valleys. The population within the Ala Wai watershed is approximately 200,000 residents. The watershed also contains the University of Hawai'i and the Waikīkī District — a prime tourist destination that attracts more than 79,000 visitors per day and accounts for approximately 8% of the gross state product and 11% of all civilian jobs in the state.

It is estimated that the Ala Wai Canal has the capacity to contain about a 20% annual exceedance probability (AEP) flood event. Overtopping of the Canal has previously flooded Waikīkī multiple times, including November 1965 and December 1967 storms and during the passage of Hurricane Iniki in 1992. Upstream areas are also at risk of flooding, as demonstrated by several recent events, including the October 2004 storm that flooded the Mānoa Valley and the March 2006 storm that flooded Makiki. The October 2004 event was estimated to have a 4% AEP that caused more than $85 million in damages.

The purpose of the general reevaluation report and environmental assessment that the Corps is preparing is to analyze a series of alternatives designed to reduce the on-going flood risks throughout the Ala Wai watershed, including a no action plan, as well as various combinations of structural, nonstructural, and natural and nature-based measures.

5.0 Measures Under Consideration

The project delivery team held a planning charrette in July 2021 to develop an initial list of management measures. The planning charette included not only the project delivery team, but also the local sponsor and relevant stakeholders. During the charette a total of 223 management measures were identified that could potentially address the study area problems and realize the study area opportunities within the Ala Wai watershed. Through subsequent screening by the PDT, the initial list of management measures has been reduced to 66 management measures still under consideration. Table 1 shows the management measures still under consideration as of July 2022.

The Corps is requesting that the U.S. Fish and Wildlife Service begin development of a planning aid letter (PAL) with the management measures presented in Table 1. As further screening of management measures occurs and an initial array of alternatives are formulated, the U.S. Fish and Wildlife will be provided this information for development of a Draft Fish and Wildlife Coordination Act Report (CAR) that describes any conservation recommendations and best management practices that the Service believes will help conserve fish and wildlife resources under the Service's jurisdiction. As the Corps analyses proceed to a final array of alternatives, they will be provided to the Service to support preparation of the Final CAR.

Table 1: List of Management Measures for the Ala Wai Canal Flood Risk Management Project, as of July 2022.

Management Measure	Basin	Description
No Action		
Do Nothing	Watershed Wide	Let it flood and federal government continues to provide funds to assist in clean-up efforts.
Nonstructural		
Emergency Preparedness Plans	Watershed Wide	Develop and maintain a flood emergency preparedness plan that identifies hazards, risks and vulnerabilities, and encourages the development of local mitigation. Plans should include the community's response to flooding, location of evacuation centers, evacuation routes, and flood recovery processes.
Flood Warning System	Watershed Wide	Flood warning systems alert citizens in flood prone areas of impending high water, giving the opportunity to evacuate damageable property and themselves from flood-prone areas.
Physical Nonstructural Measures	Watershed Wide	Nonstructural measures are permanent or contingent measures applied to a structure and/or its contents that prevent or provide resistance to damage from flooding. Measures can include elevation, relocation, acquisition, dry flood proofing, or wet flood proofing.
Risk Communication/Education	Watershed Wide	Risk communication develops and uses educational tools such as presentations, workshops, hand-outs, and pamphlets to communicate flood risk and flood risk reduction measures.
Natural and Nature-Based		

Management Measure	Basin	Description
Forest Management	Upper Watershed	Manage the forest above Waiakeakua and along Waihi. The forest is changing and becoming increasingly degraded by feral pigs and invasive plants and trees, thus reducing the resiliency of the watershed to major flooding events. Should look at the watershed starting at the top where the majority of the rainfall is and the natural systems in place that may be improved to mitigate flooding.
Daylight streams	Makiki	Daylight streams at constrictions – will need hydraulic results to identify pinch points.
Pālolo Channel Naturalization	Pālolo	Return channel to a more natural state by removing concrete and adding natural slope material. This measure will likely be in conjunction with channel deepening, upstream detention and/or bridge modification to offset increased water elevations. Naturalization will reduce velocities and dampen peak flow.
Reduce Hardcover and Impervious Surfaces	Watershed Wide	Limit and reduce hardcover in the urban environment that increase runoff. Remove impervious surfaces and replace with porous surfaces.
Traditional Hawaiian Resource Management Practices	Watershed Wide	Utilize traditional Hawaiian resource management practices like loko ia, loi kalo, and fishponds for sediment retention and flood mitigation.
Structural		
Bridge Bypass and Debris	Upper Watershed	Spot treatment to low spots along the streams – debris screening and emergency bypasses or spillways for each bridge in the valleys so that the waters don't raise and erode neighboring properties.
Debris Basins	Upper Watershed	Install debris basins to collect debris in the upper watershed before it clogs up the Ala Wai Canal.
Detention Basins	Upper Watershed	Detention basins in government lands in mauka conservation districts if the City will maintain it. There is not enough width and depth in the existing flood channels to accommodate a large flood.
Floodgate & Bypass or Floodgate & Pump at Makiki Confluence	Makiki	If floodwalls around the canal are necessary, include a floodgate with bypass or a floodgate with pump at the Makiki Stream confluence to reduce backup to interior drainage along Makiki Stream.
Kalawahine Reservoir	Makiki	
Makiki District Park and Tennis Courts Detention Pond	Makiki	Approximately 13 acre-feet of storage at confluence of Kanaha and Makiki Streams.

Management Measure	Basin	Description
Makiki Stream Conduit	Makiki	Put a conduit that goes under the Makiki Stream and divert the water directly out to the harbor.
Makiki Tunnel System	Makiki	Tunnel System with Storage (can outlet to harbor and/or release with pumps); Inflow from Kanaha at Makiki District Park.
Modify Makiki Stream Entry Angle	Makiki	Modify the angle that the Makiki Stream enters the canal to minimize additional head on the water trying to exit near McCully. The current stream outflow has less than a 90-degree angle, increasing the chance to produce higher water level with backwater during a flood, accumulate sediment, higher cost on channel wall maintainers, etc.
Piikoi Bypass	Makiki	Utilize or upgrade existing storm sewer to route water from Kanaha Stream to Ala Moana Park.
Check Dams	Mānoa	Construct check dams in Mānoa to slow the water down ahead of areas prone to flooding.
Kanewai Detention Pond	Mānoa	Approximately 4.5 acre-feet of storage on the right bank of Manoa Stream.
Kanewai Underground Storage	Mānoa	Underground detention structure below park; storage capacity not yet determined.
Koali Road Floodwall	Mānoa	Floodwall along left bank of Manoa Stream, downstream of Kanewai Community Park to protect community from upstream peak flows.
Mānoa Channel Modification	Mānoa	Deepen/widen channel to provide more within-bank storage.
Mānoa Valley District Park Detention Pond	Mānoa	Approximately 33.5 acre-feet of storage on the right bank of Mānoa Stream.
Subsurface Kanewai Tunnel	Mānoa	Subsurface tunnel from Kanewi Community Park to the harbor using gravity flow.
Woodlawn Bridge Bypass Box Culvert	Mānoa	Create a bypass box culvert that traverses around both bridge abutments and exit into the existing stream channel on the south side of Woodlawn Drive. As an added precaution and catch basin and the drainpipes along Woodlawn Drive number and sizes could be increased.
Woodlawn Bridge Floodwall	Mānoa	Floodwall (permanent or deployable) at Woodlawn Drive Bridge vicinity to contain water to channel.
Woodlawn Drive Bypass	Mānoa	Capture overflow water from Woodlawn Drive and return to stream.
City Mill Culvert	Pālolo	Utilize the culvert next to City Mill to slow down or detain water; culvert is 15-feet deep in this area.

Management Measure	Basin	Description
Modify Pālolo Stream Entry Angle	Pālolo	Modify the angle that the Pālolo Stream intercepts the Mānoa Stream with a diverter or other channel modification. The 90-degree angle disrupts Mānoa Stream flow.
Pālolo Channel Modification	Pālolo	Deepen or widen channel to provide more within-bank storage; can be used in conjunction with channel naturalization.
Pālolo Floodwalls	Pālolo	Raise existing floodwalls higher to contain more water.
Pālolo Park Detention Basin	Pālolo	Use Pālolo Valley District Park for above ground or underground storage.
Pālolo Pipe within Culverts	Pālolo	Lay a pipe within the existing culverts to evacuate water directly out to the ocean.
Pālolo Stilling Basin(s)	Pālolo	Stilling basin to dissipate energy and reduce velocities from channelized stream – will need hydraulic results to identify areas of high velocities with minimal upstream impacts.
Add Pump to the Storm Drainage System in McCully-Moiliili	Lower Watershed	Add a pump to the storm drainage system in McCully and other areas that pooling occurs (at the "bottom of the bowl").
Dredge Mānoa-Pālolo	Lower Watershed	Dredge the Mānoa-Pālolo channel.
Kapiolani Park Detention Basin	Lower Watershed	Divert water to Kapiolani Park for additional flood storage.
Ala Wai Canal Floodwall System	Ala Wai Canal	Series of new floodwalls on the left and right banks of the Ala Wai canal and M-P canal; Design considerations could include road closure structures and access for the canoes; deployable/passive system, glass system to keep viewshed, or aesthetically acceptable (e.g., lava rock wall) design will be considered.
Ala Wai Canal Pump Station(s)	Ala Wai Canal	Pump or system of smaller pumps along the canal to reduce standing water or used in conjunction with floodwalls/berms to increase storage.
Ala Wai Canal Surge Barrier	Ala Wai Canal	Pump or system of smaller pumps along the canal to reduce standing water or used in conjunction with floodwall/berms to increase storage.
Deepen the Canal, Replace Canal Walls with Higher Flood Protection	Ala Wai Canal	Dredge canal down to its original depth of 15-feet to 25-feet, and replace the degraded infrastructure with new canal walls that are set for greater flood protection.
Flap Gates on Storm Drains	Ala Wai Canal	During high tide Ala Wai Boulevard between Kalakaua and the cul de sac ending at Ala Moana Boulevard floods. Ala Wai Canal in this area needs flap gates to keep Ala Wai Canal water from flooding storm drains and flooding streets.

Management Measure	Basin	Description
Golf Course Debris Basin	Ala Wai Canal	Create a debris basin at the golf course as a first flush before entering the canal.
Golf Course Detention Basin	Ala Wai Canal	Excavate the golf course to increase storage capacity.
Golf Course Underground Parking Structure	Ala Wai Canal	Create an underground parking structure at the golf course that connects to Waikiki and can be used as flood storage.
Kaimuki High Detention Basin	Ala Wai Canal	Utilize Kaimuki High School's football field.
Microtunnel through Waikiki	Ala Wai Canal	Several microtunnels along the canal (i.e., under Paoakalani Avenue, Ohua Avenue, Liliuokalani Avenue, Kanekapolei Street, Nohonani Street, Lewers Street, Kalaimoku Street, etc.) going under Waikiki and straight out to the ocean to increase conveyance.
Paki Avenue Bypass	Ala Wai Canal	Utilize existing storm sewer system along Paki Avenue as a bypass for Ala Wai Canal waters; Outfall is away from the highly traveled beach and tourist area; Existing outfall near Tahitienne Condos of Honolulu.
Retention or Detention Pond	Ala Wai Canal	Implement retention or detention pond of a constructed wetland at Ala Wai Community Park.
Second Outlet on East End of Canal (Open Canal)	Ala Wai Canal	Open up the east end of the canal with an open system extending down Paki Avenue and Makai through Kapiolani Park
Underwater Pipes in Canal	Ala Wai Canal	Use underwater pipes laid on the flood of the canal to redirect floodwaters directly to the harbor. These pipes could redirect flows directly from Makiki or the Manoa-Palolo straight out to sea without entering the Ala Wai Canal.
Widen Canal	Ala Wai Canal	Widen the canal to provide greater flow and storage capacity.
Basement Parking Structure Detention	Watershed Wide	Convert or create basement parking structures within the watershed into underground detention (multiuse underground parking).
Berm Around all Schools	Watershed Wide	Build a three feet tall berm around all schools: Iolani School, Ala Wai Elementary, Noelani Elementary, and Hokulani Elementary.
Bridge Modification	Watershed Wide	Modify by raising or widening bridges that act as choke points, such as the bridges at Woodlawn Drive, Kahaloa, Lowery, East Manoa, and Kapiolani Boulevard.
Diversion Tunnels	Watershed Wide	Construct tunnels that can serve as a dual purpose to convey floodwaters in large storm events and can also be used as transportation (or other utility) infrastructure.
Install Baffling in Streams	Watershed Wide	Install baffling in the streams to slow the water down.

Management Measure	Basin	Description
Install Silt Dams	Watershed Wide	Build silt dams in all accessible gullies. The silt dam is composed of local rock from the immediate stream bed, encased in wire fencing. The rushing water is slowed as it goes through the dam, the gravel and dirt drop out behind the dam, the water has more time to penetrate subsoil and rock – replenishing the freshwater lens.
Redetention	Watershed Wide	Two or more detention basins in series.
Storage Tunnels	Watershed Wide	Utilize large, deep vertical tunnels to store stormwater throughout the watershed.
Underground Detention - Fields	Watershed Wide	Excavate beneath existing parks and open green spaces to create underground detention basins.
Underground Detention - Parking Lots	Watershed Wide	Excavate beneath existing parking lots to create underground detention.
Swift Tunnels	Watershed Wide	Two 12-feet diameter sub-surface tunnels (approximately 40-feet under) from Manoa and Palolo shooting straight out to the ocean using gravity flow.

6.0 U.S. Fish and Wildlife Service and Corps tasks to be implemented under the Fish and Wildlife Coordination Act

Coordination

The Service and Corps will coordinate pursuant to the FWCA. The National Marine Fisheries Service (NMFS), U.S. Environmental Protection Agency (EPA), Hawaii Department of Land and Natural Resources – Department of Aquatic Resources (DLNR-DAR), Hawaii Department of Land and Natural Resources – Department of Forestry and Wildlife (DLNR-DOFAW), Hawaii Office of Conservation and Coastal Lands (OCCL), Coastal Zone Management Program (CZMP), and Hawaii Department of Health – Clean Water Branch and any other relevant agencies will be included as appropriate regarding the Ala Wai Canal project.

Environmental Coordination Meetings

The Corps shall facilitate meetings with the Service, NMFS, EPA, DLNR-DAR, DLNR-DOFAW, OCCL, CZMP, and Hawaii Department of Health – Clean Water Branch and any other relevant agencies as appropriate for the purpose of exchanging information, identifying concerns and potential impacts to fish and wildlife resources, and resolving fish and wildlife resource issues related to the Ala Wai Canal project and document these interactions for use in the CAR and in the Final Integrated General Reevaluation Report and Environmental Assessment for the Ala Wai Canal project.

Planning Aid Letters/Coordination Act Reports

The Service with assistance from the Corps shall assemble FWCA letters and reports that describe project related opportunities and constraints regarding fish and wildlife resources (including listed species), potential modifications, the authorized project's potential impacts on fish and wildlife, measures to avoid, minimize, and mitigate these impacts, and any opportunities for enhancement of fish and wildlife resources that consider the Corps' authorized project purpose for the Ala Wai Canal project (i.e., flood risk management). The final FWCA report will become a part of the Ala Wai Canal Final Integrated General Reevaluation Report and Environmental Assessment.

7.0 U.S. Fish and Wildlife Service Tasks Not Included Under this Scope of Work

1) Cooperating agency role under the National Environmental Policy Act (NEPA)
2) Section 7, Endangered Species Act, Consultation for the Ala Wai Canal project
3) Mitigation for inter-jurisdictional trust resource issues (migratory fish, treaties, international agreements)

8.0 Working Schedule and Milestones

Milestone	Completion Date
Alternatives Milestone	July 2021
Planning Aid Letter (PAL)	August 2022
Tentatively Selected Plan Milestone	September 2022
Draft Fish and Wildlife CAR	October 2022
Conduct ATR, IEPR, Policy Review, and NEPA Public Review	November 2022
Final Fish and Wildlife CAR	December 2023
Agency Decision Milestone	January 2023
Chief's Report Milestone	June 2023

This schedule is based upon optimistic assumptions including sufficient and timely funding and no unforeseen delays arising from internal, Agency and public reviews. Changes to this schedule will be coordinated with the Service by modification of this Scope of Work.

9.0 Budget

Task	Service (days)
Meetings with Corps, NMFS, DLNR-DAR, and other relevant agencies, as needed, for preparation of Planning Aid Letter and Draft Fish and Wildlife CAR	5
Planning Aid Letter (PAL)	15
Draft Fish and Wildlife CAR	20
Meetings with Corps, NMFS, DLNR-DAR, and other relevant agencies, as needed, for preparation of the Final Fish and Wildlife CAR	5
Prepare Final Fish and Wildlife CAR	15
Total Number of Days	**60**
Cost (Daily rate of $914.14/day)	$ 54,848.40
Overhead (38% of total cost)	$20,842.39
Total Cost	**$75,690.79**

This budget reflects the use of previous information and surveys that were collected and conducted by the U.S. Fish and Wildlife Service in preparation of the 2015 Draft Fish and Wildlife Coordination Act Report, Ala Wai Watershed Flood Risk Management Study, Oahu Island, Hawaii and the 2016 Final Fish and Wildlife Coordination Act Report, Ala Wai Watershed Flood Risk Management Study, Oahu Island, Hawaii.

10.0 Payment Schedule

Item	Fiscal Year (FY)	Funding
Planning Aid Letter + 2.5 meetings	FY22	$22,076.48
Draft Coordination Act Report + 2.5 meetings	FY22	$28,384.05
Final Coordination Act Report + 5 meetings	FY23	$25,230.26
	Total	**$75,690.79**

11.0 Points of Contact

Financial Point of Contact (U.S. Fish and Wildlife Service)		

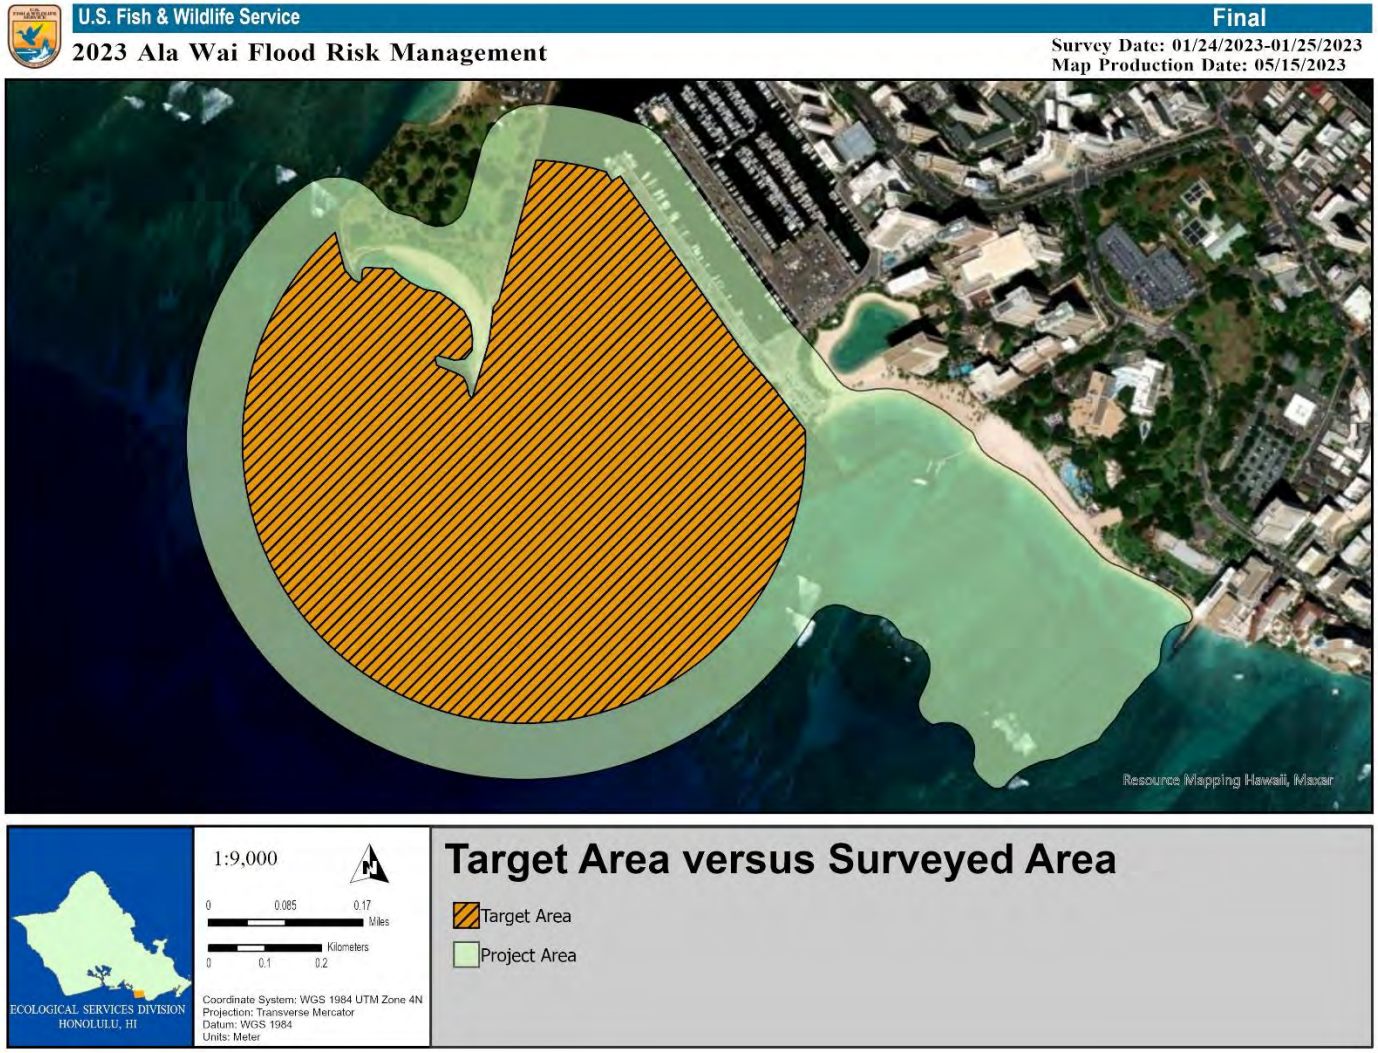

Figure B1. Target Area versus Surveyed Area. Map of the Target Area (500 m radius from Ala Wai Canal discharge point) and the Project Area (Target and surveyed are plus 100 m buffer).

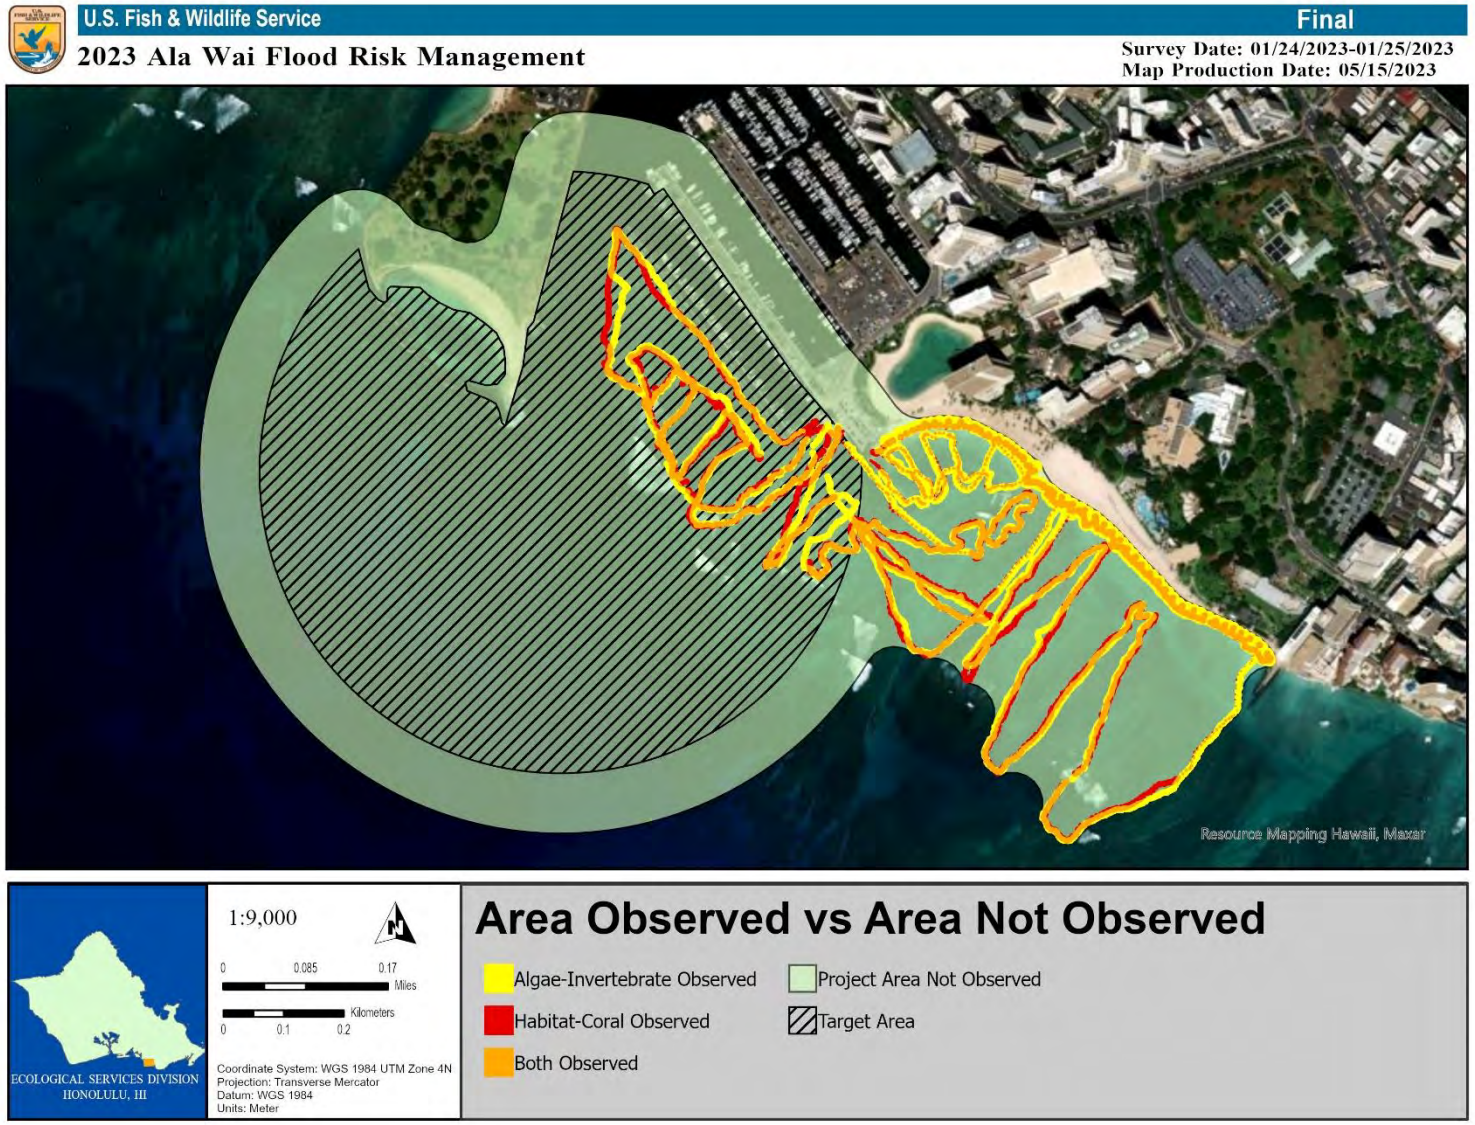

Figure B2. Area Observed vs Area Not Observed. Map of the Project Area directly observed during Service surveys.

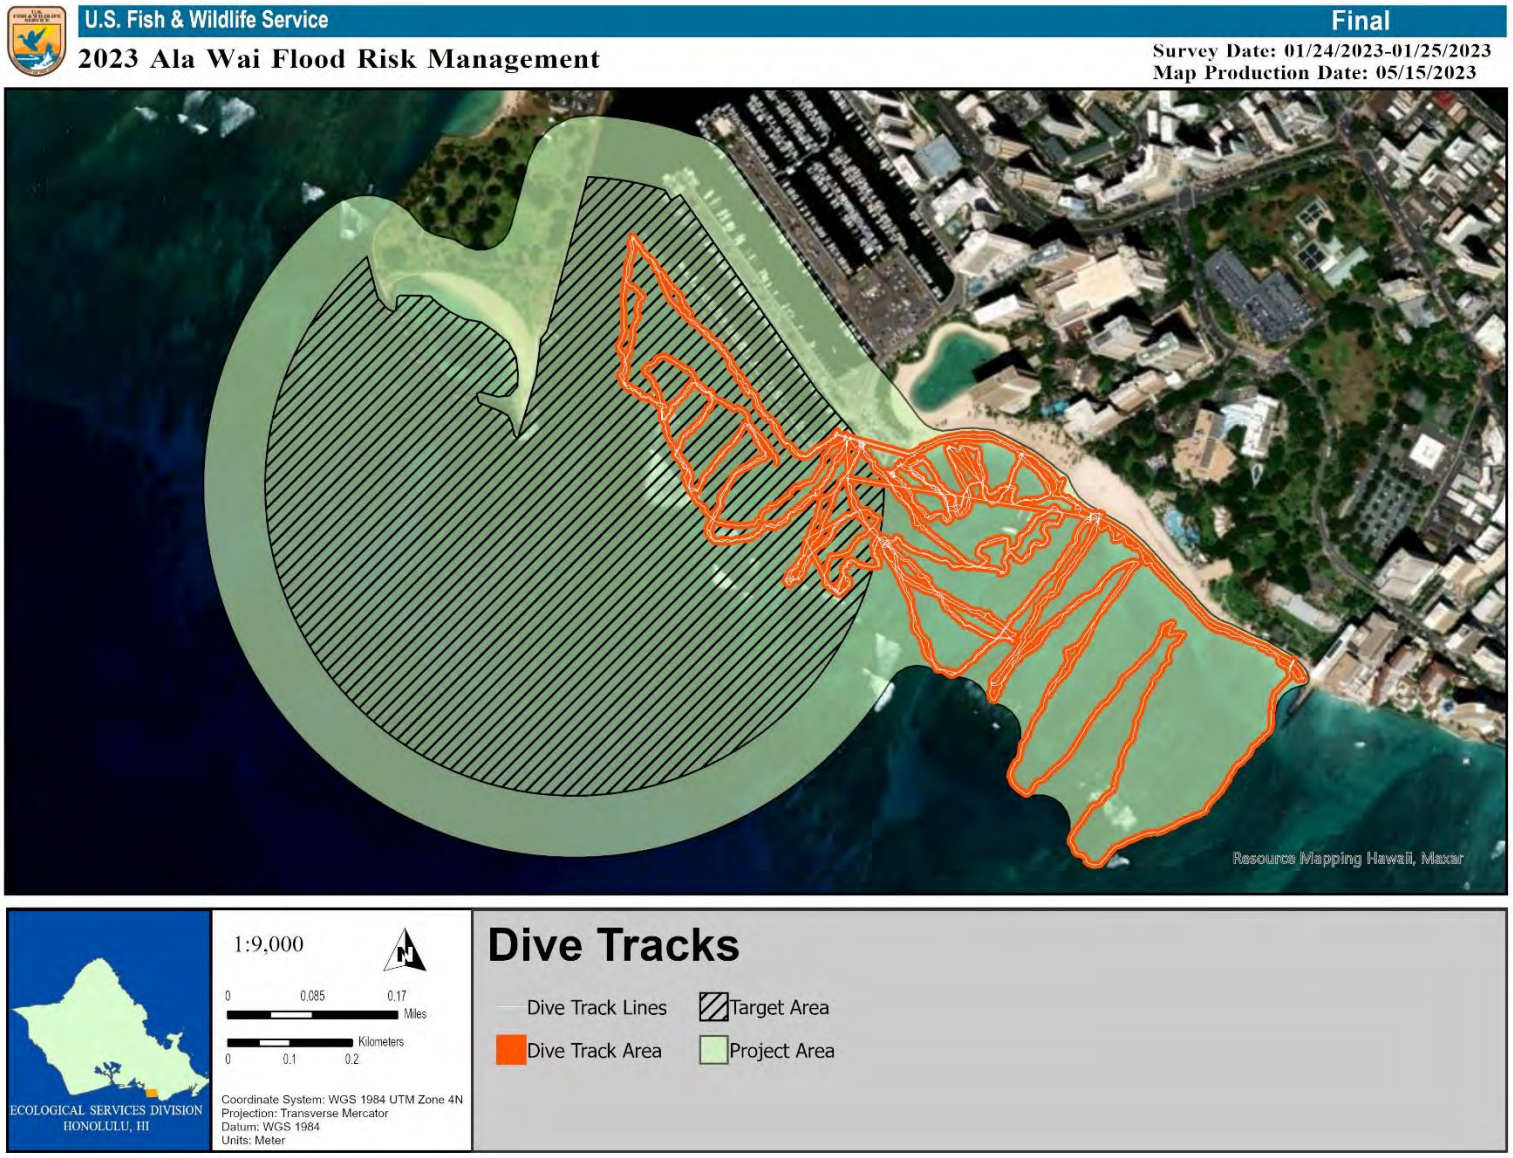

Figure B3. Dive Tracks. Map of the survey dive tracks completed by the Service.

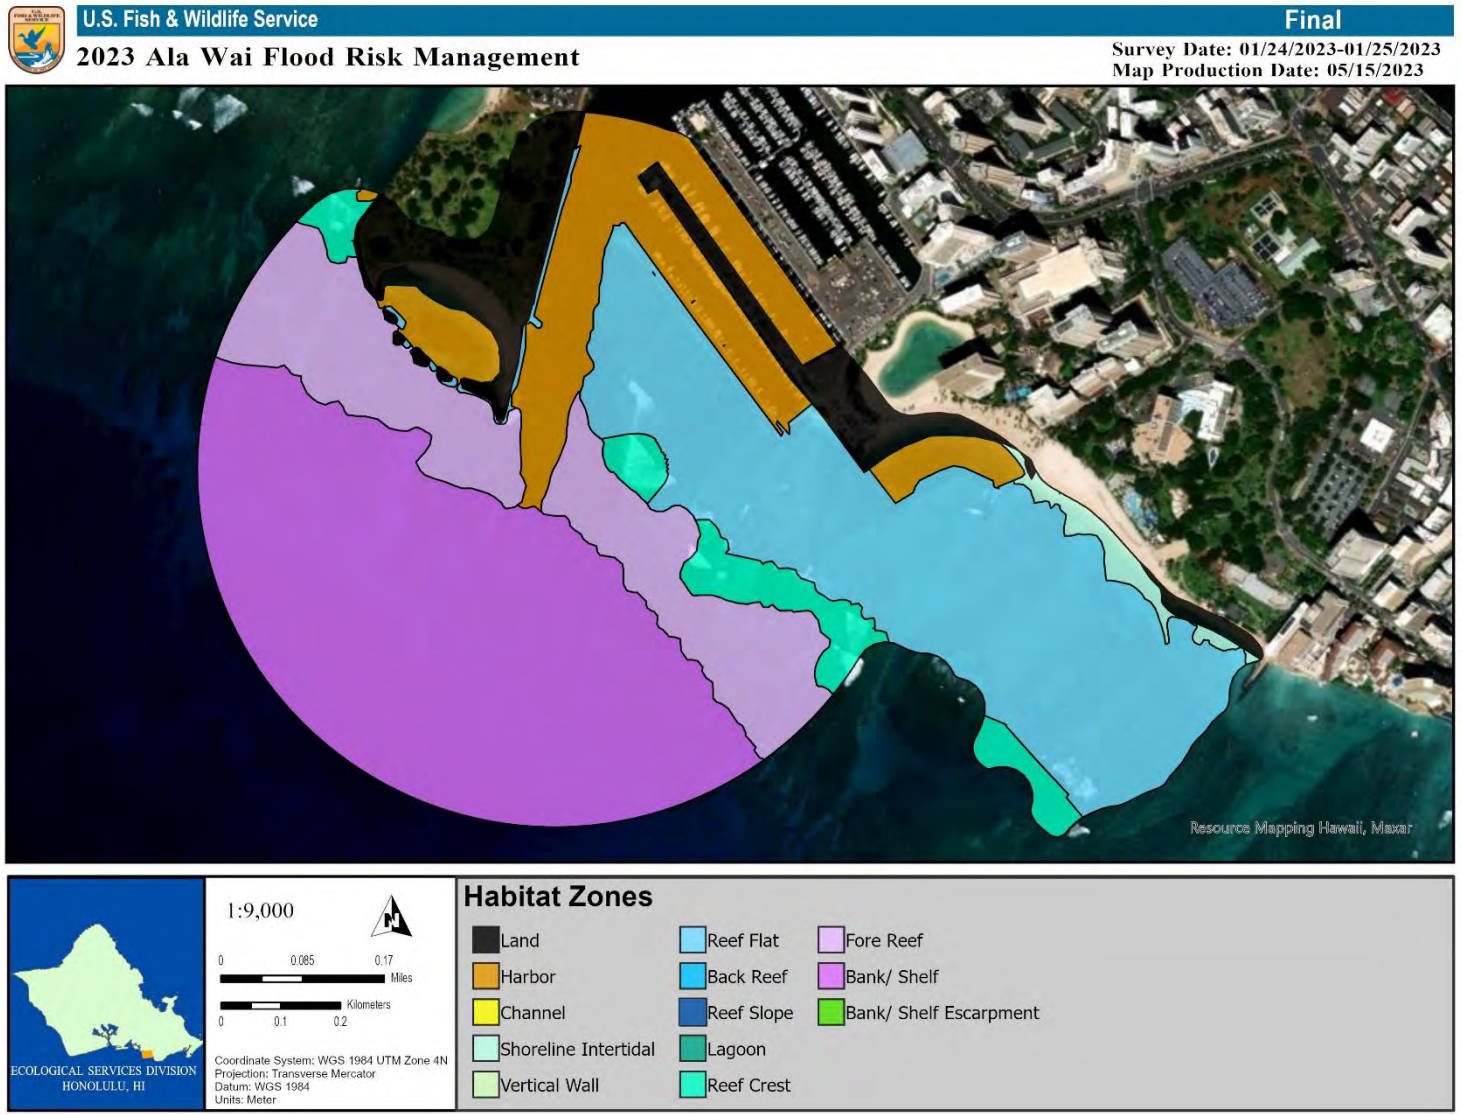

Figure B4. Habitat Zones. Map of the habitat zones within the Project Area. This image includes data obtained from NOAA Benthic Habitat Maps, ground truthed and edited based on field observations in surveyed areas.

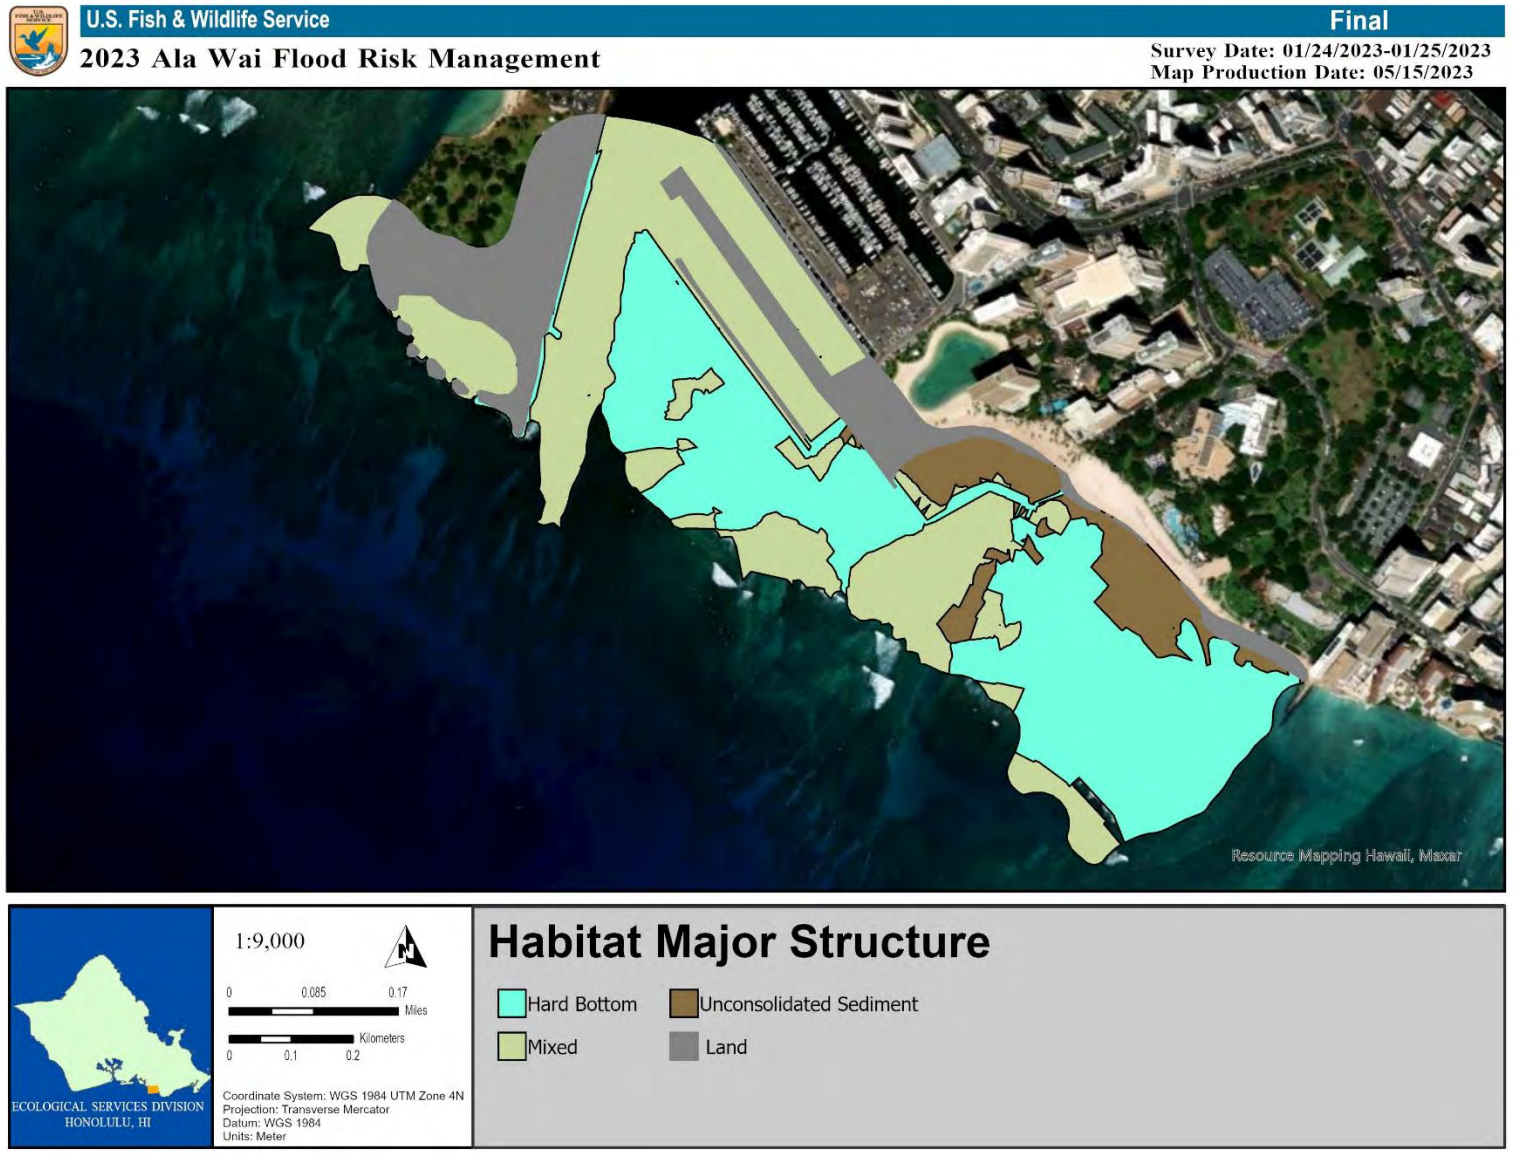

Figure B5. Habitat Major Structure. Map of habitat major structure observed within the Project Area.

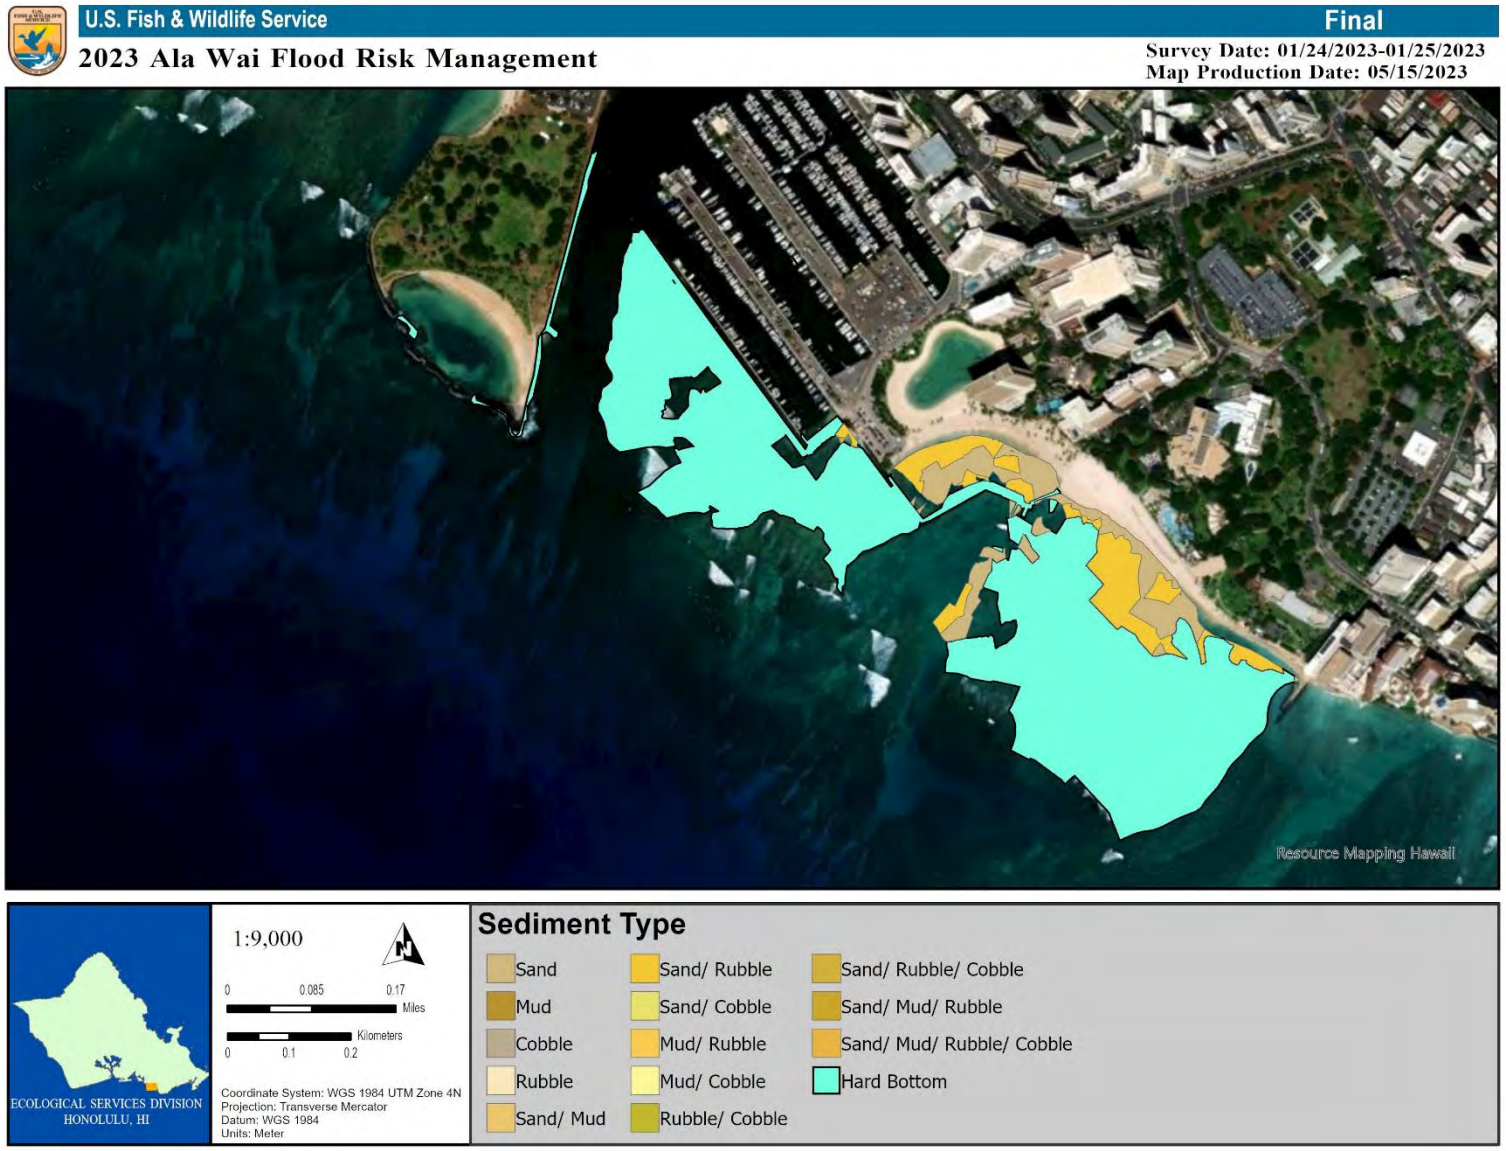

Figure B6. Sediment Type. Map of sediment types found within the Project Area.

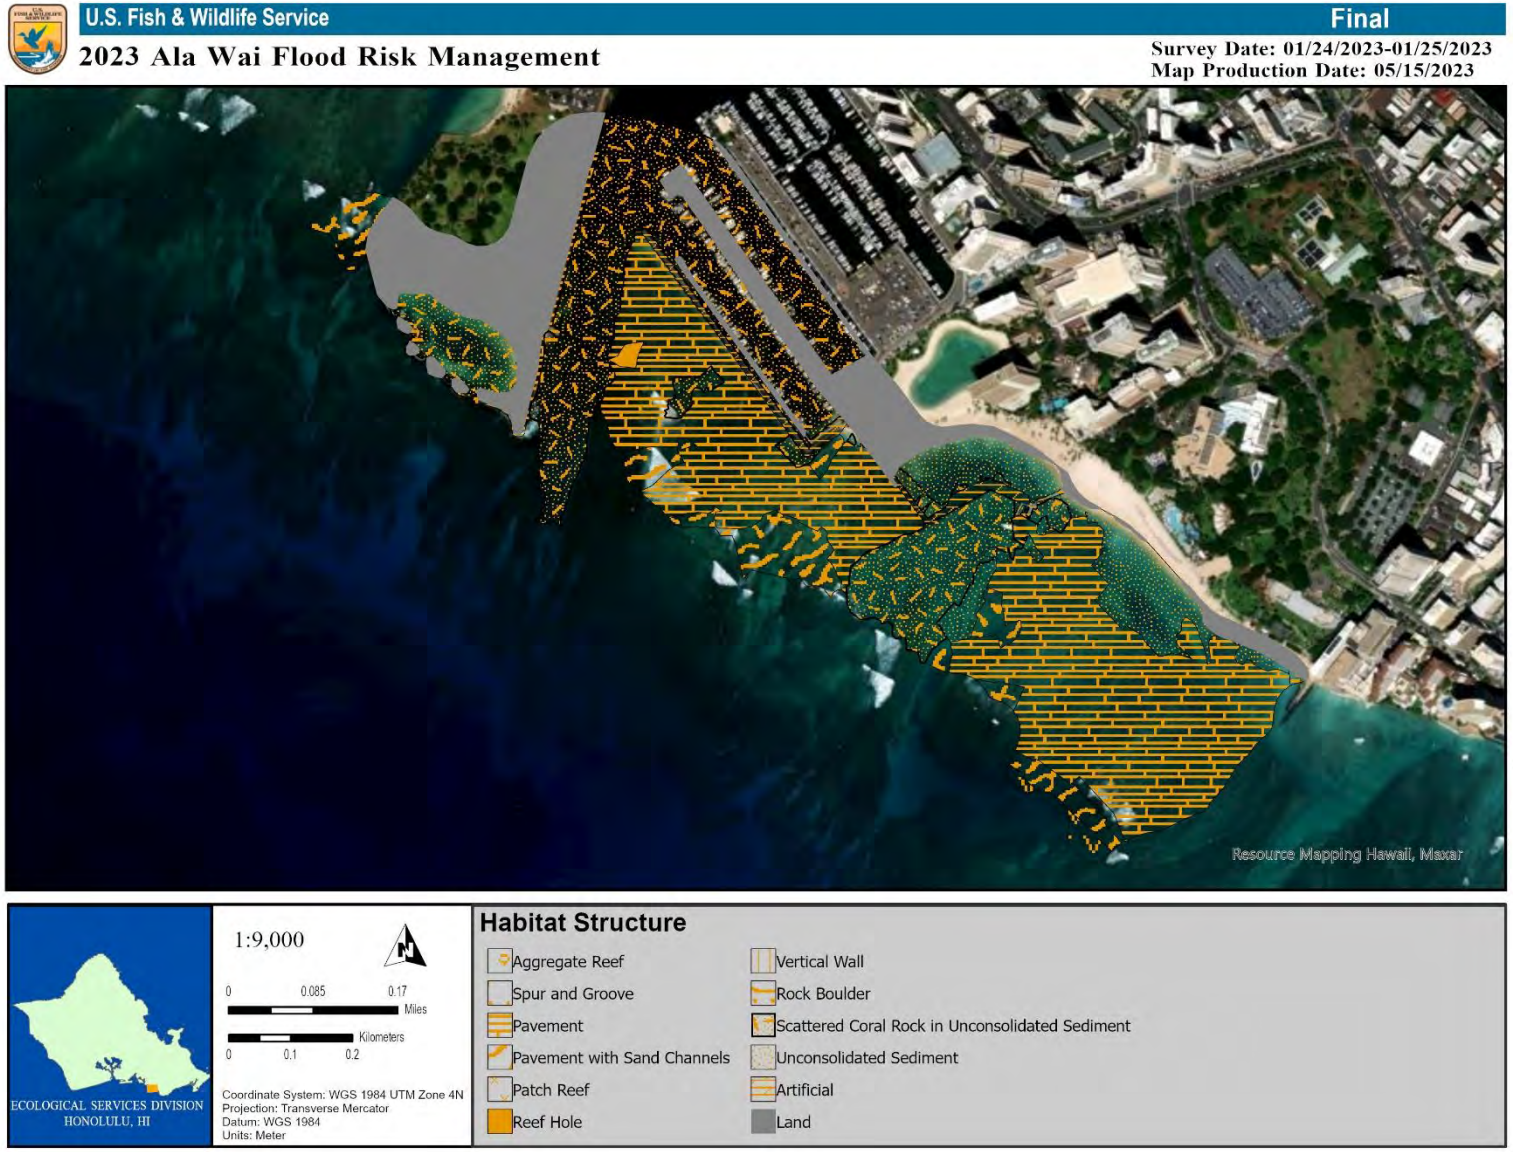

Figure B7. Habitat Structure. Map of habitat structure observed within the Project Area.

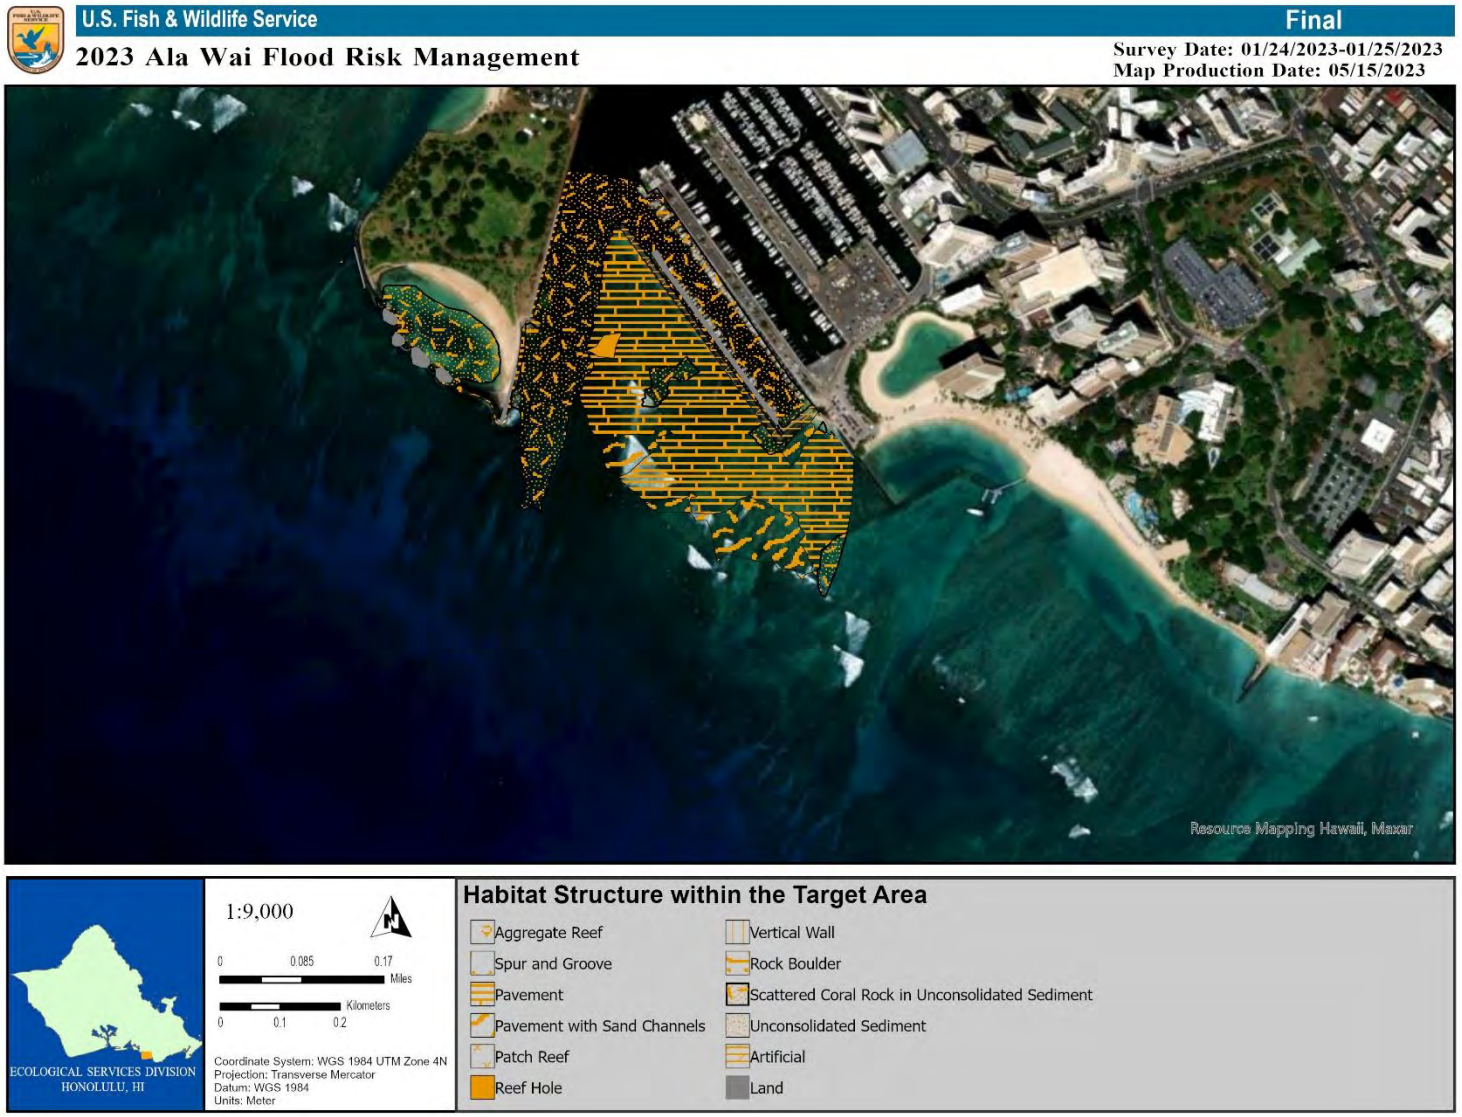

Figure B8. Habitat Structure within the Target Area. Map habitat structure observed within the Target Area.

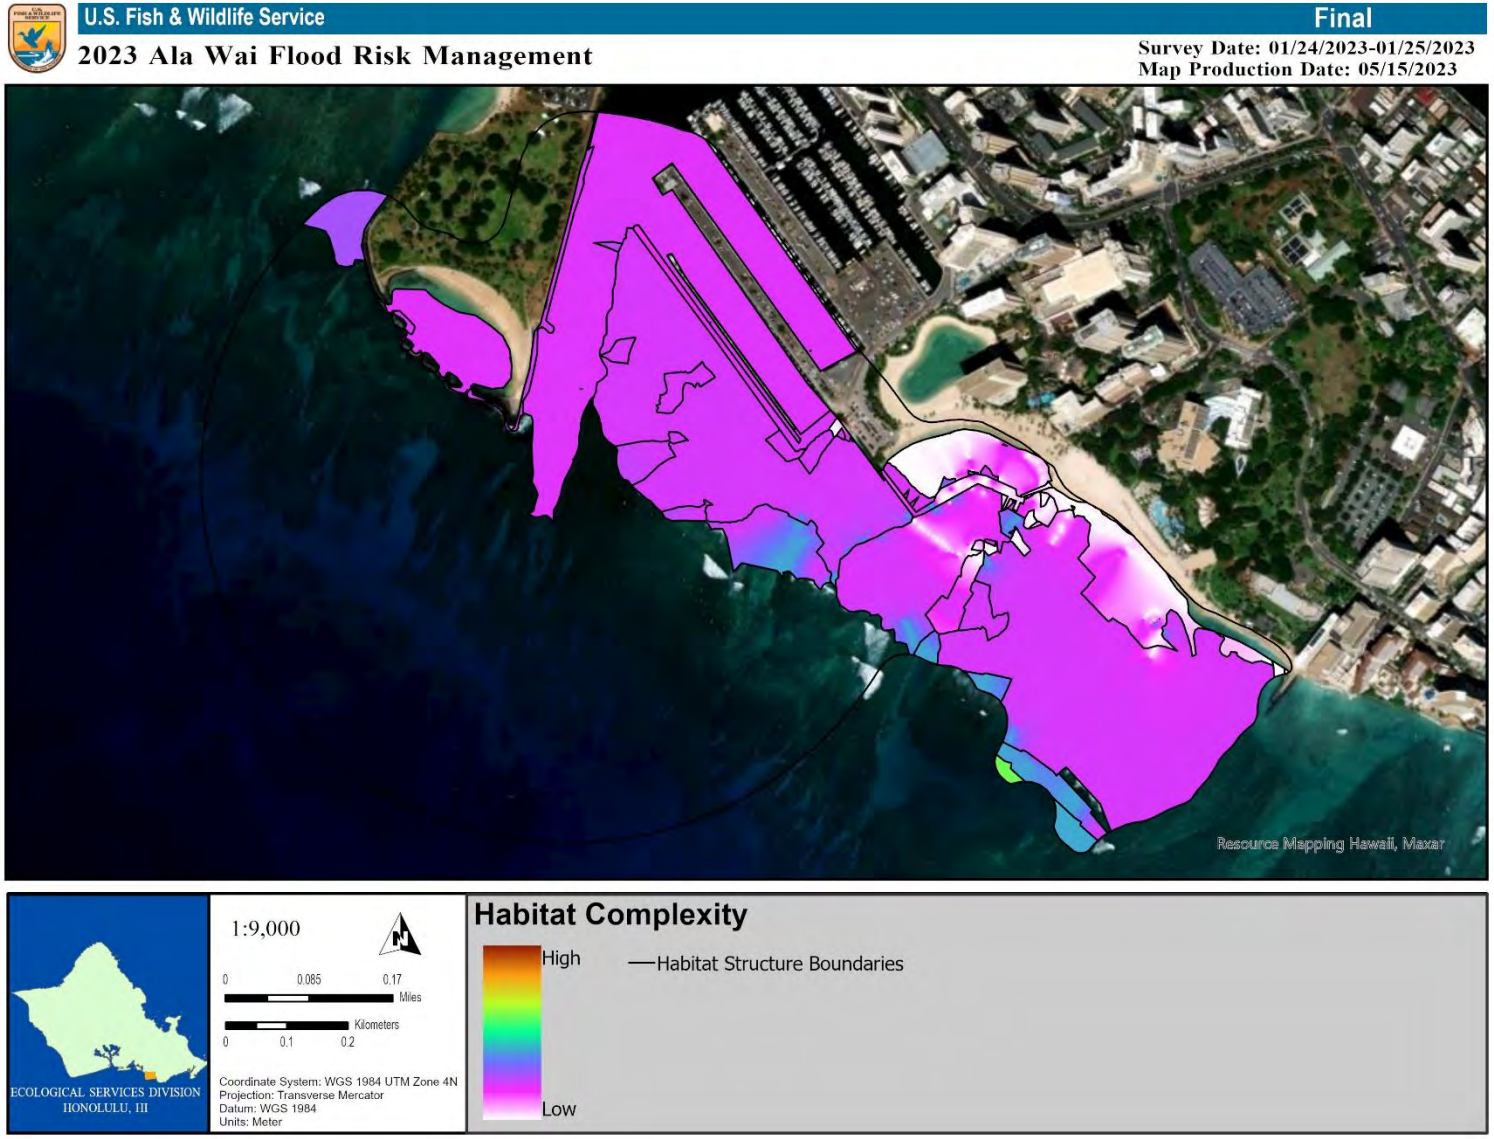

Figure B9. Habitat Complexity. Map of habitat complexity observed at the Project Area.

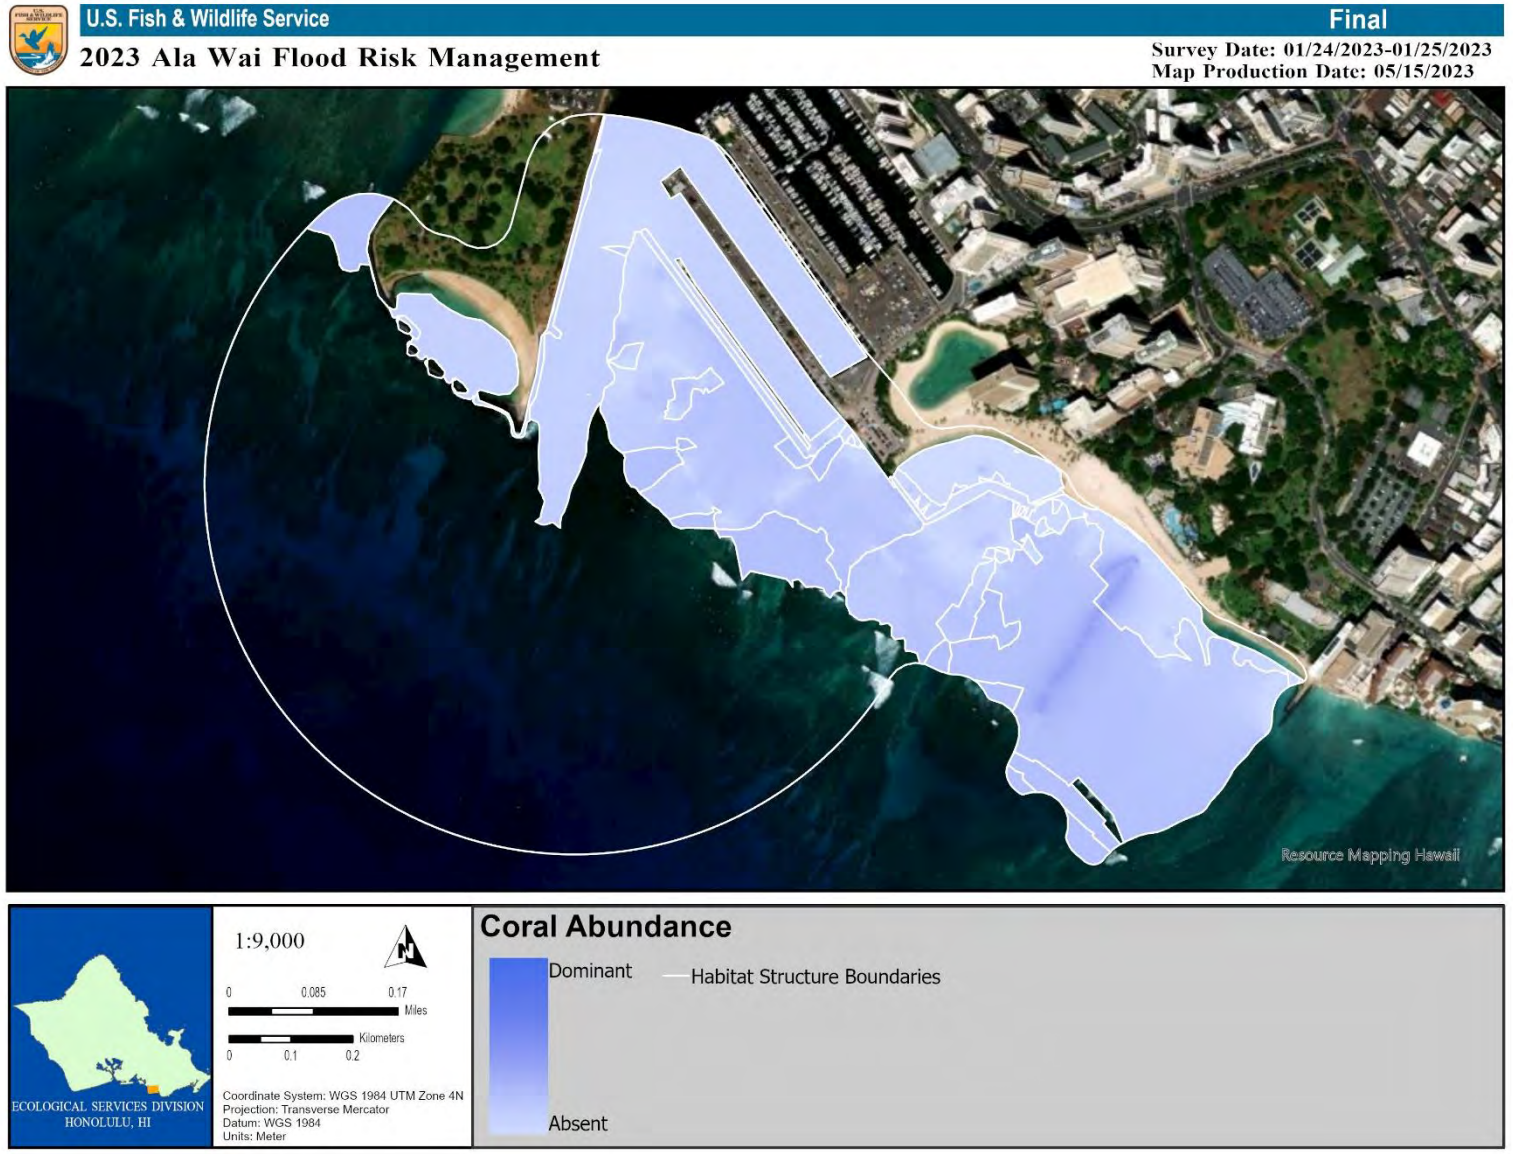

Figure B10. Coral Abundance. Map of the coral abundance observed at the Project Area.

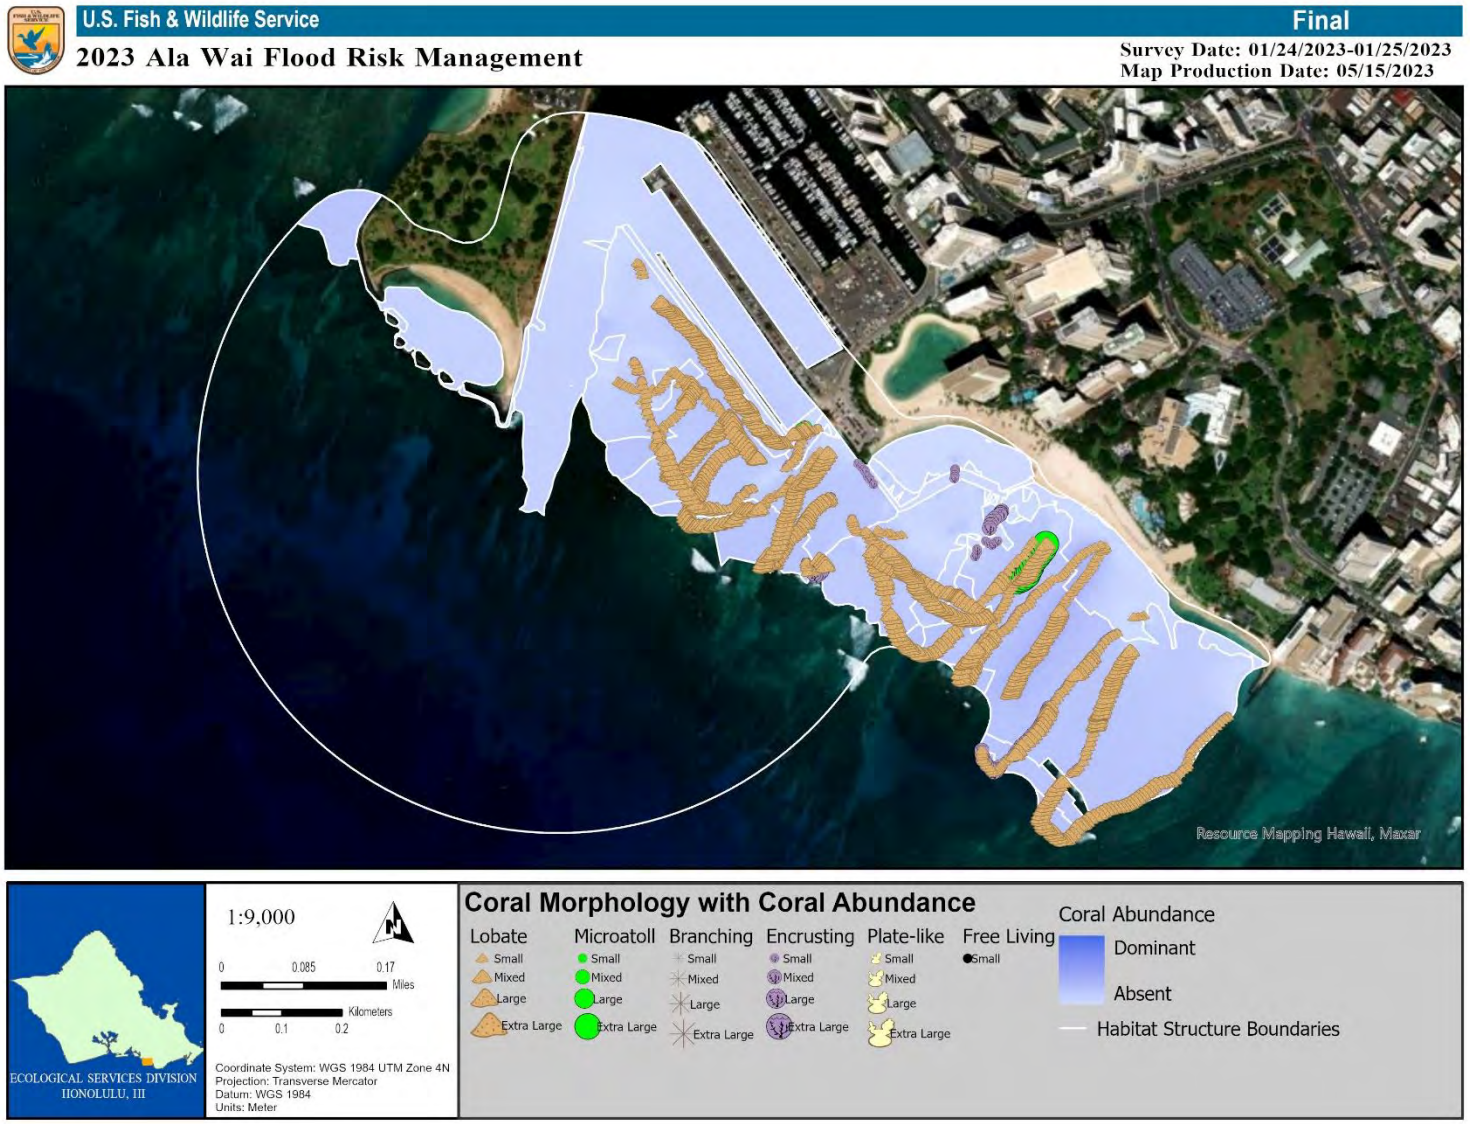

Figure B11. Coral Morphology with Coral Abundance. Map of the coral morphology and abundance observed at the Project Area.

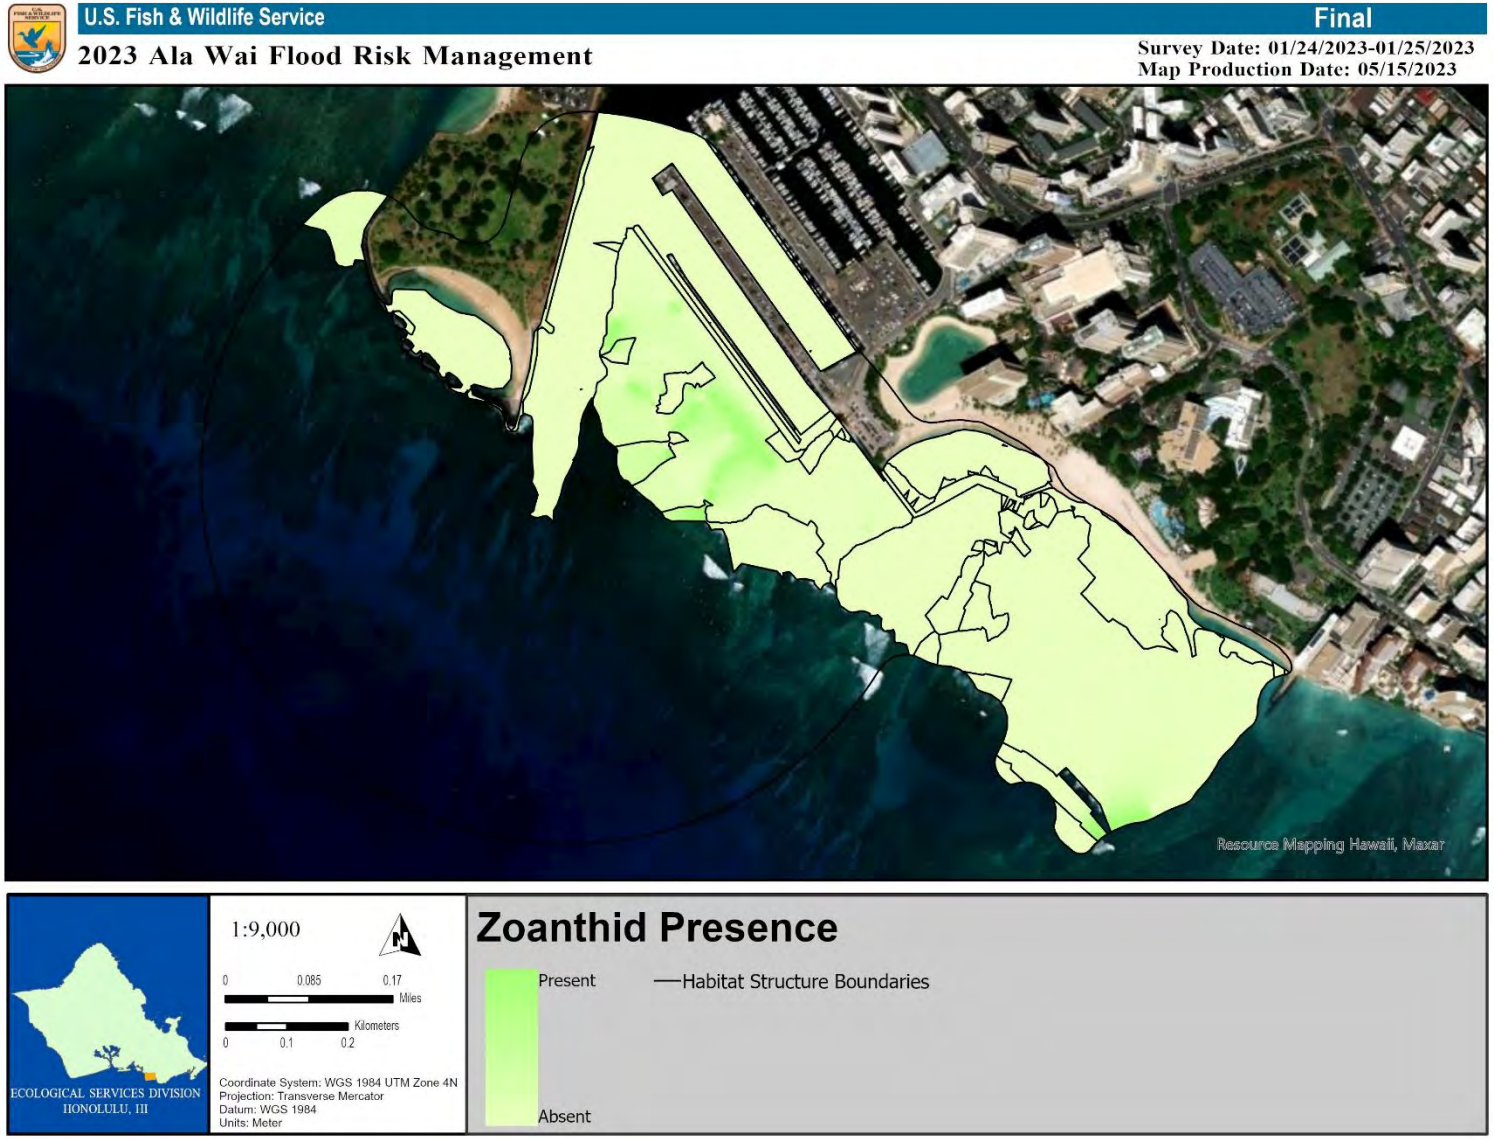

Figure B12. Zoanthid Presence. Map of the zoanthid presence observed at the Project Area.

Figure B13. Frondose Algae Abundance. Map of the frondose algae abundance observed at the Project Area.

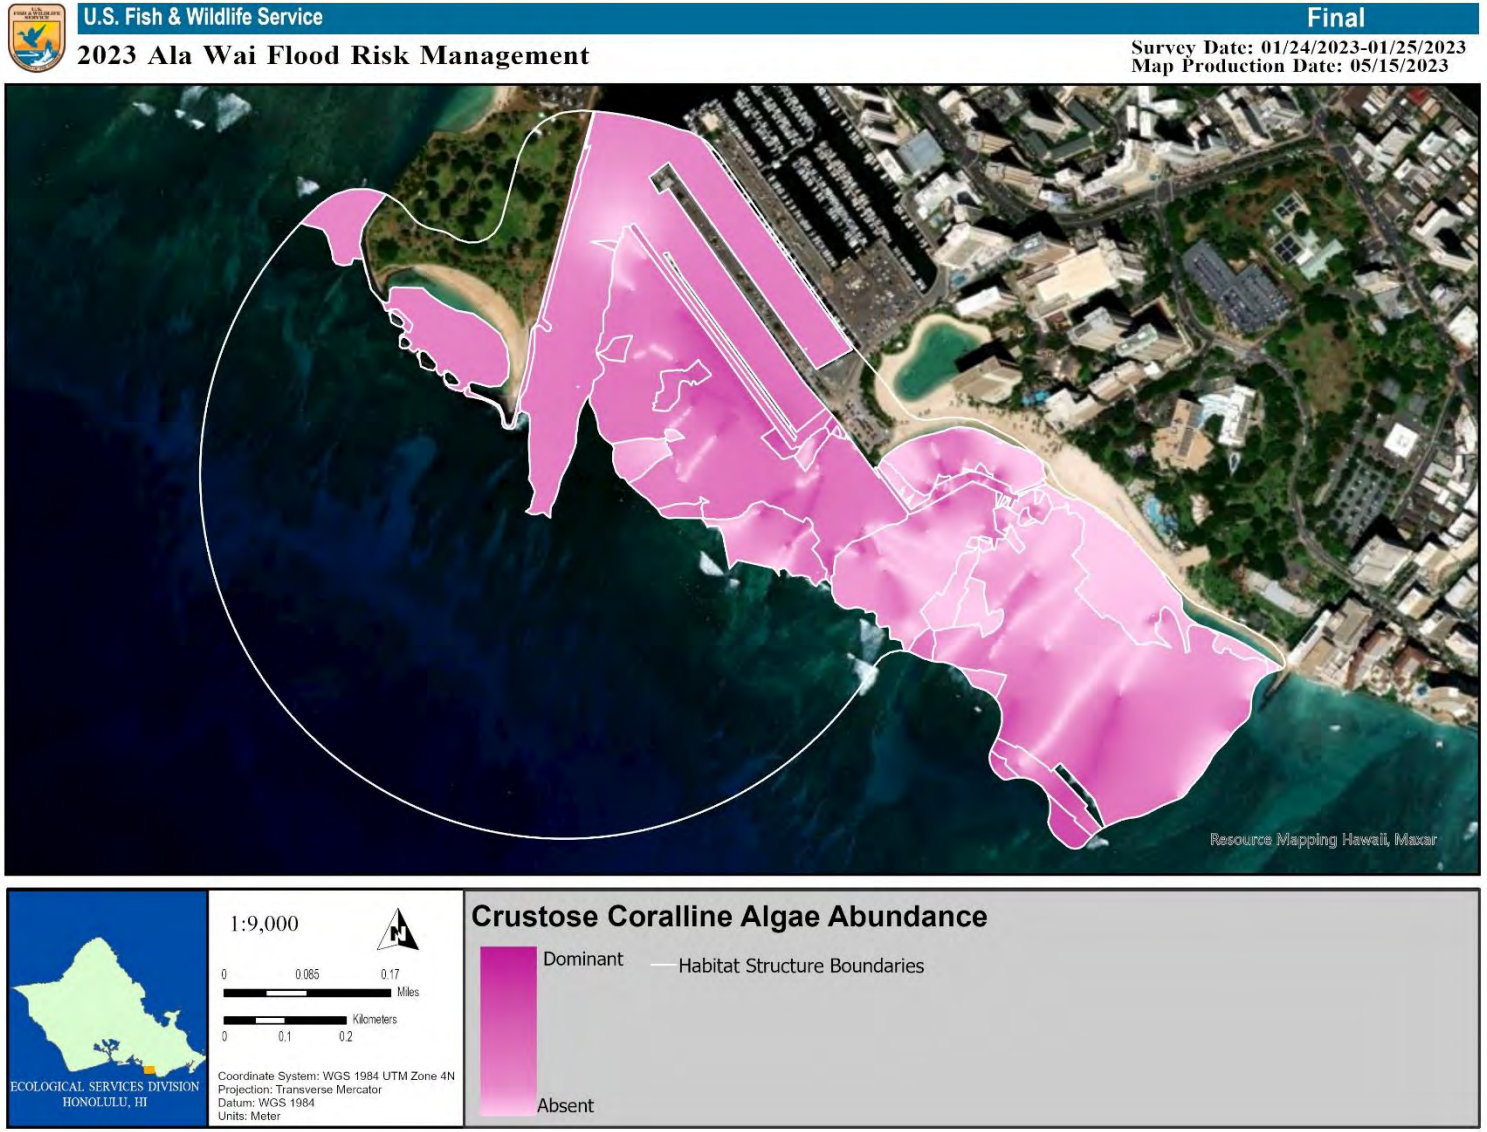

Figure B14. Crustose Coralline Algae Abundance. Map of the CCA abundance observed at the Project Area.

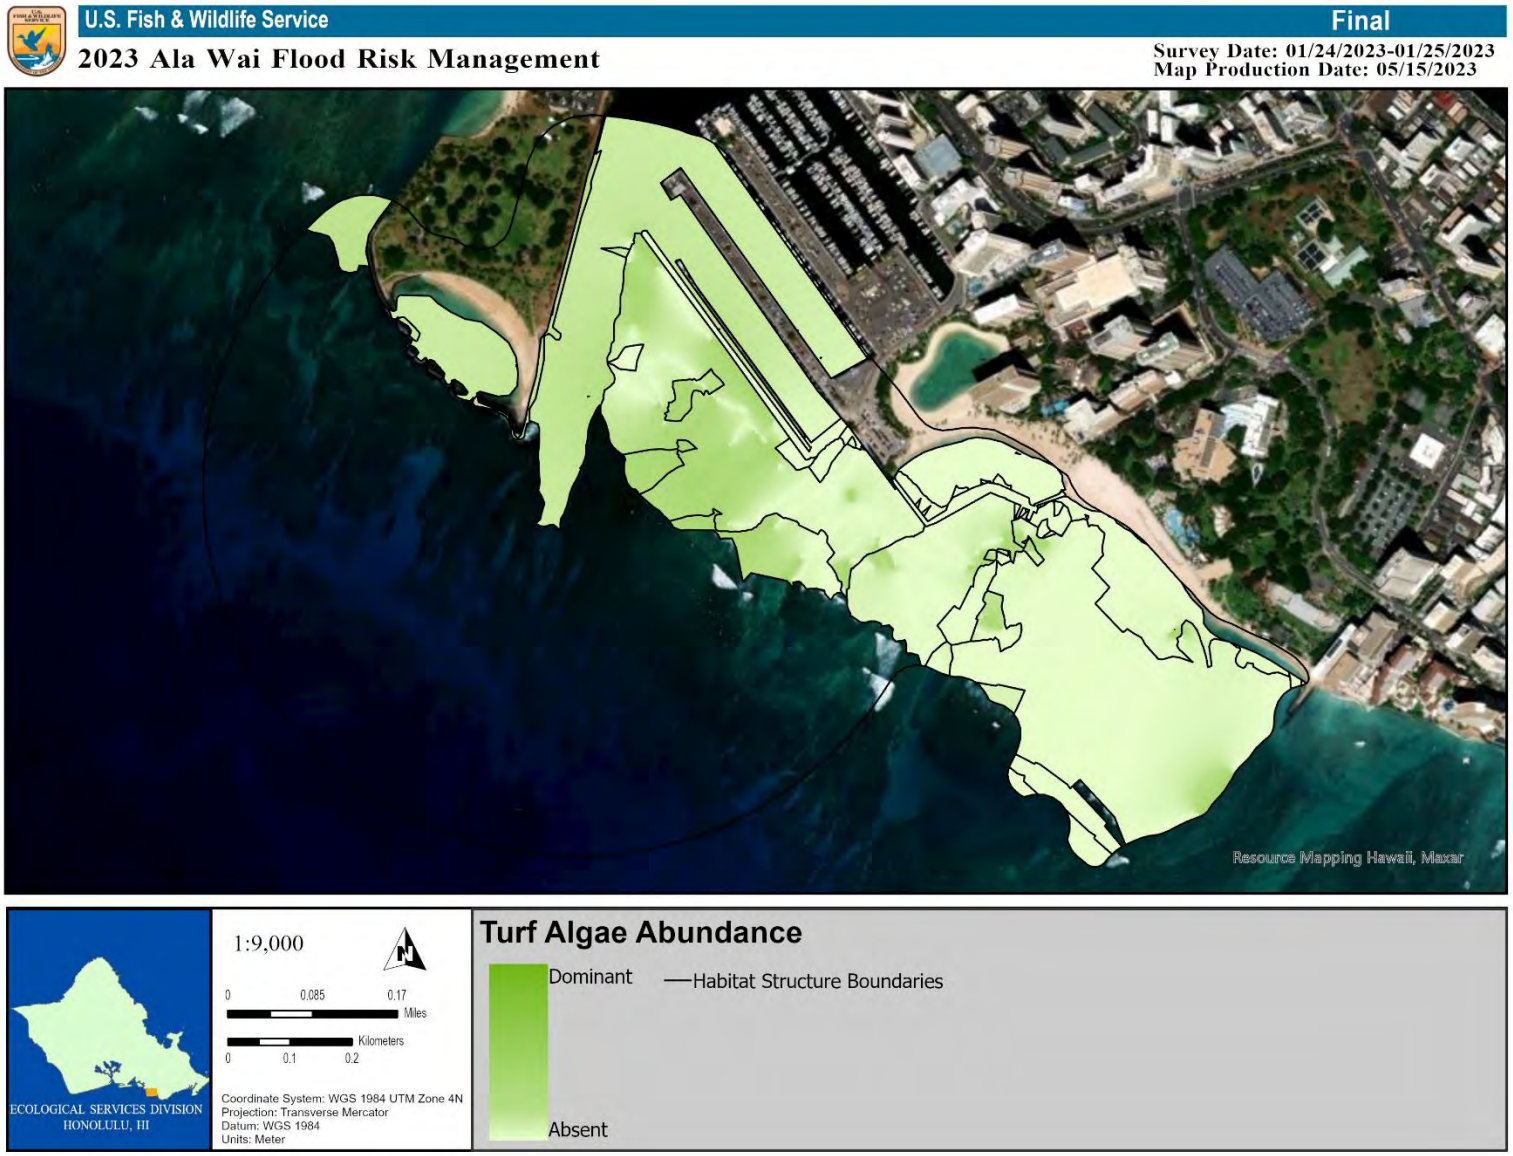

Figure B15. Turf Algae Abundance. Map of the turf algae abundance observed at the Project Area.

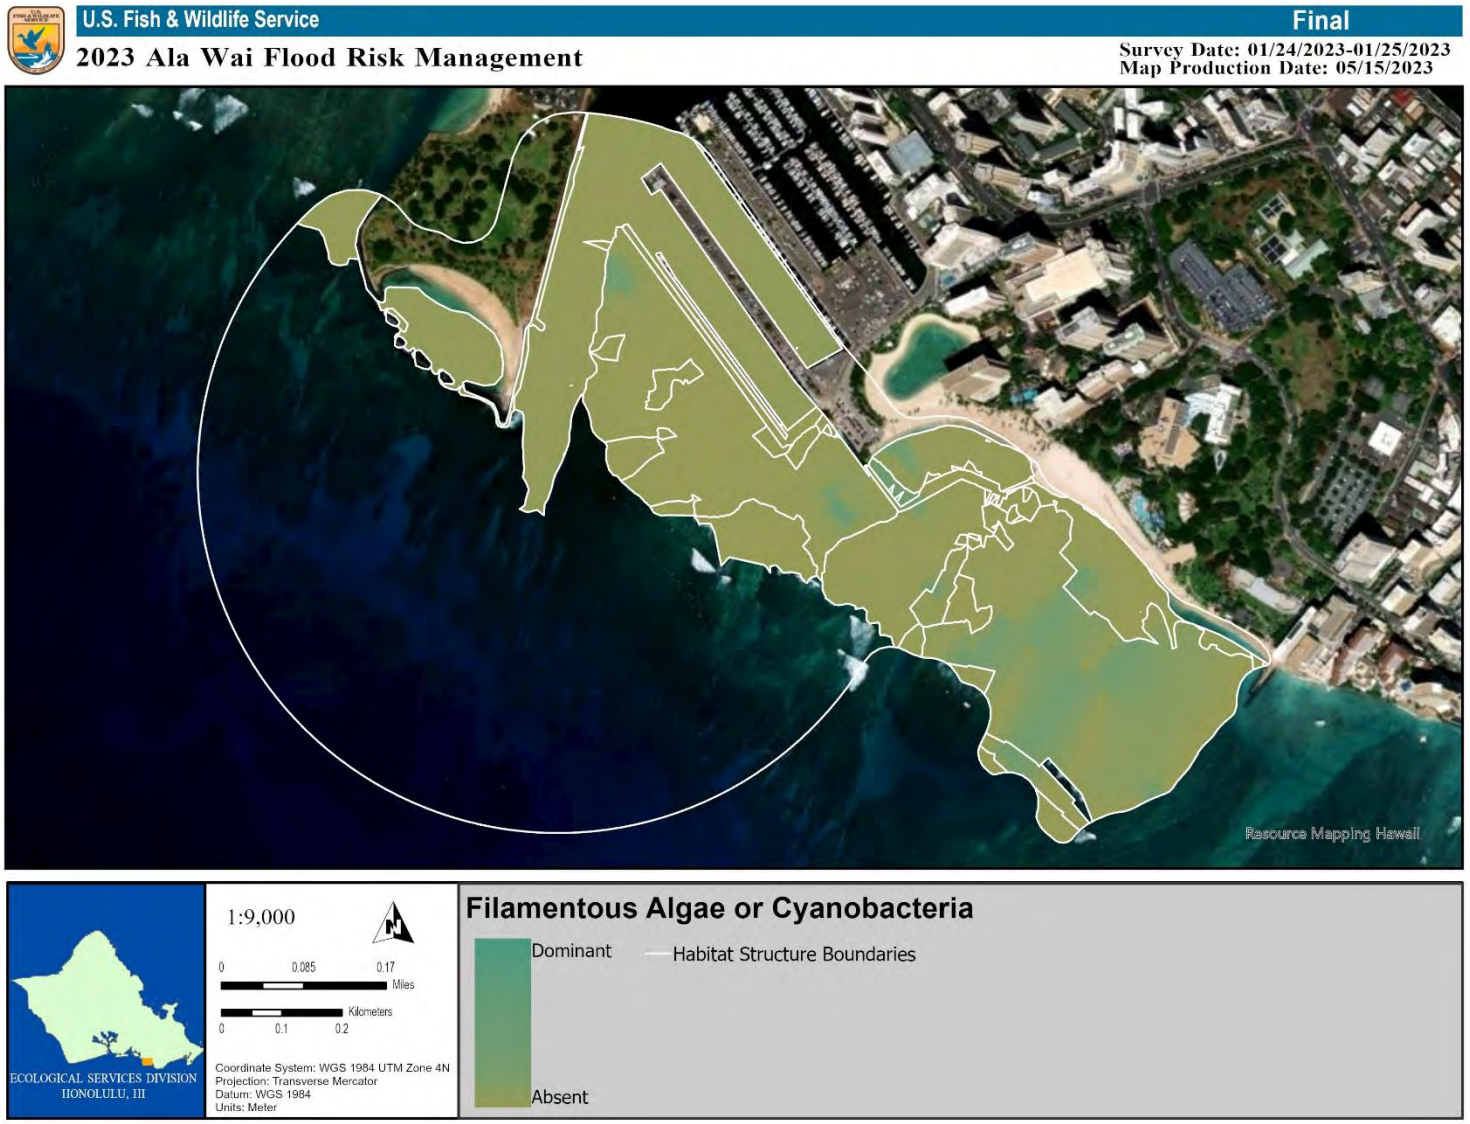

Figure B16. Filamentous Algae or Cyanobacteria Abundance. Map of the filamentous algae or cyanobacteria abundance observed at the Project Area.

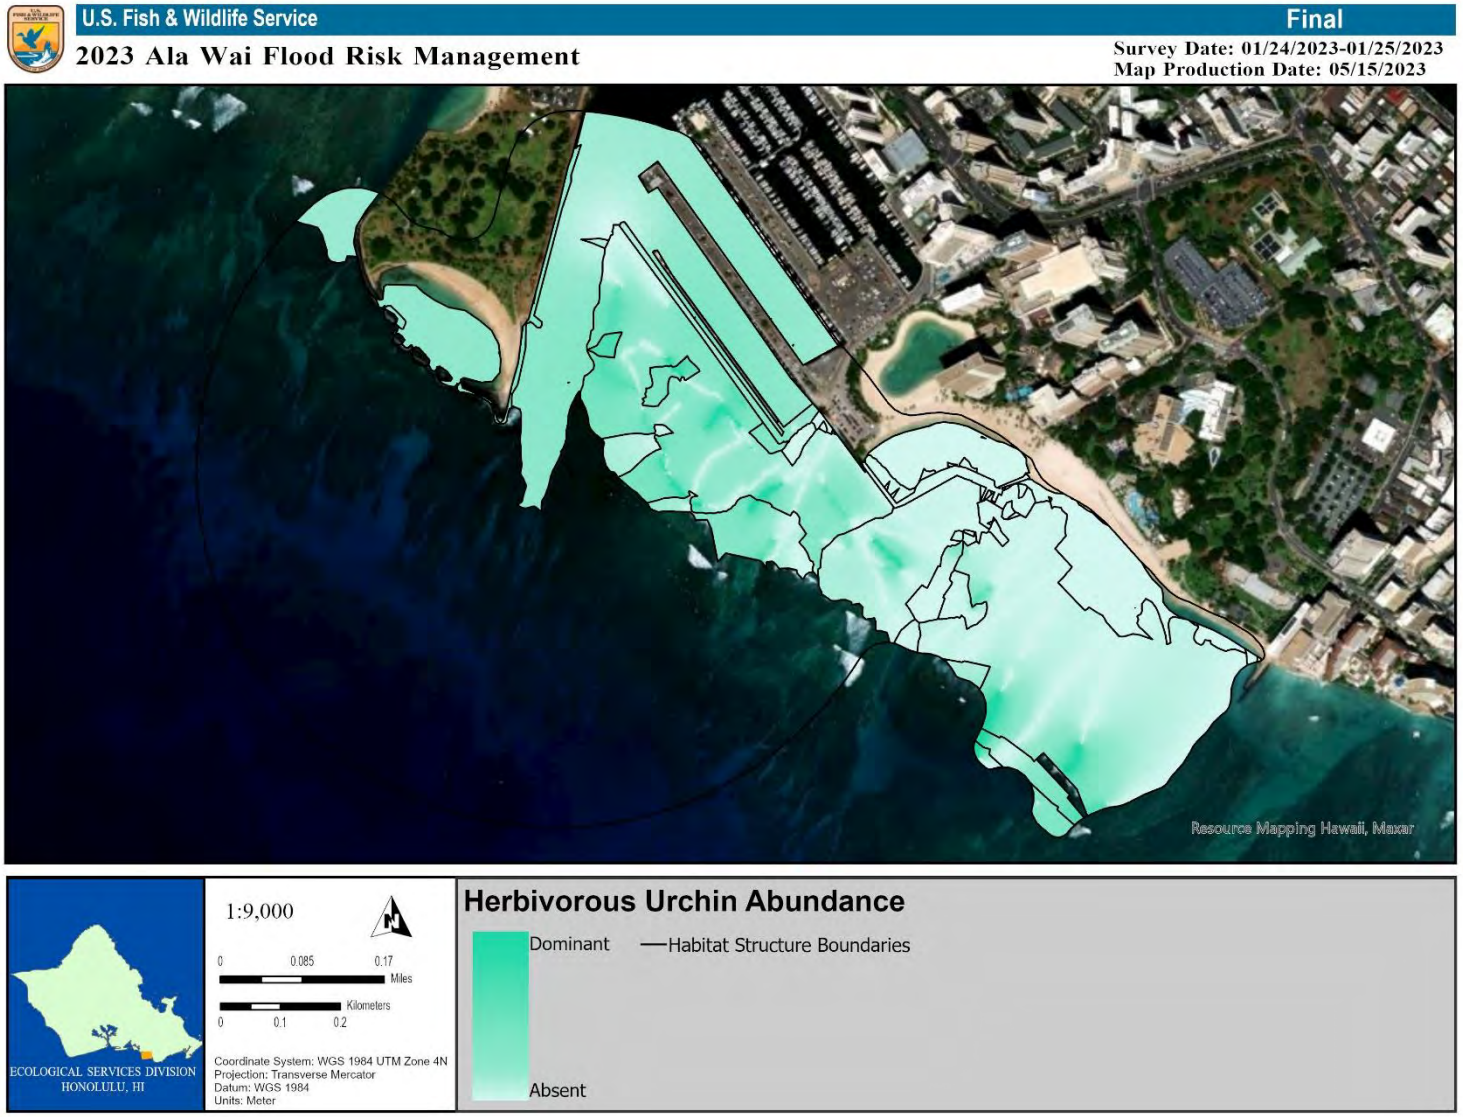

Figure B17. Herbivorous Urchin Abundance. Map of the herbivorous urchin abundance observed at the Project Area.

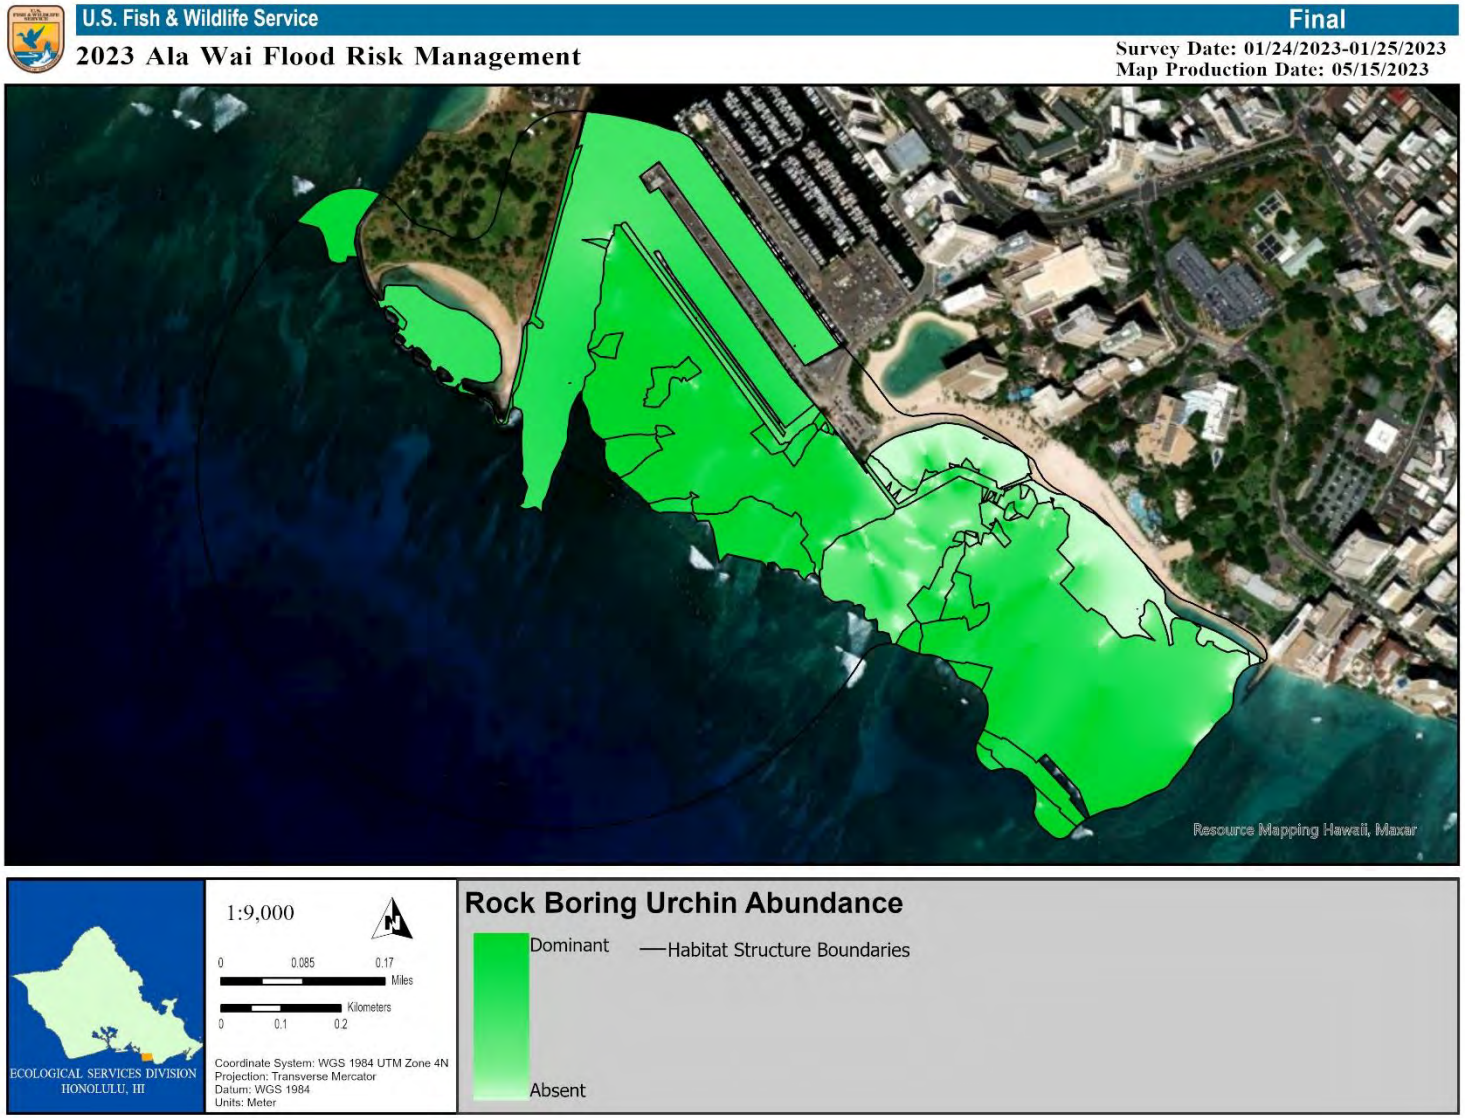

Figure B18. Rock Boring Urchin Abundance. Map of rock boring urchin abundance observed at the Project Area.

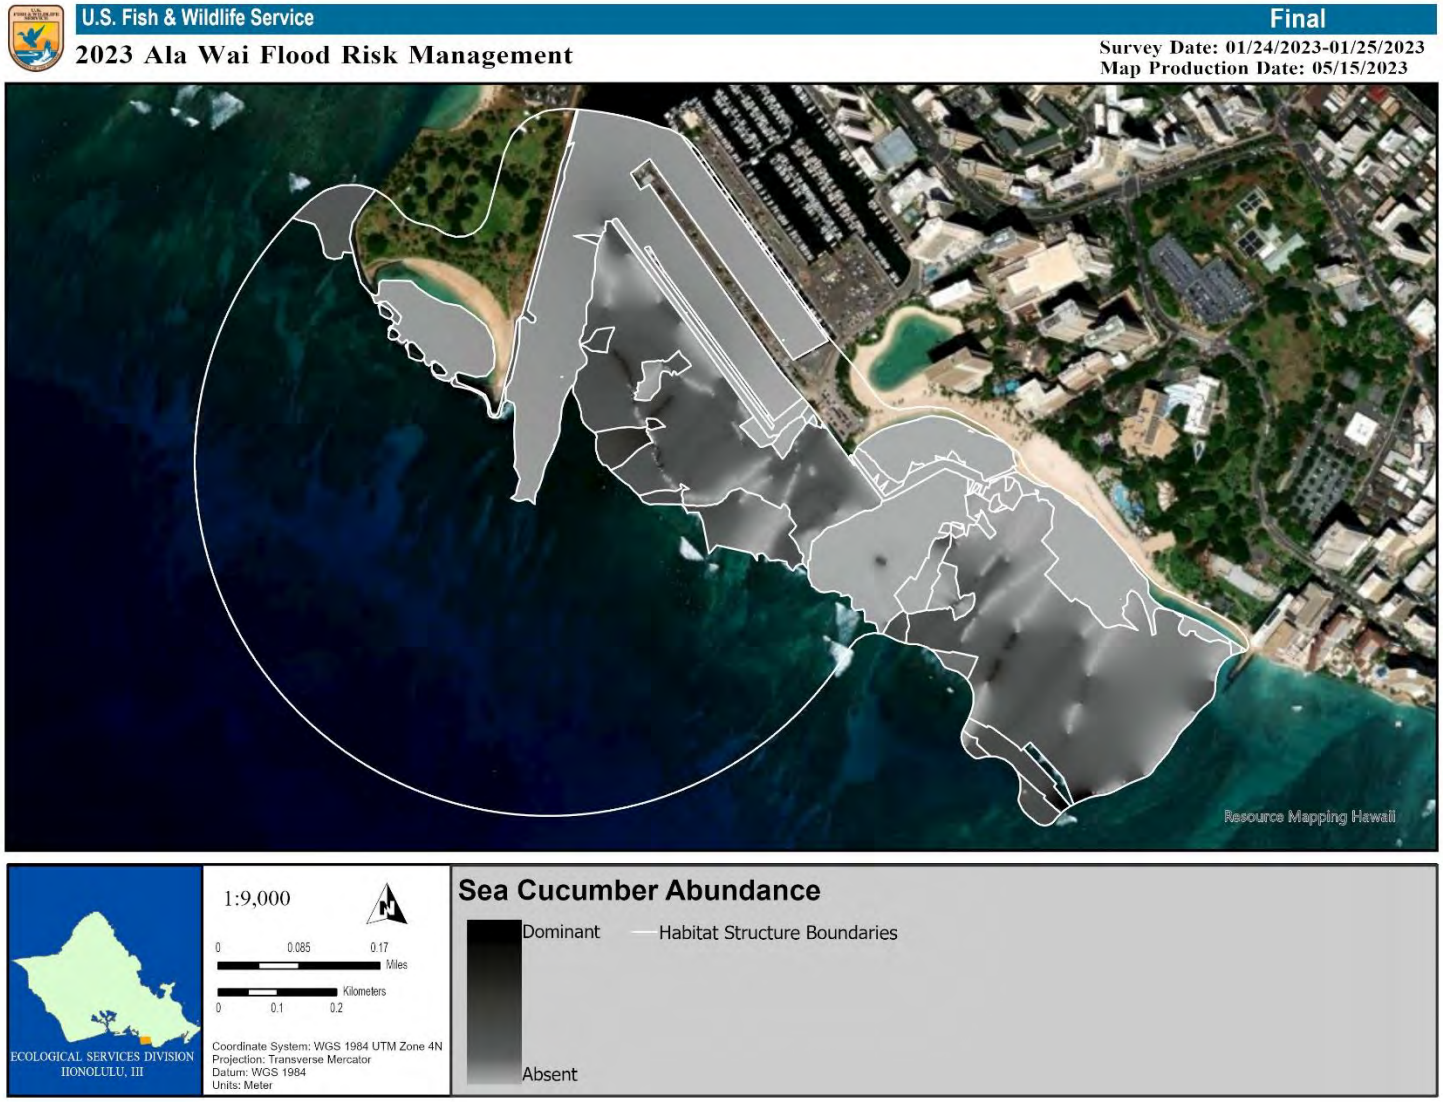

Figure B19. Sea Cumber Abundance. Map of the sea cumber abundance observed at the Project Area.

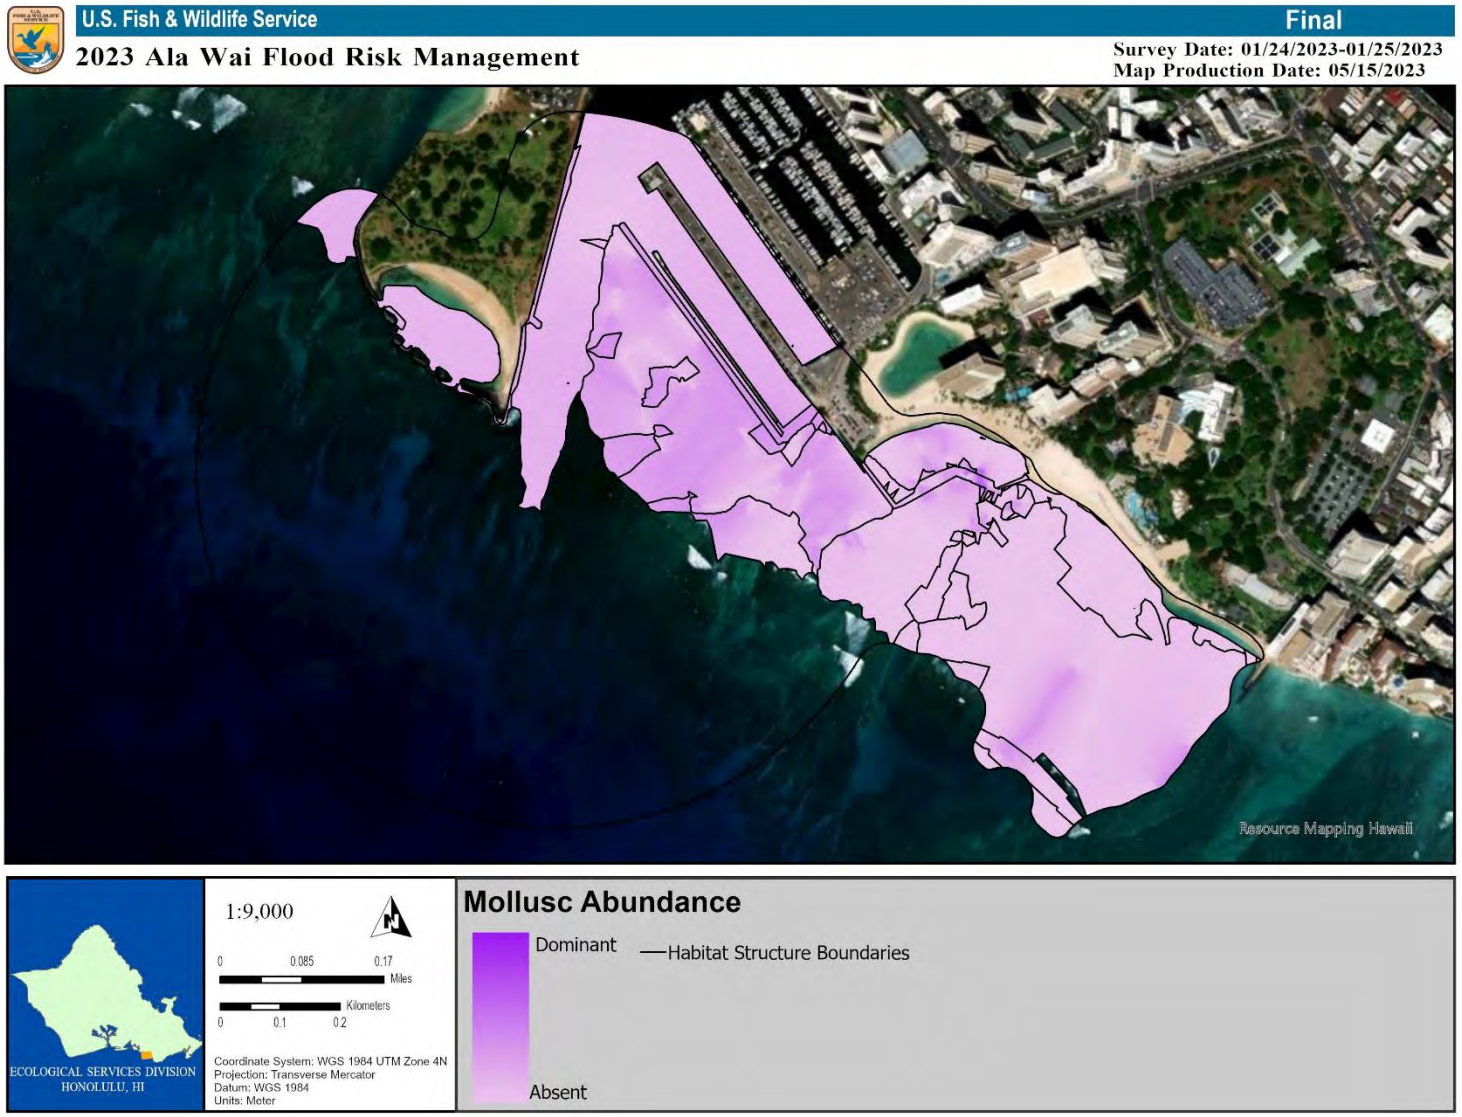

Figure B20. Mollusc Abundance. Map of mollusc abundance observed at the Project Area.

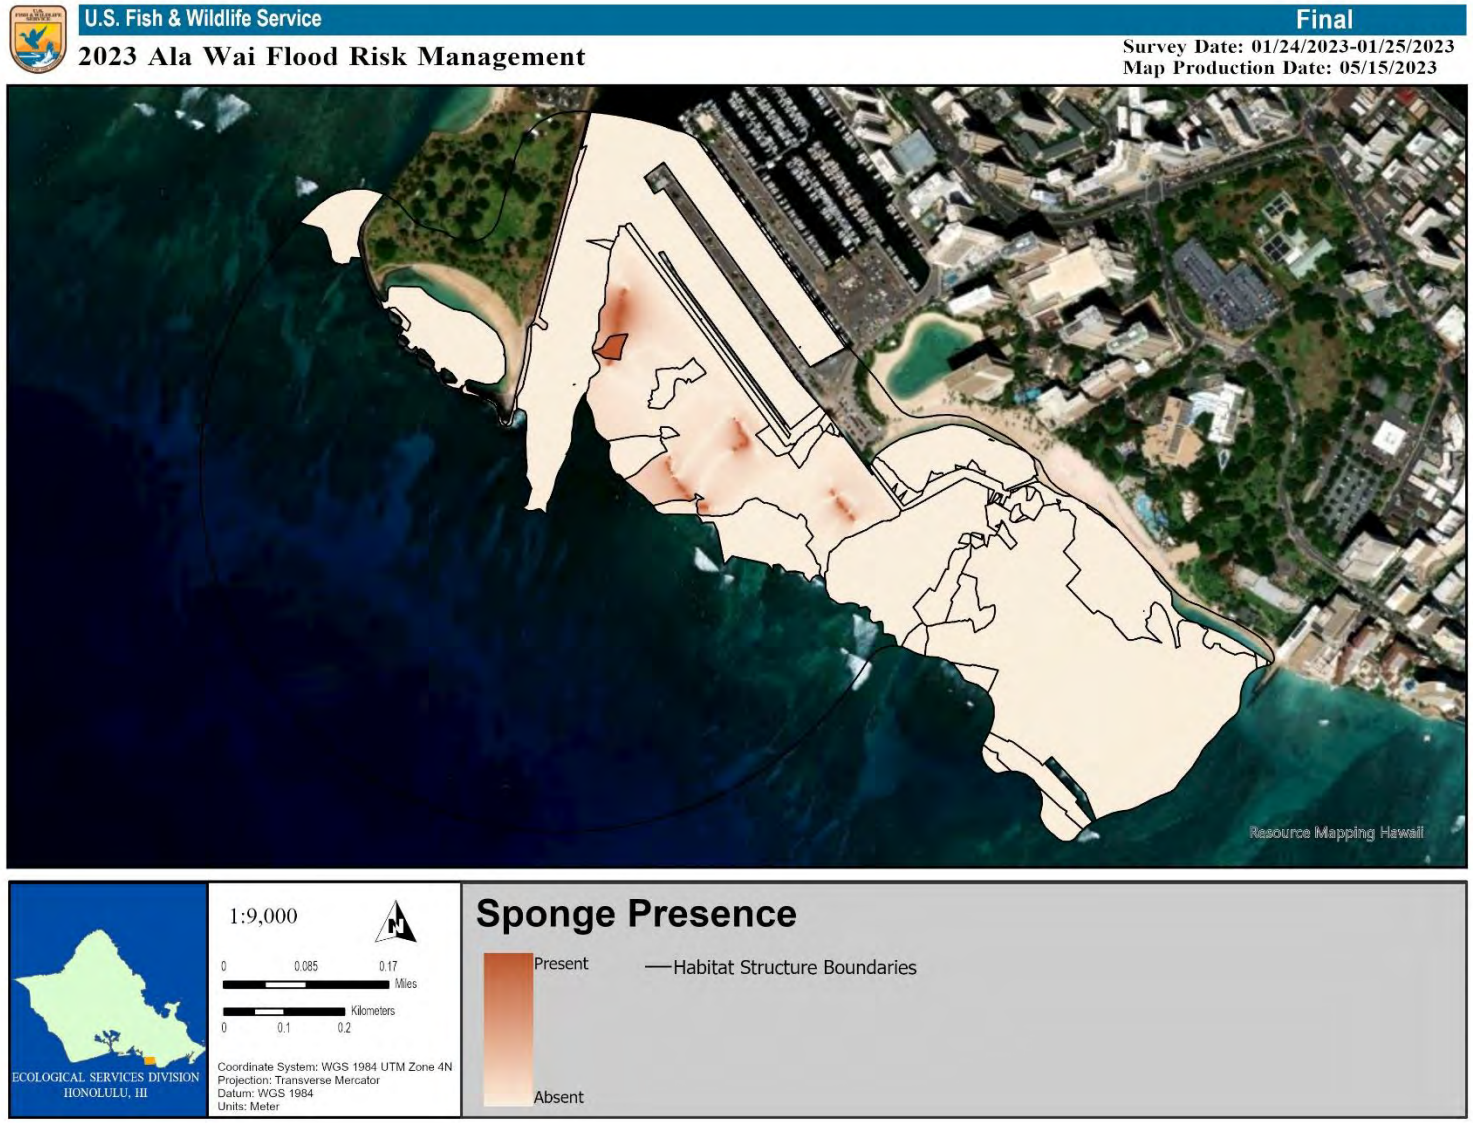

Figure B21. Sponge Presence. Map of the sponges observed at the Project Area.

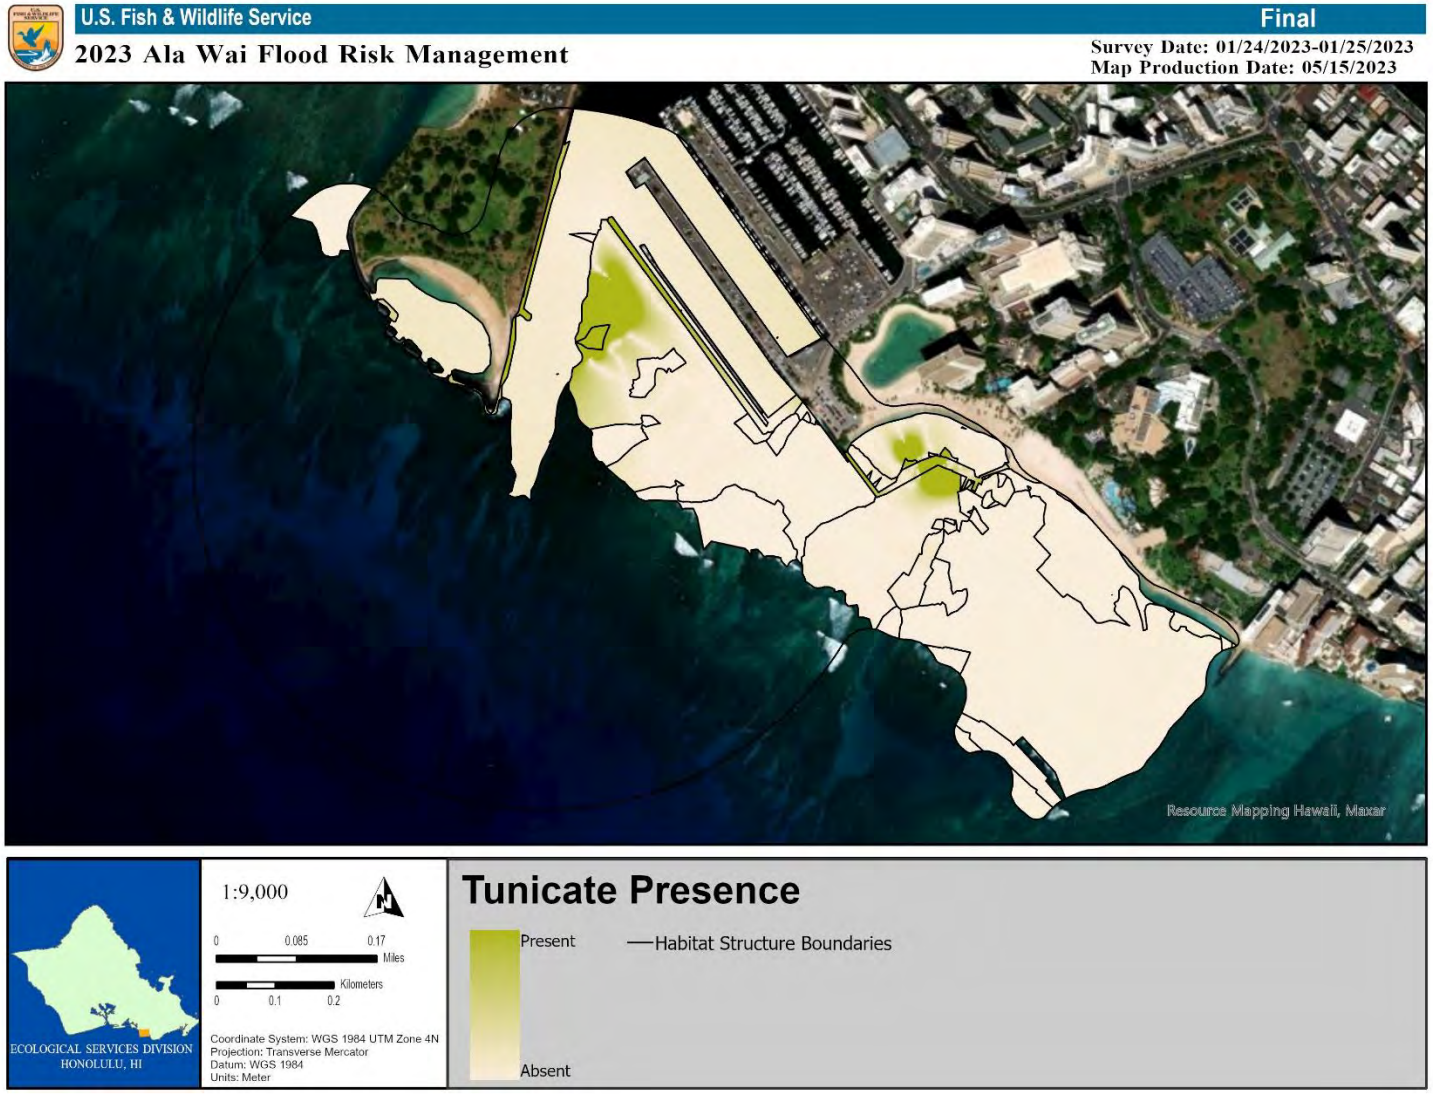

Figure B22. Tunicate Presence. Map of the tunicates observed at the Project Area.

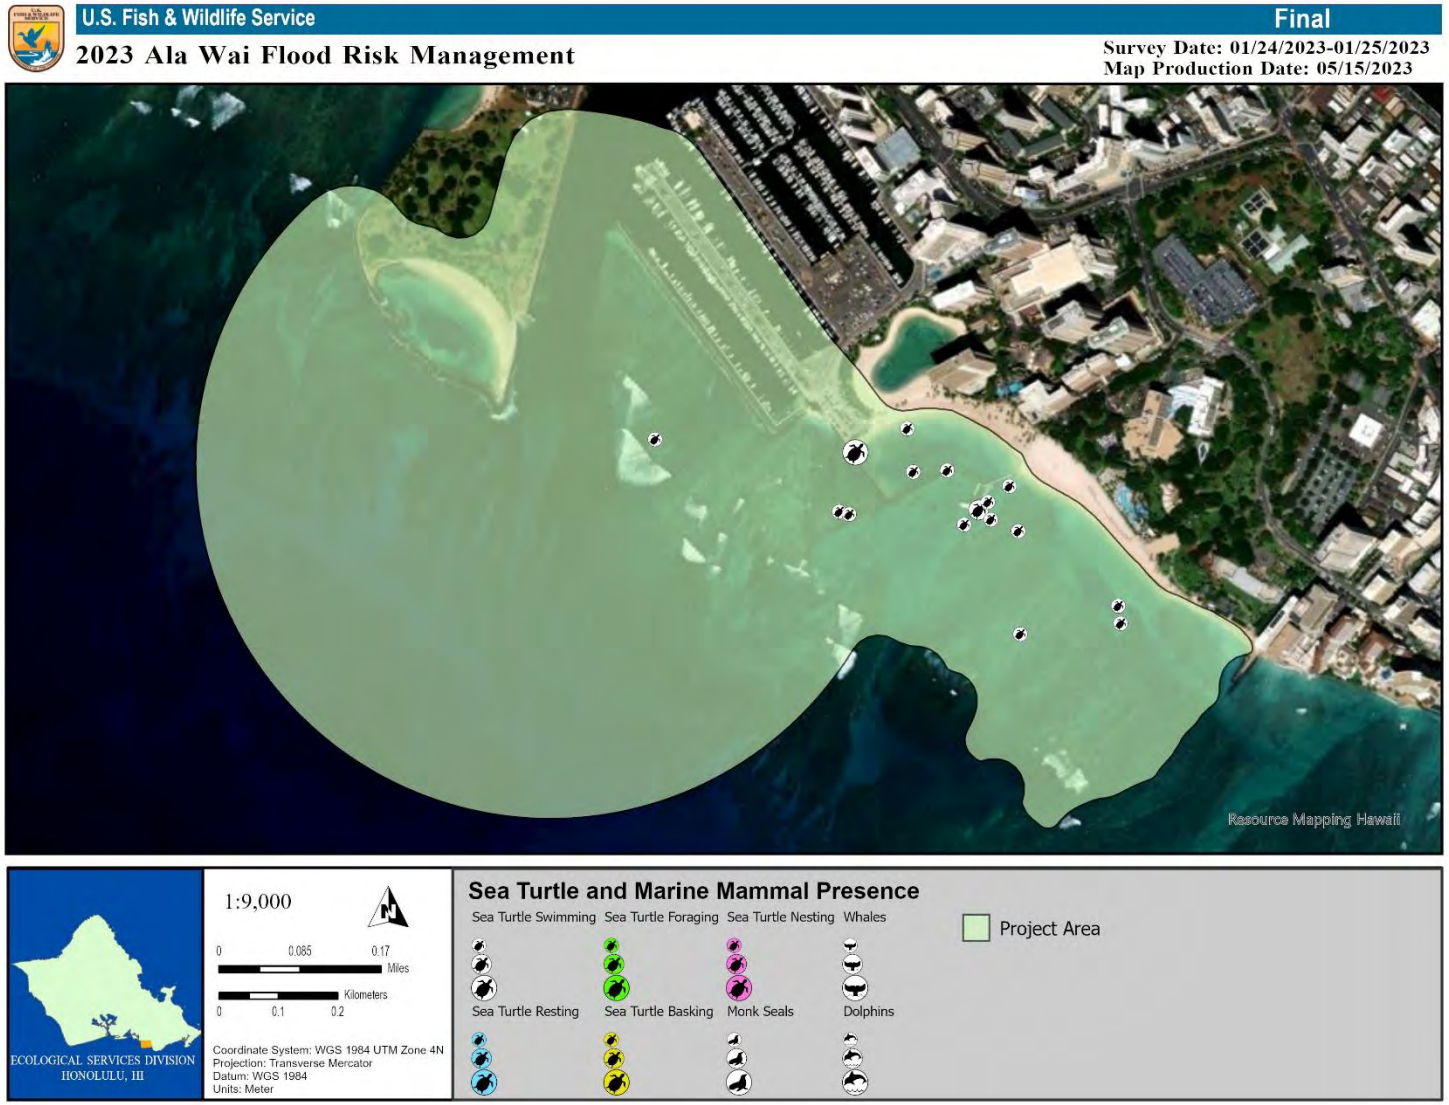

Figure B23. Sea Turtle and Marine Mammal Presence. Map indicating marine turtle presence at the Project Area. No marine mammals were observed.

U.S. Fish and Wildlife Service
Recommended Standard Best Management Practices

The U.S. Fish and Wildlife Service (USFWS) recommends the following measures to be incorporated into project planning to avoid or minimize impacts to fish and wildlife resources. Best Management Practices (BMPs) include the incorporation of procedures or materials that may be used to reduce either direct or indirect negative impacts to aquatic habitats that result from project construction-related activities. These BMPs are recommended in addition to, and do not over-ride any terms, conditions, or other recommendations prepared by the USFWS, other federal, state or local agencies. If you have questions concerning these BMPs, please contact the USFWS Aquatic Ecosystems Conservation Program at 808-792-9400.

1. Authorized dredging and filling-related activities that may result in the temporary or permanent loss of aquatic habitats should be designed to avoid indirect, negative impacts to aquatic habitats beyond the planned project area.

2. Dredging/filling in the marine environment should be scheduled to avoid coral spawning and recruitment periods, and sea turtle nesting and hatching periods. Because these periods are variable throughout the Pacific islands, we recommend contacting the relevant local, state, or federal fish and wildlife resource agency for site specific guidance.

3. Turbidity and siltation from project-related work should be minimized and contained within the project area by silt containment devices and curtailing work during flooding or adverse tidal and weather conditions. BMPs should be maintained for the life of the construction period until turbidity and siltation within the project area is stabilized. All project construction-related debris and sediment containment devices should be removed and disposed of at an approved site.

4. All project construction-related materials and equipment (dredges, vessels, backhoes, silt curtains, etc.) to be placed in an aquatic environment should be inspected for pollutants including, but not limited to; marine fouling organisms, grease, oil, etc., and cleaned to remove pollutants prior to use. Project related activities should not result in any debris disposal, non-native species introductions, or attraction of non-native pests to the affected or adjacent aquatic or terrestrial habitats. Implementing both a litter-control plan and a Hazard Analysis and Critical Control Point plan (HACCP – see https://www.fws.gov/policy/A1750fw1.html) can help to prevent attraction and introduction of non-native species.

5. Project construction-related materials (fill, revetment rock, pipe, etc.) should not be stockpiled in, or in close proximity to aquatic habitats and should be protected from erosion (*e.g.*, with filter fabric, etc.), to prevent materials from being carried into waters by wind, rain, or high surf.

6. Fueling of project-related vehicles and equipment should take place away from the aquatic environment and a contingency plan to control petroleum products accidentally spilled during the project should be developed. The plan should be retained on site with the person responsible for compliance with the plan. Absorbent pads and containment booms should be stored on-site to facilitate the clean-up of accidental petroleum releases.

7. All deliberately exposed soil or under-layer materials used in the project near water should be protected from erosion and stabilized as soon as possible with geotextile, filter fabric or native or non-invasive vegetation matting, hydro-seeding, etc.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1. Project Summary

At the request of the City and County of Honolulu, the Pittsburgh District, U.S. Army Corps of Engineers (USACE) is conducting a general reevaluation report for the proposed Ala Wai Canal Project in Honolulu, Hawaii. The study is authorized under Section 209 of the Flood Control Act of 1962 (Public Law 87-874), which is a general authority that authorizes surveys in harbors and rivers in Hawaii "with a view to determining the advisability of improvements in the interest of navigation, flood control, hydroelectric power development, water supply, and other beneficial water uses, and related land resources."

The Ala Wai watershed is located on the southeastern side of the island of Oahu, Hawaii. The watershed encompasses 19 square miles (12,064 acres) and extends from the ridge of the Ko'olau Mountains to the nearshore waters of Mamala Bay. It includes Makiki, Manoa, and Palolo streams, which drain to the Ala Wai Canal, a 2-mile long, man-made waterway constructed during the 1920s to drain extensive coastal wetlands (see Figure 1). This construction and subsequent draining allowed the development of the Waikiki district.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1.1 Purpose and Need

The purpose of the study is to analyze a series of preliminary alternatives designed to reduce the on-going flood risks throughout the Ala Wai watershed in Oahu, Hawaii. The study is needed because there is a high level of flood risk that exists within the Ala Wai watershed. Extensive urban development throughout the watershed, coupled with the basin's unique topography and hydrology (i.e., steep mountainous terrain and propensity for intense rainfall events within the headwaters) and aging and undersized infrastructure result in elevated flood risk for a large proportion of the population both along the Ala Wai Canal and within the Makiki, Manoa, and Palolo valleys. In addition to the above, the population density within the Ala Wai watershed is high, with approximately 200,000 residents in a 19 square mile area. The watershed also contains the University of Hawaii and the Waikiki District—a prime tourist destination that attracts more than 79,000 visitors per day and accounts for approximately 8% of the gross state product and 11% of all civilian jobs in the state.

It is estimated that the Ala Wai Canal has the capacity to contain about a 20% annual exceedance probability (AEP) flood event. Overtopping of the canal has previously flooded Waikiki multiple times, including November 1965 and December 1967 storm and during the passage of Hurricane Iniki in 1992. Upstream areas are also at risk of flooding, as demonstrated by several recent events, including the October 2004 storm that flooded Manoa Valley and the March 2006 storm that flooded Makiki. The October 2004 event was estimated to have a 4% AEP and caused more than $85 million in damages.

1.2 Project Description

In response to the flood-related problems and opportunities identified for the Ala Wai watershed, a variety of structural and non-structural flood risk management measures were considered, with a focus on the following approaches to flood risk management: (1) peak flow reduction, (2) increased channel capacity, (3) debris management, and (4) minimization of flood damages. The conceptual measures were sited and screened using a set of project-specific criteria, including technical feasibility, availability of land, implementation costs, O&M requirements, legal and public acceptability, and flood risk reduction. Through the screening process, some measures were eliminated while others were further refined and combined into an array of alternatives; this process incorporated the range of agency and public input obtained through the 2017 feasibility study, 2021 and 2023 scoping efforts, and other stakeholder engagement activities conducted to date. This effort resulted in the tentative selection of an alternative plan for implementation (also referred to as the tentatively selected plan). The measures included in this plan are:

Woodlawn Drive Floodwall and Koali Road Floodwall - Also within Manoa Valley, a floodwall extending six feet above ground level (i.e., Woodlawn Drive Floodwall) would be constructed along the right descending bank of Manoa Stream (Figure 2). The floodwall would be approximately 1,270 feet in length. A single road closure structure at Woodlawn Drive would be constructed. The Woodlawn Drive Floodwall would reduce the risk of flooding to the University of Hawaii and downstream residential structures due to overtopping at Woodlawn Drive Bridge. At Koali Road, near the convergence of Manoa and Palolo streams, a floodwall extending 6 feet above ground (i.e., Koali Road floodwall) would be constructed along the left descending bank of Manoa Stream and the right descending bank of Palolo Stream (Figure 3). The floodwall would be approximately 2,510 feet in length. Two concrete drainage structures would be constructed to provide interior drainage of stormwater flows from the residential neighborhood behind the Koali Road floodwall. Two flap gates would be retrofitted on smaller stormwater

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

culverts along this feature. Two road closure structures would be constructed — one at Koali Road and one at the pedestrian bridge crossing Palolo upstream (approximately 690 feet upstream of Koali Road Bridge) — to bridge the gap between the floodwall as it crosses these two throughways. The purpose of the Koali Road Floodwall is to reduce risk to adjacent residential structures, including induced damages caused by the Woodlawn Drive Floodwall. Thus, the Woodlawn Drive Floodwall and Koali Road Floodwall function as a system.

Kaimuki High School Floodwall - At the Kaimuki High School, adjacent to the Manoa-Palolo Canal, a floodwall extending six feet above ground (i.e., Kaimuki High School Floodwall [extension of Ala Wai Canal Floodwall]) would be constructed along the Kaimuki High School's track field and extending down to the vicinity of the Kaimuki High School's discus and shot put throwing area (Figure 4). The floodwall would be approximately 3,260 feet long and would be constructed of a combination of steel sheetpile (1,460 feet) and micropiles (1,800 feet) with a concrete fascia. The Alternative 5.3 Kaimuki High School Floodwall would be shorter in length than the Kaimuki High School Floodwall described under Alternative 1 and Alternative 2B. Like Alternative 2B, though, the Kaimuki High School Floodwall would join up with the Ala Wai Canal Floodwall discussed below. The purpose of the floodwall would be to reduce the risk of flooding to residential structures east/southeast of Kaimuki High School.

Ala Wai Golf Course Detention Basin – At Ala Wai Golf Course, adjacent to the Manoa-Palolo Canal and the Ala Wai Canal, an earthen levee approximately six to nine feet in height would be constructed around the perimeter of Ala Wai Golf Course to create a detention basin (i.e., Ala Wai Golf Course Detention Basin). The total length of the earthen levee would be approximately 8,315 feet in length and would extend along the perimeter of the Ala Wai Golf Course along the Manoa-Palolo and Ala Wai canals. On the left descending bank of the Manoa-Palolo Canal, there is an overtopping spillway section, approximately 100 feet in length, that is reinforced with erosion protection. The levee along the Manoa-Palolo Canal is also lined with erosion protection on the canal-side. A portion of the existing drainage ditch that runs along the north side of the golf course (parallel to Date Street) would be riprapped and used as an inlet location for overflow into the Ala Wai Golf Course Detention Basin. A small inlet channel would be excavated and lined with erosion control material to improve the flow onto the golf course. Three concrete drainage structures and three flap gates would be constructed along the levee alignment of the Ala Wai Golf Course to allow collected stormwater within the basin and from local runoff to slowly drain into Ala Wai Canal. The three drainage structures would be approximately three feet (wide) x three feet (high) and would be located at the downstream end of three existing natural drainages along the southwest side of the golf course (west of the Ala Wai Golf Course Clubhouse). The detention basin also includes a floodwall along the golf course parking lot near the Ala Wai Canal, which is nine feet in height. The floodwall has one concrete drainage structure and two flap gates. The drainage structure at this location serves to outlet flow from the Diamond Head neighborhood. The original outlet will be enclosed by concrete (instead of daylighted) and will need reconstruction of the vehicle and pedestrian access at this location. A small section of floodwall near the Kapahulu Avenue and Ala Wai Boulevard intersection at the Diamond Head end of the canal will tie-in to the golf course levee and Ala Wai Canal floodwall system. This section is 6 ft in height and includes one road closure structure and one drainage structure. Finally, there is one canoe access point in this location. One road closure structure would be constructed at the Ala Wai Golf Course Maintenance Facility driveway. The Ala Wai Golf Course Detention Basin would reduce the risk of flooding within the lower watershed.

Ala Wai Canal Floodwall - At the Manoa-Palolo Canal and Ala Wai Canal, a floodwall extending

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

six feet above ground (i.e., Ala Wai Canal Floodwall) would be constructed (Figure 4). The floodwall would be approximately 22,852 feet long and would be constructed of a combination of J-wall on micropiles (17,125 feet), L-wall on micropiles (4,069 feet), and tieback I-wall (1,658 feet) with a lava rock fascia. Existing stormwater sewers inletting into the Ala Wai Canal would be modified so that fourteen would be drainage structures and 59 would be retrofitted with flap gates. Eleven road closure structures would be constructed: (1) King Street (Manoa-Palolo Canal right descending bank), (2) King Street (Manoa-Palolo Canal left descending bank), (3) Kapiolani Boulevard (Manoa-Palolo Canal right descending bank), (4) Kapiolani Boulevard (Manoa-Palolo Canal left descending bank), (5) Date Street (near the Date Street and Laau Street junction), (6) Date Street (near the vicinity of the Kaimuki High School's discus and shot put throwing area, (7) Ala Wai Golf Course Drive, (8) McCully Street (Ala Wai Canal right descending bank), (9) McCully Street (Ala Wai Canal left descending bank), (10) Kalakaua Avenue (Ala Wai Canal right descending bank), and (11) Kalakaua Avenue (Ala Wai Canal left descending bank). The typical cross section of this feature varies along the alignment, but all are assumed to be 6 ft above ground. The floodwall along the Ala Wai Canal and the lower right descending bank of the Manoa-Palolo Canal will include an elevated walking path. On the left descending bank of the Manoa-Palolo Canal and near Kaimuki High School, there will be a floodwall on micropiles with no walking path. Where space is constricted, along the upper right descending bank of the Manoa-Palolo Canal, tieback I-walls will be constructed, with no walking path. The purpose of the Ala Wai Canal Floodwall system would be to reduce the risk of flooding within the McCully-Moiliili neighborhood, Diamond Head neighborhood, and Waikiki.

Mitigation Measures – Mitigation measures related to induced flooding include potentially adding permanent pump station(s) of moderate to large size, ranging from 500 to 20,000 cubic feet per second (cfs). At the time of compiling this Draft Report, it is unknown as to the number of pumps that may be necessary to minimize induced flooding, the size of the pumps, or the location of pumps within the watershed. If Alternative 5.3 moves forward, additional analysis would be conducted during the Preconstruction Engineering and Design (PED) phase to determine the above as well as if a pump station is even necessary to reduce induced flooding. If determined to be necessary during PED, appropriate supplemental National Environmental Policy Act (NEPA) analysis and coordination would be conducted as necessary. In addition to considering pumps as potential mitigation for induced flooding within the watershed, nonstructural measures such as dry/wet floodproofing, elevation, and acquisition are also under consideration. Additional analysis would be conducted during PED to determine the precise number and location of structures recommended for dry/wet floodproofing, elevation, or acquisition. Appropriate supplemental NEPA analysis and coordination would be conducted as necessary.

Future Operation, Maintenance, Repair, Replacement, and Rehabilitation
Maintenance, including routine inspections and minor repairs of the project and its associated features, would be required after construction is completed. The following activities may occur:

- Routine and special inspection with pickup trucks and sport utility vehicles, as needed, and up to daily during flood events.
- Vegetation management where floodwalls and earthen berms are located. Vegetation management in the areas with floodwalls would be in accordance with Corps of Engineers Engineering Pamphlet 1110-2-18; at a minimum 15-feet down slope of the floodwall would need to be a vegetation free zone (VFZ). The VFZ applies to all vegetation except for grasses for the purpose of erosion control.
- Periodic clearing of debris around inlet/outlet structures.
- Periodic clearing of accumulated sediment and debris from detention basin.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

- Periodic vegetation management such as weeding, herbicide application, and re-seeding.
- Periodic graffiti removal and vandalization repair.

Rarely, following large and erosive flood flows, larger-scale maintenance and repairs may be required, which could require access and use of heavy equipment within the floodplain adjacent to the project feature. A temporary work area may need to be established around a repair site. The local sponsor would be required to obtain emergency or standard permits from regulatory agencies, including Corps Regulatory, who would coordinate and consult, if needed, with the USFWS and NMFS. These permits would likely require active habitat restoration of temporary construction and access roads. It is likely that a storm event large enough to damage the detention basins and/or floodwalls would also have removed vegetation in the immediate area, but specific impacts cannot be evaluated until or unless damage occurs, and repair work is defined.

At this time, no unavoidable adverse impacts to biological resources have been identified. Avoidance and minimization measures included as part of the Draft Fish and Wildlife Coordination Act will be implemented during project construction to minimize potential impacts to biological resources. The Draft Genera Reevaluation Report with integrated Supplemental Environmental Impact Statement (GRR/SEIS) will be available for public review during fall 2023.

2. Recreational Resources

Hawaii CZM Program
Coastal Zone Management

RECREATIONAL RESOURCES (continued)

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. Will the proposed action occur in or adjacent to a dedicated public right-of-way? E.g., public beach access, inland or coastal hiking trail, shared-use path	☐	☑
2. Will the proposed action affect public access to or along the shoreline?	☐	☑
3. Is the project parcel adjacent to the shoreline?	☐	☑
4. Is the project site on or adjacent to a sandy beach?	☐	☑
5. Is the project site in or adjacent to a state or county park?	☑	☐
6. Is the project site in or adjacent to a water body such as a stream, river, pond, lake, or ocean?	☑	☐
7. Will the proposed action occur in or affect an ocean or coastal recreation area, swimming area, surf site, fishing or gathering area, or boating area?	☑	☐

Discussion: Explain "Yes" responses to the questions above. If more space is needed, attach a separate sheet, or append additional information.

See next page.

2.1 Recreational Resources Discussion

Given the project objective of reducing the risk of riverine flooding in the Ala Wai Watershed, the flood risk management features would generally be located within or adjacent to a stream (or the Ala Wai Canal). Several of the features would also be located within or near areas used for recreational purposes. Recreational areas that could be affected (at least in part) include Kanewai Community Park, Ala Wai Community Park, Ala Wai Golf Course, and Ala Wai Promenade. Kanewai Community Park would be used for staging and access for construction of the proposed Koali Road floodwall. Similarly, the Ala Wai Community Park would be used for staging and access for construction of the proposed Ala Wai Canal floodwall. During construction, recreational activities would be restricted within the construction limits of each feature, thus limiting the range and/or accessibility of recreational opportunities temporarily. Construction of the floodwalls would not preclude recreational use of the Manoa Stream, the Manoa-Palolo Canal, or the Ala Wai Canal, but certain access points may be temporarily unavailable during the construction phase. Similarly, the proposed project potentially includes mitigation measures for induced flooding. Proposed nonstructural measures such as wet/dry floodproofing, elevation, and acquisition would not have any impacts on recreational resources as these measures would occur on existing structures and would be staged on site of the structure. The only structural mitigation measure under consideration is a pump station along Makiki Stream between Fern Street and the confluence of Makiki Stream with the Ala Wai Canal. The location of the potential pump station is unknown currently; however, there are no recreational resources along Makiki Stream in this area that would be impacted if construction of a pump station were to occur.

Over the long-term, an earthen berm would occupy a portion of the Ala Wai Golf Course. To the extent practicable, the flood risk management feature design has the smallest footprint possible and minimizes impacts to recreational activities during non-flood conditions. For example, the berm for the Ala Wai Golf Course detention basin design would accommodate the existing golf cart path, such that the layout and use of the golf course would not be significantly affected over the long-term. The floodwall around occupying a portion of the Ala Wai Community Park would be located around the outer perimeter of the park. The floodwall is not expected to impact recreation long term, although access to recreational fishing from the bank of the Ala Wai Community Park would be somewhat impeded because of the presence of the floodwall. However, the floodwall would have an elevated walking path that would still provide access to fishing over the floodwall.

In the event of a flood, when the Ala Wai Golf Course detention basin would detain floodwaters, the area would be temporarily unavailable for recreation. In the case of a 1% AEP flood event, the projected inundation period is approximately two days. Following the flood event, post-flood maintenance would remove accumulated debris/sediment; this could require several days. Potential recreational impacts associated with post-flood maintenance could occur at those sites with detention basins where established recreational activities regularly occur. However, project analyses indicate that the golf course already floods (thereby impacting recreational uses) under without-project conditions. Furthermore, project operation and maintenance (O&M) activities would be programmed as part of the standard flood response activities to minimize post-flood maintenance response time.

In addition to the above, the Ala Wai Canal floodwall and the Manoa-Palolo Canal floodwall would potentially limit access to outrigger canoes. There are four canoe launches along Ala Wai Canal that would require closure structures. These canoe launch closure structures would primarily be open and would only be closed for a period prior to a storm event, during a storm

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

event, and for a period after the storm event until they can be reopened. Closing the canoe launch closure structures prior to a storm event and the opening of the closed structures post storm event would likely have the greatest impact by limiting access to these canoe launches when they would normally be open under the existing condition. However, closure of the canoe launch structures would likely occur within one or two days of a predicted storm event occurring and would likely open within one or two days after a storm event has passed. Therefore, this is a temporary long-term impact to recreation. During a storm event it is unlikely that the canoe launch closure structures would have an impact on recreation because a storm event would typically cause boats to refrain from being launched into the water due to human safety concerns.

Overall, these impacts are not expected to significantly decrease the long-term availability and accessibility to recreational opportunities in the coastal zone management area. Although some limited areas would be affected, the project would also provide flood risk management benefits throughout much of the watershed. Additional detail is provided in Section 3.5.1 and 3.5.4 of the Draft GRR/SEIS.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

3. Historic Resources

Hawaii CZM Program
Coastal Zone Management

HISTORIC RESOURCES

Objective: Protect, preserve, and, where desirable, restore those natural and manmade historic and prehistoric resources in the coastal zone management area that are significant in Hawaiian and American history and culture.

Policies:

1) Identify and analyze significant archaeological resources.
2) Maximize information retention through preservation of remains and artifacts or salvage operations.
3) Support state goals for protection, restoration, interpretation, and display of historic resources.

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. Is the project site within a designated historic or cultural district?	☐	☑
2. Is the project site listed on or nominated to the Hawaii or National Register of Historic Places?	☑	☐
3. Has the project site been surveyed for historic or archaeological resources?	☐	☑
4. Has the State Historic Preservation Division been consulted?	☑	☐
5. Does the project parcel include undeveloped land which has not been surveyed by an archaeologist?	☑	☐
6. Is the project site within or adjacent to a Hawaiian fishpond or historic settlement area?	☑	☐

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

3.1 Historic Resources Discussion

As detailed in the Draft IFR/SEIS, the project development effort in 2016 included an assessment of archaeological resources and a historic structure inventory for portions of the project action area. The results of these studies indicated that multiple historic properties were located within the project action area and could be affected by the project, including the Ala Wai Canal which is listed on the Hawaii Register of Historic Places; a detailed listing of historic properties is provided in Section 3.5.1 of the Draft GRR/SEIS.

Potential impacts to historic properties include modifications that may affect the integrity and/or characteristics of historic properties because of construction and operation of the project. As detailed in Section 3.5.1 of the Draft IFR/SEIS, treatment recommendations have been identified for properties that are expected to be adversely affected, with the intention of identifying conditions that can be placed on the design and construction to mitigate impacts to the resource. Historic buildings, bridges, and walls affected by construction would undergo appropriate historic documentation, and design input will be solicited from the State Historic Preservation Officer (SHPO); input would be incorporated into the final design where feasible. Where possible, impacts to archaeological resources would be avoided. Where avoidance is not possible, data recovery would be performed. Where practicable, community assistance would be solicited for re-use of materials, and possible reconstruction of features of Native Hawaiian cultural significance that would be disturbed by project actions. For the current effort, several variables remain unknown that may result in adverse effects through the future planning, design, and construction phases. A Programmatic Agreement was executed November 16, 2016, and is in effect until November 16, 2023. Updating and renewal of the Programmatic Agreement is currently in progress with the Advisory Council on Historic Preservation (ACHP), SHPO, and others as appropriate.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

4. Scenic and Open Space Resources

Hawaii CZM Program
Coastal Zone Management

SCENIC AND OPEN SPACE RESOURCES

Objective: Protect, preserve, and, where desirable, restore or improve the quality of coastal scenic and open space resources.

Policies:

1) Identify valued scenic resources in the coastal zone management area.
2) Ensure that new developments are compatible with their visual environment by designing and locating those developments to minimize the alteration of natural landforms and existing public views to and along the shoreline.
3) Preserve, maintain, and, where desirable, improve and restore shoreline open space and scenic resources.
4) Encourage those developments that are not coastal dependent to locate in inland areas.

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. Will the proposed action alter any natural landforms or existing public views to and along the shoreline?	✓	
2. Does the proposed action involve the construction of a multi-story structure?		✓
3. Is the project site located on or adjacent to an undeveloped parcel, including a beach or oceanfront land?	✓	
4. Does the proposed action involve the construction of a structure visible between the nearest coastal roadway and the shoreline?		✓
5. Will the proposed action involve constructing or placing a structure in waters seaward of the shoreline?		✓

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

4.1 Scenic and Open Space Resources Discussion

The visual landscape of the proposed project action area is generally comprised of open spaces within the heavily developed middle to lower watershed. The General Plan for the City and County of Honolulu has identified specific views that should be preserved within the watershed, including panoramic views from the Ala Wai Canal promenade and Ala Moana Beach Park toward the Koolau Mountains, as well as mauka-makai view corridors along major roadways. In addition to these viewplanes, other important scenic resources that have been identified include those in the Waikiki District, including the Ala Wai Canal itself, which is listed as a historic property on the Hawaii Register of Historic Places. Two scenic byways have also been established in this area under the Hawaii Scenic Byways Program: the Diamond Head Scenic Byway and the Waikiki-Kauhale O Hookipa Scenic Byway. The Diamond Head Scenic Byway spans from Kapiolani Park to Diamond Head Crater. The Waikiki-Kauhale O Hookipa Scenic Byway includes the major thoroughfares through Waikiki, including Ala Wai Boulevard.

Construction of the detention basins would introduce built elements to the natural environment which could alter the visual landscape to some degree. Recognizing the effect that the measures could have on the visual landscape; project siting and design would be conducted in a manner to best integrate each measure with the natural characteristics of the site and minimize visual impacts to the extent possible. open space park environment: however, these features have been designed to maintain open space characteristics of each site to the extent possible. This effort focused on using the natural topography to minimize the overall size and obtrusiveness of the proposed flood risk management structures.

In the case of the Ala Wai Golf Course detention basin, the implementation of this feature introduces a built element to an existing open space area and would be visible from adjacent areas including surrounding residences. However, the detention basin would be comprised primarily of an earthen/grass berm designed to be a multi-purpose feature, which once constructed, is expected to blend and be visually commensurate with the existing golf course facility. The detention basin is not expected to substantially diminish important environmental or landscape views from or toward the open space areas, nor is it expected to affect significant view corridors, including mauka views of the Koolau Mountains.

As planned, the floodwalls along the Ala Wai Canal would be approximately six feet high (on average) extending from King Street to Ala Moana Boulevard on both the left and right descending banks of the channel. It is important to note that the Ala Wai Canal floodwall includes floodwall along Manoa-Palolo Canal and Kaimuki High School. The proposed project also includes a floodwall along Woodlawn Drive and Koali Road. Based on the conceptual designs, the floodwalls along all these areas are currently expected to be approximately six feet high (on average). The above floodwalls would result in permanent landscape features, leading to the following changes in visual/open space resources. The floodwalls would typically dominate the view and would often only be somewhat compatible due to the project action area being a coastal landscape commonly holding panoramic views of water. The floodwalls, being an enclosure by design, often block views and become a dominant feature in a now enclosed landscape. The floodwalls are characterized as only somewhat compatible because in many places they disrupt the current harmony with the coastal landform, causing the broad and open experience currently available to be lost. For example, the floodwalls would partially obstruct views of the streams from the sides of the channels they are located on. Views from within the streams by paddlers would also be obstructed. Although the floodwalls may have a significant adverse effect on open space/views, construction of the floodwalls would provide significant benefits in the form of protecting residential structures and commercial structures from the risk

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

of inundation and resulting structural damage. To mitigate for the adverse impacts to aesthetic resources, the proposed floodwalls would have a fascia of lava rack on both sides to blend the walls into the surrounding environment as well as incorporate materials from the island.

In addition to the above, the floodwalls around Ala Wai Canal are expected to partially obstruct views of the canal from cars driving along Ala Wai Boulevard and from pedestrians along both sides of the canal. The Ala Wai Canal floodwall would also partially obstruct views from within the canal (e.g., paddlers and others using the Canal for recreation). In addition to these views being an important resource for the Waikiki District in general, they are also significant in terms of the Ala Wai Canal as a historic property on the Hawaii Register of Historic Places as well as the Kauhale O Hookipa Scenic Byway (which includes Ala Wai Boulevard). However, as stated above, the feasibility analysis determined that the floodwalls would be a necessary feature to provide adequate flood protection for this area. Efforts throughout the planning process would minimize the impacts to the extent possible, particularly as related to the overall structure heights. Further refinements would be made during the design phases and would further evaluate opportunities to reduce the dimensions of the floodwalls, as well as incorporate design details to further minimize potential visual impacts (i.e., lava rock fascia), such as use of construction materials and/or landscaping to blend the structures into the surrounding environment.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

5. Coastal Ecosystems

COASTAL ECOSYSTEMS

Objective: Protect valuable coastal ecosystems, including reefs, beaches, and coastal dunes, from disruption and minimize adverse impacts on all coastal ecosystems.

Policies:

1) Exercise an overall conservation ethic, and practice stewardship in the protection, use, and development of marine and coastal resources.
2) Improve the technical basis for natural resource management.
3) Preserve valuable coastal ecosystems of significant biological or economic importance, including reefs, beaches, and dunes.
4) Minimize disruption or degradation of coastal water ecosystems by effective regulation of stream diversions, channelization, and similar land water uses, recognizing competing water needs.
5) Promote water quantity and quality planning and management practices that reflect the tolerance of fresh water and marine ecosystems and maintain and enhance water quality through the development and implementation of point and nonpoint source water pollution control measures.

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. Does the proposed action involve dredge or fill activities?	☑	☐
2. Is the project site within the Special Management Area (SMA) or the Shoreline Setback Area?	☐	☑
3. Is the project site within the State Conservation District?	☐	☑
4. Will the proposed action involve some form of discharge or placement of material into a body of water or wetland?	☑	☐
5. Will the proposed action require earthwork, grading, clearing, grubbing, or stockpiling?	☑	☐
6. Will the proposed action include the construction of waste treatment facilities, such as injection wells, discharge pipes, or septic systems?	☐	☑
7. Will the proposed action involve the construction or installation of a stormwater discharge or conveyance system?	☑	☐
8. Is an intermittent or perennial stream located on or adjacent to the project parcel?	☑	☐

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

COASTAL ECOSYSTEMS (continued)

	Yes	No
9. Does the project site provide habitat for endangered species of plants, birds, or mammals?	✓	
10. Is any such habitat located near the project site?	✓	
11. Is a wetland located on the project site or parcel?	✓	
12. Is the project site situated in or abutting a Natural Area Reserve, Marine Life Conservation District, Marine Fisheries Management Area, or an estuary?	✓	
13. Will the proposed action occur on or near a coral reef or coral colonies?		✓

Discussion: Explain "Yes" responses to the questions above. If more space is needed, attach a separate sheet, or append additional information.

See next page.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

5.1 Coastal Ecosystems

Given the project objective to reduce riverine flooding, all the proposed flood risk management features would involve work adjacent to a stream or the Ala Wai Canal. However, the majority of the proposed features (i.e., Koali Road floodwall, Woodlawn Drive floodwall, Ala Wai Canal floodwall with Kaimuki High School extension, and the Ala Wai Golf Course detention basin) do not involve work directly within a waterway. Floodwall features would be set back from the existing edges of the relevant waterways where they are proposed to be constructed and the detention basin would be constructed upland within the Ala Wai Golf Course. A portion of the Ala Wai Canal, along the right descending bank of the Manoa-Palolo Canal, would require the placement of a temporary rock bench within waters of the U.S. for construction of the floodwall. The rock bench is necessary due to the limited space on the right-descending bank of the Manoa-Palolo Canal and residences for construction of the floodwall in this area. The rock bench would be comprised of clean inert material from a commercial supplier. This fill would be temporary and would be removed once construction of this portion of floodwall is complete.

It is important to note that the Ala Wai Golf Course detention basin would require an inlet structure and four outlet structures. In addition, the floodwall features would require inland drainage outlet structures. The inlet and outlet drainage structures would need to abut the waterways they are associated with, in order to allow floodwaters to either enter a detention basin or a waterway. Construction of the inlet and outlet features for the Ala Wai Golf Course detention basin would require placement of materials including compacted fill, concrete, and grouted riprap. These features would also require periodic removal of sediment/debris. There are small pockets of wetland habitat within the Ala Wai Golf Course that would experience fill from the construction of the drainage structures. Other areas of wetlands within the project action area would not be impacted by the discharge of fill material. Similarly, the golf course is adjacent to waters of the U.S., some of which would require the discharge of fill material to construct drainage structures for the detention basin. Drainage structures for the Ala Wai Canal and Koali Road would not include the construction of new drainage structures, but instead would include the modification of existing drainage structures with flap gates. This would be a modification to an existing structure and would not constitute fill being placed into other waters of the U.S. or wetlands. Where fill is required as discussed above, fill material would be imported materials from approved sources and would be clean and free of contaminants. The proposed action also includes mitigation measures for induced flooding. Potential nonstructural mitigation measures under consideration include wet/dry floodproofing, elevation, and acquisition. While these activities could occur adjacent to a stream, they would not involve the placement of fill within a wetland or within other waters of the U.S. Overall, the placement of fill material within wetlands and other waters of the U.S. would be minimal. While the project is located adjacent to streams, most work would occur upland with only minor work occurring near streams related to discharge inlets/outlets. BMPs listed in Section 3.3.7 of the Draft GRR/SEIS would be implemented to minimize potential impacts to coastal ecosystems.

During construction of the floodwalls and the Ala Wai Golf Course detention basin, clearing and grubbing would be required to prepare the area for construction. Clearing and grubbing would not occur within waters but would be adjacent to waters and/or wetlands (i.e., Ala Wai Golf Course detention basin). Since construction would disturb more than one acre of land, the project would be regulated under the State's National Pollution Discharge Elimination System (NPDES) stormwater program, which requires the preparation of a Stormwater Pollution Prevention Plan (SWPPP) to obtain permit coverage. The objective of a SWPP is to describe the measures that would be implemented to prevent sedimentation, erosion, and stormwater contamination, in compliance with requirements of the NPDES program. Best management practices (BMPs) would

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

be implemented to minimize impacts associated with potential pollutants and are listed in the Draft IFR/SEIS in Section 3.3.7 of the Draft GRR/SEIS. In addition, during construction, storage and use of some hazardous materials would occur. If handled inappropriately, these materials could accidentally spill or inadvertently discharge to adjacent waterways or groundwater. Construction activities would involve the use of heavy equipment, cranes, compactors, and other construction equipment that use petroleum products such as fuels, lubricants, hydraulic fluids, and coolants all of which are detrimental to water quality. BMPs listed in Section 3.3.7 of the Draft GRR/SEIS would be implemented to minimize the risk of inadvertent spills.

Impacts to aquatic habitat would primarily be expected to occur because of placing the inlet and outlet structures, but these would involve minimal in-stream work (i.e., primarily along the banks of the waterways. The design process incorporated efforts to avoid and minimize potential impacts to the extent practicable. Project designs reduce the footprint of these structures to the extent practicable and include design features to minimize impacts to waterway banks. The avoidance and minimization measures should reduce any potential impacts to aquatic habitat. Overall, associated earthwork and grubbing would occur upland and not within the coastal ecosystem. With the implementation of BMPS, potential impacts to coastal ecosystems due to earthwork, clearing, and grubbing would be minimized.

It is important to note that the Ala Wai Canal is considered an estuary, therefore, construction of the Ala Wai Canal would be abutting an estuary. Construction of the floodwall along the canal would be upland with BMPs implemented to minimize potential impacts to nearby estuary waters. Construction of the floodwall also includes modification of existing drainage structures within the Ala Wai Canal. Where these structures are located above the surface water within the canal, modification of these structures is expected to occur from upland. Where these existing drainage structures are located below the water's surface, temporary cofferdams would be used to block off the area so that construction work could occur while minimizing potential impacts to estuary resources. Once modification of the drainage structures is complete, any temporary fill placed for a cofferdam would be completely removed from the area. Material used for cofferdams would be clean inert material from a commercial supplier. Overall, with the implementation of BMPs listed in Section 3.3.7 of the Draft GRR/SEIS the risk of an adverse impact to estuary habitat would be minimized.

In general, the terrestrial habitat within the project action area is comprised of non-native species, many of which are considered invasive. Federally listed threatened or endangered species that have the potential to occur within the measure locations are Hawaiian hoary bat, seabirds (i.e., band-rumped storm-petrel and Newell's Townsend's shearwater), Hawaiian waterbirds (i.e., Hawaiian duck, Hawaiian gallinule, Hawaiian coot, Hawaiian petrel, and Hawaiian stilt), Hawaiian monk seal, green sea turtle, and hawksbill sea turtle. The project action area does include critical habitat for the Hawaiian monk seal and proposed critical habitat for the green sea turtle where the mouth of the Ala Wai canal is located. Pursuant to Section 7 of the Endangered Species Act, the USACE has been informally consulting with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service regarding potential impacts to threatened and endangered species. Based on this ongoing consultation, the USACE evaluated the potential impacts of the proposed project and has determined that the project may affect but is not likely to adversely affect the Hawaiian hoary bat, seabirds (i.e., band-rumped storm-petrel and Newell's Townsend's shearwater), Hawaiian waterbirds (i.e., Hawaiian duck, Hawaiian common gallinule, Hawaiian coot, and Hawaiian stilt), Hawaiian monk seal, green sea turtle, and hawksbill sea turtle. In addition, the USACE has determined that the project may affect but is not likely to destroy or degrade designated critical habitat for the Hawaiian monk seal or proposed critical habitat for the

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

green sea turtle. Additional detail regarding potential impacts to these resources is provided in Section 3.4.4 of the Draft GRR/SEIS.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

6. Economic Uses

Hawaii CZM Program
Coastal Zone Management

ECONOMIC USES

Objective: Provide public or private facilities and improvements important to the State's economy in suitable locations.

Policies:

1) Concentrate coastal development in appropriate areas.
2) Ensure that coastal dependent development and coastal related development are located, designed, and constructed to minimize exposure to coastal hazards and adverse social, visual, and environmental impacts in the coastal zone management area.
3) Direct the location and expansion of coastal development to areas designated and used for that development and permit reasonable long-term growth at those areas, and permit coastal development outside of designated areas when:
   a) Use of designated locations is not feasible;
   b) Adverse environmental effects and risks from coastal hazards are minimized; and
   c) The development is important to the State's economy.

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. Does the proposed action involve a harbor or port?	☐	☑
2. Is the proposed action a visitor industry facility or a visitor industry related activity?	☑	☐
3. Does the project site include agricultural lands or lands designated for such use?	☐	☑
4. Does the proposed action relate to commercial fishing or seafood production?	☐	☑
5. Is the proposed action related to energy production or transmission?	☐	☑

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

6.1 Economic Uses

Several of the flood risk management features would be located within the vicinity of the Waikiki District, a prime tourist destination that attracts more than 79,000 visitors per day. In combination with the other flood risk management features included in the proposed project, these would function to reduce flood risk within the watershed (including the Waikiki District), thus providing significant economic benefits. A detailed discussion of the economic benefits is provided in Section 4.1 of the Draft GRR/SEIS.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

7. Managing Development

Hawaii CZM Program
Coastal Zone Management

MANAGING DEVELOPMENT

Objective: Improve the development review process, communication, and public participation in the management of coastal resources and hazards.

Policies:

1) Use, implement, and enforce existing law effectively to the maximum extent possible in managing present and future coastal zone development.
2) Facilitate timely processing of applications for development permits and resolve overlapping or conflicting permit requirements.
3) Communicate the potential short and long-term impacts of proposed significant coastal developments early in their life cycle and in terms understandable to the public to facilitate public participation in the planning and review process.

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. List the permits or approvals required for the proposed action and provide the status of each in the Discussion section below.	☑	☐
2. Does the proposed action conform with state and county land use designations for the site?	☑	☐
3. Has an environmental impact statement or environmental assessment been prepared for the proposed action?	☑	☐
4. Has the public, applicable neighborhood board, or community groups been notified of the proposed action?	☑	☐

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

7.1 Managing Development

Potential permits that may need to be obtained for the project include Community Noise Permit from the City of Honolulu, General Construction Permit, NPDES Permit, Water Quality Certification, and a Special Management Area Permit. Other permits not listed may also need to be obtained to implement the proposed project.

Proposed project features conform with the state and county land use designations for the site. Project footprints are designated as urban state land use. None of the project footprints appear to be located in a Special Management Area (Figure 5); however, the Ala Wai Canal floodwall footprint near the Ala Moana Boulevard Bridge could either be located within a Special Management Area or directly adjacent to a Special Management Area. In addition, the Ala Wai Canal floodwalls are in the Waikiki Special District. Proposed project features would not conflict with the above state and county land use designations and a permit would be obtained for any work within a Special Management Area. Refer to Section 3.5.2 for additional details on state and county land use designations.

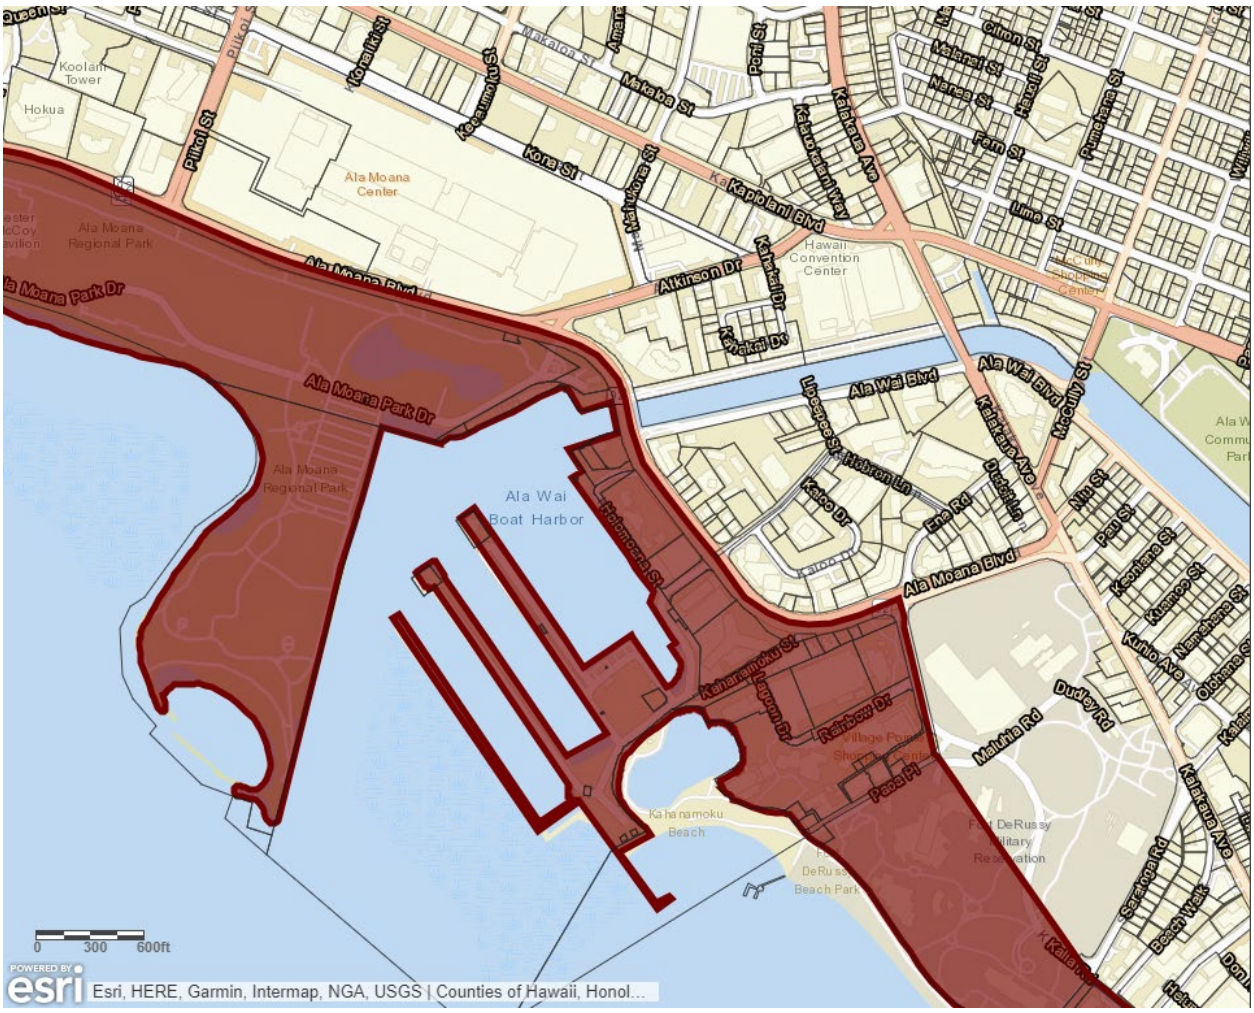

Figure 5: Results of Hawaii Special Management Area Locator Within the Vicinity of the Ala Wai Canal Project Action Area.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

A scoping letter dated August 9, 2021, was sent to various federal, state, and local agencies, other governmental organizations, and interested stakeholders. The scoping letter provided a 30-day public comment period. In addition to the scoping letter, initial public scoping meetings were held on November 10 and November 13, 2021. Additional scoping opportunities were also afforded through other stakeholder outreach events, including focus group meeting. Once it was determined that the environmental document would be a SEIS as well as pursuant to the two-year completion requirement for an EIS as required in the NEPA, a Notice of Intent (NOI) was published on February 22, 2023 (889 FR 10880). Similarly, as required by HRS Chapter 343, an Environmental Impact Statement Public Notice (EISPN) was published in the Office of Environmental Quality Control's (OEQC) *The Environmental Notice* on April 8, 2023. Publication of the NOI and EISPN included an additional 30-day public comment period. Initial public scoping meetings were held November 10 and November 13, 2021. Additional scoping opportunities were also afforded through other stakeholder outreach events, including focus group meetings. Refer to Section 7 in the Draft IFR/SEIS for additional details on public coordination.

The potential impacts of the proposed project are detailed in the Draft GRR/SEIS (Section 3), which is being published for public review. A 45-day public review will occur once the Draft GRR/SEIS is published.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

8. Public Participation

Hawaii CZM Program
Coastal Zone Management

PUBLIC PARTICIPATION

Objective: Stimulate public awareness, education, and participation in coastal management.

Policies:

1) Promote public involvement in coastal zone management processes.
2) Disseminate information on coastal management issues by means of educational materials, published reports, staff contact, and public workshops for persons and organizations concerned with coastal issues, developments, and government activities.
3) Organize workshops, policy dialogues, and site-specific mediations to respond to coastal issues and conflicts.

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. Has information about the proposed action been disseminated to the public, applicable neighborhood board, or community groups?	☑	☐
2. Has the public been provided an opportunity to comment on the proposed action?	☑	☐
3. Has or will a public hearing or public informational meeting be held?	☑	☐

Discussion: Explain "Yes" responses to the questions above. If more space is needed, attach a separate sheet, or append additional information.

See discussion below.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

8.1 Public Participation

A scoping letter dated August 9, 2021, was sent to various federal, state, and local agencies, other governmental organizations, and interested stakeholders. The scoping letter provided a 30-day public comment period. In addition to the scoping letter, initial public scoping meetings were held on November 10 and November 13, 2021. Additional scoping opportunities were also afforded through other stakeholder outreach events, including focus group meeting. Once it was determined that the environmental document would be a SEIS as well as pursuant to the two-year completion requirement for an EIS as required under NEPA, a NOI was published on February 22, 2023 (889 FR 10880). Similarly, as required by Hawaii Revised Statute (HRS) Chapter 343, an EISPN was published in OEQC's *The Environmental Notice* on April 8, 2023. Publication of the NOI and EISPN included an additional 30-day public comment period. Initial public scoping meetings were held November 10 and November 13, 2021. Additional scoping opportunities were also afforded through other stakeholder outreach events, including focus group meetings. Refer to Section 7 in the Draft GRR/SEIS for additional details on public coordination.

The potential impacts of the proposed project are detailed in the Draft GRR/SEIS (Section 3), which is being published for public review. A 45-day public review will occur once the Draft GRR/SEIS is published.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

9. Beach and Coastal Dune Protection

Hawaii CZM Program
Coastal Zone Management

BEACH AND COASTAL DUNE PROTECTION

Objective:

(A) Protect beaches and coastal dunes for:
  (i) Public use and recreation;
  (ii) The benefit of coastal ecosystems; and
  (iii) Use as natural buffers against coastal hazards; and

(B) Coordinate and fund beach management and protection.

Policies:

1) Locate new structures inland from the shoreline setback to conserve open space, minimize interference with natural shoreline processes, and minimize loss of improvements due to erosion.

2) Prohibit construction of private shoreline hardening structures, including seawalls and revetments, at sites having sand beaches and at sites where shoreline hardening structures interfere with existing recreational and waterline activities.

3) Minimize the construction of public shoreline hardening structures, including seawalls and revetments, at sites having sand beaches and at sites where shoreline hardening structures interfere with existing recreational and waterline activities.

4) Minimize grading of and damage to coastal dunes.

5) Prohibit private property owners from creating a public nuisance by inducing or cultivating the private property owner's vegetation in a beach transit corridor.

6) Prohibit private property owners from creating a public nuisance by allowing the private property owner's unmaintained vegetation to interfere or encroach upon a beach transit corridor.

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. Will the proposed action occur on a shoreline parcel?	☐	☑
2. Will the proposed action occur in an area or parcel that is adjacent to a shoreline parcel?	☑	☐
3. Is the proposed action located within the shoreline setback area?	☐	☑
4. Will the proposed action affect natural shoreline processes?	☐	☑
5. Will the proposed action affect recreational activities?	☐	☑
6. Will the proposed action affect public access to or along the shoreline?	☐	☑

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

9.1 Beach and Coastal Dune Protection

The proposed project does not occur on a shoreline parcel nor is it located within the shoreline setback area. The proposed project will not affect natural shoreline processes, recreational activities associated with the beach and coast, or public access to or along the shoreline.

The proposed project includes the Ala Wai Canal floodwall which extends around the Ala Wai Canal up to Ala Moana Boulevard. Although not a direct shoreline parcel, the Ala Wai Canal floodwall in this location is relatively near Ala Moana Regional Park and the Ala Wai Small Boat Harbor. Although the Ala Wai Canal floodwall is near these locations it does not extend into the locations and would not have an effect on recreational activities located on these parcels.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

10. Beach and Coastal Dune Protection

Hawaii CZM Program
Coastal Zone Management

MARINE AND COASTAL RESOURCES

Objective: Promote the protection, use, and development of marine and coastal resources to assure their sustainability.

Policies:

1) Ensure that the use and development of marine and coastal resources are ecologically and environmentally sound and economically beneficial.
2) Coordinate the management of marine and coastal resources and activities to improve effectiveness and efficiency.
3) Assert and articulate the interests of the State as a partner with federal agencies in the sound management of ocean resources within the United States exclusive economic zone.
4) Promote research, study, and understanding of ocean and coastal processes, impacts of climate change and sea level rise, marine life, and other ocean resources to acquire and inventory information necessary to understand how coastal development activities relate to and impact ocean and coastal resources.
5) Encourage research and development of new, innovative technologies for exploring, using, or protecting marine and coastal resources.

Check either Yes or No for each of the following questions, and provide an explanation or information for Yes responses in the Discussion section that follows:

	Yes	No
1. Will the proposed action involve the use or development of marine or coastal resources?	☐	☑
2. Will the proposed action affect the use or development of marine or coastal resources?	☐	☑
3. Does the proposed action involve research of ocean processes or resources?	☐	☑
4. Will the proposed action occur in or abutting a Natural Area Reserve, Marine Life Conservation District, Marine Fisheries Management Area, or an estuary?	☑	☐

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

10.1 Marine and Coastal Resources

The proposed project would not directly affect any marine resources.

It is important to note that the Ala Wai Canal is considered an estuary, therefore, construction of the Ala Wai Canal would be abutting an estuary. Construction of the floodwall along the canal would be upland with BMPs implemented to minimize potential impacts to nearby estuary waters. Construction of the floodwall also includes modification of existing drainage structures within the Ala Wai Canal. Where these structures are located above the surface water within the canal, modification of these structures is expected to occur from upland. Where these existing drainage structures are located below the water's surface, temporary cofferdams would be used to block off the area so that construction work could occur while minimizing potential impacts to estuary resources. Once modification of the drainage structures is complete, any temporary fill placed for a cofferdam would be completely removed from the area. Material used for cofferdams would be clean inert material from a commercial supplier. Overall, with the implementation of BMPs listed in Section 3.3.7 of the Draft GRR/SEIS the risk of an adverse impact to estuary habitat would be minimized.

The operation of the proposed project could potentially have an indirect adverse effect to marine resources. Informal coordination with the National Marine Fisheries Service (NMFS) has been occurring and an Essential Fish Habitat Assessment will be provided to NMFS when the Draft GRR/SEIS is released for public review.

SECTION 1 – PROJECT DESCRIPTION

At the request of the City and County of Honolulu, the Pittsburgh District, U.S. Army Corps of Engineers (USACE) is conducting a general reevalution report (GRR) for the Ala Wai Canal Project (hereafter referred to as “the project”).

a. Location

The Ala Wai watershed is located on the southeastern side of the island of Oahu, Hawaii. The watershed encompasses 19 square miles (12,064 acres) and extends from the ridge of the Koolau Mountains to the nearshore waters of Mamala Bay (Figure 1). It includes the Makiki, Manoa, and Palolo streams, which flow to the Ala Wai Canal, a 2-mile-long, man-made waterway constructed during the 1920s to drain extensive coastal wetlands. The construction and subsequent draining allowed the development of the Wakiki District.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Figure 1: Regional Location of the Project Action Area.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

b. Background and History

The U.S. Army Corps of Engineers (USACE), Honolulu District, received the authority to conduct the Ala Wai Canal Flood Risk Management Study under Section 209 of the Flood Control Act of 1962 (Public Law 84-874). The feasibility study's recommended plan consisted of six in-stream debris and detention basins of varying height in the upper reaches of the watershed, one standalone debris catchment structure, three multiple-purpose detention basins, floodwalls along the Ala Wai Canal averaging four feet in height, and an earthen levee at the perimeter of an adjacent golf course averaging seven feet in height, two pump stations to reduce the threat of interior flooding, and a flood warning system. The feasibility study determined the technical, economic, environmental, and social feasibility of the recommended plan to reduce the flood risk within the Ala Wai Canal watershed of Honolulu, Hawaii.

Section 1401 of the Water Resources Development Act of 2018 (Public Law 115-270) authorized construction of the Ala Wai Canal Flood Risk Management Project, as described in the Chief's Report, (*https://www.poh.usace.army.mil/Portals/10/docs/Civil%20Works%20Sponsor%20Letters/Tab%201%20Chiefs%20Report%20Ala%20Wai%20Chiefs%20Report%20SIGNED%20(003).pdf?ver=2018-09-14-171850-833*), dated December 21, 2017, and the *Ala Wai Canal Flood Risk Management Study, Oahu, Hawaii, Feasibility Study with Integrated Environmental Impact Statement*, dated May 2017. The record of decision (ROD) was signed on September 18, 2018, initiating the next phase of the study, Preconstruction Engineering and Design (PED). In 2020, an Engineering Documentation Report (EDR) provided the technical basis for modifications necessary to the Authorized Project. Subsequent analysis found that the modifications in the 2020 EDR were not cost effective and lacked the economic justification necessary for continued federal involvement. Acknowledging the need to reduce the risk to life, safety, and economic damages from flooding throughout the Ala Wai watershed, USACE, Pittsburgh District, is currently reevaluating the previously completed Ala Wai Canal Flood Risk Management Study in a GRR, using current planning criteria and policies.

c. General Description

The proposed project is Alternative 5.3 which focuses on increasing storage and conveyance of stormwater throughout the Ala Wai watershed to reduce flood risk. The proposed project includes the following measures:

Woodlawn Drive Floodwall and Koali Road Floodwall - Within Manoa Valley, a floodwall extending six feet above ground level (i.e., Woodlawn Drive Floodwall) would be constructed along the right descending bank of Manoa Stream. The floodwall would be approximately 1,270 feet in length. A single road closure structure at Woodlawn Drive would be constructed. The Woodlawn Drive Floodwall would reduce the risk of flooding to the University of Hawaii and downstream residential structures due to overtopping at Woodlawn Drive Bridge. At Koali Road, near the convergence of Manoa and Palolo streams, a floodwall extending 6 ft above ground (i.e., Koali Road floodwall) would be constructed along the left descending bank of Manoa Stream and the right descending bank of Palolo Stream. The floodwall would be approximately 2,510 feet in length. Two concrete drainage structures would be constructed to provide interior drainage of stormwater flows from the residential neighborhood behind the Koali Road floodwall. Two flap gates would be retrofitted on smaller stormwater culverts along this feature. Two road closure structures would be constructed — one at Koali Road and one at the pedestrian bridge crossing Palolo upstream (approximately 690 ft upstream of Koali Road Bridge) — to bridge the gap between the floodwall as it crosses these two throughways. The purpose of the Koali Road Floodwall is to reduce risk to adjacent residential structures, including induced damages caused by the Woodlawn Drive Floodwall. Thus, the Woodlawn Drive Floodwall and Koali Road

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Floodwall function as a system.

Kaimuki High School Floodwall - At the Kaimuki High School, adjacent to the Manoa-Palolo Canal, a floodwall extending six feet above ground (i.e., Kaimuki High School Floodwall [extension of Ala Wai Canal Floodwall]) would be constructed along the Kaimuki High School's track field and extending down to the vicinity of the Kaimuki High School's discus and shot put throwing area. The floodwall would be approximately 3,260 feet long and would be constructed of a combination of steel sheetpile (1,460 feet) and macropiles (1,800 feet) with a concrete fascia. The Alternative 5.3 Kaimuki High School Floodwall would be shorter in length than the Kaimuki High School Floodwall described under Alternative 1 and Alternative 2B. Like Alternative 2B, though, the Kaimuki High School Floodwall would join up with the Ala Wai Canal Floodwall discussed below. The purpose of the floodwall would be to reduce the risk of flooding to residential structures east/southeast of Kaimuki High School.

Ala Wai Golf Course Detention Basin – At Ala Wai Golf Course, adjacent to the Manoa-Palolo Canal and the Ala Wai Canal, an earthen levee approximately six to nine feet in height would be constructed around the perimeter of Ala Wai Golf Course to create a detention basin (i.e., Ala Wai Golf Course Detention Basin). The total length of the earthen levee would be approximately 8,315 feet in length and would extend along the perimeter of the Ala Wai Golf Course along the Manoa-Palolo and Ala Wai canals. On the left descending bank of the Manoa-Palolo Canal, there is an overtopping spillway section, approximately 100 feet in length, that is reinforced with erosion protection. The levee along the Manoa-Palolo Canal is also lined with erosion protection on the canal-side. A portion of the existing drainage ditch that runs along the north side of the golf course (parallel to Date Street) would be riprapped and used as an inlet location for overflow into the Ala Wai Golf Course Detention Basin. A small inlet channel would be excavated and lined with erosion control material to improve the flow onto the golf course. Three concrete drainage structures and three flap gates would be constructed along the levee alignment of the Ala Wai Golf Course to allow collected stormwater within the basin and from local runoff to slowly drain into Ala Wai Canal. The three drainage structures would be approximately 3 feet (Width) x 3 feet (Height) and would be located at the downstream end of three existing natural drainages along the southwest side of the golf course (west of the Ala Wai Golf Course Clubhouse). The detention basin also includes a floodwall along the golf course parking lot near the Ala Wai Canal, which is nine feet in height. The floodwall has one concrete drainage structure and two flap gates. The drainage structure at this location serves to outlet flow from the Diamond Head neighborhood. The original outlet will be enclosed by concrete (instead of daylighted) and will need reconstruction of the vehicle and pedestrian access at this location. A small section of floodwall near the Kapahulu Avenue and Ala Wai Boulevard intersection at the Diamond Head end of the canal will tie-in to the golf course levee and Ala Wai Canal floodwall system. This section is 6 ft in height and includes one road closure structure and one drainage structure. Finally, there is one canoe access point in this location. One road closure structure would also be constructed at the Ala Wai Golf Course Maintenance Facility driveway. The Ala Wai Golf Course Detention Basin would reduce the risk of flooding within the lower watershed.

Ala Wai Canal Floodwall - At the Manoa-Palolo Canal and Ala Wai Canal, a floodwall extending six feet above ground (i.e., Ala Wai Canal Floodwall) would be constructed. The floodwall would be approximately 22,852 feet long and would be constructed of a combination of J-wall on macropiles (17,125 feet), L-wall on macropiles (4,069 feet), and tieback I-wall (1,658 feet) with a lava rock fascia. Existing stormwater sewers inletting into the Ala Wai Canal would be modified so that fourteen would be drainage structures and 59 would be retrofitted with flap gates. Eleven road closure structures would be constructed: (1) King Street (Manoa-Palolo Canal right

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

descending bank), (2) King Street (Manoa-Palolo Canal left descending bank), (3) Kapiolani Boulevard (Manoa-Palolo Canal right descending bank), (4) Kapiolani Boulevard (Manoa-Palolo Canal left descending bank), (5) Date Street (near the Date Street and Laau Street junction), (6) Date Street (near the vicinity of the Kaimuki High School's discus and shot put throwing area, (7) Ala Wai Golf Course Drive, (8) McCully Street (Ala Wai Canal right descending bank), (9) McCully Street (Ala Wai Canal left descending bank), (10) Kalakaua Avenue (Ala Wai Canal right descending bank), and (11) Kalakaua Avenue (Ala Wai Canal left descending bank). The typical cross section of this feature varies along the alignment, but all are assumed to be 6 ft above ground. The floodwall along the Ala Wai Canal and the lower right descending bank of the Manoa-Palolo Canal will include an elevated walking path. On the left descending bank of the Manoa-Palolo Canal and near Kaimuki High School, there will be a floodwall on macropiles with no walking path. Where space is constricted, along the upper right descending bank of the Manoa-Palolo Canal, tieback I-walls will be constructed, with no walking path. The purpose of the Ala Wai Canal Floodwall system would be to reduce the risk of flooding within the McCully-Moiliili neighborhood, Diamond Head neighborhood, and Waikiki.

Mitigation Measures – Mitigation measures related to induced flooding include potentially adding permanent pump station(s) of moderate to large size, ranging from 500 to 20,000 cubic feet per second (cfs). At the time of compiling this Draft Report, it is unknown as to the number of pumps that may be necessary to minimize induced flooding, the size of the pumps, or the location of pumps within the watershed. If Alternative 5.3 moves forward, additional analysis would be conducted during the PED phase to determine the above as well as if a pump station is even necessary, and appropriate supplemental National Environmental Policy Act (NEPA) analysis and coordination would be conducted as necessary. In addition to considering pumps as potential mitigation for induced flooding within the watershed, nonstructural measures such as dry/wet floodproofing, elevation, and acquisition are also under consideration. Similar to the above, if Alternative 5.3 moves forward, additional analysis would be conducted during PED to determine the precise number and location of structures recommended for dry/wet floodproofing, elevation, or acquisition. Appropriate supplemental NEPA analysis and coordination would be conducted as necessary.

Table 1: Proposed Project Features Summary

Measure	Structure Type[1]	Maximum Wall Height	Total Wall Length	Number of Road Closures	Number of Drainage Structures[1]	Number of Flapgates[2]
Woodlawn Drive Floodwall	L-wall on Macropiles	6 ft	1,270 ft	1	--	--
Koali Road Floodwall	L-wall on Macropiles	6 ft	2,510 ft	2	2	2
Ala Wai Golf Course Detention Basin	Berm (8,315 ft) L-wall on Macropiles[3] (1,861 ft)	6-9 ft	10,176 ft	1	5	5
Ala Wai Canal Floodwall[4]	J-wall on Macropiles[3] (17,125 ft)	6 ft	22,852 ft	11	14	59

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Measure	Structure Type[1]	Maximum Wall Height	Total Wall Length	Number of Road Closures	Number of Drainage Structures[1]	Number of Flapgates[2]
	L-wall on Macropiles[3] (4,069 ft) Tieback I-Wall[3] (1,658 ft)					

[1] Berms assumed to be 6-9 ft tall and have side slopes of 3Horizontal (H):1Vertical (V) with a 12-foot crown.
L-walls along the Ala Wai Canal assumed to be 6 feet tall with a 12-foot-wide X 40-inch-thick base supported on 16-inch diameter X 40 feet long cased macropiles with a 14-inch outer diameter X ½-inch thick full-length permanent casing and a full-length No. 11 all-thread center bar. The macropiles to be in two rows with 5-foot on-center spacing, with the first row vertical and the second row battered at 3V:1H.
L-walls at the Golf Course assumed to be 9 feet tall with a 13-foot-wide X 44-inch-thick base supported on 18-inch diameter by 50 feet long cased macropiles with a 18-inch outer diameter X ½-inch thick full length permanent casing and a full-length No. 11 all-thread center bar. The macropiles to be in two rows with 5-foot on-center spacing, with the first row vertical and the second row battered at 6V:1H.
J-wall assumed to be the same design as 6-foot L-walls (i.e., same width, macropiles configuration, etc.), except the wall will include a 3-foot-tall concrete wall on the heel, with the 3-foot-deep area created between the front and rear walls backfilled with soil to create an elevated walkway along the Ala Wai Canal.
Tieback I-wall assumed to be toed into rock or extended 15 feet below the stream level with PZ30 sheet piles and 50-foot-long angled ties at 7 feet on-center with a continuous HP12X53 waler located 6 feet below the streambank crest.
[2] Indicates the number of assumed outlet structures. It is assumed that existing storm drains larger than 36 inches will require a drainage structure (and positive closure). Smaller sizes may require drainage structures during future design phases.
[3] J-wall on macropiles assumed to be used along the Ala Wai Canal only. L-wall on macropiles assumed to be used adjacent to streams where visibility of the canal is not a major consideration and where erosion is more of a concern, while the I-wall assumed to be used in areas away from streams where there is flat ground and erosion is not a concern; however, there are no I-walls in the proposed project. The Tieback I-wall will be used where space limitations and vibrations are major considerations and prevent the use of the other wall types (i.e., specifically planned on the Manoa-Palolo Stream from Date Street to Kapiolani Boulevard).
[4] The floodwall around the canal also accounts for four canoe closure structures.

Future Operation, Maintenance, Repair, Replacement, and Rehabilitation

Maintenance, including routine inspections and minor repairs of the project and its associated features, would be required after construction is completed. The following activities may occur:

- Routine and special inspection with pickup trucks and sport utility vehicles, as needed, and up to daily during flood events.
- Vegetation management where floodwalls and earthen berms are located. Vegetation management in the areas with floodwalls would be in accordance with Corps of Engineers Engineering Pamphlet 1110-2-18; at a minimum 15-feet down slope of the floodwall would need to be a vegetation free zone (VFZ). The VFZ applies to all vegetation except for grasses for the purpose of erosion control.
- Periodic clearing of debris around inlet/outlet structures.
- Periodic clearing of accumulated sediment and debris from detention basin.
- Periodic vegetation management such as weeding, herbicide application, and re-seeding.
- Periodic graffiti removal and vandalization repair.

Rarely, following large and erosive flood flows, larger-scale maintenance and repairs may be required, which could require access and use of heavy equipment within the floodplain adjacent to the project feature. A temporary work area may need to be established around a repair site. The local sponsor would be required to obtain emergency or standard permits from regulatory agencies, including Corps Regulatory, who would coordinate and consult, if needed, with the U.S. Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS). These

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

permits would likely require active habitat restoration of temporary construction and access roads. It is likely that a storm event large enough to damage the detention basins and/or floodwalls would also have removed vegetation in the immediate area, but specific impacts cannot be evaluated until or unless damage occurs, and repair work is defined.

d. Authority and Purpose

The project is authorized under Section 209 of the Flood Control Act of 1962. Section 209 is a general authority that authorizes surveys in harbors and rivers in Hawaii "with a view to determining the advisability of improvements in the interest of navigation, flood control, hydroelectric power development, water supply, and other beneficial water uses, and related land resources."

The purpose of the project is to analyze a series of alternatives designed to reduce the on-going flood risks throughout the Ala Wai watershed. The project is needed because a high level of flood risk exists within the Ala Wai Watershed. Extensive urban development throughout the watershed, coupled with the basin's unique topography and hydrology (i.e., steep mountainous terrain and propensity for intense rainfall events within the headwaters) and aging and undersized infrastructure result in elevated flood risk for a large proportion of the population both along the Ala Wai Canal and within the Makiki, Manoa, and Palolo valleys. The population density within the Ala Wai watershed, with approximately 200,000 residents. The watershed also contains the University of Hawaii and the Wakiki District—a prime tourist destination that attracts more than 79,000 visitors per day and accounts for approximately 8% of the gross state product and 11% of all civilian jobs in the state.

It is estimated that the Ala Wai Canal has the capacity to contain about a 20% annual exceedance probability (AEP) flood event. Overtopping of the Canal has previously flooded Wakiki multiple times, including November 1965 and December 1967 storms and during the passage of Hurricane Iniki in 1992. Upstream areas are also at risk of flooding, as demonstrated by several recent events, including the October 2004 storm that flooded the Manoa Valley and the March 2006 storm that flooded Makiki. The October 2004 event was estimated to have a 4% AEP and caused more than $85 million in damages.

e. General Description of Dredged of Fill Material

(1) General Characteristics of Material

The exact specifications of the materials have not yet been determined. In general, the materials would be obtained from existing sources. Stone for the riprap would be durable material free from cracks, seams and other defects that would tend to increase deterioration from natural causes. Rip-rap stone used for scour protection would have a mean diameter of 2.2 feet. Fill material would consist of soil and stones less than 3-inches in diameter; concrete would be a 4000 pounds per square inch (psi) standard mix. Base course material would consist of clean gravel. Box culverts would be used for inlet and outlets for detention basins; the size of these would vary. Culverts and storm sewers would be either concrete or corrugated steel; the size of these would vary.

(2) Quantity of Material

Table 2, Table 3, Table 4, and Table 5 lists the type and quantities of fill material specific to each measure. These quantities are based on the 35% level of design and will be revisited and modified as needed during the detailed design phase. Specific to operations and maintenance (O&M), no placement of fill material is anticipated. O&M activities would require work within the ordinary high water mark (OHWM); however, these activities would generally

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

be limited to trimming/clearing vegetation around the perimeter of the berms, floodwalls, and detention basin. Accumulated sediment and debris would also be removed from the Ala Wai Golf Course detention basin as necessary; the Golf Course is not within the OHWM.

(3) Source Material

The exact source of the material has yet to be determined. However, all fill material would be obtained from a certified pit/quarry or other approved source and will be free of contaminants. All stone and rock would be clean and reasonably free from soil, quarry fines, and would contain no refuse. Concrete and steel would be standard, commercially purchased materials. There is no dredging planned, nor use of dredged materials. Any excavated soil would meet clean fill requirements for reuse within the project site.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

f. Description of the Proposed Discharge Site(s)

(1) Location

The proposed measures would be located within and along the various waterways within the Ala Wai watershed; these include Manoa and Palolo Streams and the Ala Wai Canal. Proposed mitigation measures, structural and nonstructural could occur along Manoa, Palolo, Makiki, and the Ala Wai Canal. Each measure is briefly described above. The following maps (Figure 2, Figure 3, and Figure 4) show the general locations of project features at this phase of feasibility, including construction footprints, staging areas, and access.

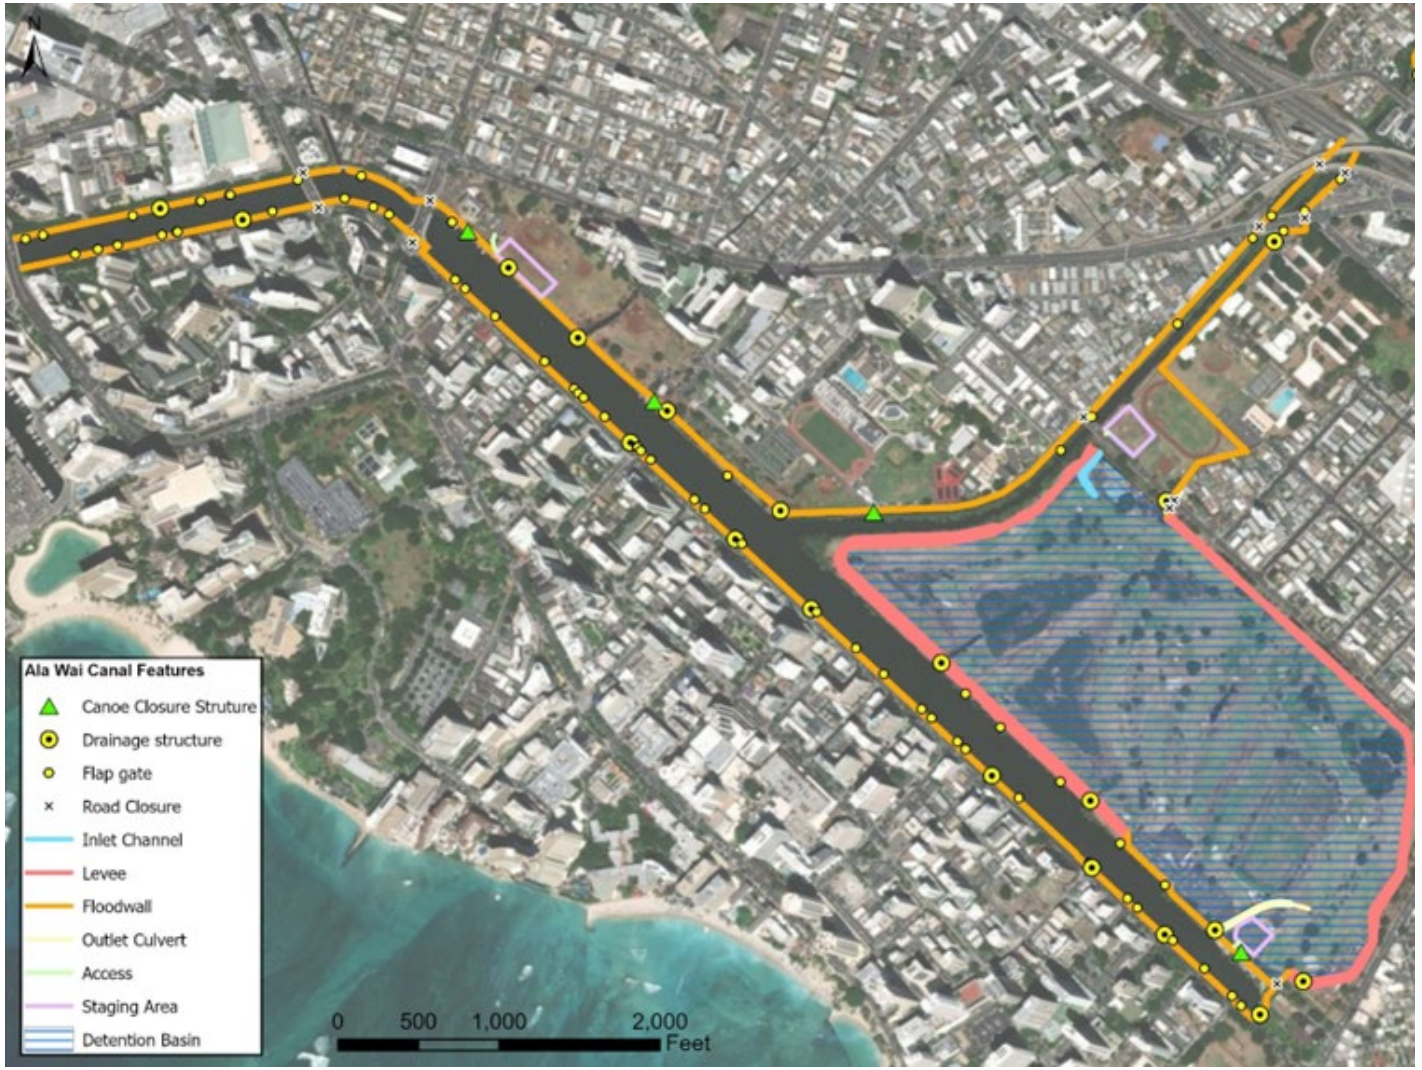

Figure 4: Ala Wai Canal Floodwall and Ala Wai Golf Course Detention Basin Proposed Project Footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

(2) Size

The amount of area within which fill material would be discharged varies by measure. The length of channel that would be within the footprint of each permanent structure (i.e., the areas that would be subject to placement of fill), as well as the length of channel within the overall construction limits for each measure is summarized in Table 6. (It is noted that much of the floodwall construction will be adjacent to the waterways but will not include work within the OHWM. Drainage structures will involve work within the OHWM.)

[1] Disturbance to stream is due to the placement of a temporary rock bench for construction of floodwall.
[2] Fill is a temporary rock bench for construction of floodwall along the right descending bank of the Manoa-Palolo Canal. Fill would be removed once construction of the wall is complete.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

(3) Type of Habitat

Streams in the Ala Wai watershed arise on the southern slopes of the Koolau range. Manoa and Palolo valleys contain the two major streams draining to the Ala Wai Canal, with Manoa Stream consisting of a complex radial set of six tributaries in its upper reaches. Makiki Stream also flows to the Ala Wai Canal, but drains a much smaller area, with at least one of its four tributaries (Kanaha Stream) flowing only intermittently (Englund and Arakaki, 2004). A formal jurisdictional determination of Waters of the U.S. has not yet been completed for the project area; however, all the streams and canals in the watershed are assumed to be Waters of the U.S. (AECOS, 2014). Jurisdictional wetlands are not expected to be present outside the defined channel limits. This information will be verified during the next phase of the project through a formal jurisdictional determination in accordance with the new Clean Water Rule: Definition of "Waters of the United States" (33 CFR Part 328).

Each stream generally consists of an upper, middle, and lower reach that flow to an estuarine reach and then to the Ala Wai Canal, before discharging to the ocean. In this context, upper reaches are the tributary streams with youthful profiles (steep, relatively straight courses in down-cutting channels). Middle reaches have more mature profiles, slightly meandering and eroding mostly laterally. Lower reaches flow across the coastal plain and are typified by sediment accumulation. The estuarine reaches are those in which sea water and freshwater mix, typically along a gradient of increasing salinity seaward.

Riparian vegetation is present along all of the upper stream reaches, and is generally dominated by non-native species (many of which are considered invasive), including large trees such as Chinese banyan, *kukui* (*Aleurites moluccana*), mango, octopus tree, *hau* (*Hibiscus tiliaceus*), fiddlewood (*Citharexylum spinosum*), mountain apple (*Syzygium malaccense*), gunpowder tree (*Trema orientalis*), and gum (*Eucalyptus* sp.), as well as smaller herbaceous species such as exotic ginger (*Hedychium* sp.) and Job's tears (*Coix lachryma-jobi*) (Kido, 2006; Kido, 2007; Kido, 2008; Oceanit, 2004).

Within the urbanized portion of the watershed, riparian vegetation is generally limited to unchannelized stream reaches, such as along portions of Manoa Stream (for example, near the Dole Street Bridge). A majority of Palolo and Makiki streams are channelized and lack a riparian zone (Oceanit, 2004; Englund and Arakaki, 2004; Kido, 2008). Mangrove trees (*Rhizophora mangle*) are present in some areas in the lower estuarine reaches of the Manoa–Palolo Drainage Canal and the Ala Wai Canal, although concrete and concrete masonry (CRM) walls constructed as banks have eliminated much of the riparian vegetation.

(4) Timing and Duration of Discharge

Subject to approvals and appropriation of funds, construction would begin in the year 2027. In total, construction is expected to last approximately 4 years; it is expected that construction of individual measures will require on the order of 6 to 12 months each.

g. Description of Placement Method

In general, all material would be moved and placed mechanically. Cranes, backhoes, scrapers, dump trucks and other appropriate heavy machinery would be used to deliver and place fill materials during construction. Materials would be placed in a manner that minimizes disturbance of the aquatic environment. Riprap would generally be placed in a systematic manner to ensure a continuous uniform layer of well-graded stone. Concrete for footings would be placed using pumps into wooden formwork.

Concrete for riprap may be placed using pumps or by hand. Piles would be pounded using a large

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

crane. For the Tieback I-wall construction, a temporary stone bench would be constructed within the channel for equipment access. Stone would be clean quarried materials free from contamination and would be placed using a crane. Post construction, stone would be removed, and the stream would be restored to the pre-construction condition.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

SECTION 2 - FACTUAL DETERMINATIONS

The purpose of the Section(b)(1) Guidelines is to restore and maintain the chemical, physical, and biological integrity of the waters of the U.S. through the control of discharges of dredged or fill material. Except as provided under the Clean Water Act Section 404(b)(2), no discharge of dredged or fill material will be authorized if there were a practicable alternative to the proposed discharge that would have less adverse impact on the aquatic ecosystem, as long as the alternative does not have other significant adverse environmental consequences. In accordance with the Section 404(b)(1) Guidelines, the potential short-term or long-term effects of a proposed discharge of dredged or fill material on the physical, chemical, and biological components of the aquatic environment must be determined.

The following discussion evaluates impacts of the proposed project on environmental resources identified in Subpart C through Subpart F of the Section 404(b)(1) Guidelines.

a. Physical Substrate Determinations

(1) Substrate Elevation and Slope

In general, the proposed measures are designed to conform to the existing elevation and slope of the stream channel/canal, as further described below.

Placement of fill material as part of the proposed project could alter substrate elevations and slopes but this would primarily be where inlet and outlet structures are located. The exception is the placement of a rock bench within the Manoa-Palolo Canal to construct the Tieback I-wall on the right-descending bank of the channel. The rock bench would be approximately 15-feet wide and would run parallel to the channel bank. The rock bench would temporarily alter substrate elevation and slope within this area of the Manoa-Palolo Canal, however, once construction of the Tieback I-wall is complete, the rock bench would be completely removed. Similarly, temporary cofferdams may need to be placed in areas where inlet and outlet discharge structures are being constructed and/or modified as part of the project. The placement of fill for the cofferdams would also temporarily alter substrate elevation and slope within these localized areas, however, once construction/modification of drainage structures is complete, the cofferdam fill would be completely removed, and the substrate elevation and slope would be returned to the existing condition. Based on the minimal degree of change in channel substrate elevation and slope, there are not expected to be significant changes in substrate elevation and slope because of the proposed project.

(2) Substrate Type

The existing substrate in stream channel within the Ala Wai watershed includes a gradation of materials, with a mixed size of rock and varying levels of sediment. The substrate in the upper reaches of the watershed is typically comprised of large boulders and cobbles, and the middle reaches incorporate a mixed substrate, with a larger percentage of medium-sized substrate. The lower reaches of the watershed, including, the Ala Wai Canal, include a large component of sediment and other fine particulates. The proposed project would have no substantial adverse effect on substrate types within the adjacent waterways. Only minor amounts of riprap would need to be placed around inlet/outlet drainage structures to prevent scouring and erosion of the structures. The exception is the placement of a temporary rock bench within the Manoa-Palolo Canal to construct the Tieback I-wall on the right-descending bank of the channel. The rock bench would be approximately 15 feet wide and would run parallel to the channel bank. The rock bench would temporarily alter substrate type where it is located, however, once construction of the Tieback I-wall is complete, the rock bench would be

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

completely removed. Similarly, temporary cofferdams may need to be placed in areas where inlet/outlet discharge structures are being constructed and/or modified as part of the project. The placement of fill material for the cofferdams would also temporarily alter substrate type within these localized areas, however, once construction/modification of drainage structures is complete, the cofferdam fill would be completely removed, and the substrate elevation and slope would be returned to the existing condition. Based on the minimal degree of permanent changes in substrate type, there are not expected to be any significant changes to substrate type because of the proposed project.

(3) Dredged/Fill Material Movement

There is no plan to dredge sediment during construction. Riprap fill material used around inlet/outlet drainage structures would be sized appropriately to ensure no material movement, especially since the material is needed to prevent scour and erosion around the inlet/outlet drainage structures. Best management practices (BMPs) would also be implemented to reduce the potential for erosion and sedimentation during construction. Similarly, the temporary rock bench placed within the Manoa-Palolo Canal would be sized appropriately to ensure that movement of the fill material comprising the rock bench does not occur. Likewise, fill material used for temporary cofferdams would also be sized appropriately to ensure movement of the material does not occur while construction is occurring. Once construction is complete, the rock bench and cofferdam fill material would be permanently removed from the waterways. Based on the minimal amount of permanent fill and fill being sized appropriately to prevent movement, fill material is not expected to move within the waterways.

(4) Physical Effects on Benthos

Since there is no major work (dredging for example) proposed for the stream channel, there is expected to be minimal impact on benthic organisms. Small areas of disturbance, for example at drainage structures, will result in minor localized impacts. Placement of the temporary rock bench for construction of the Tieback I-wall along the right descending bank of the Manoa-Palolo Canal would be expected to destroy benthic habitat and organisms under the bench area. Similarly, the placement of temporary fill for cofferdams needed to construct/modify drainage structures would also destroy benthic habitat and organisms where it is placed. While it is possible these temporary structures could be colonized by benthic organisms, depending on the time they are needed for construction, any colonies established on the temporary structures would also be destroyed when the temporary fill is removed permanently from the waterways. However, once the temporary fill material is removed, it is anticipated that nearby adjacent benthic communities would be able to recolonize these areas and benthic habitat would ultimately be established. Overall, no detrimental loss of benthic organisms in the short-term or long-term is anticipated.

(5) Other Effects

Construction of the proposed project could cause water quality impacts if best management practices, including erosion control and stormwater pollution prevention practices, are not followed. Any environmental impacts caused by the short-term increases in suspended solids due to construction activities are anticipated to be temporary and minimal; the use of best management practices as a proactive approach is recommended.

(6) Actions Taken to Minimize Impacts

Efforts to minimize stream-related impacts on the physical substrate include the use of approved construction procedures, in compliance with Federal and State requirements, as well as implementation of BMPs. These include:

- Work along the banks of the stream channels would be limited to periods of low flow, with proper diversion/ dewatering techniques, as appropriate.
- Construction activities would be sequenced to limit the extent of exposed soil at any given time.
- Erosion prevention and sedimentation control measures would be implemented and maintained for the duration of construction, including for staging and storage areas.
- Dirt stockpile areas containing more than 100 cubic yards of material would be covered or kept wet.
- All fill materials would be acquired from approved sources and will be free of contaminants.
- Appropriate vehicles and equipment would be utilized for all stages of construction, and construction crews would be adequately trained to avoid and minimize impacts to the aquatic environment.
- Good housekeeping, such as the use of tire brushes and silt fencing, will be used to limit soil tracking and erosion.

b. Water Circulation, Fluctuation, and Salinity Determinations

(1) Water Chemistry

The use of clean fill material (such as clean rock for riprap) would preclude any significant impacts on water chemistry because of the proposed bank work. Minor, short-term decreases in water clarity could occur during construction, but are not expected to occur long-term. No significant impacts on water color, odor, taste, dissolved oxygen levels, temperature or nutrient levels are anticipated.

(a) Salinity

The proposed project is not expected to have a direct impact on salinity due to the placement of fill material. The operation of the proposed project could introduce freshwater into the adjacent marine environment faster during a storm event than it would under the existing condition. However, the total discharge is not expected to be significantly different coming out of the Ala Wai Canal between the Future Without Project Condition and the Future with Project Condition. Overall, no significant adverse impacts to salinity concentrations are anticipated.

(b) Water Chemistry

Temporary and permanent fill material would be new, inert materials such as rock and concrete. Short-term effects on water quality are expected because of the temporary increase in the concentration of suspended solids and turbidity following the placement of riprap during construction of inlet/outlet drainage structures, placement of temporarily fill for the rock bench, and placement of temporarily fill for cofferdams. The potential temporary increase of suspended solids is expected to cause short-term decreases in water clarity and minor changes to the color of the water, particularly if erosion controls are not used. There would also be expected to be a temporary increase in the concentration of suspended solids and turbidity with the removal of the temporary rock bench and cofferdams fill material. Overall, the long-term water chemistry of the waterways should not be impacted by construction of the project.

(c) Clarity

Temporary and permanent fill material would be new, inert materials such as rock and

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

concrete. Short-term effects on water clarity are expected because of the temporary increase in the concentration of suspended solids and turbidity following the placement of riprap during construction of inlet/outlet drainage structures, placement of temporarily fill for the rock bench, and placement of temporarily fill for cofferdams. The potential temporary increase of suspended solids is expected to cause short-term decreases in water clarity and minor changes to the color of the water, particularly if erosion controls are not used. There would also be expected to be temporary increase in the concentration of suspended solids and turbidity with the removal of the temporary rock bench and cofferdams fill material. Overall, the long-term water clarity of the waterways should not be impacted by construction of the project.

(d) Color

The proposed project is not anticipated to cause any considerable long-term effects or changes to water color, but a temporary increase of suspended solids during construction could cause short-term minor changes to the color of water. The temporary increase of suspended solids during construction would occur from the placement of riprap during construction of inlet/outlet drainage structures, placement of temporary fill for a rock bench, and placement of temporary fill for cofferdams. The potential temporary increase in suspended solids would be expected to cause a short-term minor impact on water color, particularly if erosion controls are not used. There would also be expected to be temporary increase in the concentration of suspended solids and turbidity with the removal of the temporary rock bench and cofferdams once construction is complete. Overall, the long-term color of water within the waterways should not be impacted by construction.

(e) Odor

The proposed project is not anticipated to cause any considerable long-term effects on, or changes to, the odor of water within the waterways. Minor excavation required for the construction of inlet/outlet drainage structures would be stockpiled before proper disposal on site and could cause temporary upland odor impacts due to the anaerobic nature of most sediment. These odors would dissipate over a relatively short time as the substrate dries and is slowly hauled off to an approved disposal site.

(f) Taste

The proposed project would not be anticipated to cause any short-term or long-term effects on, or changes to, the tase of water. Surface water in the Ala Wai watershed is not used as a drinking water source.

(g) Dissolved Gas Levels

The proposed project is not anticipated to alter dissolved gas levels in the adjacent waterways in the short-term or long-term.

(h) Nutrients

Temporary increases of turbidity during construction could produce minor, localized effects on nutrient levels in the water column. Turbidity would primarily be a result of the placement of riprap during construction of inlet/outlet drainage structures, placement of temporary fill for a rock bench, and placement of temporary fill for cofferdams. Overall, the proposed project is not expected to increase nutrient levels of adjacent waterways.

(i) Eutrophication

Eutrophication is typically caused by excessive nutrient levels. As discussed above, the

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

proposed project could produce minor, localized effects on nutrient levels in the water column during construction, but these effects are expected to be short-term and minor aesthetic impacts. Overall, the proposed project is not expected to increase eutrophication of the adjacent waterways.

(j) Others as Appropriate

No other impacts were identified.

(2) Current Patterns and Circulation, Current Flow, and Water Circulation

(a) Current Patterns and Flow

None of the measures involve placement of fill materials that would substantially modify the existing flow patterns under normal flow conditions. During construction, a temporary rock bench would be placed along the right-descending bank of the Manoa-Palolo Canal as a work area for construction the Tieback I-wall in this location. The rock bench would run parallel to the channel bank and would not completely cut off flow in the area it is placed, however, the channel would be constricted due to the rock bench which in turn could have some effects on currents upstream and downstream of the rock bench as well as a temporary increase flow in the constriction area (less than 1700 ft total length of construction area). Once construction of the floodwall is complete, the rock bench would be permanently removed, and the full width of the channel would be restored. Similarly, temporary cofferdams would be used in areas where inlet/outlet drainage structures are being constructed as well as in areas where existing drainage structures are being modified. The cofferdams would not completely restrict flow, as flow would be able to continue around them. The cofferdams would also be sized to occupy the least amount of area possible, but still allow construction. Once construction/modification of the drainage structures are complete, the fill materials for the cofferdams would be permanently removed.

Some aspects of the proposed project could temporarily alter flow patterns during high flow events. The Ala Wai Detention Basin is located upland but adjacent to the Ala Wai Canal and Manoa-Palolo Canal. The detention basin would include an inlet and outlets along the waterway banks to divert stream flows during flood conditions. The inlet would not affect flow patterns or current patterns during normal stream flows. During flood flows, the detention basin would temporarily fill with stream flows, which would then be returned to the Ala Wai Canal over time as canal flows reduce. As this feature is located off-channel and would serve to reduce peak flow volumes on an infrequent basis, it is not expected to affect flow patterns in a manner that would substantially affect stream characteristics. Floodwalls would be located on upland areas near the waterways. The floodwalls would have no impact on normal flows. The floodwalls would contain floodwaters within the channel during high flow conditions, but these conditions would only occur on an infrequent basis and for a short duration (e.g., less than 12 hours for a 1% AEP event). Potential mitigation measures for induced flooding include a pump station constructed along Makiki Stream. Although the precise location is unknown still, it would be generally located between Fern Street and the confluence of Makiki Stream with the Ala Wai Canal. The pump station would collect stormwater during a flood event and pump it over and/or under a nearby floodwall. This could affect flow as the water is being pumped into the receiving waterway, however, the pump station would only be operational during a flood event during which the flood waters would also be impacting flow. Overall, the proposed project is not expected to substantially alter current patterns or flow.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

(b) Velocity

Velocities in the waterways during storm events can vary depending on location and severity of the storm event. Measures that involve placement of fill materials are not expected to substantially modify the existing velocities under normal flow conditions. During construction, a temporary rock bench would be placed along the right-descending bank of the Manoa-Palolo Canal as a work area for construction of the Tieback I-wall. The rock bench would run parallel to the channel bank and would not completely cut off flow since it will only be partial channel width, however, the channel would be constricted due to the rock bench which in turn would likely increase flow velocity of surface water traveling through the reach. Once construction of the floodwall is complete, the rock bench would be permanently removed, and the full width of the channel would be restored. Temporary cofferdams would also be used in areas where inlet/outlet drainage structures are being constructed as well as in areas where existing drainage structures are being modified. The cofferdams would be sized to occupy the least amount of area possible, but still allow construction; therefore, they are not anticipated to have a substantial affect on surface water velocity while they are in place. Once construction/modification of the drainage structures are complete, the fill materials for the cofferdams would be permanently removed.

Floodwalls, especially those along the Ala Wai Canal, would contain floodwaters within the channel during high flow conditions, which is likely to cause an increase in surface water velocity. However, a change in surface water velocity would be experienced under existing conditions when a storm event occurs currently. It is expected, though, that velocities with the floodwalls present would be slightly higher than those observed under the existing condition during a storm event. Overall, though, the proposed project is not expected to substantially alter surface water velocity.

(c) Stratification

The waterways comprising the Ala Wai watershed are unlikely to be deep enough to allow for stratification. Therefore, due to the lack of stratification occurring during the current condition, the proposed project is not anticipated to have any adverse effect to thermal stratification in the short-term or long-term.

(d) Hydrologic Regime

Flows within the various waterways can be variable, with the highest flows typically occurring during the rainy season (November – April). The proposed project does include features that would alter the hydrologic regime, but only during storm events. During normal flows, the flood risk features would have no effect on the hydrologic regime.

(3) Normal Water Level Fluctuations

In general, the proposed project is designed to maintain the normal flow regime, such that typical water level fluctuations would not be affected. However, during flood flows, the Ala Wai Golf Course detention basin is intended to retain water, resulting in areas of inundation within the detention basin berms. However, these conditions would only occur on an infrequent basis and for a short duration (e.g., less than 12 hours for a 1% AEP event), such that no substantial changes are anticipated relative to the stream characteristics and values.

(4) Salinity Gradients

The proposed projects features are mostly located in areas that are not tidally influenced. The only measures that would be in areas subject to salinity gradients are the Ala Wai Golf Course Detention Basin and the Ala Wai Canal floodwall. However, implementation of these

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

measures would not divert or restrict flows in a manner that would affect the salinity gradients. The Ala Wai Golf Course Detention Basin would only divert flood flows that exceed the 20% AEP storm event and flows would return to the Ala Wai Canal as the flood waters subside (estimated to occur within less than 12 hours). The Ala Wai Canal floodwall will retain flows within the channel during high flow periods (estimated to occur for a duration of less than 12 hours) such that there will be only short-term impacts on any salinity gradients.

(5) Actions Taken to Minimize Impact

Standard BMPs for erosion control would be implemented, including those listed above (Section II(A)(5)).

c. Suspended Particulate/Turbidity Determinations

(1) Expected Changes in Suspended Particulates and Turbidity Levels in Vicinity of Disposal Site

As previously described, the fill materials to be placed include riprap, which would consist of clean stone and would be adequately stabilized during construction. In general, the size and characteristics of these materials would not substantially contribute to increased turbidity or suspended particulate levels over the long term. However, some degree of increased turbidity and increased concentration of suspended solids may occur during construction of project features. Proper diversion/dewatering techniques and other BMPs would be implemented to avoid and minimize the potential for erosion and sedimentation to the extent possible. As such, these are expected to be temporary impacts, and would be relatively minor and restricted to a localized area. No long-term adverse effects on water quality are expected.

(2) Effects on Chemical and Physical Properties of the Water Column

(a) Light Penetration

Construction of the inlet/outlet drainage structures would require the placement of riprap to prevent scour of the immediate area. In addition, construction of the Tieback I-wall along the right-descending bank of the Manoa-Palolo Canal would require the placement of a temporary rock bench to serve as a work platform. Lastly, the modification of existing drainage structures within the Ala Wai Canal would likely require the placement of temporary cofferdams to allow construction work to occur. The placement of fill material as described above could cause minor, temporary, and localized increases of suspended solids that in turn could cause temporary decreases in the clarity of water and reduce the penetration of light through the water column. If the penetration of light is reduced for an extended period, it can lower the rate of photosynthesis and “primary productivity” of an aquatic area. Primary productivity generally refers to the fixation of solar energy by green plants (i.e., autotrophs) in a terrestrial ecosystem, or phytoplankton for an aquatic c ecosystem. Persistently high turbidity can cause adverse impacts to sight-dependent species because the reduced clarity can hinder the feeding ability of these species, and thereby limit their growth and increase their susceptibility to disease.

Regarding elevated suspended solids concentrations, it explains the following in 40 CFR 230.21:

> “The extent and persistence of these adverse impacts caused by discharges depend upon the relative increase in suspended particulates above the amount

> occurring naturally, the duration of the higher levels, the current patterns, water level, and fluctuations present when such discharges occur, the volume, rate, and duration of the discharge, particulate deposition, and the seasonal timing of the discharge."

Since the placement of permanent fill within the vicinity of a water way is limited to riprap around inlet/outlet drainage structures or concrete weirs and temporary construction features, the proposed project is not expected to cause any long-term adverse impacts to light penetration within the waterways.

(b) Dissolved Oxygen

The proposed project is not anticipated to alter dissolved gas levels in the adjacent waterways in the short-term or long-term.

(c) Toxic Metals and Organics

Sediment-bound pollutants are known to occur throughout the Ala Wai watershed (particularly in the urbanized areas). Construction of the proposed project would involve placement of imported materials (i.e., riprap and concrete), with only minimal amounts of excavation for the construction of new inlet/outlet drainage structures. None of the soils that would be exposed by construction are expected to contain excessive levels of contamination. All fill materials used would be from approved sources and would be clean and free of contaminants. Areas requiring excavation (e.g., inlet and outlet drainage structures and the Ala Wai Golf Course Detention Basin) are located on bank areas above the sediment floor of the canal, such that a significant increase in pollutant delivery to the receiving waterways would be expected because of construction. Any excavated sediment or soil will be tested for proper (upland) disposal.

(d) Pathogens

The drainage area is primarily an urban environment. The sediment and water within the lower reaches of the waterways may reflect the urban area and its potential pathogen sources such as uncontrolled waste disposal (dumping) and urban storm runoff. Since all excavated material will be disposed of upland, any pathogens entrained in the sediment will not be released to the environment. Proposed fill materials will be clean materials that are not anticipated to be a source of pathogens.

(e) Aesthetics

Construction of the proposed project would involve placement of imported materials (i.e., riprap and concrete), with only minimal amounts of excavation for the construction of new inlet/outlet drainage structures. In addition, temporary fill would be placed within the Manoa-Palolo Canal for a rock bench that would be a work area for construction of the Tieback I-wall in this area. Similarly, temporary fill would be placed in the form of a cofferdam around inlet/outlet drainage structures that would be modified as part of the proposed project. The placement of temporary fill and the removal of the temporary fill is likely to cause suspended solids and turbidity. Turbidity created by the temporary placement of fill would be localized and expected to dissipate quickly, although there could be some temporary effects to the aesthetics of the waterways in the vicinity of where temporary fill is placed.

(f) Others as Appropriate

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The proposed project is not expected to cause any other adverse effects on the chemical and physical properties of the water column.

(3) Effects on Biota

(a) Primary Production, Photosynthesis

Construction of the inlet/outlet drainage structures would require the placement of riprap to prevent scour of the immediate area. In addition, construction of the Tieback I-wall along the right-descending bank of the Manoa-Palolo Canal would require the placement of a temporary rock bench to serve as a work platform. Lastly, the modification of existing drainage structures within the Ala Wai Canal would likely require the placement of temporary cofferdams to allow construction work to occur. The placement of fill material as described above could cause minor, temporary, and localized increases of suspended solids that in turn could cause temporary decreases in the clarity of water and reduce the penetration of light through the water column. If the penetration of light is reduced for an extended period, it can lower the rate of photosynthesis and “primary productivity” of an aquatic area. Primary productivity generally refers to the fixation of solar energy by green plants (i.e., autotrophs) in a terrestrial ecosystem, or phytoplankton for an aquatic c ecosystem.

(b) Suspension/Filter Feeders

Construction of the inlet/outlet drainage structures would require the placement of riprap to prevent scour of the immediate area. In addition, construction of the Tieback I-wall along the right-descending bank of the Manoa-Palolo Canal would require the placement of a temporary rock bench to serve as a work platform. Lastly, the modification of existing drainage structures within the Ala Wai Canal would likely require the placement of temporary cofferdams to allow construction work to occur. The placement of fill material as described above could cause minor, temporary, and localized increases of suspended solids that in turn could impact the feeding ability of suspension and filter feeders. This would be expected to only be a minor short-term impact to these species and no different than an increase in suspended solids that is likely experienced during a storm event.

(c) Sight Feeders

Construction of the inlet/outlet drainage structures would require the placement of riprap to prevent scour of the immediate area. In addition, construction of the Tieback I-wall along the right-descending bank of the Manoa-Palolo Canal would require the placement of a temporary rock bench to serve as a work platform. Lastly, the modification of existing drainage structures within the Ala Wai Canal would likely require the placement of temporary cofferdams to allow construction work to occur. The placement of fill material as described above could cause minor, temporary, and localized increases of suspended solids that in turn could cause temporary decreases in the clarity of water and reduce the penetration of light through the water column. Persistently high turbidity can cause adverse impacts to sight-dependent species because the reduced clarity can hinder the feeding ability of these species, and thereby limit their growth and increase their susceptibility to disease. This would be expected to only be a minor short-term impact to these species and no different than an increase in suspended solids that is likely experienced during a storm event.

(4) Action Taken to Minimize Impacts

As required by the Clean Water Act, the project would comply with an NPDES Permit. The NPDES Permit Program regulates storm water and urban runoff discharges from developments to natural and constructed storm drain systems. Since the project would

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

disturb one or more acres of soil, construction activities would be subject to the Construction General Permit. The Construction General Permit requires implementation of a SWPPP for site clearing, grading, and disturbances such as stockpiling or excavation. The SWPPP would generally contain a site map showing the construction perimeter, proposed structures, storm water collection and discharge points, general pre- and post-construction topography, drainage patterns across the site, and adjacent roadways. Appropriate erosion control measures would be incorporated into the SWPPP by the construction contractor to prevent sediment from entering waterways and to minimize temporary turbidity impacts. Examples include, but are not limited to, strawbales/wattles, erosion blankets, silt fencing, silt curtains, mulching, revegetation, and temporary covers.

d. Contaminant Determinations

As previously specified, all materials used for construction would be from approved sources and would be clean and free of contaminants. Previous studies have investigated the extent of pollution in the water column and sediments within the Ala Wai Canal, with a few studies also sampling the main streams in the watershed. In general, these studies have identified the presence of contaminants including bacteria, trace metals, nutrients, pesticides, and toxic organics (Spengler et al., 2019; USGS, 2004). As previously described, the detention basins would function to temporarily hold stream flows, slowly releasing them within the streams and Canal. To the extent that contaminants are present in the detention areas (which may be subject to herbicide applications), detained water could flush contaminants into the streams, thus contributing to degraded water quality conditions. However, the detention features are located within areas that are already subject to flooding, such that the project is not expected to substantially increase delivery of contaminants to the streams beyond that which already occurs. Control of turbidity in discharges will have the effect of controlling contaminants, since pollutants such as pesticides and organics tend to adhere to the sediment particles. As such, the proposed work is not expected to introduce or increase the presence of contaminants into the streams.

(e) Aquatic Ecosystem and Organism Determinations

(1) Effects on Plankton

During construction, an increase in turbidity and suspended solids in the areas associated with the proposed activities might have a short-term localized effect on phytoplankton productivity. It is expected that any potential impacts would be temporary, such that the plankton populations would recover quickly following construction.

(2) Effects on Benthos

Placement of riprap on stream banks may impact benthic communities located within the footprint of each measure. However, it is expected that any affected areas would be small and rapidly colonized, with little to no long-term effects on benthic organisms.

(3) Effects on Nekton

Construction activities are expected to temporarily increase turbidity and suspended solids in localized areas, as well as noise and overall level of habitat disturbance, which could affect the various species present in the streams, including the assemblage of native aquatic species. However, the work area (such as streambanks) for each measure would be dewatered prior to construction if needed, such that fish and other free-moving organisms would be precluded from the temporarily impacted areas. Once stream flows are returned to the work areas, construction-related impacts are expected to rapidly dissipate such that

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

significant effects on nekton are not anticipated.

Measures have been designed to minimize the potential impacts to aquatic habitat and have been designed to maintain passage for native species. The concrete box culverts necessary at some of the detention basins are expected to have an effect on aquatic organisms similar to that of a short stretch of channelized stream. Passage through the culvert may be limited during peak storm flows when the detention basins are inundated, but these conditions would only occur on an infrequent basis and for short duration, such that impacts are expected to be minor. In addition, the mitigation measures focus on removal of existing passage barriers and improved access to high-quality upstream habitat and would serve to mitigate for potential impacts associated with the flood management measures.

(4) Effects on Aquatic Food Web

The proposed fill activities would temporarily disrupt aquatic biota during project construction but are not expected to affect overall productivity of the stream ecosystem within the watershed.

(5) Effects on Special Aquatic Sites

(a) Sanctuaries and Refuges

There are no sanctuaries or refuges located within the project footprint.

(b) Wetlands

A jurisdictional determination has not been conducted for this phase of the project but will be conducted during PED. The U.S. Fish and Wildlife Service's National Wetlands Inventory (NWI) Database was used to query wetlands that have been identified within the project footprint. It is important to note that the NWI Database provides only reconnaissance level information on the location, type, and size of wetland resources. Certain wetland habitats are excluded from the NWI because of limitations of aerial imagery as the primary data source used to detect wetlands. Wetland habitats that are excluded from the NWI include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (e.g., coral or tuberficid worm reefs) have also been excluded from the database.

The only wetland habitat, according to the NWI Database, that would be impacted by the project is located on the Ala Wai Golf Course. Approximately 0.005 acres of freshwater forested/shrub wetland would be permanently filled with a concrete weir that would act as one of the drainage structures for the Ala Wai Golf Course detention basin.

(c) Mud Flats

There is no mud flat habitat located within the project footprint.'

(d) Vegetated Shallows

No vegetated shallows were determined to be present within the project footprint.

(e) Coral Reefs

There are no coral reefs located within the project footprint.

(f) Riffle and Pool Complexes

There are no riffle/pool complexes located within the project footprint.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

(6) Threatened and Endangered Species

An assessment of the federally listed threatened and endangered species that could potentially be affected by the project was conducted, in consultation with the U.S. Fish and Wildlife Service (USFWS). The results of this analysis indicate there are several listed species that the project may affect but is not likely to adversely affect; these are summarized below. Additional detail, including a discussion of the species that are not expected to be affected by the project is provided in the Biological Assessment, which is included as an appendix to the Draft General Reevaluation Report/EIS.

- **Hawaiian hoary bat (ESA status – Endangered):** Should they occur, Hawaiian hoary bats could be directly or indirectly impacted by the project. Direct effects could include mortality or other forms of take (e.g., harm or harassment) to individual bats because of heavy equipment used for clearing and grubbing of the project sites and construction of the flood risk management structures. The use of heavy equipment would also generate noise, which could disrupt bats that are present within the project area. To avoid and minimize the potential for these impacts, vegetation clearing for the project would be performed during times of the year when Hawaiian hoary bats are not expected to be breeding to avoid potential for harm or disruption of juvenile bats that are unable to fly; specifically trees greater than 15 feet in height would not be cleared between June 1 and September 15. In addition, all construction activities would be scheduled to occur during daytime hours, thus avoiding potential bat foraging activities, which typically occur in the evening hours.

  Other effects could include permanent loss or temporary impacts to habitat. However, given the amount of habitat available through the upper Ala Wai watershed, tree clearing within the project area is not expected to measurable decrease the amount of forest available to the local population of bats for roosting. In addition, on Oahu roost trees are plentiful and are not expected to be a limiting factor for the species. The forest habitat in the upper portions of the Ala Wai watershed is homogenous and does not vary significantly in composition or structure between adjacent patches. For these reasons, it is expected that any bats displaced by the clearing would readily find alternate roost sites in surrounding undisturbed forest.

  With the implementation of seasonal restrictions for tree trimming/clearing and enforcement of construction hours, impacts to the Hawaiian hoary bat are expected to be insignificant, such that the project may affect, but is not likely to adversely affect the species.

- **Seabirds (i.e., band-rumped storm petrel [ESA status – Endangered], Hawaiian petrel [ESA status – Endangered], and Newell's Townsend's shearwater [ESA status – Endangered]):** No direct effects due to implementation of the project are expected to sea bird species since the proposed project area does not provide suitable nesting habitat. Therefore, there would be no direct impacts to sea bird nesting habitat. During construction of the proposed project, artificial lighting could be used during pre-dawn and pre-dusk hours within staging areas. Seabirds show a strong attraction to light sources, including artificial lights. Artificial lights can act as an attractant causing disorientation, confusion, and eventual grounding. The effects of artificial lights lead to a condition known as fallout, where fledgling young and adults are grounded and unable to regain flight, making them vulnerable to depredation or

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

dehydration. Avoidance and minimization measures regarding artificial lighting would be implemented to reduce potential indirect impacts to seabirds that may be flying over the proposed project area. Given the above, coupled with the nature of activities proposed in the project area, impacts to seabirds are expected to be insignificant, such that the project may affect, but is not likely to adversely affect seabird species.

- **Hawaiian Waterbirds (i.e., Hawaiian duck (ESA status – Endangered), Hawaiian common gallinule [ESA status – Endangered], Hawaiian coot [ESA status – Endangered], and Hawaiian stilt [ESA status – Endangered]):** The extent and quality of potentially suitable habitat within the proposed project area is very limited and is likely to only be used as resting habitat for Hawaiian waterbird species. In the unlikely event that Hawaiian waterbird species are present within the proposed project area, it is expected that they would readily disperse to nearby areas with higher quality habitat (e.g., Pearl Harbor National Wildlife Refuge) in response to disturbance; as such, the potential effects of the proposed project are expected to be limited to temporary construction-related disturbance (e.g., noise). Injury or mortality of Hawaiian waterbird species (or their nests) is not expected.

  Areas of potentially suitable wetland habitat may be temporarily unavailable during construction (due to increased levels of disturbance), but sufficient habitat is expected to be available in nearby areas (e.g., Pearl Harbor National Wildlife Refuge). Following construction, the extent and quality of habitat is expected to be the same as the existing condition. During large-scale flood events, the detention basins would be inundated for short periods of time (i.e., about 1 day for Manoa Valley and Makiki Park District detention basins and about 2 days for the Ala Wai Golf Course detention basin), which could temporarily increase the extent of potential habitat. Although increased habitat may be viewed as a benefit, in heavily urbanized areas (such as the Ala Wai watershed), it can also create an attractive nuisance for waterbird species. Specifically, areas of increased habitat may attract waterbirds, which are then vulnerable to predator species that are prevalent in an urban environment (e.g., feral cats, mongoose). However, given the low probability of species occurrence and the infrequent recurrence and short-term duration of flooding, these conditions are not expected to significantly affect Hawaiian waterbirds. Based on the minimal extent and quality of suitable habitat, there is a low probability of species occurrence in the proposed project area. Given the above, coupled with the nature of activities proposed, impacts to Hawaiian waterbirds are expected to be insignificant, such that the proposed project may affect, but is not likely to adversely affect Hawaiian waterbird species.

- **Hawaiian monk seal (ESA status – Endangered):** Activities associated with the proposed action could reasonably be expected to interact directly or indirectly with Hawaiian monk seal through:

  1. Collision with vessels;
  2. Direct physical impact;
  3. Disturbance from human activity and equipment operation;
  4. Exposure to elevated noise levels;
  5. Exposure to elevated turbidity;
  6. Exposure to wastes and discharges; and
  7. Loss of forage habitat.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Collision with vessels:
Activities associated with the proposed action do not include the use of vessels in nearshore marine waters or lower reaches of rivers and streams. All work is anticipated to occur from upland with equipment staged upland.

Direct physical impact:
Physical impact to Hawaiian monk seal is not expected to occur. At this time, all construction work would occur from upland with no construction equipment (i.e., push barge, vessel, etc.) anticipated to be present within the aquatic habitat. The exception is construction of the Ala Wai Canal floodwall which includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area. The placement of cofferdam materials could potentially physically impact Hawaiian monk seal should these animals be present when cofferdam materials strike the bottom. Potential injuries and their severity will depend on the animal's proximity to the bottom when struck, the angle of the strike, and the body part impacted, but may include cuts, bruises, broken bones, and amputations, any of which could result in the animal's death. Hawaiian monk seal could also be pinned to the bottom and drowned. To minimize potential physical impacts to Hawaiian monk seal during cofferdam material placement, avoidance and minimization measures listed under environmental commitments, located further below in this section, would be implemented. Some of these avoidance and minimization measures require surveys for ESA-listed species in the area to occur prior to the start of each workday and prior to resumption of work following any break of more than one-half hour. They also require that all work be postponed or halted when motile ESA-listed marine species are within 164 feet of proposed work and resumption of activities should only occur after the animals have voluntarily left the area. These types of avoidance and minimization measures (refer to environmental commitments located further below in this section for the complete list) would minimize the potential physical impact to Hawaiian monk seal during the placement and removal of cofferdam material.

Disturbance from human activity and equipment operation:
Although construction of the floodwalls would occur upland, work would occur near marine habitat where ESA-listed marine species may be directly exposed to project-related activity. Hawaiian monk seal may experience a startle reaction and resulting stress should they encounter site preparation and construction activities. The reaction could range from one extreme where an animal calmly approaches and investigates the activity, to an opposite reaction of panicked flight, where an animal injures itself in an attempt to flee. However, marine mammals such as Hawaiian monk seal typically avoid human activity. Thus, the most likely effect of this interaction will be moderate level stress with a moderate to high energy avoidance behavior leading to the Hawaiian monk seal rapidly leaving the project footprint without injury.

Exposure to elevated noise levels:
Activities such as pile-driving may produce in-air and in-water sound levels capable of injury or adverse behavioral modifications for Hawaiian monk seal. Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. For example, construction of the floodwalls along Manoa-Palolo Canal and the Ala Wai Canal would occur upland. In addition, most of the floodwalls being constructed do not include pile driving; the exception being the reach along the right-descending bank of the Manoa-Palolo Canal

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

between Kapiolani Boulevard and Date Street. In this reach, the upland area is constricted to such a degree that a steel sheet pile wall (i.e., I-wall) would need to be installed in this location. A 15-foot-wide rock bench would be placed in-water along the right-descending bank of the Manoa-Palolo Canal parallel to the bank. Equipment for construction of the I-wall would be staged along this rock bench. Upon completion of the I-Wall, the rock bench would be permanently removed. Although equipment for constructing of the floodwall would be staged along the 15-foot-wide rock bench, inserting the steel sheet pile for the floodwall would be into the adjacent upland area. The method to be used would be push in place instead of impact pile driving. The push in place method pushes the steel sheet pile into the ground without an impact hammer or vibration. The operation, except for a crane engine (to hold the steel sheet pile) and the generator to power the machine for pushing in the pile, is almost silent. For reference, a crane and a generator typically produce airborne noise levels of 87 dBA at 50 feet from the source. Therefore, using the push in place method would reduce airborne noise levels typically associated with pile driving as well as in water noise levels. In addition, installation of pile would be upland where it is in the dry. Pile installation in the dry is typically a minimization measure designed to reduce the amount of sound that is transmitted through water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since pile installation would occur upland, this would be like pile driving occurring in the dry; therefore, installing the pile upland is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

The floodwall along the Ala Wai Canal does not include the installation of steel sheet pile. Instead, floodwalls along the Ala Wai Canal would be either J-walls or L-walls on macropiles. The macropiles require the use of a drill rig and associated drilling equipment to create a hole to design depth. The drill rig and drilling of the macropile hole would likely create the most noise during construction of these types of floodwalls. However, like the pile installation along the reach of Manoa-Palolo Canal, drilling would occur upland which is effective at minimizing the effects of sound in the water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since drilling of the macropile holes would occur upland, this is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

In addition to construction of floodwall, the Ala Wai Canal floodwall also includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose Hawaiian monk seals to project-related activity. However, Hawaiian monk seals typically avoid human interaction, so exposure to the project-related activity detailed above would be infrequent and non-injurious. The presence of the cofferdam would allow work on the stormwater drainage structures to be completed in the dry. As stated previously, working in the dry is a minimization measure designed to reduce the amount of sound that is transmitted

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

through the water. Therefore, upgrading existing stormwater outlet structures would occur in the dry which is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

Exposure to elevated turbidity and sedimentation:
In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed under environmental commitments, located further below in this section. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon Hawaiian monk seal.

USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to marine habitat occupied by the Hawaiian monk seal due to water quality degradation. The project includes the construction of floodwalls primarily along the Ala Wai Canal (including Manoa-Palolo Canal). Floodwalls would increase the capacity of the Ala Wai Canal to hold more storm water as well as increase storm flow velocities in the canal. Increased storm flow velocities in the canal could in turn disturb and/or resuspend sediments in the water column creating a turbidity plume that could affect water quality in the canal, the Ala Wai Small Boat Harbor, and the nearshore marine environment. Changes to velocities within the Ala Wai Canal were modeled with project features constructed and are compared against velocities within the canal under existing conditions in Table 7. Although the project would result in increased velocities and likely a large turbidity plume during a storm event, it is important to note that increased velocities and turbidity plumes already occur under the existing condition during a storm event.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Table 7: Future Without Project and Future with Project Modeled Velocities at the 5%, 2%, and 1% AEP.

Ala Wai Canal Location	Existing Velocities at Different AEPs without Project			Predicted Velocities at Different AEPs with Project			Velocity Difference (+) increase (-) decrease

Currently, under existing conditions, high rainfall events disturb sediments in the upper reaches of the Ala Wai watershed and cause these sediments to become suspended in the water column. There are also three general areas in the Ala Wai Canal where previously suspended sediments have sedimented out and built up within the canal: Kalakaua Avenue Bridge, mouth of the Manoa-Palolo Canal, and the terminus of the Ala Wai Canal (Montgomery et al., 2009). These built-up sediments within the canal at these locations can become resuspended in the water column during a storm event due to increased water velocities within the canal. The combination of these suspended sediments in the water column cause turbidity plumes during storm events which can extend beyond the canal and degrade water quality within the nearshore marine environment. Predicting how far turbidity plumes could extend during a storm event is difficult and can in turn make it difficult to predict where impacts to the nearshore marine environment could occur. However, PacIOOS has developed a turbidity plume forecast model for the Ala Wai Canal allowing the tracking of potential turbidity levels and extent of turbidity plumes along the nearshore marine environment. As an example of how a turbidity plume might extend out of the Ala Wai Small Boat Harbor and into the nearshore marine environment, PacIOOS conducted a model run of a turbidity plume for a storm event that occurred December 25 through December 27, 2017, in the Honolulu area. Figure 5 shows selected time progressions of this storm's modeled turbidity plume.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

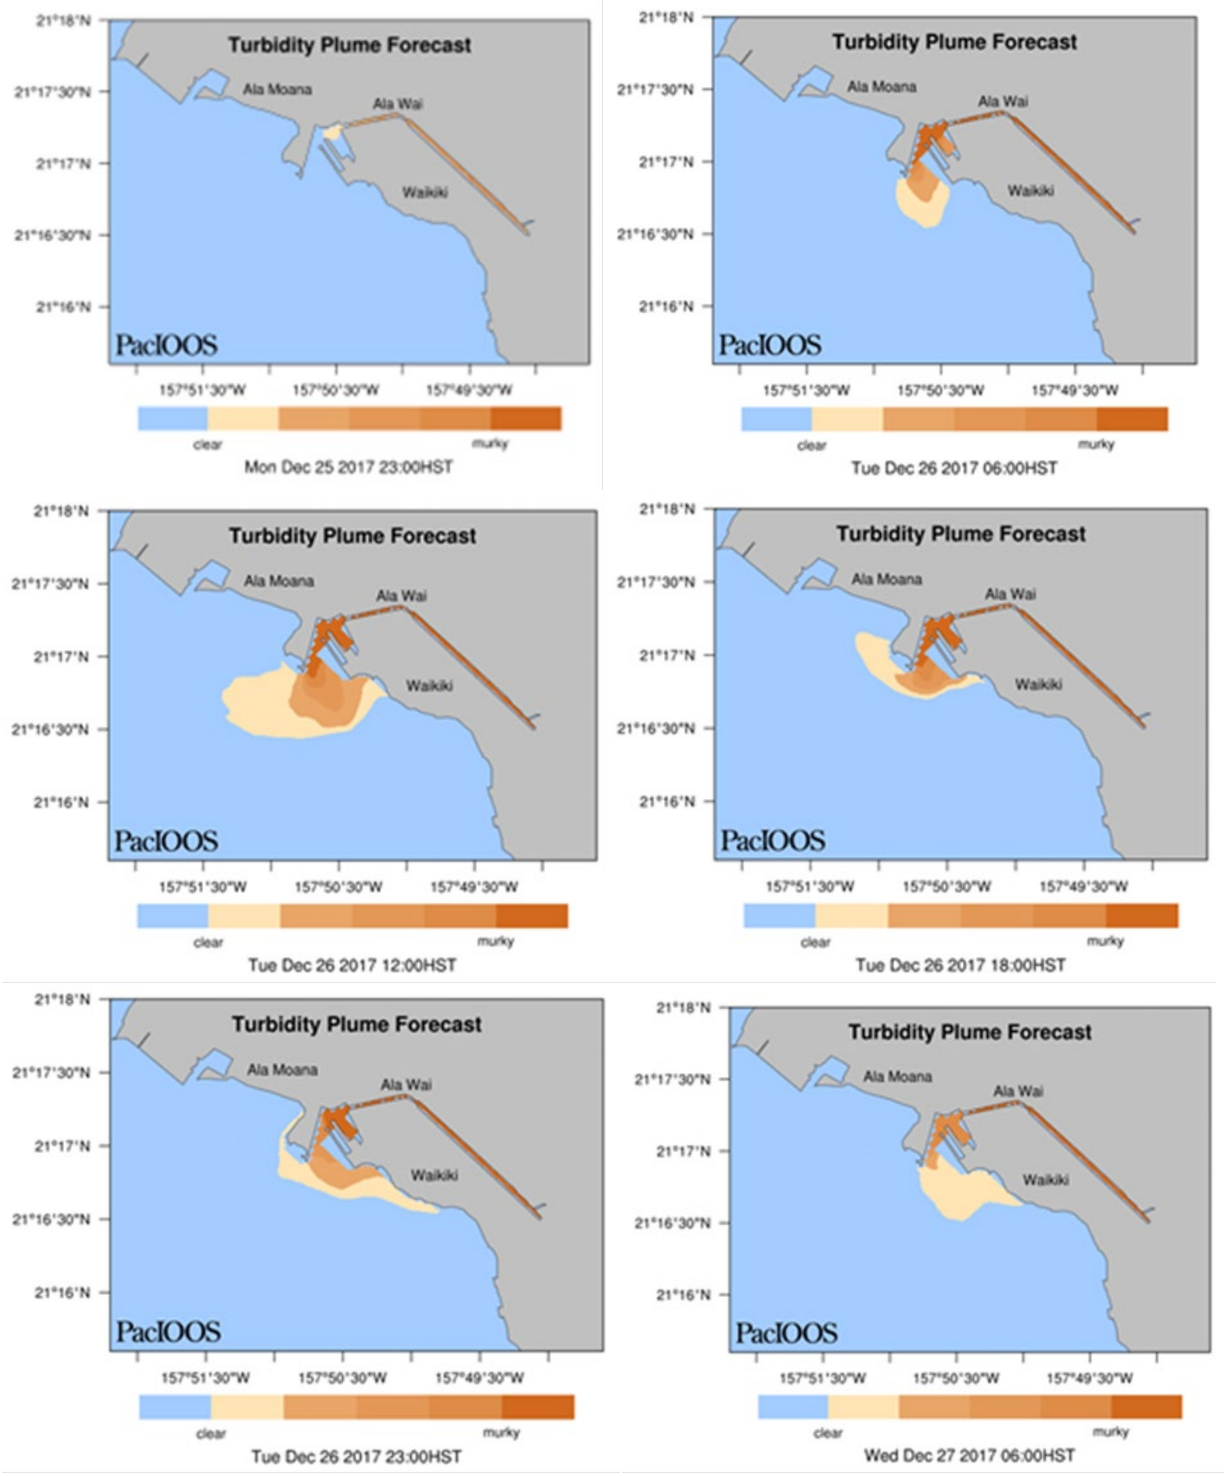

Figure 5: Modeled Turbidity Plume Forecast for December 25-27, 2017, High Rainfall Event.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

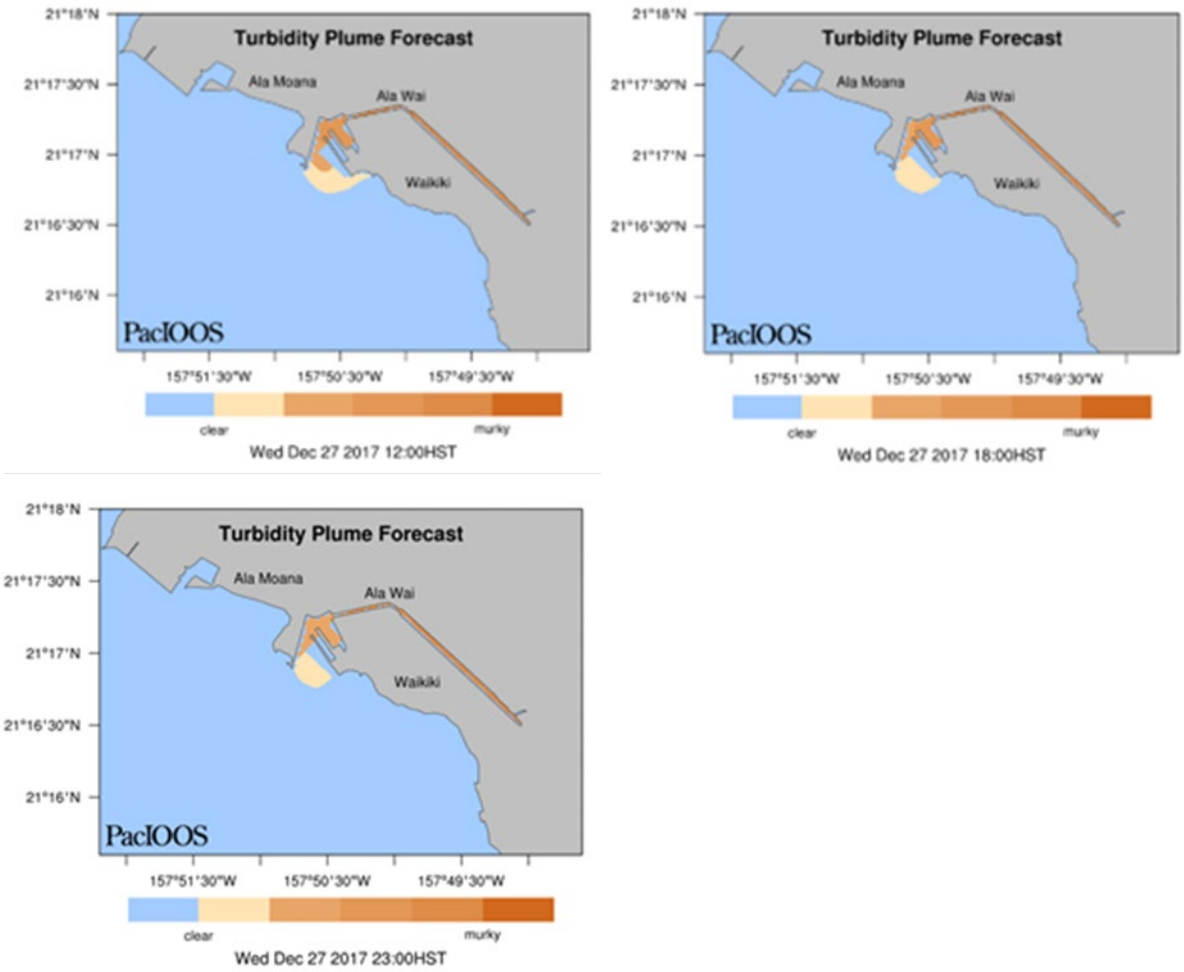

Figure 5, cont'd: Modeled Turbidity Plume Forecast for December 25-27, 2017, High Rainfall Event.

As seen in the above time progressions, at the beginning of the storm event (i.e., December 25; 23:00 HST) the Ala Wai Canal begins to experience high turbidity with low turbidity beginning to occur within the Ala Wai Small Boat Harbor. Following approximately 12 hours (i.e., December 26, 2017; 12:00 HST), high turbidity is experienced throughout Ala Wai Canal and Ala Wai Small Boat Harbor, while low to medium turbidity is beginning to occur along the reef flat area outside of Ala Wai Harbor and within the vicinity of the Atlantis Submarines harbor. Following the passage of another 12 hours (i.e., December 26, 2017; 23:00 HST), high turbidity continues to be experienced throughout the Ala Wai Canal, but high turbidity within the Ala Wai Boat Harbor is beginning to dissipate. Similarly, medium turbidity is still being experienced within the vicinity of the Atlantis Submarines Harbor and low turbidity is being experienced along the nearshore marine area (reef flat)—within the vicinity of the Sheraton Hotel on Waikiki. Following the passage of another 6 hours (i.e., December 27, 201; 06:00 HST), the turbidity plume begins to dissipate along the nearshore marine area, although low turbidity is still being experienced. Turbidity within the Ala Wai Boat Harbor has also begun to dissipate currently with moderate turbidity occurring in the harbor. Over the course of the following 18 hours, from 12:00 HST to 23:00 HST on December 27, 2017, the turbidity plume further dissipates, although low/medium turbidity is still being experienced within the Ala Wai Boat Harbor and the harbor channel. In addition, the Ala Wai Canal is experiencing medium turbidity still after approximately 48 hours

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

has passed from the beginning of the storm event. The above details a potential turbidity plume under the future without project condition. This means that even under the future without project condition, marine habitat located within Ala Wai Harbor generally experiences high turbidity during a storm event while marine habitat located outside the Ala Wai Boat Harbor and along Waikiki Beach experiences medium to low turbidity during a storm event.

During a storm event under the future without project condition, marine habitat in the harbor (Ala Wai Small Boat Harbor and Atlantis Submarines Harbor), reef flat (adjacent to Ala Wai Small Boat Harbor), reef crest (near Ala Wai Small Boat Harbor), fore reef (near Ala Wai Small Boat Harbor), and bank/shelf (near Ala Wai Small Boat Harbor) zones experiences medium to high turbidity for approximately 24 hours (depending on the size of the storm event) before turbidity begins to dissipate. Low turbidity during this same time occurs in the shoreline intertidal and reef flat zones between the Atlantis Submarines Harbor and the Sheraton Hotel in Waikiki. Between approximately 24 and 48 hours (depending on the size of the storm event) following a storm event, turbidity within the harbor zone has been reduced to medium levels while turbidity along shoreline intertidal, reef flat, reef crest, fore reef, and bank/shelf zones has been reduced to low or clear levels.

Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced at the harbor, reef flat, reef crest, fore reef, and bank/shelf zones sooner than under the without project condition. Turbidity plumes extending into the nearshore marine environment may also take longer than approximately 24 hours for dissipation to begin. Elevated turbidity and sedimentation may impact Hawaiian monk seal. However, given that Hawaiian monk seal breathe air instead of water, increased turbidity should not adversely affect their respiration or other biological function.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to marine habitat utilized by Hawaiian monk seal from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment. The operation of the detention basin could also help avoid and minimize the potential impact of the proposed project on accelerated discharge of freshwater to the nearshore marine environment.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Exposure to wastes and discharges:
Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, construction waste may end up in the aquatic environment if not properly disposed of. Construction wastes may include plastic trash and bags that may be ingested and cause digestive blockage or suffocation, or if large enough, along with discarded sections of ropes and lines, may entangle Hawaiian monk seal. Equipment spills and discharges likely consist of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, which could expose Hawaiian monk seal to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects, from avoidance of an area to death. Local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed under environmental commitments, located further below in this section, include measures intended to prevent or reduce exposure of Hawaiian monk seal to wastes and discharges in the marine environment.

Loss of forage habitat:
Short-term, the loss of forage habitat could occur with the upgrading/modification of stormwater drainage structures which has the potential to be in habitat where Hawaiian monk seal may forage. The upgrading/modification of drainage structures includes the temporary placement of cofferdam materials within the Ala Wai Canal which may impact forage species through damage or destruction. At the level of the individual, the loss of significant levels of available forage may lead to lower growth rates, reduced fitness, reduced reproductive success, and potential death by starvation. At the population level, significantly reduced forage opportunities may eventually cause local extirpation through the death or emigration of members of that population.

The upgrading and/or modification of stormwater drainage structures would occur from upland if the structure is located above the water level of the canal. If the stormwater drainage structure is located at water level or below water level a cofferdam would need to be constructed so that upgrading and/or modification of the drainage structure could occur in the dry. The placement of cofferdam material would occupy the smallest footprint possible, therefore, limited in-water substrate disturbance is anticipated to occur. Once upgrading/modification of the drainage structure is complete the cofferdam would be removed in its entirety. Therefore, the loss of potential forage habitat located within the cofferdam footprint would be temporary because epibenthic life would likely re-colonize the area once the structure is removed.

Long-term, the operation of the proposed action could cause sediment mobilization that has the potential to smother forage resources. An increase in suspended sediments during a storm event, above that experienced under the future without project condition, would likely result in increased deposition rates within the canal and nearshore marine areas. According to the Ala Wai Canal Watershed Water Quality Improvement Project (City and County of Honolulu, 1998), sedimentation in the Ala Wai Canal occurs at the rate of about 10,300 CY per year. Sedimentation is also prevalent in the Manoa-Palolo Canal which receives the first flush from storm waters. Increased sedimentation in nearshore marine waters could smother Hawaiian monk seal foraging habitat. Although the proposed project is expected to potentially increase sediment delivery to the nearshore marine environment, the degree of increase is not expected to be substantially different from the existing condition; therefore, Hawaiian monk seal foraging habitat in the action area is not expected to substantially decrease from its current abundance within the action area.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to Hawaiian monk seal foraging habitat from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur and in turn minimize the potential impact on Hawaiian monk seal foraging habitat within the nearshore marine environment. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment and thereby minimize the potential for resulting habitat degradation of Hawaiian monk seal foraging habitat.

Critical Habitat

Activities associated with the proposed action that could reasonably be expected to impact designated marine critical habitat for the Hawaiian monk seal include:

1. Exposure to elevated turbidity and sedimentation; and
2. Exposure to wastes and discharges.

Exposure to elevated turbidity and sedimentation:

In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area which could include proposed designated critical habitat for the green sea turtle. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed under environmental commitments, located further below in this section. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat, green sea turtle proposed designated critical habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon designated critical habitat for the Hawaiian monk seal.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The long-term operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to designated critical habitat for the Hawaiian monk seal from potential water quality degradation. Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced primarily at nearby designated critical habitat for the Hawaiian monk seal sooner than under the without project condition. Turbidity plumes extending into nearby designated critical habitat for the Hawaiian monk seal may also take longer than approximately 24 hours for dissipation to begin. The degraded water quality caused by the turbidity plumes could stimulate and sustain algae growth within the action area. Currently, frondose algae, crustose coralline algae, and turf algae are common but not dominant in the action area. Filamentous algae or cyanobacteria are also present primarily seaward of Waikiki beaches but do not dominate the habitat. While the proposed project is likely to increase nutrient and sediment concentrations reaching the nearshore marine environment during a storm event, the degree of increase in concentrations is not expected to stimulate algae growth in such a way that algae would be expected to become dominant in the action area and smoother corals that provide habitat for Hawaiian monk seal prey. Hawaiian monk seals are “generalist” feeders, meaning they eat a wide variety of foods depending on availability. Hawaiian monk seals eat many species of common fishes, squids, octopuses, eels, and crustaceans (crabs, shrimps, and lobsters). There could be slight increases in algae growth observed due to increased nutrient and sediment concentrations and turbidity taking longer to begin to dissipate, but the increase in algae growth would not be expected to be substantial to cause a loss of foraging habitat for the Hawaiian monk seal in the action area. Overall, the proposed project is not expected to substantially affect foraging habitat for the Hawaiian monk seal; therefore, the proposed project is not expected to destroy or adversely modify designated critical habitat for the Hawaiian monk seal.

Exposure to discharges:
Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, equipment spills and discharges likely consisting of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, could enter the nearshore marine environment and designated critical habitat for the Hawaiian monk seal to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects. Regarding foraging habitat for the Hawaiian monk seal (i.e., designated critical habitat), inadvertent spills and discharges from construction equipment has the potential to quickly kill Hawaiian monk seal prey. Highly motile prey such as fish, squid, octopus, and eels may be able to avoid harm by moving out of the area. Highly motile prey is also expected to be able to recolonize the affected

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

area faster once contamination is contained and/or dissipates. Less motile prey such as crabs, shrimps, and lobsters are likely to be killed. Less motile prey is also expected to take longer to recolonize the affected area once contamination is contained and/or dissipates. Although inadvertent spills and discharges from construction equipment have the potential to kill Hawaiian monk seal prey, motile prey are expected to be able to avoid harm and recolonize the area quickly. Less motile prey species would likely take longer to recolonize the area, but since Hawaiian monk seals eat a wide variety of foods depending on availability, diet for the seals would likely consist of more motile species until less motile species are able to recolonize the area. It is important to note that local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed under environmental commitments, located further below in this section, include measures intended to prevent or reduce exposure of the marine environment to wastes and discharges from construction equipment. Based on the above and the implementation of measures under environmental commitments, located further below in this section, the proposed project is not expected to substantially affect foraging habitat for the Hawaiian monk seal; therefore, the proposed project is not expected to destroy or adversely modify designated critical habitat for the Hawaiian monk seal.

In summary, the proposed action involves minor in-water work which could expose Hawaiian monk seal to project-related activity. However, with the implementation of avoidance and minimization measures listed under environmental commitments, located further below in this section, potential impacts to Hawaiian monk seal due to project-related activity is expected to be minimized such that the proposed action may affect, but is not likely to adversely affect Hawaiian monk seal or designated critical habitat for Hawaiian monk seal.

- **Green Sea Turtle (ESA status – Threatened):** Activities associated with the proposed action could reasonably be expected to interact directly or indirectly with green sea turtle through:

    1. Collision with vessels;
    2. Direct physical impact;
    3. Disturbance from human activity and equipment operation;
    4. Exposure to elevated noise levels;
    5. Exposure to elevated turbidity;
    6. Exposure to wastes and discharges; and
    7. Loss of forage habitat.

<u>Collision with vessels:</u>
Activities associated with the proposed action do not include the use of vessels in nearshore marine waters or lower reaches of rivers and streams. All work is anticipated to occur from upland with equipment staged upland.

<u>Direct physical impact:</u>
Activities associated with the proposed action do not include the use of vessels in nearshore Physical impact to green sea turtle is not expected to occur. At this time, all construction work would occur from upland with no construction equipment (i.e., push barge, vessel, etc.) anticipated to be present within the aquatic habitat. The exception is construction of the Ala Wai Canal floodwall which includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area. The placement of cofferdam materials could potentially physically impact green sea turtle should these animals be present when cofferdam materials strike the bottom. Potential injuries and their severity will depend on the animal's proximity to the bottom when struck, the angle of the strike, and the body part impacted, but may include cuts, bruises, broken bones, and amputations, any of which could result in the animal's death. Green sea turtle could also be pinned to the bottom and drowned. To minimize potential physical impacts to green sea turtle during cofferdam material placement, avoidance and minimization measures listed under environmental commitments, located further below in this section, would be implemented. Some of these avoidance and minimization measures require surveys for ESA-listed species in the area to occur prior to the start of each workday and prior to resumption of work following any break of more than one-half hour. They also require that all work be postponed or halted when motile ESA-listed marine species are within 164 feet of proposed work and resumption of activities should only occur after the animals have voluntarily left the area. These types of avoidance and minimization measures (refer to environmental commitments, located further below in this section,for the complete list) would minimize the potential physical impact to green sea turtle during the placement and removal of cofferdam material.

Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. Construction of the Ala Wai Canal floodwall, however, includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose green sea turtles to project-related activity. However, sea turtles typically avoid human activity, so exposure to the project-related activity detailed above would be infrequent and non-injurious. In addition, avoidance and minimization measures would be implemented during construction such that in insignificant effects on the green sea turtle are anticipated.

Exposure to elevated noise levels:
Activities such as pile-driving may produce in-air and in-water sound levels capable of injury or adverse behavioral modifications for green sea turtle. Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. For example, construction of the floodwalls along Manoa-Palolo Canal and the Ala Wai Canal would occur upland. In addition, a majority of the floodwalls being constructed do not include pile driving; the exception being the reach along the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard and Date Street. In this reach, the upland area is constricted to such a degree that a steel sheet pile wall (i.e., I-wall) would need to be installed in this location. A 15-foot wide rock bench would be placed in-water along the right-descending bank of the Manoa-Palolo Canal parallel to the bank. Equipment for construction of the I-wall would be staged along this rock bench. Upon completion of the I-Wall, the rock bench would be permanently removed. Although equipment for constructing of the floodwall would be staged along the 15-foot wide rock bench, inserting the steel sheet pile for the floodwall would be into the adjacent upland

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

area. The method to be used would be push in place instead of impact pile driving. The push in place method pushes the steel sheet pile into the ground without an impact hammer or vibration. The operation, except for a crane engine (to hold the steel sheet pile) and the generator to power the machine for pushing in the pile, is almost silent. For reference, a crane and a generator typically produce airborne noise levels of 87 dBA at a distance of 50 feet from the source. Therefore, using the push in place method would reduce airborne noise levels typically associated with pile driving as well as in water noise levels. In addition, installation of pile would be upland where it is in the dry. Pile installation in the dry is typically a minimization measure designed to reduce the amount of sound that is transmitted through water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since pile installation would occur upland, this would be like pile driving occurring in the dry; therefore, installing the pile upland is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting green sea turtle from potential noise-related impacts.

The floodwall along the Ala Wai Canal does not include the installation of steel sheet pile. Instead, floodwalls along the Ala Wai Canal would be either J-walls or L-walls on macropiles. The macropiles require the use of a drill rig and associated drilling equipment to create a hole to design depth. The drill rig and drilling of the macropile hole would likely create the most noise during construction of these types of floodwalls. However, like the pile installation along the reach of Manoa-Palolo Canal, drilling would occur upland which is effective at minimizing the effects of sound in the water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since drilling of the macropile holes would occur upland, this is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting green sea turtle from potential noise-related impacts.

In addition to construction of floodwall, the Ala Wai Canal floodwall also includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose green sea turtle to project-related activity. However, green sea turtles typically avoid human interaction, so exposure to the project-related activity detailed above would be infrequent and non-injurious. The presence of the cofferdam would allow work on the stormwater drainage structures to be completed in the dry. As stated previously, working in the dry is a minimization measure designed to reduce the amount of sound that is transmitted through the water. Therefore, upgrading existing stormwater outlet structures would occur in the dry which is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting green sea turtle from potential noise-related impacts.

<u>Exposure to elevated turbidity and sedimentation:</u>
In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column,

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed under environmental commitments, located further below under this section. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon green sea turtle.

USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to marine habitat occupied by the green sea turtle due to water quality degradation. The project includes the construction of floodwalls primarily along the Ala Wai Canal (including Manoa-Palolo Canal). Floodwalls would increase the capacity of the Ala Wai Canal to hold more storm water as well as increase storm flow velocities in the canal. Increased storm flow velocities in the canal could in turn disturb and/or resuspend sediments in the water column creating a turbidity plume that could affect water quality in the canal, the Ala Wai Small Boat Harbor, and the nearshore marine environment. Changes to velocities within the Ala Wai Canal were modeled with project features constructed and are compared against velocities within the canal under existing conditions in Table 7. Although the project would result in increased velocities and likely a large turbidity plume during a storm event, it is important to note that increased velocities and turbidity plumes already occur under the existing condition during a storm event.

Currently, under existing conditions, high rainfall events disturb sediments in the upper reaches of the Ala Wai watershed and cause these sediments to become suspended in the water column. There are also three general areas in the Ala Wai Canal where previously suspended sediments have sedimented out and built up within the canal: Kalakaua Avenue Bridge, mouth of the Manoa-Palolo Canal, and the terminus of the Ala Wai Canal (Montgomery et al., 2009). These built-up sediments within the canal at these locations can become resuspended in the water column during a storm event due to increased water velocities within the canal. The combination of these suspended sediments in the water column cause turbidity plumes during

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

storm events which can extend beyond the canal and degrade water quality within the nearshore marine environment. Predicting how far turbidity plumes could extend during a storm event is difficult and can in turn make it difficult to predict where impacts to the nearshore marine environment could occur. However, PacIOOS has developed a turbidity plume forecast model for the Ala Wai Canal allowing the tracking of potential turbidity levels and extent of turbidity plumes along the nearshore marine environment. As an example of how a turbidity plume might extend out of the Ala Wai Small Boat Harbor and into the nearshore marine environment, PacIOOS conducted a model run of a turbidity plume for a storm event that occurred December 25 through December 27, 2017, in the Honolulu area. Figure 5 shows selected time progressions of this storm's modeled turbidity plume.

As seen in Figure 5, at the beginning of the storm event (i.e., December 25; 23:00 HST) the Ala Wai Canal begins to experience high turbidity with low turbidity beginning to occur within the Ala Wai Small Boat Harbor. Following approximately 12 hours (i.e., December 26, 2017; 12:00 HST), high turbidity is experienced throughout Ala Wai Canal and Ala Wai Small Boat Harbor, while low to medium turbidity is beginning to occur along the reef flat area outside of Ala Wai Harbor and within the vicinity of the Atlantis Submarines harbor. Following the passage of another 12 hours (i.e., December 26, 2017; 23:00 HST), high turbidity continues to be experienced throughout the Ala Wai Canal, but high turbidity within the Ala Wai Boat Harbor is beginning to dissipate. Similarly, medium turbidity is still being experienced within the vicinity of the Atlantis Submarines Harbor and low turbidity is being experienced along the nearshore marine area (reef flat)—within the vicinity of the Sheraton Hotel on Waikiki. Following the passage of another 6 hours (i.e., December 27, 201; 06:00 HST), the turbidity plume begins to dissipate along the nearshore marine area, although low turbidity is still being experienced. Turbidity within the Ala Wai Boat Harbor has also begun to dissipate currently with moderate turbidity occurring in the harbor. Over the course of the following 18 hours, from 12:00 HST to 23:00 HST on December 27, 2017, the turbidity plume further dissipates, although low/medium turbidity is still being experienced within the Ala Wai Boat Harbor and the harbor channel. In addition, the Ala Wai Canal is experiencing medium turbidity still after approximately 48 hours has passed from the beginning of the storm event. The above details a potential turbidity plume under the future without project condition. This means that even under the future without project condition, marine habitat located within Ala Wai Harbor generally experiences high turbidity during a storm event while marine habitat located outside the Ala Wai Boat Harbor and along Waikiki Beach experiences medium to low turbidity during a storm event.

During a storm event under the future without project condition, marine habitat in the harbor (Ala Wai Small Boat Harbor and Atlantis Submarines Harbor), reef flat (adjacent to Ala Wai Small Boat Harbor), reef crest (near Ala Wai Small Boat Harbor), fore reef (near Ala Wai Small Boat Harbor), and bank/shelf (near Ala Wai Small Boat Harbor) zones experiences medium to high turbidity for approximately 24 hours (depending on the size of the storm event) before turbidity begins to dissipate. Low turbidity during this same time occurs in the shoreline intertidal and reef flat zones between the Atlantis Submarines Harbor and the Sheraton Hotel in Waikiki. Between approximately 24 and 48 hours (depending on the size of the storm event) following a storm event, turbidity within the harbor zone has been reduced to medium levels while turbidity along shoreline intertidal, reef flat, reef crest, fore reef, and bank/shelf zones has been reduced to low or clear levels.

Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

at the harbor, reef flat, reef crest, fore reef, and bank/shelf zones sooner than under the without project condition. Turbidity plumes extending into the nearshore marine environment may also take longer than approximately 24 hours for dissipation to begin. Elevated turbidity and sedimentation may impact green sea turtle. However, given that green sea turtles breathe air instead of water, increased turbidity should not adversely affect their respiration or other biological function.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to marine habitat utilized by green sea turtle from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment. The operation of the detention basin could also help avoid and minimize the potential impact of the proposed project on accelerated discharge of freshwater to the nearshore marine environment.

Exposure to wastes and discharges:
Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, construction waste may end up in the aquatic environment if not properly disposed of. Construction wastes may include plastic trash and bags that may be ingested and cause digestive blockage or suffocation, or if large enough, along with discarded sections of ropes and lines, may entangle green sea turtle. Equipment spills and discharges likely consist of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, which could expose green sea turtles to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects, from avoidance of an area to death. Local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed under environmental commitments, located further below under this section, include measures intended to prevent or reduce exposure of green sea turtles to wastes and discharges in the marine environment.

Loss of forage habitat:
Short-term, the loss of forage habitat could occur with the upgrading/modification of stormwater drainage structures which has the potential to be in habitat where green sea turtles may forage. The upgrading/modification of drainage structures includes the temporary placement of cofferdam materials within the Ala Wai Canal which may impact forage species through damage

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

or destruction. At the level of the individual, the loss of significant levels of available forage may lead to lower growth rates, reduced fitness, reduced reproductive success, and potential death by starvation. At the population level, significantly reduced forage opportunities may eventually cause local extirpation through the death or emigration of members of that population.

The upgrading and/or modification of stormwater drainage structures would occur from upland if the structure is located above the water level of the canal. If the stormwater drainage structure is located at water level or below water level a cofferdam would need to be constructed so that upgrading and/or modification of the drainage structure could occur in the dry. The placement of cofferdam material would occupy the smallest footprint possible, therefore, limited in-water substrate disturbance is anticipated to occur. Once upgrading/modification of the drainage structure is complete the cofferdam would be removed in its entirety. Therefore, the loss of potential forage habitat located within the cofferdam footprint would be temporary because epibenthic life would likely re-colonize the area once the structure is removed.
Long-term, the operation of the proposed action could cause sediment mobilization that has the potential to smother forage resources. An increase in suspended sediments during a storm event, above that experienced under the future without project condition, would likely result in increased deposition rates within the canal and nearshore marine areas. According to the Ala Wai Canal Watershed Water Quality Improvement Project (City and County of Honolulu, 1998), sedimentation in the Ala Wai Canal occurs at the rate of about 10,300 CY per year. Sedimentation is also prevalent in the Manoa-Palolo Canal which receives the first flush from storm waters. Increased sedimentation in nearshore marine waters could smother green sea turtle foraging habitat. Although the proposed project is expected to potentially increase sediment delivery to the nearshore marine environment, the degree of increase is not expected to be substantially different from the existing condition; therefore, green sea turtle foraging habitat in the action area is not expected to substantially decrease from its current abundance within the action area.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to green sea turtle foraging habitat from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur and in turn minimize the potential impact on green sea turtle foraging habitat within the nearshore marine environment. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment and thereby minimize the potential for resulting habitat degradation of green sea turtle foraging habitat.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Critical Habitat

Activities associated with the proposed action that could reasonably be expected to impact proposed designated habitat for the green sea turtle include:

1. Exposure to elevated turbidity and sedimentation; and
2. Exposure to wastes and discharges.

Exposure to elevated turbidity and sedimentation:

In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area which could include proposed designated critical habitat for the green sea turtle. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization measures listed under environmental commitments, located further below in this section. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat, green sea turtle proposed designated critical habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon proposed designated critical habitat for the green sea turtle.

USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

The long-term operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to proposed designated critical habitat for the green sea turtle from potential water quality degradation. Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced primarily at nearby proposed designated critical habitat for the green sea turtle sooner than under the without project condition. Turbidity plumes extending into nearby proposed designated critical habitat for the green sea turtle may also take longer than approximately 24 hours for dissipation to begin. The degraded water quality caused by the turbidity plumes could stimulate and sustain

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

algae growth within the action area. Currently, frondose algae, crustose coralline algae, and turf algae are common but not dominant in the action area (USFWS, 2023b). Filamentous algae or cyanobacteria are also present primarily seaward of Waikiki beaches but do not dominate the habitat (USFWS, 2023b). While the proposed project is likely to increase nutrient and sediment concentrations reaching the nearshore marine environment during a storm event, the degree of increase in concentrations is not expected to stimulate algae growth in such a way that algae would be expected to become dominant in the action area. Green sea turtles are herbivores and eat mostly seagrasses and algae. Although the project is not expected to significantly stimulate algae growth, the project is also not expected to substantially decrease algae growth beyond that which currently occurs in the action area. Overall, the proposed project is not expected to substantially affect foraging habitat for the green sea turtle; therefore, the proposed project is not expected to destroy or adversely modify proposed designated critical habitat for the green sea turtle.

Exposure to discharges:
Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, equipment spills and discharges likely consisting of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, could enter the nearshore marine environment and proposed designated critical habitat for the green sea turtle to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects. Regarding foraging habitat for the green sea turtle (i.e., proposed designated critical habitat), inadvertent spills and discharges from construction equipment has the potential to quickly kill algae filaments; however, populations may recover rapidly by growth and vegetative reproduction of any unharmed fragments or spores (O'Brien and Dixon, 1976). Although inadvertent spills and discharges from construction equipment have the potential to kill algae, hydrocarbon-based chemicals generally have a greater adverse impact on algal grazers than algae (O'Brien and Dixon, 1976). Therefore, inadvertent spills and discharges would likely kill algal grazers and result in a temporary increase in algae until algal grazers are able to recolonize the impacted area (O'Brien and Dixon, 1976). It is important to note that local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, environmental commitments listed further below in the section include measures intended to prevent or reduce exposure of the marine environment to wastes and discharges from construction equipment. Based on the above and the implementation of environmental commitments listed further below in the section, the proposed project is not expected to substantially affect foraging habitat for the green sea turtle; therefore, the proposed project is not expected to destroy or adversely modify proposed designated critical habitat for the green sea turtle.

Overall, the proposed action involves minor in-water work which could expose green sea turtle to project-related activity. However, with the implementation of avoidance and minimization environmental commitments, listed further below in the section, potential impacts to green sea turtle due to project-related activity is expected to be minimized such that the proposed action may affect, but is not likely to adversely affect green sea turtle or proposed designated critical habitat for green sea turtle.

- **Hawksbill Sea Turtle (ESA status – Endangered):** Activities associated with the proposed action could reasonably be expected to interact directly or indirectly with hawksbill sea turtle through:

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1. Collision with vessels;
2. Direct physical impact;
3. Disturbance from human activity and equipment operation;
4. Exposure to elevated noise levels;
5. Exposure to elevated turbidity;
6. Exposure to wastes and discharges; and
7. Loss of forage habitat.

Collision with vessels:
Activities associated with the proposed action do not include the use of vessels in nearshore marine waters or lower reaches of rivers and streams. All work is anticipated to occur from upland with equipment staged upland.

Direct physical impact:
Activities associated with the proposed action do not include the use of vessels in nearshore Physical impact to hawksbill sea turtle is not expected to occur. At this time, all construction work would occur from upland with no construction equipment (i.e., push barge, vessel, etc.) anticipated to be present within the aquatic habitat. The exception is construction of the Ala Wai Canal floodwall which includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area. The placement of cofferdam materials could potentially physically impact hawksbill sea turtles should these animals be present when cofferdam materials strike the bottom. Potential injuries and their severity will depend on the animal's proximity to the bottom when struck, the angle of the strike, and the body part impacted, but may include cuts, bruises, broken bones, and amputations, any of which could result in the animal's death. Hawksbill sea turtle could also be pinned to the bottom and drowned. To minimize potential physical impacts to hawksbill sea turtle during cofferdam material placement, avoidance and minimization environmental commitments, listed further below in the section, would be implemented. Some of these avoidance and minimization measures require surveys for ESA-listed species in the area to occur prior to the start of each workday and prior to resumption of work following any break of more than one-half hour. They also require that all work be postponed or halted when motile ESA-listed marine species are within 164 feet of proposed work and resumption of activities should only occur after the animals have voluntarily left the area. These types of avoidance and minimization environmental commitments, listed further below in the section, would minimize the potential physical impact to hawksbill sea turtle during the placement and removal of cofferdam material.

Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. Construction of the Ala Wai Canal floodwall, however, includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

of the cofferdam would potentially expose hawksbill sea turtles to project-related activity. However, sea turtles typically avoid human activity, so exposure to the project-related activity detailed above would be infrequent and non-injurious. In addition, avoidance and minimization measures would be implemented during construction such that in insignificant effects on the hawksbill sea turtle are anticipated.

Exposure to elevated noise levels:
Activities such as pile-driving may produce in-air and in-water sound levels capable of injury or adverse behavioral modifications for hawksbill sea turtle. Much of the construction for the proposed action would occur upland and adjacent to waterways, not within a waterway. For example, construction of the floodwalls along Manoa-Palolo Canal and the Ala Wai Canal would occur upland. In addition, most of the floodwalls being constructed do not include pile driving; the exception being the reach along the right-descending bank of the Manoa-Palolo Canal between Kapiolani Boulevard and Date Street. In this reach, the upland area is constricted to such a degree that a steel sheet pile wall (i.e., I-wall) would need to be installed in this location. A 15-foot-wide rock bench would be placed in-water along the right-descending bank of the Manoa-Palolo Canal parallel to the bank. Equipment for construction of the I-wall would be staged along this rock bench. Upon completion of the I-Wall, the rock bench would be permanently removed. Although equipment for constructing of the floodwall would be staged along the 15-foot-wide rock bench, inserting the steel sheet pile for the floodwall would be into the adjacent upland area. The method to be used would be push in place instead of impact pile driving. The push in place method pushes the steel sheet pile into the ground without an impact hammer or vibration. The operation, except for a crane engine (to hold the steel sheet pile) and the generator to power the machine for pushing in the pile, is almost silent. For reference, a crane and a generator typically produce airborne noise levels of 87 dBA at 50 feet from the source. Therefore, using the push in place method would reduce airborne noise levels typically associated with pile driving as well as in water noise levels. In addition, installation of pile would be upland where it is in the dry. Pile installation in the dry is typically a minimization measure designed to reduce the amount of sound that is transmitted through water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since pile installation would occur upland, this would be like pile driving occurring in the dry; therefore, installing the pile upland is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

The floodwall along the Ala Wai Canal does not include the installation of steel sheet pile. Instead, floodwalls along the Ala Wai Canal would be either J-walls or L-walls on macropiles. The macropiles require the use of a drill rig and associated drilling equipment to create a hole to design depth. The drill rig and drilling of the macropile hole would likely create the most noise during construction of these types of floodwalls. However, like the pile installation along the reach of Manoa-Palolo Canal, drilling would occur upland which is effective at minimizing the effects of sound in the water. Although there is no method for calculating sound transmission loss through soil outside of the water, and then calculating the loss in water, it is assumed that transmission loss through soil is greater than what occurs in water or air due to the density of soil. Since drilling of the macropile holes would occur upland, this is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting Hawaiian monk seal from potential noise-related impacts.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

In addition to construction of floodwall, the Ala Wai Canal floodwall also includes upgrading existing stormwater drainage outlets. Upgrades would potentially include increasing the size of the outlets and/or installing flap gates on the outlets. While some outlets would be accessible from upland and would not require in-water work, some of the outlets to be upgraded could be at water level or below water level. For outlets that cannot be upgraded from land only, minor in-water work would occur. In-water work would require the placement of a cofferdam around the work area, pumping the work area within the cofferdam dry, performing the upgrades, and then removal of the cofferdam materials. The size of the cofferdam would be the minimum necessary to perform the upgrade work. Placement of the cofferdam and removal of the cofferdam would potentially expose hawksbill sea turtle to project-related activity. However, Hawaiian monk seals typically avoid human interaction, so exposure to the project-related activity detailed above would be infrequent and non-injurious. The presence of the cofferdam would allow work on the stormwater drainage structures to be completed in the dry. As stated previously, working in the dry is a minimization measure designed to reduce the amount of sound that is transmitted through the water. Therefore, upgrading existing stormwater outlet structures would occur in the dry which is expected to be effective at minimizing the effects of sound in adjacent aquatic habitat and protecting hawksbill sea turtle from potential noise-related impacts.

Exposure to elevated turbidity and sedimentation:
In-water construction activities have the potential to generate turbidity through disturbance of existing in-place substrates causing the resuspension of sediments into the water column, thereby raising ambient turbidity levels. Elevated turbidity levels over ambient turbidity levels would degrade ambient water quality within the construction footprint and immediate surrounding area. Elevated turbidity levels would be discrete, temporary, and are expected to naturally dissipate, restoring water quality to ambient levels with no anticipated permanent impact to water quality resulting from construction. Suspended sediments are expected to settle rather quickly upon completion of any in-water disturbances. Adverse impacts to the water column within the Ala Wai Canal due to construction related turbidity, are likely to be limited in both physical and temporal extent due to the lack of currents in the canal and use of avoidance and minimization environmental commitments listed further below in the section. The Ala Wai Canal is generally subjected to low flow velocities from tidal influence which naturally and considerably limit the potential for turbidity plumes to be carried into adjacent habitats (i.e., Ala Wai Small Boat Harbor, nearshore marine habitat). Given that the Ala Wai Canal is subject to bouts of high turbidity during storm events under the existing condition, it is unlikely that temporary increases in turbidity from constructing/modifying existing drainage structures would have any measurable impact upon hawksbill sea turtle.

USACE has proposed BMPs (e.g., silt curtains) to contain resuspended sediments in the immediate in-water work areas during construction/modification of drainage structures to avoid spreading project-related, degraded water quality impacts to surrounding waters. In addition, USACE would stipulate to the contractor that no in-water construction activities could occur during periods of heavy rainfall. This would minimize the potential compounding adverse water quality impacts resulting from in-water construction work in combination with high turbidity levels from the Manoa-Palolo Canal during a storm event. Additionally, USACE is seeking a water quality certification under Section 401 of the Clean Water Act from the State of Hawaii Department of Health, Clean Water Branch (DOH-CWB). To obtain such certification, all proposed actions would comply with State water quality standards and implement necessary and appropriate monitoring BMPs to curtail water quality impacts.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The operation of the project is passive, however, components of the project when working as a system could cause adverse indirect impacts to marine habitat occupied by the hawksbill sea turtle due to water quality degradation. The project includes the construction of floodwalls primarily along the Ala Wai Canal (including Manoa-Palolo Canal). Floodwalls would increase the capacity of the Ala Wai Canal to hold more storm water as well as increase storm flow velocities in the canal. Increased storm flow velocities in the canal could in turn disturb and/or resuspend sediments in the water column creating a turbidity plume that could affect water quality in the canal, the Ala Wai Small Boat Harbor, and the nearshore marine environment. Changes to velocities within the Ala Wai Canal were modeled with project features constructed and are compared against velocities within the canal under existing conditions in Table 7. Although the project would result in increased velocities and likely a large turbidity plume during a storm event, it is important to note that increased velocities and turbidity plumes already occur under the existing condition during a storm event.

Currently, under existing conditions, high rainfall events disturb sediments in the upper reaches of the Ala Wai watershed and cause these sediments to become suspended in the water column. There are also three general areas in the Ala Wai Canal where previously suspended sediments have sedimented out and built up within the canal: Kalakaua Avenue Bridge, mouth of the Manoa-Palolo Canal, and the terminus of the Ala Wai Canal (Montgomery et al., 2009). These built-up sediments within the canal at these locations can become resuspended in the water column during a storm event due to increased water velocities within the canal. The combination of these suspended sediments in the water column cause turbidity plumes during storm events which can extend beyond the canal and degrade water quality within the nearshore marine environment. Predicting how far turbidity plumes could extend during a storm event is difficult and can in turn make it difficult to predict where impacts to the nearshore marine environment could occur. However, PacIOOS has developed a turbidity plume forecast model for the Ala Wai Canal allowing the tracking of potential turbidity levels and extent of turbidity plumes along the nearshore marine environment. As an example of how a turbidity plume might extend out of the Ala Wai Small Boat Harbor and into the nearshore marine environment, PacIOOS conducted a model run of a turbidity plume for a storm event that occurred December 25 through December 27, 2017, in the Honolulu area. Figure 5 shows selected time progressions of this storm's modeled turbidity plume.

As seen in Figure 5, at the beginning of the storm event (i.e., December 25; 23:00 HST) the Ala Wai Canal begins to experience high turbidity with low turbidity beginning to occur within the Ala Wai Small Boat Harbor. Following approximately 12 hours (i.e., December 26, 2017; 12:00 HST), high turbidity is experienced throughout Ala Wai Canal and Ala Wai Small Boat Harbor, while low to medium turbidity is beginning to occur along the reef flat area outside of Ala Wai Harbor and within the vicinity of the Atlantis Submarines harbor. Following the passage of another 12 hours (i.e., December 26, 2017; 23:00 HST), high turbidity continues to be experienced throughout the Ala Wai Canal, but high turbidity within the Ala Wai Boat Harbor is beginning to dissipate. Similarly, medium turbidity is still being experienced within the vicinity of the Atlantis Submarines Harbor and low turbidity is being experienced along the nearshore marine area (reef flat)—within the vicinity of the Sheraton Hotel on Waikiki. Following the passage of another 6 hours (i.e., December 27, 201; 06:00 HST), the turbidity plume begins to dissipate along the nearshore marine area, although low turbidity is still being experienced. Turbidity within the Ala Wai Boat Harbor has also begun to dissipate currently with moderate turbidity occurring in the harbor. Over the course of the following 18 hours, from 12:00 HST to 23:00 HST on December 27, 2017, the turbidity plume further dissipates, although low/medium turbidity is still being experienced within the Ala Wai Boat Harbor and the harbor channel. In

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

addition, the Ala Wai Canal is experiencing medium turbidity still after approximately 48 hours has passed from the beginning of the storm event. The above details a potential turbidity plume under the future without project condition. This means that even under the future without project condition, marine habitat located within Ala Wai Harbor generally experiences high turbidity during a storm event while marine habitat located outside the Ala Wai Boat Harbor and along Waikiki Beach experiences medium to low turbidity during a storm event.

During a storm event under the future without project condition, marine habitat in the harbor (Ala Wai Small Boat Harbor and Atlantis Submarines Harbor), reef flat (adjacent to Ala Wai Small Boat Harbor), reef crest (near Ala Wai Small Boat Harbor), fore reef (near Ala Wai Small Boat Harbor), and bank/shelf (near Ala Wai Small Boat Harbor) zones experiences medium to high turbidity for approximately 24 hours (depending on the size of the storm event) before turbidity begins to dissipate. Low turbidity during this same time occurs in the shoreline intertidal and reef flat zones between the Atlantis Submarines Harbor and the Sheraton Hotel in Waikiki. Between approximately 24 and 48 hours (depending on the size of the storm event) following a storm event, turbidity within the harbor zone has been reduced to medium levels while turbidity along shoreline intertidal, reef flat, reef crest, fore reef, and bank/shelf zones has been reduced to low or clear levels.

Under the proposed project, turbidity plumes occurring during a storm event could carry higher sediment and nutrient concentrations and take additional time to dissipate upon reaching the nearshore marine environment. Therefore, medium to high turbidity levels could be experienced at the harbor, reef flat, reef crest, fore reef, and bank/shelf zones sooner than under the without project condition. Turbidity plumes extending into the nearshore marine environment may also take longer than approximately 24 hours for dissipation to begin. Elevated turbidity and sedimentation may impact green sea turtle. However, given that green sea turtles breathe air instead of water, increased turbidity should not adversely affect their respiration or other biological function.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to marine habitat utilized by hawksbill sea turtle from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment. The operation of the detention basin could also help avoid and minimize the

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

potential impact of the proposed project on accelerated discharge of freshwater to the nearshore marine environment.

Exposure to wastes and discharges:
Although construction of the proposed action primarily occurs upland, construction activities are often located adjacent to the aquatic environment. Therefore, construction waste may end up in the aquatic environment if not properly disposed of. Construction wastes may include plastic trash and bags that may be ingested and cause digestive blockage or suffocation, or if large enough, along with discarded sections of ropes and lines, may entangle hawksbill sea turtle. Equipment spills and discharges likely consist of hydrocarbon-based chemicals such as fuel oils, gasoline, lubricants, hydraulic fluids, and other toxicants, which could expose hawksbill sea turtle to toxic chemicals. Depending on the chemicals and their concentration, exposure could result in a range of effects, from avoidance of an area to death. Local and Federal regulations prohibit the intentional discharge of toxic wastes and plastics into the marine environment. In addition, BMPs listed under environmental commitments, located further below in this section, include measures intended to prevent or reduce exposure of hawksbill sea turtle to wastes and discharges in the marine environment.

Loss of forage habitat:
Short-term, the loss of forage habitat could occur with the upgrading/modification of stormwater drainage structures which has the potential to be in habitat where hawksbill sea turtle may forage. The upgrading/modification of drainage structures includes the temporary placement of cofferdam materials within the Ala Wai Canal which may impact forage species through damage or destruction. At the level of the individual, the loss of significant levels of available forage may lead to lower growth rates, reduced fitness, reduced reproductive success, and potential death by starvation. At the population level, significantly reduced forage opportunities may eventually cause local extirpation through the death or emigration of members of that population.

The upgrading and/or modification of stormwater drainage structures would occur from upland if the structure were located above the water level of the canal. If the stormwater drainage structure is located at water level or below water level a cofferdam would need to be constructed so that upgrading and/or modification of the drainage structure could occur in the dry. The placement of cofferdam material would occupy the smallest footprint possible, therefore, limited in-water substrate disturbance is anticipated to occur. Once upgrading/modification of the drainage structure is complete the cofferdam would be removed in its entirety. Therefore, the loss of potential forage habitat located within the cofferdam footprint would be temporary because epibenthic life would likely re-colonize the area once the structure is removed.

Long-term, the operation of the proposed action could cause sediment mobilization that has the potential to smother forage resources. An increase in suspended sediments during a storm event, above that experienced under the future without project condition, would likely result in increased deposition rates within the canal and nearshore marine areas. According to the Ala Wai Canal Watershed Water Quality Improvement Project (City and County of Honolulu, 1998), sedimentation in the Ala Wai Canal occurs at the rate of about 10,300 CY per year. Sedimentation is also prevalent in the Manoa-Palolo Canal which receives the first flush from storm waters. Increased sedimentation in nearshore marine waters could smother hawksbill sea turtle foraging habitat. Although the proposed project is expected to potentially increase sediment delivery to the nearshore marine environment, the degree of increase is not expected to be substantially different from the existing condition; therefore, hawksbill sea turtle foraging

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

habitat in the action area is not expected to substantially decrease from its current abundance within the action area.

Although BMPs are not defined for operation of the proposed project, the project does include a detention basin at the Ala Wai Golf Course that would collect storm water runoff from the Manoa-Palolo Canal, detain the runoff, and slowly release the runoff back into the Ala Wai Canal. The operation of the detention basin in conjunction with the floodwalls could minimize potential indirect impacts to hawksbill sea turtle foraging habitat from acceleration of the delivery of storm water runoff to the nearshore marine environment and the quality of storm water runoff reaching the nearshore marine environment. This is because storm water runoff from the Manoa-Palolo canal would be held within the detention basin for up to two days providing time for some sediments entrained within the water column to settle out in the detention basin. After approximately two days, the detained storm water runoff would begin to slowly be released back into the Ala Wai Canal. Sediment retained in the detention basin would then be collected and disposed of at an appropriate facility. With the operation of the detention basin, a negligible or no change to the sediment/nutrient concentration of the storm water runoff reaching the nearshore marine environment could occur and in turn minimize the potential impact on hawksbill sea turtle foraging habitat within the nearshore marine environment. Most of the sediment containing excess nutrients and legacy contaminants comes from the Manoa and Palolo streams which feed into the Manoa-Palolo Canal. Therefore, the operation of the detention basin—which would hold storm water runoff from these streams during a storm event and provide time for sedimentation to occur—has the potential to avoid or minimize the possible impact of the proposed project on increased nutrient and sediment loading to the nearshore marine environment and thereby minimize the potential for resulting habitat degradation of hawksbill sea turtle foraging habitat.

Overall, the proposed action involves minor in-water work which could expose hawksbill sea turtle to project-related activity. However, with the implementation of avoidance and minimization measures listed under environmental commitments, located further below in this section, potential impacts to hawksbill sea turtle due to project-related activity is expected to be minimized such that the proposed action may affect, but is not likely to adversely affect hawksbill sea turtle.

The Draft Biological Assessment will be transmitted to the USFWS with a request for concurrence with the USACE's determination that the project may affect but is not likely to adversely affect the Hawaiian hoary bat, seabirds (band-rumped storm petrel and Newell's Townsend's shearwater), and Hawaiian waterbirds (Hawaiian duck, Hawaiian common gallinule, Hawaiian coot, and Hawaiian stilt); the USACE has determined there would be no effect on all other federally listed/candidate species and/or designated critical habitat. The proposed project has been discussed with the resource agencies, and the Biological Assessment incorporates their input provided to date.

(7) Other Wildlife

Overall, the project is not expected to substantially affect the diversity or productivity of the project area. The proposed project would result in minor losses of habitat for terrestrial and aquatic species as outlined in Section 3.4of the Draft Feasibility Report/EIS.

(8) Actions Taken to Minimize Impacts

Best management practices will be used for all construction. Avoidance and minimization measures will be implemented to minimize potential impacts on the aquatic ecosystem.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

(f) Proposed Disposal Site Determinations

(1) Mixing Zone Determination

Construction of drainage features and placement of stream bank riprap at each measure location would be conducted within an area subject to dewatering and would involve minimal mixing zones. In general, the fill material used for the project would either consist of large components (culverts, rocks), or would be adequately stabilized, such that very little exposed material could be suspended in the water column.

(2) Determination of Compliance with Applicable Water Quality Standards

Specific water quality criteria have been promulgated in the Hawaii Administrative Rules [HAR] §11-54, which, if met, are designed to allow water bodies to achieve designated beneficial uses. Water bodies that do not achieve the criteria are designated as “impaired” and are placed on the CWA §303(d) List of Impaired Waters. Based on the data presented in the 2022 State of Hawaii Water Quality Monitoring and Assessment Report (DOH, 2022), several locations within the Ala Wai watershed are not in attainment of the designated water quality standards.

Locations with impairment listings in the watershed include the three major streams and the Ala Wai Canal. Manoa Stream is listed for total nitrogen, nitrate and nitrite nitrogen, total phosphorus, turbidity, dieldrin, and chlordane. Palolo Stream is listed for trash, and Makiki Stream is listed for total nitrogen and total phosphorus. The Ala Wai Canal is listed for total nitrogen, nitrate and nitrite nitrogen, total phosphorus, turbidity, enterococci, pathogens, metals, suspended solids, and organochlorine pesticides.

For each water body on the §303(d) list, a pollution budget, or Total Maximum Daily Load (TMDL) must be developed to bring that water body into compliance with water quality standards. To date, the only TMDLs that have been developed are for nitrogen and phosphorus in the Ala Wai Canal. Development of the remaining TMDLs has been designated by DOH as a low priority (DOH, 2022).

As described throughout this evaluation, the project would involve placement of riprap and drainage structures, all of which will be adequately stabilized during construction. In general, the size and characteristics of these materials will not contribute to increased turbidity or suspended particulate levels, or other constituents which impair water quality. Some degree of increased turbidity and increased concentration of suspended solids would likely occur during construction of project features. Proper dewatering techniques and other BMPs would be implemented to avoid and minimize the potential for erosion and sedimentation to the degree possible. As such, these are expected to be temporary impacts, and would be relatively minor and restricted to a localized area. No long-term adverse effects on water quality are expected, such that the project is expected to be in compliance with applicable water quality standards. Water quality certification will be obtained from the State of Hawaii Department of Health prior to project construction.

(3) Potential Effects on Human Use Characteristics

(a) Municipal and Private Water Supply

The waterways within the Ala Wai watershed do not directly provide drinking water,

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

therefore, the project would have no impacts to municipal and private water supplies.

(b) Recreational and Commercial Fisheries

The project could have temporary and long-term impacts on recreational fishing. The construction of the Ala Wai Canal floodwall would make fishing from the banks of the canal challenging due to the height of the wall currently (i.e., 6 feet tall). However, the floodwall around the Ala Wai Canal does include an approximately 3-foot elevated pathway which would make access to fishing over the canal slightly easier, but accessibility would not be as it is under the current condition. For additional detail on potential impacts to recreational fishing refer to Section 3.5.4 of the Draft GRR/SEIS.

(c) Water Related Recreation

The project would result in some impacts to recreation, as several of the measures are sited in designated recreational areas. Facilities that would be affected (at least in part) include Ala Wai Promenade, Ala Wai Community Park, Ala Wai Golf Course, and Ala Wai Canal. In general, the measures would displace some areas that are currently used for recreation. However, to the maximum extent possible, they have been designed with the smallest footprint possible, and to minimize impacts to recreational activities during non-flood conditions. For example, the Ala Wai Golf Course detention basin has been designed to be a multi-purpose facility, such that the golf course may still be used during non-flood conditions. During a flood event, the golf course would function to temporarily detain water, thereby precluding recreational use; however, the golf course would have minimal recreational value under flood conditions. Additional detail on potential impacts to recreation is provided in Section 3.5.4 of the Draft GRR/SEIS.

(d) Aesthetics

Other potential impacts on human use characteristics include those associated with aesthetics. In general, the measures would introduce a built element (floodwalls for example) to the natural environment, which would impact views from and toward the site. In general, the detention features in the upper portions of the watershed will either be screened by dense vegetation or otherwise fit into the natural topography, such that they are not expected to be prominently visible from any readily accessible public locations. The proposed measures along the Ala Wai Canal, including the flood walls, would diminish views along and toward the Ala Wai Canal. In addition to these views being an important resource for the Waikiki District in general, they are also significant in terms of the Ala Wai Canal's listing on the National and State Register of Historic Places (as well as a component of the Kauhale O Hookipa Scenic Byway). Despite the visual impact of the flood walls, the analysis conducted for this project determined that they are a necessary feature to provide adequate flood protection for Waikiki, such that the impacts are unavoidable. Efforts were made throughout the planning process, to minimize the impacts to the extent possible. Refinements to the measure design will be made during as part of the detailed design phase and will consider opportunities to further reduce the height of the flood walls, as well as incorporate design details that may otherwise minimize potential visual impacts, such as use of construction materials and/or landscaping to blend the structures into the surrounding environment. Additional detail on potential impacts to visual resources is provided in Section 3.5.5 of the Draft GRR/EIS.

(e) Parks, National and Historical Monuments, National Seashores, Wilderness Areas, Research Sites, and Similar Preserves

The proposed project does not occur within any parks, national and historical monuments, national seashores, wilderness areas, research sites, or similar preserves; therefore, there

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

would be no impact to this human use characteristic.

(g) Determination of Cumulative Effects on the Aquatic Ecosystem

Although there are multiple measures throughout the watershed, they are generally located in geographically distinct areas. BMPs would be implemented for each of the measures to minimize the potential for impacts to the aquatic environment, such that they are not expected to significantly contribute to cumulative impacts. A detailed discussion of cumulative impacts is provided in Section 3.7 of the Draft GRR/SEIS.

(h) Determination of Secondary Effects on the Aquatic Ecosystem

No secondary impacts to the aquatic environment are anticipated to occur.

SECTION 3 – FINDINGS OF COMPLIANCE OR NON-COMPLIANCE WITH THE RESTRICTIONS ON DISCHARGE

The proposed fill activities would comply with Section 404(b)(1) guidelines of the Clean Water Act, as amended. No significant adaptations of the guidelines were made for this evaluation. As discussed in the Draft IFR/SEIS, other alternatives considered to reduce the flood risk within the Ala Wai Watershed include no action; detention basins throughout the urbanized watershed; floodwalls alone; and non-structural solutions. However, it was determined that these alternatives were prohibitively more costly, were significantly less effective in reducing flood risk, had extensive impacts that would have been difficult to mitigate, and/or did not meet the overall project purpose of reducing flood risk throughout the watershed. Although the tentatively selected plan would involve minor work in areas that support riffle and pool complexes, this type of habitat occurs throughout the mid to upper reaches of the streams where peak flows are greatest. No other practicable alternative with less environmental impact has been identified, such that the tentatively selected plan has been identified as the least environmentally damaging practicable alternative. A detailed discussion of the potential effects of the project is presented in Section 3 of the Draft GRR/SEIS.

The proposed fill activities would comply with all State water quality standards, Section 307 of the Clean Water Act, and the Endangered Species Act of 1973, as amended. The proposed fill activities would not have significant adverse effects on human health and welfare, including municipal and private water supplies, recreation and commercial fishing, plankton, fish, shellfish, wildlife, and special aquatic sites. The life stages of aquatic life and other wildlife would not be adversely affected. Significant adverse effects on aquatic ecosystem diversity, productivity, and stability, and on recreational, and economic values would not occur. To avoid and minimize the potential for adverse impacts, the project areas would be properly dewatered and standard BMPs would be implemented. Habitat improvements would be implemented to mitigate for loss of aquatic habitat.

A public meeting will be held for the project as part of the public review process for the Draft IFR/SEIS. This draft evaluation will be included as an attachment to the Draft IFR/SEIS and relevant comments will be received as part of the public review process. Comments received at the public meeting and during the following comment period will be considered and this evaluation will be updated as needed.

On the basis of this evaluation, I have determined that the proposed project complies with the requirements of the 404(b)(1) guidelines for the discharge of fill material.

Appendix L – Cultural Resources

This document contains CONTROLLED UNCLASSIFED INFORMATION (CUI). It contains information that may be exempt from public release under the Freedom of Information Act (5 USC 552). It is to be controlled, stored, handled, transmitted, distributed, and disposed of in accordance with USACE policy relating to CUI information and it is not to be released to the public or other personnel who do not have a valid "need to know" without prior written approval of an authorized USACE official.

Report Status: Draft, November 2023

TABLE OF CONTENTS

1. Introduction 2

2. November 16, 2016, Programmatic Agreement 3

3. List of Cultural Resource Reports 49

1. Introduction

Cultural and historic resources for the Ala Wai watershed were originally evaluated in the context of a National Historic Preservation Act Programmatic Agreement (PA) signed in 2016 by the U.S. Army Corps of Engineers, the Hawaii State Historic Preservation Office, the State of Hawaii Department of Land and Natural Resources, the Oahu Island Burial Council, the Office of Hawaiian Affairs, and Historic Hawaii Foundation. The Programmatic Agreement was fully executed on November 16, 2016, and remains in effect for a period of seven years. The U.S. Army Corps of Engineers is currently working with the consulting parties on renewal of the Programmatic Agreement.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

2. November 16, 2016, Programmatic Agreement

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

PROGRAMMATIC AGREEMENT
AMONG
THE U. S. ARMY CORPS OF ENGINEERS
AND
THE HAWAII STATE HISTORIC PRESERVATION OFFICER
AND
THE STATE OF HAWAII
DEPARTMENT OF LAND AND NATURAL RESOURCES ENGINEERING DIVISION
REGARDING THE
ALA WAI CANAL PROJECT
HONOLULU, HAWAII

9 November 2016

WHEREAS, under Section 209 of the Flood Control Act of 1962, the U.S. Army Corps of Engineers (Corps) is conducting a feasibility study of measures to manage flood risk in the Ala Wai watershed; and

WHEREAS, the Corps is considering the following flood risk management measures for the Ala Wai watershed: in-stream detention basins in the upper reaches of Makiki, Manoa and Palolo streams; off-stream detention basins in the middle and lower portions of the watershed; debris catchment features; floodwalls along the Ala Wai Canal; improvements to the flood warning system; and as compensatory mitigation for anticipated impacts to waters of the U.S., in-stream measures to improve passage for native aquatic species (the Undertaking) (Appendix A); and

WHEREAS, the Corps cannot complete the cultural resources investigations, evaluations, and coordination necessary for compliance with Section 106 of the National Historic Preservation Act of 1966 (NHPA) (54 U.S.C. § 306108), as amended, prior to the design phase of the Undertaking; and

WHEREAS, the Corps has defined the Area of Potential Effect (APE) for direct and indirect impacts in coordination with the Hawaii State Historic Preservation Officer (SHPO) (Appendix B). The Direct APE is the area that will be directly affected by construction, and includes the footprint of each measure to be constructed and its construction buffer, staging areas, access roads and aquatic habitat mitigation measures. The specific locations for some project features have yet to be determined. The Indirect APE is defined as a one-half mile radius from the outer edge of the Direct APE. The APEs are defined the same for archaeological resources, historic architectural resources, and Traditional Cultural Properties (TCP); and

WHEREAS, the Corps has applied the National Register of Historic Places (NRHP) Criteria (Criteria) to properties identified within the Direct and Indirect APEs, and to date has completed substantial surveys within the Direct and Indirect APEs (Appendix C) with the recognition that additional identifications and evaluations may be required; and

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

WHEREAS, the Corps and the SHPO have determined there is only one archaeological resource eligible for the NRHP within the Direct APE; State Site Number 50-80-14-6734, mounds platforms, and wall at the juncture of Aihualama and Waihi Streams; and

WHEREAS, the Corps and the SHPO have determined archaeological resources in the Indirect APE, identified in Appendix D, are eligible for the NRHP; and

WHEREAS, the Corps and the SHPO have determined historic architectural resources in the Direct APE, identified in Appendix E, are eligible for the NRHP; and

WHEREAS, the Corps and the SHPO have determined historic architectural resources in the Indirect APE, identified in Appendix F, are eligible for the NRHP; and

WHEREAS, the Corps, SHPO and consulting parties have agreed that portions of the following TCPs are within the Direct APE: Makiki Stream, Waihi Stream, Waiakeakua Stream, Pukele Stream, Waiomao Stream, Manoa Stream, Palolo Stream; and

WHEREAS, the Corps, SHPO and consulting parties have agreed that the following TCPs are within the Indirect APE: Makiki Stream, Waihi Stream, Aihualama Loi, Waiakeakua Stream, Kanewai Loi, Pukele Stream, Waiomao Stream, Manoa Stream, Palolo Stream; and

WHEREAS, the Corps has determined that the Undertaking, as proposed, may have an adverse effect on archaeological sites, historic structures and TCPs identified in Appendices D, E, and F, as well as Makiki Stream, Waihi Stream, Waiakeakua Stream, Pukele Stream, Waiomao Stream, Manoa Stream, Palolo Stream; and

WHEREAS, the Corps along with consulting parties have developed potential treatment recommendations as mitigation for impacts to archaeological sites, historic structures and TCPs, (Appendices D, E, and F) these treatments will be finalized in a mitigation plan to be developed by the Corps, SHPO, and consulting parties during the planning and design phase of the Undertaking; and

WHEREAS, the Corps has invited agencies, organizations, and other interested parties listed in Appendix G to participate in the Section 106 consultation process; and

WHEREAS, the Advisory Council on Historic Preservation (ACHP) has been notified by the Corps of the finding of adverse effect and has chosen not to participate in consultation; and

WHEREAS, the Corps made the historic resources, effects determinations and proposed mitigations available for public review in the Draft Environmental Impact Statement prepared under the National Environmental Policy Act which will serve as the District's Section 106 public coordination for the Undertaking; and

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

WHEREAS, this PA was developed pursuant to Section 106 of the NHPA and in accordance with 36 CFR Part 800.14, the Corps and the SHPO have determined that execution of this PA will establish alternative procedures to streamline the coordination of the Undertaking; and

WHEREAS, the Corps will implement the provisions of this PA during the appropriate phase (e.g. planning, design, construction) as funding for various phases of the project is appropriated in future years; and

NOW, THEREFORE, the Corps and the SHPO agree that the Undertaking shall be implemented in accordance with the following stipulations in order to take into account the effect of the Undertaking on historic properties.

STIPULATIONS

The Corps shall ensure that the following measures are carried out:

I. APPLICABILITY

This PA applies to all Undertakings associated with the Ala Wai Canal Project, regardless of whether they are carried out by the Corps or another governmental entity. In the event that another federal agency not initially a party to or subject to this PA receives an application for funding/license/permit for the Undertaking as described in this PA, that agency may fulfill its Section 106 responsibilities by stating in writing it concurs with the terms of this PA and notifying the Corps, SHPO, and consulting parties that it intends to do so. Such agreement shall be evidenced by filing the written statement with the ACHP, and implementation of the terms of this PA.

II. IDENTIFICATION

A. The Corps has consulted with the SHPO, and the SHPO has concurred with the surveyed areas and identification of historic properties effort completed thus far. The Corps, in consultation with the SHPO, shall identify areas that require additional investigation to document previously unidentified historic properties eligible for inclusion in the NRHP. Identification of such properties shall occur in the event there are changes to the APE and/or other unforeseen modifications to the scope of work that may affect NRHP eligible historic properties.

B. The Corps shall consult with the SHPO to develop plans to complete the identification of historic properties in locations specified through Stipulation II(A). Plans may include survey prior to construction and archeological monitoring during construction. The level of effort for these activities shall be determined in consultation with the SHPO. See Stipulation IV(C)(2)(c) for archaeological monitoring protocols. Proposed additional Identification efforts shall be submitted by the Corps to the SHPO and consulting parties for review and comment within 30 days of receipt. If the Corps has not received comments from the SHPO and consulting parties within 30 days, the

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Corps may assume concurrence with the additional identification efforts and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

C. The Corps and the SHPO shall take into consideration the views of Native Hawaiian Organizations (NHOs), individuals, the Oahu Island Burial Council (OIBC), and other interested parties in completing its identification responsibilities. When an interested party recommends additional identification efforts, they must do so by letter or e-mail to the Corps, and the Corps will review the request with the SHPO, and respond to the request in writing within 60 days with the Corps' position.

D. The Corps shall ensure that qualified professionals meeting the NPS professional qualifications for the appropriate discipline [National Park Service Professional Qualification Standards, Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation (48 FR 44738-39)] are used to complete all identification, evaluation, and mitigation research proposals related to this undertaking.

E. When additional survey is needed prior to the initiation of construction related activities, or during project construction for actions which may affect historic properties, the Corps, in consultation with the SHPO, shall identify:

1. Archaeological Sites

a.) The Corps shall ensure that archaeological surveys and any necessary archaeological testing within areas requiring surveys as per Stipulation II(A) are conducted in a manner consistent with the Secretary of the Interior's Standards and Guidelines for Identification (48 FR 44720-23) and "Archeological Inventory Survey Standards and Cost Estimation Guidelines for the Department of Defense (Zeidler, 1995).

b.) In the event that an interested party contacts the Corps in accordance with Stipulation II(C) regarding its recognition of an archaeological site located within the Direct or Indirect APE and previously unidentified by the Corps, the Corps shall notify the SHPO, to initiate discussions with all parties to evaluate whether the resource meets the NRHP criteria set forth in 36 CFR Part 60.4, and the effect on the resource by the Undertaking.

c.) The surveys and any testing shall be conducted following consultation with the SHPO, and a report of the findings shall be submitted to the SHPO and consulting parties for review. The SHPO and consulting parties shall complete their review within 30 days of receipt of the report. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the survey's findings and acceptance of the survey as the final draft and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A. Interested parties can request findings, and the Corps, in conjunction with the SHPO, will evaluate their request.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

2. Traditional Cultural Properties

a.) The Corps shall ensure that surveys within areas requiring surveys as per Stipulation II(A) includes procedures to identify TCPs and to consult with Native Hawaiian Organization and other affected parties in accordance with the guidelines provided by National Park Service Bulletin 38, Guidelines for Evaluating and Documenting Traditional Cultural Properties.

b.) In the event that a Native Hawaiian Organization or affected group contacts the Corps in accordance with Stipulation II(C) regarding its recognition of a TCP located within the Direct or Indirect APE and previously unidentified by the Corps, the Corps shall notify the SHPO, to initiate discussions with all parties to evaluate whether the property is a Traditional Cultural Property that meets the NRHP criteria set forth in 36 CFR Part 60.4, and the effect on the resource by the Undertaking.

c.) The TCP evaluation shall be conducted in consultation with the SHPO and consulting parties, and a report of the findings shall be submitted to the SHPO and consulting parties for review. The SHPO and consulting parties shall complete their review within 30 days of receipt of the report. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the survey's findings and acceptance of the survey as the final draft and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

3. Buildings and Structures

a.) The Corps shall ensure that surveys for buildings and structures within areas requiring surveys as per Stipulation II(A) are conducted in a manner appropriate for the resource and consistent with other reports completed for the Island of Oahu, and the Secretary of the Interior's Standards and Guidelines for Identification (48 FR 44720-23).

b.) In the event that an interested party contacts the Corps in accordance with Stipulation II(C) regarding its recognition of a building or structure located within the Direct or Indirect APE and previously unidentified by the Corps, the Corps shall notify the SHPO, to initiate discussions with all parties to evaluate whether the resource meets the NRHP criteria set forth in 36 CFR Part 60.4, and the effect on the resource by the Undertaking.

c.) The survey shall be conducted following consultation with the SHPO, and a report of the survey, shall be submitted to the SHPO and consulting parties for review and comment within 30 days. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the survey's findings and acceptance of the survey as the final draft and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

4. Cultural Landscapes

a.) In the event that an interested party contacts the Corps in accordance with Stipulation II(C) regarding its recognition of a cultural landscape located within the Direct or Indirect APE and previously unidentified by the Corps, the Corps shall notify the SHPO, to initiate discussions with all parties to evaluate whether the resource meets the NRHP criteria set forth in 36 CFR Part 60.4, and the effect on the resource by the Undertaking.

b.) Cultural landscapes are defined in the National Park Service Preservation Brief 36, Protecting Cultural Landscapes, as "a geographic area, including both cultural and natural resources and the wildlife or domestic animals therein, associated with a historic event, activity, or person or exhibiting other cultural or aesthetic values." The four general types of cultural landscapes include: historic sites, historic designed landscapes, historic vernacular landscapes, and ethnographic landscapes.

c.) The Corps shall consult National Park Service Bulletins 18, How to Evaluate and Nominate Designed Historic Landscapes, and 30 Guidelines for Evaluating and Documenting Rural Historic Landscapes, National Park Service Preservation Brief 36, Protecting Cultural Landscapes, and other publications and materials made available by the SHPO to assist in defining the criteria that should be applied to such properties.

d.) The objective in conducting the surveys is to identify NRHP listed or potentially eligible historic landscapes not previously identified within the project area that may be adversely affected by the Undertaking implementation, and to determine whether they meet the NRHP criteria set forth in 36 CFR Part 60.4.

e.) The survey shall be conducted following consultation with the SHPO, and a report of the survey shall be submitted to the SHPO and consulting parties for review and comment. The SHPO and consulting parties shall complete their review within 30 days of receipt of the report. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the survey's findings and acceptance of the survey as the final draft and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

III. DETERMINATION OF ELIGIBILITY

A. Eligibility

1. The Corps has completed numerous surveys to identify National Register eligible properties within the Direct and Indirect APEs of the Undertaking. The Corps has consulted with the SHPO, and the SHPO has concurred with the determinations of eligibility of historic properties identified within the APEs (Appendices D, E, and F).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

2. The Corps shall consult with the SHPO and consulting parties to evaluate historic properties using the Criteria established for the NRHP [36 CFR Part 60] when previously unidentified historic properties within the Direct APE are identified.

a.) If the Corps and the SHPO agree that the Criteria apply in evaluating the NRHP eligibility of a property, the property shall be treated accordingly as a historic property eligible for the NRHP.

b.) If the Corps determines, and the SHPO concurs that the property does not meet the Criteria for listing on the NRHP, then the property is not a historic property as defined by statute and regulation and thus shall be treated accordingly.

c.) If the Corps and the SHPO disagree regarding NRHP eligibility, or if the ACHP so requests, prior to the start of any project-related work at the site or in the vicinity of the property, the Corps shall obtain a formal Determination of Eligibility (DOE) from the Keeper of the National Register (Keeper), National Park Service, whose determination shall be final.

d.) Notification of historic property evaluation will be provided by the Corps to all consulting parties within 90 days of identification.

B. Effect Determinations

1. Undertakings Requiring No Further Review

a.) For projects involving historic buildings and structures, archaeological sites, and/or traditional cultural properties, determined by the Corps as having No Adverse Effect, or No Historic Properties Affected and concurred with by the SHPO, as documented in Appendices D, E, and F, no further review under this PA and the NHPA is required.

2. Undertakings Requiring Further Review

a.) The Corps has consulted with the SHPO, and found that the proposed Undertaking may have adverse effects to historic properties. As necessary, the Corps shall consult with the SHPO and consulting parties to determine whether there are additional effects to previously identified, or unidentified historic properties by the proposed Undertaking on eligible resources as per 36 CFR 800.5.

b.) If a change in the scope of work or APE for an Undertaking previously determined to have No Adverse Effect, or No Historic Properties Affected occurs, then the Corps shall follow the process identified in Stipulation VI below.

c.) If a previously unidentified historic property is discovered within the APE of the Undertaking previously determined to have No Adverse Effect, or No Historic Properties Affected, then the Corps shall follow the process identified in Stipulation VI.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

d.) If an inadvertent adverse effect occurs to an historic property within the APE of the Undertaking previously determined to have No Adverse Effect, or No Historic Properties Affected, then the Corps shall follow the process identified in Stipulation VII and/or Stipulation VIII.

3. The Corps shall maintain records of all decisions it makes related to the NRHP eligibility of properties and determinations of effect subsequent to the signing of this Programmatic Agreement, and distribute to consulting parties.

4. For effects on historic properties that have not been resolved through mitigations in this PA (identified in Appendices D, E, and F), the Corps shall resolve adverse effects to historic properties in consultation with the SHPO and consulting parties per Stipulation IV, below.

5. Disagreements on effect determinations. Should the Corps and SHPO disagree as to whether the criteria of adverse effect apply to the effects of the Undertaking on particular historic properties, the Corps will request the ACHP to review the finding and request their written opinion, in accordance with 36 CFR 800.5(c). The Corps will take the ACHP's opinion into account when reaching a final decision.

C. Treatment. The Corps will make a treatment recommendation for adverse effects to NRHP eligible historic properties based on Stipulation IV, below.

IV. TREATMENT OF HISTORIC PROPERTIES

The Corps will incorporate mitigation measures identified in Appendices D, E, and F for adverse effects to all NRHP eligible historic properties. For those resources not previously identified or mitigated, the Corps, in consultation with SHPO and consulting parties shall adhere to the following treatment strategies to avoid, minimize, or mitigate adverse effects to historic properties. The Corps shall notify the ACHP of adverse effect findings. The analysis of alternatives shall consider appropriate treatment of historic properties, program needs, cost, public benefit and values, and design feasibility. The Corps will present their preferred alternative (Avoidance, Minimize, and/or Mitigation) to consulting parties. For any treatment of a historic property under this Stipulation, the Corps shall make information, including documentation specified, available to the public and allow the public to express their views on adverse effects of the undertaking. To engage the public, the Corps, along with the Hawaii Department of Land and Natural Resources will post information for public comment on the DLNR State website and allow 30 days to receive written comment.

A. Avoidance. The preferred treatment is avoidance of adverse effects to historic properties. The Corps shall, to the extent feasible, avoid historic properties either through project design changes, use of temporary fencing or barricades, realignments, or other measures that will protect historic properties. The Corps, the SHPO, and consulting parties shall consult to assist the Corps with developing plans for avoiding effects to known and previously unidentified historic properties. The Corps shall incorporate feasible avoidance measures into project activities as part of the implementation of the Undertaking. If, in consultation with the SHPO and consulting

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

parties, avoidance is determined to be infeasible, the Corps shall implement Stipulation IV(B) and/or (C).

B. Minimize. When the Corps, in consultation with the SHPO and consulting parties, determines that complete avoidance of historic properties is infeasible, consulting parties shall explore the practicalities of preservation in place and design compatibility.

1. **Preservation in Place**. Could entail complete avoidance, or may entail partial avoidance or protection of historic properties against project-related activities in proximity to the property.

2. **Design Compatibility**. Where appropriate, the Corps shall minimize impacts through project design, i.e. incorporating color, texture, scale, and/or materials which are compatible with the architectural or historic character of the historic property; and/or preservation of vegetation including mature trees, landscaping and planting which screen the property. Such design compatibility will comply with the Secretary of the Interior's Standards and Guidelines for the Treatment of Historic Properties (SOI Standards). If the Corps, in consultation with the SHPO and consulting parties, determines that avoidance of the resource is feasible, then the Corps will implement avoidance measures in accordance with Stipulation IV (A). If the Corps, in consultation with the SHPO and consulting parties, determines that efforts to minimize impacts are infeasible, the Corps shall develop and implement treatment/mitigation measures consistent with Stipulation IV(C), below.

C. Mitigation. If the Corps, in consultation with the SHPO and consulting parties, determines a way to avoid or minimize impacts to historic properties, then the Corps will implement the appropriate protective measures in accordance with Stipulation IV(A) or (B). When the Corps, in consultation with the SHPO and consulting parties, determines that complete avoidance, or minimizing impacts to historic properties is infeasible, the Corps shall consult with the SHPO and consulting parties to determine the appropriate mitigation, and implement the appropriate mitigation measure(s) before the initiation of construction activities that will cause the adverse impact(s). Appropriate mitigation measures identified by the consulting parties must be documented in a Mitigation Plan. The Mitigation Plan must include:

1) Identification of the Undertaking and associated PA
2) Location and identification of the historic property adversely effected
3) Explanation of adverse effect
4) Summary of mitigation consultation with SHPO and consulting parties
5) Mitigation measure(s) to be completed
6) Timeline of mitigation measure implementation
7) Review process of mitigation measure(s)
8) Reporting requirements

The Corps will provide a copy of a draft Final Mitigation Plan to the SHPO and consulting parties for concurrence for each historic property adversely affected. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the proposed Mitigation Plan and acceptance of the proposed Mitigation Plan

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

as the final draft and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

After the Corps has received concurrence on the Mitigation Plan, implementation may begin. Once all Mitigation Measures are completed the Corps with notify the SHPO and consulting parties and submit all final reporting requirements for concurrence. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the completed Mitigation Plan and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

1. Buildings and Structures

a. Recordation. The Corps shall consult with the SHPO and consulting parties to determine the appropriate level and type of recordation for affected resources, to include Historic American Building Survey/Historic American Engineering Record (HABS/HAER), or Historic American Landscapes Survey (HALS) where appropriate. For NRHP eligible historic properties, recordation shall be consistent with the requirements and standards of the Department of the Interior (April 2003), and the Corps shall consult with the NPS Pacific West Regional Office for any HABS/HAER/HALS requirements. All HABS/HAER/HALS documentation must be submitted to NPS for review, prior to construction affecting the resource, unless otherwise agreed to by either the SHPO or NPS.

b. Treatment of Buildings and Structures. Prior to alteration of historic properties, the Corps, in consultation with the SHPO and other consulting parties, shall develop treatment guidelines and design standards in keeping with the Secretary's Standards or other approved standards. If relocation of historic architectural properties is not feasible prior to demolition, partial demolition, or substantial alteration, the Corps, in consultation with the SHPO and consulting parties, shall develop a salvage and donation plan to identify appropriate parties willing and capable of receiving and preserving the salvaged significant elements from buildings/structures. The Corps shall submit the plans to the SHPO for review and comment.

c. Design Review. SHPO and appropriate consulting parties will be afforded the opportunity to review design plans and specifications (in electronic format) to ensure design elements agreed upon during consultation are implemented. The Corps will provide plans and specs to appropriate consulting parties at every design submittal with a minimum two week review period. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the proposed plans and acceptance of the proposed plans as the final draft and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

d. Interpretation. The Corps will consult with the SHPO and consulting parties to develop an interpretation plan for historic properties affected by the Undertaking to ensure preservation of the historic context of the resource. The Corps will provide interpretation documentation to appropriate consulting parties with a minimum two week review period. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

concurrence with the proposed plans and acceptance of the proposed plans as the final draft and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

2. Archaeological Sites

a. Archaeological Data Recovery. The Corps shall develop a data recovery plan for archaeological sites which the Corps determines, in consultation with the SHPO and consulting parties, cannot be avoided or appropriately preserved in place. The data recovery plan to retrieve significant archaeological information will be developed and implemented by the Corps or its representative(s), in consultation with the SHPO and consulting parties, and prior to the implementation of project-related activities within or in the vicinity of the archaeological sites.

i.) The Corps shall ensure that the data recovery plan for each NRHP eligible site addresses substantive research questions developed in consultation with the SHPO and consulting parties. The plan shall be consistent with the Secretary of the Interior's Standards and Guidelines for Archaeological Documentation (48 FR 44734-37) and the ACHP's publication, Treatment of Archaeological Properties.

ii.) The Corps shall submit data recovery plans to the SHPO and consulting parties for review and comment within 30 days of receipt. The Corps and SHPO shall consult to resolve any objections to the data recovery plan as proposed. The data recovery plan shall then be implemented by the Corps. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the proposed data recovery plan and acceptance of the proposed data recovery plan as the final draft and will notify the SHPO and consulting parties in writing, in accordance with Stipulation X.A.

b. Archaeological Documentation. Where appropriate, the Corps shall conduct documentation of archaeological sites in accordance with the Secretary of the Interior's Standards and Guidelines for Archaeological Documentation (48 FR 44734-37).

c. Archaeological Monitoring. For locations or actions agreed to by all signatories that archaeological monitoring may be undertaken during construction, the Corps shall develop an Archaeological Monitoring Plan in consultation with the SHPO and consulting parties. The Archaeological Monitoring Plan shall clearly state:

i.) Whether monitor will be on site full-time, part-time or on an on-call basis and rationale for this selection.

ii.) Timing of monitoring (both in the overall construction schedule and time allotted in the field). Ideally work on areas to be monitored shall be conducted at the initiation of construction to allow for consultation and further work, as needed, should significant resources be encountered. See Stipulation IX for protocols should burials be encountered.

iii.) Authority and role of the archaeologist

iv.) Location of monitoring

v.) The nature of the work to be undertaken by the archaeologist (extent of excavation, types of recording, screening, artifact sampling, etc.)

vi.) The type(s) of resource(s) anticipated

vii.) The protocol for actions should a resource be encountered

viii.) Artifact analysis and reporting requirements

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

ix.) Archaeological monitoring shall be included in the construction specifications and drawings demarcating where archaeological monitors are to be used. The archaeologist does not have to be hired under the construction contract, and could be hired under a master contract through the Corps. Protocols shall be in the contract specifications regarding responsibilities of all parties and timing for monitoring. The nature of archaeological monitoring (e.g. on-site monitoring to on-call monitoring) can be changed through a written request by either the Agency (Corps), or the SHPO, and with concurrence by the other. The Corps will share changes to archaeological monitoring with consulting parties.

d. Cultural Monitoring. For locations or actions agreed to by all signatories that cultural monitoring may be undertaken during construction, the Corps shall develop a Cultural Monitoring Plan in consultation with the SHPO and consulting parties. The Cultural Monitoring Plan shall clearly state:

i.) Definition of a cultural monitor

ii.) Whether monitor will be on site full-time, part-time or on an on-call basis and rationale for this selection.

iii.) Timing of monitoring (both in the overall construction schedule and time allotted in the field). Ideally work on areas to be monitored shall be conducted at the initiation of construction to allow for consultation and further work, as needed, should significant resources be encountered. See Stipulation IX for protocols should burials be encountered.

iv.) Authority and role of the cultural monitor (including briefings and education of construction personnel)

v.) Location of monitoring

vi.) The nature of the work to be undertaken by the cultural monitor

vii.) The types of resources anticipated

viii.) The protocol for actions should a resource be encountered

ix.) Reporting requirements

x.) Cultural monitoring shall be included in the construction specifications and drawings demarcating where cultural monitors are to be used. The cultural monitor does not have to be hired under the construction contract, and could be hired under a master contract through the Corps. Protocols shall be in the contract specifications regarding responsibilities of all parties and timing for monitoring. The nature of cultural monitoring (e.g. on-site monitoring to on-call monitoring) can be changed through a written request by either the Agency (Corps), or the SHPO, and with concurrence by the other. The Corps will share changes to cultural monitoring with consulting parties.

3. Traditional Cultural Properties (TCPs)

TCPs will be evaluated for NRHP eligibility using the Criteria established for the NRHP [36 CFR Part 60] per Stipulation III(A), above. If the Corps and the SHPO agree that the Criteria apply in evaluating the NRHP eligibility of a property, the property shall be treated accordingly, which may include the following mitigation measures:

a. The Corps, in consultation with the SHPO and Native Hawaiian Organizations, shall identify and evaluate design alternatives and treatment measures which will avoid, minimize, or mitigate impacts when it is determined that a TCP will be affected by the Undertaking.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

b. Treatment ideas may be generated from the guidelines provided by National Park Service Bulletin 38, Guidelines for Evaluating and Documenting Traditional Cultural Properties, and through ideas proposed by interested parties that are not standard treatment mitigations (creative mitigations).

4. Cultural Landscapes

a. The Corps, in consultation with the SHPO and other consulting parties, shall identify and evaluate design alternatives which will avoid or minimize impacts when it is determined that an NRHP eligible cultural landscape will be affected by Undertaking activities.

b. Treatment measures for historic landscapes shall consider recordation, preservation, rehabilitation, restoration, reconstruction, and additions in accordance with The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for the Treatment of Cultural Landscapes (1996) and Protecting Cultural Landscapes, National Park Service Preservation Brief Number 36.

c. Where recordation is required, the Corps shall consult with the SHPO and other consulting parties to determine the appropriate level and type of recordation for affected resources, including Historic American Landscapes Survey (HALS), as appropriate. For NRHP eligible historic properties, recordation shall be consistent with the requirements and standards of the Department of the Interior (April 2003), and the Corps shall consult with the NPS Pacific West Regional Office for any HABS/HAER/HALS requirements. All HABS/HAER/HALS documentation must be submitted to NPS for review, prior to construction affecting the resource, unless otherwise agreed to by either the SHPO or NPS.

D. Verification. For all records and reports generated by the Corps that document compliance with this PA, submittals to the SHPO will be provided under Memorandum for Record (MFR) cover letter, and reference the appropriate section of the PA. For protection measures developed under Stipulations IV(B) and (C) above, the Corps shall ensure that the measures were implemented by providing photos of the measure during construction along with a brief write up documented as an MFR. The MFR(s) will be submitted to the SHPO, and made available to consulting parties upon request within 30 days of completion of the implemented protection measure. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the verification and acceptance of the verification as the final draft and will notify the SHPO and consulting parties in writing that the applicable PA stipulation has been met, in accordance with Stipulation X.A.

V. CURATION AND DISSEMINATION OF INFORMATION

A. The Corps shall maintain all decision records on identification, evaluation, effects determination and mitigation of historic properties for this Undertaking.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

B. The Corps, in consultation with the SHPO shall ensure that all materials and records resulting from the survey, evaluation, and data recovery or mitigation conducted for the Undertaking, or recovered during construction of the Undertaking, will be curated in accordance with 36 CFR Part 79 Curation of Federally-Owned and Administered Archaeological Collections, unless a private property owner wishes to retain ownership of artifacts recovered from his or her land. For project components that will occur on private land, DLNR will incorporate provisions in the real estate agreement prior to commencement of construction activities that explicitly address the disposition of artifacts that may be found on the subject parcel, including whether the owner or DLNR will retain ownership. Certain materials may not be curated where state law and regulations require different treatment.

C. The parties to this PA acknowledge that historic properties covered by this PA are subject to the provisions of Section 304 of the NHPA (54 U.S.C. § 307103) relating to the disclosure of certain information about historic properties and, having so acknowledged, will ensure that all actions and documentation prescribed by this PA maintain the confidentiality required by law.

VI. ADDITIONS OR CHANGES TO THE UNDERTAKING'S SCOPE OF WORK AND AREA OF POTENTIAL EFFECT

A. In the event of any changes to the Undertaking's scope work that would require a change in the Direct or Indirect APE, the following measure shall be implemented in consultation with the signatories:

1. The Corps shall assess and revise the Undertaking's Direct and Indirect APE as needed to incorporate any additional areas that have the potential to affect historic properties.

2. The Corps shall carry out additional investigations, in accordance with Stipulation II, to identify historic architectural, archaeological, or cultural properties that may be affected.

3. The Corps shall assess the Undertaking's effect on any new historic properties, in accordance with Stipulation III.B, and explore measures to avoid, minimize or mitigate effects on these properties, in accordance with Stipulation IV.

4. The Corps shall ensure the preparation of appropriate reports and documents, notify Section 106 consulting parties, including Native Hawaiian Organizations, of any changes in the Undertaking's effect on historic properties, and provide the SHPO, NHOs, and consulting parties 30 days to review the Corps' findings. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with the new findings and will notify the SHPO and consulting parties in writing that the applicable PA stipulation(s) has been met in accordance with Stipulation X.A.

5. If a change in project scope results in additional adverse effects to historic properties the Corps shall consult with all consulting parties to identify appropriate mitigation in accordance with Stipulation IV.C.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

VII. UNANTICIPATED DISCOVERY

A. If previously unidentified cultural resources are discovered during Undertaking implementation, the Corps shall cease all work in the vicinity of the discovered resource until it can be evaluated pursuant to the guidelines in Stipulation III of this PA.

B. If the cultural resource is determined to be eligible for listing on the NRHP, the Corps shall consult with the SHPO to develop treatment in accordance with Stipulation IV of this PA.

C. The Corps shall implement the treatment for non-burial discoveries in accordance with Stipulation IV. For burials, treatment will be in accordance with Stipulation IX, below.

VIII. INADVERTENT ADVERSE EFFECTS

A. If previously identified or unidentified historic properties are inadvertently adversely affected during the Undertaking implementation, the Corps shall cease all work in the vicinity of the inadvertent adverse effect until it can be evaluated pursuant to the guidelines in Stipulation III of this PA.

B. If the historic property is determination to be NRHP eligible; the Corps shall consult with the SHPO to develop treatment in accordance with Stipulation IV of this PA.

C. The Corps shall implement the treatment for non-burial discoveries in accordance with Stipulation IV. For burials, treatment will be in accordance with Stipulation IX, below

IX. TREATMENT OF HUMAN REMAINS

A. Human remains must be treated with the utmost respect and dignity. Historic and prehistoric human remains from non-federal, non-tribal lands are subject to protection under the state's burial law(s) (Hawaiian Administrative Rules §13-300, Rules of Practice and Procedure Relating to Burial Sites and Human Remains, and Hawaii Revised Statutes 6E-43.6, Inadvertent Discovery of Burial Sites). As such, if human remains are discovered during construction, work on that portion of the project shall stop immediately. The remains shall be covered and/or protected in place in such a way that minimizes further exposure of, and damage to the remains, and the Corps shall immediately consult with the SHPO and Oahu Island Burial Council. A treatment plan shall be developed by the Corps in accordance with Hawaiian Administrative Rules §13-300-1. The Corps shall ensure that any approved treatment and reburial plan is fully implemented.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

X. ADMINISTRATIVE TERMS

A. REVIEW PERIODS

Unless indicated otherwise within this document, the SHPO, ACHP, Native Hawaiian Organizations, consulting parties, and any other interested party shall have thirty (30) days to review and comment on determinations, evaluations, plans, reports, and other documents submitted to them by the Corps. If the Corps has not received comments from the SHPO and consulting parties within 30 days the Corps may assume concurrence with determinations, evaluations, plans, reports, and other documents and will notify the SHPO and consulting parties in writing that the applicable PA stipulation(s) has been met.

B. DISPUTE RESOLUTION

1. Should a signatory, invited signatory, or consulting party to this PA object to the manner in which the terms of this PA are being implemented, they shall notify the Corps in writing of the objection. The Corps shall consult with such party to resolve the objection. If the Corps determines that such objection cannot be resolved then Stipulations X(B)(2) and (3) below will be implemented.

2. The Corps and the signatories shall attempt to resolve any disagreement arising from implementation of this PA. If there is a determination that the disagreement cannot be resolved, the Corps shall request the ACHP`s recommendations or request the comments of the ACHP in accordance with 36 CFR Part 800.7.

3. Any ACHP recommendations or comments provided in response will be considered in accordance with 36 CFR Part 800.7, with reference only to the subject of the dispute. The Corps shall respond to ACHP recommendations or comments indicating how the Corps has taken the ACHP's recommendations or comments into account and complied with same prior to proceeding with Undertaking’s activities that are subject to dispute. Responsibility to carry out all other actions under this PA that are not the subject of the dispute will remain unchanged.

C. SUNSET CLAUSE

This PA will continue in full force and effect until the construction of the Undertaking is complete and all terms of this PA are met, unless the Project is terminated or authorization is rescinded or a period of seven (7) years from execution of the PA has passed. Prior to such time, the Corps may consult with other signatories to reconsider the terms of the PA, and the agreement may be extended as written, or amended, in accordance with Stipulation X(D) below, provided all signatories concur.

D. AMENDMENT

This PA may be amended upon agreement in writing by all signatories. The amendment will be effective on the date a copy signed by all of the signatories is filed with the ACHP.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

E. TERMINATION

Any signatory to this PA may terminate it by providing thirty (30) days notice to the signatories by certified mail, provided that the signatories will consult during the period prior to termination to seek agreement on amendments or other actions that would avoid termination. In the event of termination, the Corps will comply with 36 CFR Parts 800.4 through 800.6 with regard to individual Undertaking actions covered by this Agreement.

F. ANTI-DEFICIENCY ACT

All requirements set forth in this PA requiring expenditure of funds by the Corps are expressly subject to the availability of appropriations and the requirements of the Anti-Deficiency Act (31 U.S.C. 1341). No obligation undertaken by the Corps under the terms of this PA shall require or be interpreted to require a commitment to expend funds not appropriated for a particular purpose. If the Corps cannot perform any obligation set forth in this PA because of the unavailability of funds, that obligation must be renegotiated among the Corps and the signatories as necessary.

Execution and implementation of this PA evidences that the Corps has satisfied its Section 106 responsibilities for all individual Undertakings of the Project, and that the Corps has afforded the ACHP an opportunity to comment on the Undertaking and its effects on historic properties.

1. Introduction

The purpose of this appendix is to document the public engagement that has been undertaken in support of the General Reevaluation Report with Integrated Supplemental Environmental Impact Statement document for the Ala Wai Canal Flood Risk Management Study. In this appendix, information on scoping, public meetings, and public comments received as part of the ongoing coordination with the public during the development of the GRR and Supplemental Environmental Impact Statement (SEIS) is documented.

1.1 Public Engagement

The public engagement strategy for the study initially included four rounds of community engagement opportunities for the community throughout the study. The first round of community engagements was to present the problem and discuss possible opportunities and potential solutions. The second round of community engagements were to discuss a more focused set of potential solutions under consideration at that stage; prior to the release of the Draft Report. The third round of community engagements were to discuss the Tentatively Selected Plan as presented in the Draft Report. The final round of community engagements was to review the Recommended Plan prior to release of the Final Report.

The public engagement strategy was then refined based on feedback received during the initial public workshops to provide additional opportunities for interested parties to provide input into the study process and the development of alternative flood risk management plans. Fundamental elements of the revised public engagement plan included:

- Continuous, virtual, asynchronous engagement through website, email, documents
- Workshops and structured meetings aligned with study milestones (hybrid – i.e., simultaneously virtual and in-person – when possible)
- Additional meetings with stakeholders for updates and focused exercises (virtual)

A website (https://www.honolulu.gov/alawai/public-engagement.html) was established that included features for receiving public input, responding to that input, as well as for providing information with regard to the study. The website served not only as an information and communication hub, but it provided a degree of transparency that was equally accessible to all stakeholders and the entire public. Information provided on the website included in general:

- Basis study information
- Public releases and announcements
- Public meeting schedule

Responsive information provided on the website included in general:

- Frequently Asked Questions (FAQs); brief answers to questions, updated regularly and as new questions were received
- Extended (1-pagee) explanations of selected complex issues and questions
- Records of public meetings and sanctioned *ex-parte* discussions
- Table/spreadsheet that tracks measures and alternatives considered, including up-to-date status and briefing notes

Features on the website for receiving input from stakeholders and the public included in general:

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

- Contact information, including active email link
- Submittable contact form
- Link to crowdsource reporter for submitting geolocated input (closed April 2022)

The following sections provide information on the public engagement opportunities, as described above, that have occurred to date as part of this study.

1.2 Scoping Notice

Per CFR 43 § 46.235, scoping is required for an environmental impact statement but not for an environmental assessment, although scoping is likely helpful during preparation of an environmental assessment. At the beginning of the feasibility phase for the Ala Wai Canal General Reevaluation Report, it was unknown as to the type of environmental document that would be necessary. Therefore, it was assumed an environmental assessment would be prepared until it was determined the proposed project may have significant, unavoidable impacts. Although an environmental assessment was assumed, scoping was still conducted. Scoping is used to engage federal, State, local, and tribal governments, and the public in the early identification of concerns, potential impacts, relevant effects of past actions and possible alternative actions.

1.3 Scoping Notice

On August 9, 2021, a scoping notice was sent via email to parties identified in the 2017 Ala Wai Canal Integrated Feasibility Study and Environmental Impact Statement. The scoping notice requested feedback from recipients on the scope of issues to be addressed in the NEPA document, any resources, or habitats of concern in the study area, information on ongoing projects in the study area, and input on management measures. The following is the scoping letter that was sent and the distribution list for the scoping notice.

PITTSBURGH, PA 15222-4186

REPLY TO
ATTENTION OF

Environmental and Cultural Resources Section

9 August 2021

To Whom It May Concern:

The U. S. Army Corps of Engineers Pittsburgh District (Corps) is in the process of preparing a General Reevaluation Report (GRR) with integrated environmental documentation for the Ala Wai Canal Flood Risk Management Feasibility Study, O'Ahu, Hawai'i. The GRR will present the results of a Corps study undertaken to identify and evaluate flood risk management problems and opportunities for the Ala Wai Watershed in O'Ahu, Hawai'i. The GRR will constitute a reevaluation of the authorized project proceeding from the 2018 Chief's Report approving the recommended plan from the 2018 Ala Wai Canal Flood Risk Management Feasibility Report, Environmental Impact Statement (EIS), and Record of Decision (ROD). The 2018 Feasibility Study and this GRR are authorized under Section 209 of the Flood Control Act of 1962 (Public Law 87-874). The sponsor for this project is the City and County of Honolulu.

The general purpose of this GRR study is to analyze alternatives to reduce the risk to life safety and economic damages from flooding throughout the entire Ala Wai Watershed (i.e., Manoa, Palolo, and Makiki drainages, including Waikiki and surrounding areas). The scope of this study is to complete a GRR of the authorized project for the Ala Wai Watershed, O'Ahu, Hawai'i. It is a single-purpose study for flood risk reduction. This reevaluation will result in a recommendation that will either update and confirm the authorized project or make a new recommendation. The study will evaluate and compare benefits, costs, and impacts (positive or negative) of alternatives including the No Action Alternative. The study will identify whether a federal interest exists to reduce economic damages and life safety risk due to flooding. The GRR will also satisfy the requirement of the National Environmental Policy Act (NEPA) to evaluate the proposed federal action.

The study area includes encompasses the Ala Wai Watershed, which is located on the southeastern side of the island of O'ahu, and includes Makiki, Manoa, and Palolo streams. All these streams drain to the 2-mile-long Ala Wai Canal, which was constructed during the 1920s to drain extensive coastal wetlands, thus allowing development of the Waikiki District. A large portion of the watershed, including most of Waikiki, is highly susceptible to flooding. Overtopping of the Ala Wai Canal has previously flooded Waikiki multiple times, including November 1965 and December 1967 storms and during the passage of Hurricane Iniki in 1992. Upstream areas are also at risk of flooding, as demonstrated by several recent events, including the October 2004 storm that flooded Manoa Valley and the March 2006 storm that flooded Makiki.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Flood management measures that are currently being considered to address the study area problems include: traditional structural measures such as channel improvement (widening, deepening, straightening), flood walls, levees, channel relocation, and wet and dry retention/detention; non-structural measures such as flood-proofing, home acquisition and relocation, structure elevation, and emergency planning; and natural and nature-based measures such as wetland retention, riparian restoration, and instream structures (e.g., riffles, cross-vanes, j-hooks, etc.). The GRR study is still within the scoping phase, and therefore the list above may not include all management measures that are ultimately considered for the project; additional measures may be considered, and measures may be removed from consideration, as the GRR study progresses.

Pursuant to compliance with the National Environmental Policy Act (NEPA) and associated environmental laws and regulations, [including the Endangered Species Act, Fish and Wildlife Coordination Act, Coastal Zone Management Act, Magnuson-Stevens Fishery Conservation and Management Act, Clean Water Act, Clean Air Act, National Historic Preservation Act] the Corps will be preparing an environmental document to analyze the potential effects of identified alternatives. At this time, we request your feedback on the scope of issues to be addressed in the environmental document, any resource or habitats of concern in the study area, information on ongoing projects in the study area, and any feedback you may have on the management measures we're considering.

Please provide your input within 30 days of receipt of this letter regarding this GRR. If you have any questions on this matter, please feel free to contact Shawna Herleth-King by email at Shawna.S.Herleth-King@usace.army.mil.

Sincerely,

Marc A. Glowczewski, PE, PMP
Chief, Planning and Environmental Branch

Ala Wai Canal Flood Risk Management Feasibility Study
Kona Moku, Honolulu, O'ahu, Hawai'i

The Department of Hawaiian Home Lands acknowledges receiving the request for comments on the above-cited project. After reviewing the materials submitted, due to its lack of proximity to Hawaiian Home Lands, we do not anticipate any impacts to our lands or beneficiaries from the project.

However, we highly encourage all agencies to consult with Hawaiian Homestead community associations and other (N)native Hawaiian organizations when preparing environmental assessments in order to better assess potential impacts to cultural and natural resources, access and other rights of Native Hawaiians.

Mahalo for the opportunity to provide comments. If you have any questions, please call Andrew H. Choy, Acting Planning Program Manager at (808)620-9481, or contact via email at andrew.h.choy@hawaii.gov.

Dear sir,

The U.S. Fish and Wildlife Service (Service) has received the request of August 9, 2021 from the U. S. Army Corps of Engineers (Corps) on a pending General Reevaluation Report (GRR) related to the Ala Wai Canal Flood Risk Management Project located in the Ala Wai watershed in Oahu, Hawaii. Herein, the Service provides response to this request in accordance with the Fish and Wildlife Coordination Act (FWCA) of 1934 [16 U.S.C. 661 *et seq*.; 48 Stat. 401]; the Clean Water Act of 1977 [33 USC 1251 et seq.; 91 Stat. 1566], as amended (CWA); and the National Environmental Policy Act of 1969 (NEPA).

Summary

As most recently proposed, this project aims to enhance flood management in the Ala Wai Canal Watershed with a series of proposed mitigation features. An underground bypass culvert is proposed to be constructed at the Woodlawn Bridge in Manoa Valley to prevent excess waters from overflowing stream banks where a sharp turn in the stream has caused historic flooding in the University of Hawaii campus area. The bypass will be designed to activate at the 2-year flood event. Construction of floodwalls and streambed excavation are proposed south of East Manoa Road Bridge to reduce potential flood impacts of local residences.

A multipurpose detention basin (MDB) is proposed for installation at Kanewai Field to temporarily hold flood waters from Manoa Stream during flood events. MDB construction will include creating a 9-foot earthen berm to hold water in, a grouted riprap inflow spillway from Manoa Stream, and a drainage pipe exit back downstream to Manoa Stream.

A larger-scale MDB is proposed for Ala Wai Golf Course. Its construction will include a 3–6 foot earthen berm around the western half of the golf course, a grouted riprap inflow from the Manoa-Palolo Drainage Canal, passive drainage back to the Ala Wai Canal, and construction of a ramp over the levee to allow for maintenance vehicle entrance.

Flood walls, to approximately 6 feet in height, are proposed to be constructed to maintain floodwaters within Ala Wai Canal. Flood walls are expected to extend from the Manoa-Palolo confluence to the Ala Wai Boat Harbor, and from Date Street southward to the canal. A pump station will be added to convey water from the Kapahulu and Diamondhead interior drainage and the golf course drainage westward through the canal. Gates will be installed to prevent flow from the Ala Wai Canal to the golf course or otherwise upstream.

A MDB is proposed at Hausten Ditch and Ala Wai Community Park. This will include a 5.5-foot-high earthen berm and a concrete wall with slide gate to prevent backflow from the Ala Wai Canal. An outlet will be constructed south of Kalakaua Bridge.

A diversion structure is proposed at the Makiki Stream outlet to alleviate backflow from Ala Wai Canal. The structure will also carry water from the stream directly to the harbor.

Comments & Recommendations

The Service notes that the focus of the project as now proposed has changed from detention of flood waters in the upper basins of Makiki, Manoa, and Palolo streams to efficient conveyance of flood waters to detention basins near the shoreline, with a modified set of flood walls along the Ala Wai Canal carried over from the former proposed design. Of the detention basins, only the one at Kanewai Park was included in the original design that was evaluated by the Service in its FWCA report of 2016. As such, most of the new project features proposed have not been subject to previous review under FWCA or NEPA.

USACE allotted our office very little time in which to evaluate these new project alternatives. In many cases, a re-design this fundamental would result in a supplementary survey and report under FWCA. The Service appreciates the internal dynamics driving USACE timelines, but does note that these USACE timelines are self-imposed, and are not necessarily legally binding on the Service.

In the present letter, our office lays out a variety of concerns and recommendations regarding the new project design. Our previous concerns related to the original project design, as articulated in our FWCA report of 2016, centered primarily on impacts to populations of ESA-listed damselfly species along upper Manoa Stream, potential barriers to longitudinal passage of diadromous biota along stream corridors, and certain aspects of legacy environmental contaminant accumulation in the detention basins.

By contrast, our current concerns include:

1) The progressive accumulation of legacy environmental contaminants, particularly termiticides used in older wood frame neighborhoods such as Manoa, in the proposed retention basins. Many of these basins are proposed to be located in parks or along the margins of the Ala Wai Golf Course,

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

in areas which are used by the general public. Such contaminants could be re-mobilized when the basins are filled during spates, and could also constitute a periodic attractive nuisance for ESA-listed waterbirds, particularly Hawaiian stilts, which frequently seek out temporarily flooded sites.

2) Potential conveyance of sediments and environmental contaminants into the Ala Wai Canal, though the Ala Wai Small Boat Harbor, and onto adjacent reefs fronting Ala Moana Park and Waikiki. The Service does not currently have sufficient information to evaluate such impacts, based on both a lack of sufficient hydrological and sediment transport modelling from USACE, and no provision of adequate time or budget to undertake any surveys that would clarify the nature and extent of the resources that might be adversely affected.

Based on these concerns, the Service offers the following recommendations in regard to the pending GRR:

Sediments, Contaminants, and Runoff

a) Sediments, urban runoff, and other contaminants are expected to build up in some areas and be released at higher flows. The associated potential risks to marine habitats are unclear. The Service recommends that the GRR model and quantify expected sediment and contaminant discharges to Ala Wai Canal, Ala Wai Marina, and adjacent marine environments.
b) The Service recommends that the Corps undertake mid to long-term monitoring of marine resources and contaminants in adjacent marine habitats, with the results reported in the GRR.
c) The Service recommends that the GRR provide clarification on location of contaminated sediment disposal.
d) The Service recommends that the GRR evaluate data on sediment organochlorine levels throughout the Manoa Stream.
e) The Service recommends that the GRR evaluate anticipated mobilization of contaminated sediments (AEP%) at expected flow levels.
f) The Service recommends that the GRR evaluate anticipated deposition of sediments in each MDB to be constructed and whether or not any associated contamination will restrict recreational activities in those areas.
g) The Service recommends that the GRR evaluate concentrations of chlordane and dieldrin in each MDB and the nearshore reef.

Woodlawn Bypass

a) The Service recommends that the GRR evaluate the possible construction of an uncovered migration route along the alignment of the previously proposed Woodlawn Bypass to provide a required migration corridor for native diadromous fish species.

Ala Wai Golf Course

a) The golf course provides a good opportunity for a buffer in case of flooding. The Service recommends that the GRR evaluate this area in the context of the recommendations listed above regarding sediments and contaminants, since they will apply to this area as well.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Makiki Diversion Culvert

a) Contaminants associated with urban runoff are anticipated to flow directly into the harbor in this section of the project. The Service recommends that the GRR provide additional information on anticipated contaminants and levels expected to reach the nearshore environment.

Conclusion

The Service concludes that the Ala Wai Canal Flood Risk Management Project is essential to mitigate future floods that could potentially cause extensive damage withing the Palolo and Manoa watersheds. The Service therefore recommends that the GRR associated with this project take into consideration the above comments and recommendations.

It should also be noted that in correspondence with the Corps over the past 12 months, the Service has requested a significant amount of supplemental information in order to clarify the concerns noted above. Most of our queries are still awaiting response. Because of the extensive re-design and addition of many new alternatives, the Service considers the impact assessment of this project under FWCA to be still ongoing, since in the absence of additional information and field studies we cannot make definitive recommendations for avoidance or minimization of impacts to trust resources. We will await the completion of the GRR to determine the extent to which it addresses these information gaps.

We appreciate the opportunity to provide input on this GRR process, and look forward to your incorporation of our comments and recommendations. If you have questions regarding our comments, please contact Aquatic Ecosystem Conservation Program biologist Jeremy Raynal (jeremy_raynal@fws.gov) or program manager Dan Polhemus (dan_polhemus@fws.gov or 808-792-9400).

Sincerely,

Hi Shawna,

The Federal Highway Administration received a letter dated August 9, 2021 from the Army Corps of Engineers regarding the General Reevaluation Report for the Ala Wai Canal Flood Risk Management Feasibility Study. As you likely already know, the City and County of Honolulu is planning the Ala Wai Bridge project, which consists of a new pedestrian and bicycle crossing of the Ala Wai Canal in the vicinity of University Avenue. The project is partially funded through Federal-aid highway funds. From what I understand, the proposed Ala Wai Bridge project design meets the USACE's criteria for the 100 year level flood protection along the Ala Wai Canal and the City and County of Honolulu has coordinated with the Army Corps of Engineers.

If you have any questions about the Ala Wai Bridge project or if there is anything that we should coordinate further on, please feel free to contact me.

Thank you!

SEP 27 2021

SUBJECT: Ala Wai Canal Flood Risk Management Feasibility Study, General Reevaluation Report

Dear Mr. Glowczewski:

The Department of Land and Natural Resources (DLNR) Office of Conservation and Coastal Lands (OCCL) has received your August 23, 2021 letter requesting feedback on the scope of issues being addressed in a Federal Reevaluation Report for the Ala Wai Canal Flood Risk Management Feasibility Study, O'ahu, Hawai'i. It is stated in your letter that the general purpose of the subject study is to analyze alternatives to reduce risk to life, safety, and economic damages from flooding throughout the entire Ala Wai Watershed. It is a single purpose study for flood risk reduction.

We appreciate the opportunity to provide comments and offer the following feedback:

- Overall, the flood management measures currently being considered as part of this project are well put together and feature innovative elements including nature-based measures, emergency planning, wet and dry retention/detention, flood proofing, and structure elevation/relocation. We suggest that you also consider use of bio enhancing materials such as ECOncrete or similarly composed materials as part of Ala Wai channel improvements and other submerged hard structures to improve marine habitat.

- It is unclear if contingencies are being included in the design that would account for increased magnitudes of sea level rise such as the NOAA "intermediate" or "intermediate-high" scenarios (i.e. are structures or other project elements designed such that they can be altered if elevated SLR magnitudes occur?). We suggest including such consideration given that the project represents a substantial addition to the city's infrastructure.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

- Local studies[1] have shown that the project area will be subject to increased flooding from various flood mechanisms in the future that are often overlooked in project development, including groundwater inundation and storm drain failure/backflow. These flood sources can occur in the absence of precipitation but are exacerbated by rainfall events such as those being considered in this study. Thus, we suggest including consideration of these flood sources as part of project development so that flooding is thoroughly addressed.

Thank you again for the opportunity to review the scope of the Ala Wai General Reevaluation Report. Should you have any questions on the matter, please feel free to contact Dr. Shellie Habel, Hawaii Sea Grant Extension Agent in the DLNR Office of Conservation and Coastal Lands at (808) 587-0049 or via email at Shellie.L.Habel@Hawaii.gov.

Sincerely,

for SAMUEL J. LEMMO, ADMINISTRATOR

RE: SHPD Migration of Submittals to the Hawaii Cultural Resource Information System (HICRIS)

DATE: November 30, 2020

Aloha,

The State of Hawaii Historic Preservation Division is in the process of moving to an online submission system. The Hawaii Cultural Resource Information System (HICRIS) will be the only way for SHPD to accept and process submittals. We are not accepting submissions currently, while we migrate the data from our existing systems to HICRIS. The transition period is from November 28 to December 16, 2020. Additional information on HICRIS and the launch date can be found on our website. http://dlnr.hawaii.gov/shpd/

William S. Moorhead Federal Building
1000 Liberty Avenue
Pittsburgh, Pennsylvania 15222-4186

Dear: Mr. Glowczewski:

Subject: General Reevaluation Report - Ala Wai Canal Flood Risk Management Feasibility Study

Thank you for the opportunity to provide comments on the General Reevaluation Report (GRR) - Ala Wai Canal Flood Risk Management Feasibility Study. The GRR notification was received by our office via memo on August 24, 2021.

It is our understanding that the U.S Army Corps of Engineers (USACE) has authorized a general reevaluation study of the Ala Wai watershed. The feasibility study will include a full reevaluation of measures and alternatives to reduce flood risk in the Ala Wai watershed. The expectation is that a new National Environmental Policy Act (NEPA) Environmental Assessment (EA) will be created based on revised recommendations and agency and public input.

The Office of Planning and Sustainable Development (OPSD) has the following comments to offer:

1. Previous Comments:
   We reference our previous comments on the proposed Ala Wai Canal watershed feasibility study, Ref. No P-15640, dated June 20, 2017. Our comments on the original feasibility study can be summarized as follows:
   a. The concept of developing an upstream debris and detention basin system as a means to protect the lower elevations of Waikīkī and its surroundings against flooding and reducing erosion and contaminated runoff is consistent with low impact development (LID). The use of

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

LID design measures are runoff and flood mitigation concepts that OPSD is an advocate for.

b. The Final Environmental Impact Statement included examinations of policies and initiatives that aligned with issues of importance to our office such as: the Hawai'i State Planning Act, Hawai'i Revised Statute (HRS) Chapter 226; and the HRS § 205A-2 objectives and policies of the Hawai'i Coastal Zone Management (CZM) Program.

The issues of concern listed in our previous comments on limiting land-based pollutants, suspended solids, and soils upstream, from being carried away via stormwater runoff, so that they do not have the devastating effects on the downstream environment is an issue of concern and an important subject matter to OPSD.

2. Coastal Zone Management Act (CZMA) – Federal Consistency
We note that the Hawai'i CZM Program completed the federal consistency review of the Ala Wai Canal flood reduction project in April 2016. The review covered the "Tentatively Selected Plan" as identified in the Draft Feasibility Study with Integrated Environmental Impact Statement (August 2015), which was submitted in support of the consistency determination. The review involved requirements for conditional concurrences specified in 15 CFR § 930.4(a),(1) through (3).

Any changes or a new preferred alternative plan for flood mitigate, watershed basin inundation controls, or promotion of water quality may necessitate further federal consistency consideration by our office.

3. Public Participation and Inclusion
Pursuant to HRS § 205A-2(c)(8) Public Participation; it is vital that the USACE and those involved with the GRR and Feasibility Study engage stakeholders, community groups, and the public in an impactful and meaningful way. OPSD concurs that incorporation of stakeholder input regarding the complex management of the Ala Wai Watershed would be beneficial to the upcoming environmental assessment.

If you have any questions or concerns regarding this comment letter, please contact Joshua Hekekia of our CZM Program at (808) 587-2845; or Debra Mendes at (808) 587-2840 on CZMA federal consistency matters.

Mr. Marc Glowczewski
Chief
Planning and Environmental Branch
Department of the Army
1000 Liberty Avenue
Pittsburgh, Pennsylvania 15222-4186

Dear Mr. Glowczewski:

Subject: Request for Comments for Pre-Assessment Consultation
General Reevaluation Report
Honolulu, Oahu, Hawaii
Tax Map Key Nos.: Various and including (1) 2-3-034: 000, 2-3-036: 000 and 2-7-036: 000

Thank you for your letter dated August 9, 2021, requesting for our comments for your General Reevaluation Report (GRR) pursuant to an upcoming preparation of a National Environmental Policy Act and additional environmental documents. The purpose of the report is to study alternatives and analyze potential effects for the Ala Wai Watershed. The GRR study was authorized due to escalating costs and lack of public support for the authorized plan recommended for implementation in a previous 2020 Final Environmental Impact Statement.

The on-going studies for the Ala Wai Watershed relating to flood risk assessment encompasses areas such as Makiki, Manoa, and Palolo Streams that drains into the 2-mile long Ala Wai Canal. A variety of flood management measures will include both structural and non-structural improvements. As an early consultation, there are no exhibits included; therefore, we are unable to determine specific State facilities that will be potentially impacted at this time.

The Hawaii Department of Transportation (HDOT) has the following comments:

1. The following discussions should be provided in the various environmental documents.

    a. A full evaluation is required on whether the proposed improvements and flooding events will have any local impacts to the nearby State highway facilities.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

2. In general, the bridges which the HDOT owns, would be affected by some of the basins which are the Interstate H-1 Freeway, King Street, Kapiolani Overpass, and the Old Waialae Road Bridges over Manoa-Palolo Stream.

    a. In the event there are increases in flows or velocities at the HDOT bridges, the HDOT would recommend mitigation to decrease the risk of erosion/scour and reduce overtopping potential at our bridge structures at no cost to the State.

3. A discussion of future timelines/phasing should also be included in the study.

4. No additional discharge of surface water run-off onto the State highway facilities right-of-way is permitted. This includes the use of the existing State drainage culverts and channels. All additional stormwater run-off shall be managed and mitigated.

If you have any questions, please contact Jeyan Thirugnanam, Systems Planning Engineer, Highways Division, Planning Branch at (808) 587-6336 or by email at jeyan.thirugnanam@hawaii.gov. Please reference file review number PS 2021-152.

Sincerely,

JADE T. BUTAY
Director of Transportation

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1.6 Scoping Public Meeting

Two virtual workshops were held in order to engage with the public on problems, opportunities, and potential solutions for the Ala Wai FRM study. The first virtual workshop was held on November 10, 2021, from 5:00 p.m. to 8:00 p.m. Hawaiian Standard Time (HST). The second virtual workshop was held on November 13, 2021, from 1:00 p.m. to 4:00 p.m. HST. Slides presented during these meetings as well as recordings of the workshop are available in their entirety at https://www.honolulu.gov/alawai/public-engagement.html. These workshops fulfilled the obligation of a scoping public meeting.

1.7 Additional Public Engagement

On January 20, 2022, from 12 p.m. to 1:00 p.m. HST a virtual meeting was held to update stakeholders on the public engagement strategy, path forward, and the study schedule. Slides presented during this meeting as well as the recording of the virtual meeting are available in their entirety at https://www.honolulu.gov/alawai/public-engagement.html.

The next four virtual workshops that were held between April 1, 2022, and April 22, 2022, were mini workshops to gather focused input on specific problems, opportunities, and solutions for the sub-watershed within the Ala Wai watershed. The first virtual workshop held on April 1, 202,2 from 12 to 1:10 p.m. HST focused on the Makiki and Palolo sub-watershed. The second virtual workshop held on April 8, 2022, from 12 to 1:10 p.m. HST focused on the Manoa sub-watershed. The third virtual workshop held on April 14, 2022, from 12 to 1:10 p.m. HST focused on the Ala Wai Canal and Lower watershed. Lastly, the fourth virtual workshop held on April 22, 2022, from 12 to 1:10 p.m. allowed an opportunity for additional discussion and a question-and-answer session. Slides presented during these virtual workshops, summary notes, as well as the recordings of the workshops are available in their entirety at https://www.honolulu.gov/alawai/public-engagement.html.

Two workshops were held in July 2022 to present the initial array of alternative plans to the public and receive feedback on the proposed initial array. The first workshop on July 26, 2022, was virtual and was held from 5:30 to 8:30 p.m. HST. The second workshop on July 28, 2022, was in-person and was held from 5:30 to 8:30 p.m. HST. Slides presented during these two workshops, summary notes, as well as the recordings of the workshops are available in their entirety at https://www.honolulu.gov/alawai/public-engagement.html.

On December 13, 2022, a virtual workshop was held to update the public on the development of the initial array of alternative plans presented in July. Slides presented during this workshop as well as the recording of the workshop are available in their entirety as https://www.honolulu.gov/alawai/public-engagement.html.

1.8 Release of Notice of Intent

As described earlier, the type of environmental document that would accompany the General Reevaluation Report for the Ala Wai Canal study was unknown at the early stages since it was still unknown if the project would have any adverse significant and unavoidable impacts to the human environment. Following feedback from scoping and public meetings/workshops held between November 10, 2021, and December 13, 2022, the decision was made that a Supplemental Environmental Impact Statement should be prepared to accompany the General Reevaluation Report. When an Environmental Impact Statement is triggered, there are certain requirements that must be fulfilled by the action agency. As discussed above under Section 1.2, scoping is required for an environmental impact statement even though scoping had been

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

conducted when the document was assumed to be an environmental assessment. Therefore, scoping requirements under CFR 43 § 46.235, had already been met. However, in addition to scoping requirements, an Environmental Impact Statement also requires the publication of a Notice of Intent in the Federal Register. The Notice of Intent is considered the start of the scoping process and has a 30-day public comment period associated with it. In addition, new NEPA regulations now require that the decision document associated with an EIS (i.e., Record of Decision) be signed within two-years of publication of the Notice of Intent to prepare an EIS. The switching of the document from an environmental assessment to an environmental impact statement essentially in the middle of the feasibility phase created some challenges because of requirements for when an EIS is triggered as well as timing on when an NOI can be published.

Therefore, although scoping had for the project had occurred between August and November 2021, the need to publish the NOI now that an EIS was being pursued prompted another scoping period in the middle of the feasibility phase. Therefore, the NOI was published in the Federal Register on February 22, 2023. The second 30-day scoping period prompted by the publication of the NOI was originally set to occur from February 22, 2023, through March 24, 2023.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1.9 Notice of Intent

Grade level or pay band equivalent	Level of education
GS–01 or Pay Band Equivalent	Enrollment in a high school diploma or General Education Diploma (GED) program.
GS–02 or Pay Band Equivalent	Completion of high school or GED diploma.
GS–03 or Pay Band Equivalent	Completion of 1 full academic year of post-high school study.
GS–04 or Pay Band Equivalent	Completion of 2 full academic years of post-high school study or an associate's degree.
GS–05 or Pay Band Equivalent	Completion of 4 academic years of post-high school study leading to a bachelor's or equivalent degree.
GS–07 or Pay Band Equivalent	Completion of 1 full academic year of graduate level education; or Eligibility under the Superior Academic Achievement Provision and completion of a bachelor's degree.
GS–09 or Pay Band Equivalent	Completion of 2 academic years of graduate level education, or a master's degree or equivalent graduate degree.
GS–11 or Pay Band Equivalent	For research positions, completion of all requirements for a master's or equivalent graduate degree. For non-research positions, completion of all requirements for a PhD or equivalent degree.

Appointments may be at the highest grade or pay band for which the participant is qualified. One full academic year of undergraduate; graduate; technical or high school education is the number of credit hours determined by the college, university or school to represent one year of full-time study. The high school curriculum must be approved by a State or local governing body. All education beyond the high school level must be accredited by an accrediting body or organization recognized by the U.S. Department of Education.

Special Provisions/or Students With Previous Related Education or Experience

Previous education and/or experience may be evaluated to determine the highest grade Level or pay band for which the student is qualified.

Dated: February 15, 2023.

Aaron T. Siegel,

Alternate OSD Federal Register Liaison Officer, Department of Defense.

[FR Doc. 2023–03601 Filed 2–21–23; 8:45 am]

BILLING CODE 5001–06–P

DEPARTMENT OF DEFENSE

Department of the Army, Corps of Engineers

Notice of Intent To Prepare a General Reevaluation Report/Supplemental Environmental Impact Statement for the Ala Wai Canal Flood Risk Management Study, Honolulu, HI

AGENCY: Department of the Army, U.S. Army Corps of Engineers, DoD.

ACTION: Notice of intent.

SUMMARY: In accordance with the National Environmental Policy Act of 1969 (NEPA), as amended, and pursuant to the Hawaii Revised Statutes (HRS) Chapter 343 (Hawaii Environmental Policy Act (HEPA)), the Pittsburgh District, U.S. Army Corps of Engineers (Corps) is preparing a draft General Reevaluation Report/Supplemental Environmental Impact Statement (GRR/SEIS) to evaluate the opportunities to reduce the risk to life, safety and economic damages from flooding throughout the Ala Wai Watershed in Oahu, Hawaii. The Ala Wai Canal Flood Risk Management Study was authorized under Section 209 of the Flood Control Act of 1962. The study was completed in 2017 and resulted in a recommendation that was subsequently authorized for construction under Section 1401 of the Water Resources Development Act of 2018 (Authorized Project). The purpose of the GRR/SEIS is to reevaluate the Authorized Project and either confirm the Authorized Project or make a new recommendation that will include modifications to the Authorized Project. The non-Federal sponsor for this study is the City and County of Honolulu.

DATES: To ensure consideration, all comments concerning the scope of the GRR/SEIS, potential alternatives, and identification of relevant information and studies must be received by March 24, 2023.

ADDRESSES: You may submit comments related to the GRR/SEIS by any of the following methods:

- *Website: https://www.honolulu.gov/alawai/contact.html.*
- *Email: alawai@honolulu.gov.*
- *Mail:* U.S. Army Corps of Engineers, Honolulu District, 230 Otake St. (Attn: POH–PPC, Ala Wai), Fort Shafter, HI 96858–5440.

FOR FURTHER INFORMATION CONTACT: For further information about this project, please visit *https://www.honolulu.gov/alawai.* You may also contact Shawna Herleth-King at 312–846–5407 or by email at: *shawna.s.herleth-king@usace.army.mil.*

SUPPLEMENTARY INFORMATION:

1. *Background:* The Corps-Hnnnlulu District received the authority to conduct the Ala Wai Canal Flood Risk Management Study under Section 209 of the Flood Control Act of 1962 (Public Law 84–874). The feasibility study's recommended plan consisted of six in-stream debris and detention basins of varying height in the upper reaches of the watershed, one standalone debris catchment structure, three multi-purpose detention basins, floodwalls along the Ala Wai Canal averaging four feet in height and an earthen levee at the perimeter of an adjacent golf course averaging seven feet in height, two pump stations to reduce the threat of interior flooding, and a flood warning system. The feasibility study determined the technical, economic, environmental, and social feasibility of the recommended plan to reduce flood risk within the Ala Wai Canal watershed of Honolulu, Hawaii.

Section 1401 of the Water Resources Development Act of 2018 (Public Law 115–270) authorized construction of the Ala Wai Canal Flood Risk Management Project, as described in the Chief's Report, (*https://www.poh.usace.army.mil/Portals/10/docs/Civil%20Works%20Sponsor%20Letters/Tab%201%20Chiefs%20Report%20Ala%20Wai%20Chiefs%20Report%20SIGNED%20(003).pdf?ver=2018-09-14-171850-833*), dated December 21, 2017, and the *Ala Wai Canal Flood Risk Management Study, Oahu, Hawaii, Feasibility Study with Integrated Environmental Impact Statement,* dated May 2017. The **Federal Register** notice (82 FR 24325, May 26, 2017) for the EIS being supplemented is available at *https://www.govinfo.gov/content/pkg/FR-2017-05-26/pdf/2017-10719.pdf.* The record

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

of decision (ROD) was signed on September 18, 2018, initiating the next phase of the study, Preconstruction Engineering and Design (PED). In 2020, an Engineering Documentation Report (EDR) provided the technical basis for modifications necessary to the Authorized Project. Subsequent analysis found that the modifications in the 2020 EDR were not cost effective and lacked the economic justification necessary for continued federal involvement. Acknowledging the need to reduce the risk to life, safety and economic damages from flooding throughout the Ala Wai Watershed in Oahu, Hawaii, the Corps is currently reevaluating the previously completed Ala Wai Canal Flood Risk Management Study in a GRR, using current planning criteria and policies. Since the GRR is reevaluating alternatives and could result in a new recommendation, NEPA documentation for the Ala Wai Canal Flood Risk Management Project will be updated.

2. *Proposed Action:* The project is undergoing a GRR to (1) redefine the flood problems and risks in the Ala Wai Watershed by updating hydrology, physical, biological, and socioeconomic conditions; (2) reevaluate alternatives for reducing flood damages in the area; and (3) reaffirm the Federal interest by recommending a plan that is economically feasible. The results of this study will be presented in the GRR/SEIS. The formulation and evaluation of alternatives, benefits and costs, and implementation requirements will be presented in the GRR/SEIS.

3. *Alternatives:* A number of project alternatives will be evaluated in the GRR/SEIS. In addition to the No Action alternative, other potential alternatives to reduce flood damages include a combination of the following components: Makiki District Park detention basin, Manoa Valley District Park detention basin, Ala Wai Golf Course detention basin, Kaimuki High School berm/floodwall, Kanaha floodwall, Woodlawn Bridge floodwall, Koali Road floodwall, and Ala Wai Canal floodwall.

4. *Scoping/Public Participation:* The GRR/SEIS will be coordinated with Federal, State, and local government agencies; Native Hawaiian organizations; local stakeholders; special interest groups; and any other interested individuals and organizations. A 30-day scoping period for Federal, State, local agencies, and non-governmental organizations was held between August 9, 2021, through September 9, 2021, when the environmental document accompanying the GRR was anticipated to be a supplemental environmental assessment. The Corps held a public meeting to discuss the scope of the draft GRR and accompanying environmental documentation on November 10 and November 13, 2021. The virtual meeting dates and times were advertised in advance on the City and County of Honolulu's Ala Wai Study Flood Risk Management website (*https://www.honolulu.gov/alawai/public-engagement.html*). The purpose of these meetings was to involve local stakeholders and the public early in the study process. The meetings collected public input regarding the study scope, historic and current problems, and potential opportunities. Based on public feedback, additional virtual workshops/meetings were incorporated into the public engagement strategy for the study. To date, additional public engagement opportunities have occurred via virtual and/or in-person workshops/meetings held on January 20, 2022, April 1, 2022, April 8, 2022, April 14, 2022, April 22, 2022, July 26, 2022, July 28, 2022, and December 13, 2022.

Based on feedback from the public and the non-Federal sponsor, the environmental document being prepared to accompany the GRR is now anticipated to be a SEIS. Therefore, this notice of intent to prepare a GRR/SEIS is initiating a new 30-day public scoping period. Due to public workshops and meetings that have already occurred, no additional scoping meetings are planned at this time. All public comments received to date regarding the GRR/SEIS, either verbally or in writing, during prior meetings, workshops, and scoping periods will be considered by the Corps in the GRR/SEIS.

5. *Anticipated Impacts, Permits, and Authorization:* The GRR/SEIS will analyze the full range of impacts, both beneficial and negative, of the alternatives. Potentially significant issues to be analyzed include impacts to water quality, biological resources, endangered and threatened species and their habitats, cultural resources, and visual resources. Other impacts that will be analyzed include geology, seismicity, and soils; surface water resources; hydrology and hydraulics; land use; recreation; hazardous and toxic waste; air quality; noise; traffic and transportation; public health and safety; public services and utilities; socioeconomics; and environmental justice. Anticipated permits and authorizations include water quality certification and Coastal Zone Consistency Determination. In addition, many other Federal, State, and local authorizations will be required for the Project. Applicable Federal laws include NEPA, the Endangered Species Act, Fish and Wildlife Coordination Act, Magnuson-Stevens Fishery Conservation and Management Act, Marine Mammal Protection Act, Coastal Zone Management Act, National Historic Preservation Act, and the Clean Water Act.

6. *Public Comment Availability:* Comments received in response to this solicitation, including names and addresses of those who comment, will be part of the public record. Comments submitted anonymously will be accepted and considered. Before including your address, phone number, email address, or other personal identifying information in your comment, be advised that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

7. *Study Schedule:* The Draft GRR/SEIS is currently estimated to be available to the public in Summer 2023, with a 45-day public review and comment period following release of the draft document.

Kimberly A. Peeples,

Brigadier General, U.S. Army, Commander, Great Lakes and Ohio River Division.

1.10 Extension of NOI Public Comment Period

Due to public feedback, the 30-day public comment period prompted by the publication of the NOI was extended from an original end date of March 24, 2023, to May 8, 2023.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1.11 Notice of Intent Extension

include changes so minor (*e.g.*, reduction in pile size) that the changes do not affect the previous analyses, mitigation and monitoring requirements, or take estimates (with the exception of reducing the type or amount of take).

(2) A preliminary monitoring report showing the results of the required monitoring to date and an explanation showing that the monitoring results do not indicate impacts of a scale or nature not previously analyzed or authorized.

Upon review of the request for renewal, the status of the affected species or stocks, and any other pertinent information, NMFS determines that there are no more than minor changes in the activities, the mitigation and monitoring measures will remain the same and appropriate, and the findings in the initial IHA remain valid.

Dated: March 20, 2023.

COMMITTEE FOR PURCHASE FROM PEOPLE WHO ARE BLIND OR SEVERELY DISABLED

Procurement List; Change

AGENCY: Committee for Purchase From People Who Are Blind or Severely Disabled.

ACTION: Change to the Procurement List.

SUMMARY: This action changes service additions to the Procurement List that are furnished by nonprofit agencies employing persons who are blind or have other severe disabilities.

DATES: *Comments must be received on or before:* April 21, 2023.

ADDRESSES: Committee for Purchase From People Who Are Blind or Severely Disabled, 355 E Street SW, Washington, DC 20024.

FOR FURTHER INFORMATION CONTACT: Michael R. Jurkowski, Telephone: (703) 785–6404, or email *CMTEFedReg@AbilityOne.gov.*

SUPPLEMENTARY INFORMATION:

Additions

If the Committee approves the change to the Procurement List, the entities of the Federal Government identified in this notice will be required to procure the service(s) listed below from nonprofit agencies employing persons who are blind or have other severe disabilities.

Regulatory Flexibility Act Certification

I certify that the following action will not have a significant impact on any small entities. The major factors considered for this certification were:

1. The action did not result in any additional reporting, recordkeeping, or other compliance requirements for small entities other than the nonprofit agencies furnishing the services to the Government.
2. The action did result in authorizing nonprofit agencies to furnish the products to the Government.
3. There were no known regulatory alternatives which would have accomplished the objectives of the Javits-Wagner-O'Day Act (41 U.S.C. 8501–8506) in connection with the products added to the Procurement List.

End of Certification

The following is the intended change to the service currently on the Procurement List:

Service(s)

Service Type: Facilities Maintenance Services

Mandatory for: U.S. Army, Department of Public Works, Fort Knox, KY

The Committee for Purchase From People Who Are Blind or Severely Disabled (Committee), is announcing that Skookum Contract Services and Professional Contract Services, Inc. were recommended to the Committee to serve as mandatory sources for the Total Facilities Maintenance (TFM) Pilot Project at Ft. Knox, KY. The short-term goal of this Pilot is to allocate the TFM requirement, utilizing enhanced competitive procedures. The long-term goal is to incorporate lessons learned from the Pilot into the Committee's regulatory and policy framework to promote greater Program transparency, spur innovation, and enhance employment opportunities for blind and other significantly disabled individuals.

The TFM requirement consists of approximately 109,054 acres and 2,326 buildings and covers several functional areas, such as building and structure maintenance, snow and ice removal, landscaping services, utility system maintenance, and others. The current requirement also includes custodial services, which is excluded from the Pilot and will become a separate, stand-alone addition for the currently performing NPA. SourceAmerica is the incumbent TFM contractor, but the follow-on requirement will transition from SourceAmerica to one of the recommended NPAs, using a two-phase evaluation process.

Phase I began mid-January 2023 with SourceAmerica's issuance of an Opportunity Notice, which established the criteria to participate in the competition. After responses were received, SourceAmerica assessed and recommend two NPAs to the Committee for further considerations. If the Committee determines this requirement is suitable for transfer in accordance with 41 CFR 51–2.4, the Committee will authorize one or both NPAs for addition to the Procurement List as mandatory sources, and conclude Phase I. After which, the Committee will publish a final notice formally identifying the NPA(s) authorized to compete in Phase II.

The Phase II evaluation will assess the NPAs on technical capability, past performance, and price. The SourceAmerica Phase II Evaluation Team will assess the NPAs against the stated evaluation factors. The U.S. Army's Installation Management Command and the Army's Mission and Installation Contracting Command will provide technical support to SourceAmerica throughout the Phase II evaluation process. SourceAmerica will select the NPA that can provide the best overall solution to the Army at the conclusion of Phase II.

Michael R. Jurkowski,

Acting Director, Business Operations.

Department of the Army, Corps of Engineers

Notice of Intent To Prepare a General Reevaluation Report/Supplemental Environmental Impact Statement for the Ala Wai Canal Flood Risk Management Study, Honolulu, HI

AGENCY: Department of the Army, U.S. Army Corps of Engineers, DoD.

ACTION: Notice of Intent; extension of public comment period.

SUMMARY: The U.S. Army Corps of Engineers, Pittsburgh District, is extending the public comment period for the Notice of Intent (NOI) to Prepare a General Reevaluation Report/Supplemental Environmental Impact Statement for the Ala Wai Canal Flood Risk Management Study, Honolulu, HI. The NOI was published in the **Federal Register** on Wednesday, February 22, 2023. The public comment period for the NOI was originally scheduled to end on Friday, March 24, 2023. The U.S. Army Corps of Engineers is extending the public comment period by 45 days and will consider comments received through Monday, May 8, 2023.

DATES: The deadline for receipt of comments on the NOI published in the **Federal Register** on February 22, 2023 (88 FR 10880) is extended to May 8, 2023.

ADDRESSES: You may submit comments related to development of the General Reevaluation Report/Supplemental Environmental Impact Statement by any of the following methods:

- *Website: https://www.honolulu.gov/alawai/contact.html.*

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

DEPARTMENT OF DEFENSE

Department of the Navy

Certificate of Alternate Compliance for USS NANTUCKET (LCS 27)

AGENCY: Department of the Navy (DoN), Department of Defense (DoD).

ACTION: Notice of issuance of Certificate of Alternate Compliance.

SUMMARY: The U.S. Navy hereby announces that a Certificate of Alternate Compliance has been issued for USS NANTUCKET (LCS 27). Due to the special construction and purpose of this vessel, the Admiralty Counsel of the Navy has determined it is a vessel of the Navy which, due to its special construction and purpose, cannot comply fully with the navigation lights provisions of the International Regulations for Preventing Collisions at Sea, 1972 (72 COLREGS) without interfering with its special function as a naval ship. The intended effect of this notice is to warn mariners in waters where 72 COLREGS apply.

DATES: This Certificate of Alternate Compliance is effective March 23, 2023 and is applicable beginning March 15, 2023.

FOR FURTHER INFORMATION CONTACT: Lieutenant Commander Joel White, JAGC, U.S. Navy, Admiralty Attorney, Office of the Judge Advocate General, Admiralty and Claims Division (Code 15A), 1322 Patterson Ave. SE, Suite 3000, Washington Navy Yard, DC 20374–5066, 619–553–0356, or *admiralty@navy.mil.*

SUPPLEMENTARY INFORMATION: Background and Purpose. Executive Order (E.O.) 11964 of January 19, 1977 and 33 U.S.C. 1605 provide that the requirements of 72 COLREGS as to the number, position, range, or arc of visibility of lights or shapes, as well as to the disposition and characteristics of sound-signaling appliances, shall not apply to a vessel or class of vessels of the Navy where the Secretary of the Navy shall find and certify that, by reason of special construction or purpose, it is not possible for such vessel(s) to comply fully with the provisions without interfering with the special function of the vessel(s). Notice of issuance of a Certificate of Alternate Compliance must be made in the **Federal Register**.

In accordance with 33 U.S.C. 1605, the Admiralty Counsel of the Navy, under authority delegated by the Secretary of the Navy, hereby finds and certifies that USS NANTUCKET (LCS 27) is a vessel of special construction or purpose, and that, with respect to the position of the following navigational lights, it is not possible to comply fully with the requirements of the provisions enumerated in the 72 COLREGS without interfering with the special function of the vessel:

Annex I, paragraph 2(a)(i), pertaining to the vertical position of the forward masthead light; Annex I, paragraph 3(a), pertaining to the horizontal position of the forward masthead light; and Annex I, paragraph 3(a), pertaining to the horizontal separation between the forward and aft masthead lights.

The Admiralty Counsel of the Navy further finds and certifies that these navigational lights are in closest possible compliance with the applicable provision of the 72 COLREGS.

Authority: 33 U.S.C. 1605(c), E.O. 11964.

Dated: March 20, 2023.

A.R. Holt,

Lieutenant Commander, Judge Advocate General's Corps, U.S. Navy, Federal Register Liaison Officer.

BILLING CODE 3810–FF–P

DEPARTMENT OF EDUCATION

President's Board of Advisors on Historically Black Colleges and Universities

AGENCY: U.S. Department of Education, President's Board of Advisors on Historically Black Colleges and Universities, Office of Secretary, U.S. Department of Education.

ACTION: Announcement of an open meeting.

SUMMARY: This notice sets forth the agenda for the April 5, 2023, hybrid meeting of the President's Board of Advisors on Historically Black Colleges and Universities (Board) and provides information to members of the public about how to attend the meeting, request to make oral comments at the meeting, and submit written comments pertaining to the work of the Board.

DATES: The Board meeting will be held on April 5, 2023 from 10 a.m. to 4 p.m. E.D.T. on the campus of Norfolk State University, 700 Park Avenue, Norfolk, Virginia 23504 in the Norfolk State University Student Center, Dorothy B. Brothers Auditorium, Room 149. The public may also join the meeting virtually at *https://ems8.intellor.com/login/847260,* join the Zoom event and follow the prompts to connect audio by computer or utilize the "call me" feature for audio by telephone.

FOR FURTHER INFORMATION CONTACT: Sedika Franklin, Associate Director/Designated Federal Official, U.S. Department of Education, White House Initiative on Historically Black Colleges and Universities, 400 Maryland Avenue SW, Washington, DC 20204; telephone: (202) 453–5634 or (202) 453–5630, or email *sedika.franklin@ed.gov.*

SUPPLEMENTARY INFORMATION:

The Board's Statutory Authority and Function: The Board is established by 20 U.S.C. 1063e (the HBCUs Partners Act) and Executive Order 14041 (September 3, 2021) and is continued by Executive Order 14048 (September 30, 2021). The Board is also governed by the provisions of 5 U.S.C. Chapter 10 (Federal Advisory Committees), which sets forth standards for the formation and use of advisory committees. The purpose of the Board is to advise the President, through the White House Initiative on Historically Black Colleges and Universities (Initiative), on all matters pertaining to strengthening the educational capacity of Historically Black Colleges and Universities (HBCUs).

The Board shall advise the President in the following areas: (i) improving the identity, visibility, and distinctive capabilities and overall competitiveness of HBCUs; (ii) engaging the philanthropic, business, government, military, homeland-security, and education communities in a national dialogue regarding new HBCU programs and initiatives; (iii) improving the ability of HBCUs to remain fiscally secure institutions that can assist the Nation in achieving its educational goals and in advancing the interests of all Americans; (iv) elevating the public awareness of, and fostering appreciation of, HBCUs; (v) encouraging public-private investments in HBCUs; and improving government-wide strategic planning related to HBCU competitiveness to align Federal

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

1.12 Hawaii Environmental Protection Act

The SEIS being prepared for the General Reevaluation Report as required by NEPA will also be a joint Hawaii Environmental Protection Act (HEPA) as well. Like a NOI, HEPA requires the submittal of an EIS Preparation Notice (EISPN) to OEQC for publication in *The Environmental Notice*. The EISPN, like the NOI, undergoes a 30-day comment period. The consultation process of the EISPN affords agencies, organizations, and individuals an opportunity to request to become a consulted party in the preparation of an EIS. The EISPN for the General Reevaluation Report was submitted to OEQC and was published in the April 8, 2023, The Environmental Notice. Comments related to the EISPN were accepted between April 8, 2023, and May 8, 2023, although comments outside of this period have also been accepted by the Ala Wai Project Delivery Team and taken into consideration in the development of the GRR and SEIS. A virtual EIS Public Scoping Meeting as required by HEPA was held on Monday, April 24, 2023, from 5:30 to 6:45 p.m. HST.

The City and County of Honolulu and U.S. Army Corps of Engineers (USACE) are preparing a General Reevaluation Report / Supplemental Environmental Impact Statement (GRR/SEIS) to reevaluate the effects potential rainfall and flood events may have on the Ala Wai Watershed on O'ahu, Hawai'i. This project includes re-evaluations of ways to improve public health and safety, and opportunities that can reduce economic damages.

The original Ala Wai Canal Flood Risk Management Study was completed in 2017 and resulted in a recommendation that was subsequently authorized for construction under Section 1401 of the Water Resources Development Act of 2018 (Authorized Project). The purpose of the GRR/SEIS is to reevaluate the Authorized Project and either confirm original recommendations or provide new or modified Authorized Project recommendations.

Status	Finding of No Significant Impact (FONSI) determination

Waimānalo Health Center (WHC) is proposing a new, one-story health care facility to replace existing health care facilities on the project site. In 2015, the Department of Land and Natural Resources awarded a 65-year lease to the Applicant. The new facility will house the programs and services that WHC currently provides at the project site. WHC's project includes improvements to site infrastructure and the reconfiguration of the parking lot to increase patient parking space. Tree removal will occur to allow equipment to access and demolish old buildings. WHC intends to operate and deliver services to its patients during the various phases of demolition and construction.

Sustainable building design concepts will be utilized in the design and construction of the new facility. The recent pandemic provided opportunities to adjust waiting and gathering areas to achieve safe distancing requirements; the design of the proposed facility will incorporate outdoor space considerations.

Subject: Draft Supplemental EIS for Ala Wai Canal Flood Risk Management

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

The U.S. Army Corps of Engineers's Supplemental Environmental Impact Statement should disclose the data and the assumptions that were relied upon in rejecting management of the watershed to reduce storm runoff volumes. USACE has repeatedly claimed that management of the forest would not sufficiently reduce runoff from larger storm events, but has refused to reveal (a) how much runoff could be reduced through better management of the forest and (b) the assumptions and data that USACE has relied upon to reach its conclusion. Many studies have revealed the benefits of diverse, native forest compared to forests dominated by alien species.

The SEIS should also disclose the impact of debris coming down from the watershed (from albizia and other non-native species) and blocking both streams and the mitigation measures. How will tree branches clog detention basins? How will tree branches clog the area that water flows (under bridges, through culverts etc.)? How does clogging affect the modeling? How does USACE plan to address the massive amounts of debris that will flow within the streams?

USACE should disclose what will happen to the waters retained on the mauka side of the Ala Wai canal that currently flow makai, but which would be blocked by (a) the walls and (b) higher profile of water in the Ala Wai canal that is raised by the wall on the makai side of the Ala Wai canal. How much more water will flood McCully/Moiliili with the walls versus without them.

Has USACE looked at the alternative of getting Waikiki buildings to move vulnerable elements (such as generators) to higher floors?

What threatens Waikiki more, temporary flooding from rare storm events or long-term flooding from sea level rise?

Finally, USACE should disclose the assumptions and data behind its economic modeling of the damage to Waikiki from flooding. Are the calculations based on the loss of revenue generated by tourist visits, or just damage to buildings themselves? Which buildings does USACE expect will be damaged? Are those buildings currently insured by flood insurance?

Subject: Hawaii – Supplemental Environmental Impact Statement (SEIS) for the Ala Wai Canal Flood Risk Management Study in Honolulu.

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Aloha,

As a paddler and the former President of the Friends of Kamehameha Canoe Club located on the Ala Wai at the McCully Bridge, I am distressed the this issue with USACE continues without transparency and lack of LISTENING to community input. Are they so desparate for the funds that they will do anything to push the project forward?

It is very clear from the wording that USACE has notified the unions and is seeking their support to push the supplement through. This notice does not appear on either the city or USACE website nor was it sent out on the email list that is used to notify the public of the zoom meetings.

If USACE is going to do another SEIS, these are some questions that MUST be answered:

* Disclose the data and the assumptions that were relied upon in rejecting management of the watershed to reduce storm runoff volumes. USACE still has not revealed how much runoff could be reduced by better forest management practices.
* SEIS should disclose impact of debris from watershed on mitigation measures.
* What will happen to waters retained on mauka side of Ala Wai canal which would be impeded by planned walls?
* How much more water will flood McCully/Moilili with walls versus without walls?
* What about following the 2015 city study that states buildings in Waikiki have to move their infrastructure up to avoid sea level rise? Is USACE recommending this? How would this affect any flood plans?
* What is economic modeling based on? Loss to infrastructure? Loss to tourism? Which buildings will be damaged? Do they have flood insurance?

This action is irresonsible, lacks transparency, and has NOT involved the community that will be affected. There is clearly political maneuvering behind the scenes. This needs to stop.

Mahalo for receiving my testimony. Please be responsible to your constituents, the home owners and tax payers of Honolulu.

Subject: USACE planning Supplemental EIS for Ala Wai

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Aloha.

I am writing to convey my disappointment with the push of this project to the unions.

As an affected party, I DO NOT SUPPORT this project.

Basins in the upper reaches of the watershed pose a serious danger to my property and family. Myself and members of my community have shared our concerns with this part of the project since we were first made aware of it by our neighborhood board. Since then, this project ,as it was incepted, is still being pushed with disregard to those who will be daily and directly impacted by construction of the basins in our community.

Particularly, I am concerned with the elevated danger the upper basins pose to my property due to high water levels and debris. I have lived in upper Palolo for over 40 years along Palolo stream. Every time it rains in the back of the valley, water levels increase significantly in the stream in my backyard from 1 foot to over 4 feet. This is with the free flow of water and without the basin. The natural movement of the water over the years has been significant as I have seen boulders the size of cars moved down river. An upper basin will dramatically change the dynamics of water flow, volume, and speed. As my home and property front the stream, I am extremely concerned for my family's safety. I can't help but be reminded of the devastation caused by Kaloko damn and what that could mean for my community in upper Palolo and for those downstream of me. I am at peace in my home knowing that the natural flow of the stream has kept my family safe for decades.

I encourage future planning to be implemented in Waikiki and not upstream where the people of the island live. Local peoples safety, in the affected communities, will be affected daily by this project. Whereas, Waikiki, built on swamp lands and having always had water issues, will not have this dangerous and intrusive construction in their backyards. I find that huge disparity extremely upsetting as the quality of life for local people are being sacrificed for peace of mind for Waikiki. We all need to feel safe and secure in our homes.

If a basin needs to be constructed, build it on city property downstream at the Ala Wai golf course, or in the city parks.

Thank you for the opportunity to share my concerns and for your thoughtful consideration of the impact this project has on the local community.

With appreciation,

Lise Vaughan-Sekona

alawai@honolulu.gov

Attention: POH-PPC, Ala Wai

Dear Ms. Herleth-King:

SUBJECT: Notice of Intent To Prepare a General Reevaluation Report/Supplemental Environmental Impact Statement for the Ala Wai Canal Flood Risk Management Study, Honolulu, Hawaii

The Department of Transportation Services (DTS) is actively coordinating with the U.S. Army Corps of Engineers (USACE) on the Ala Wai Flood Risk Management Study (Study). The DTS' representative attends weekly Study coordination meetings with the USACE, participates in the USACE's Study public meetings, and coordinates the DTS' communications and projects with the USACE.

The DTS currently has two ongoing projects in the Study area, (1) the Ala Wai Boulevard Complete Streets Project, located between Kapahulu and Kalakaua Avenues, and (2) the Ala Wai Bridge Project, spanning the Ala Wai Canal at Kalaimoku Street. The USACE must ensure ongoing coordination between the DTS projects and the Study's flood risk management measures.

Should you have any questions, please contact Greg Tsugawa, of my staff, at (808) 768-6683.

Very truly yours,

J. Roger Morton
Director

Subject: Ala Wai NOI

Aloha,

Councilmember Say met with a couple of concerned residents re: the lack of public outreach for the NOI public comment period. I wanted to confirm that the information on the extension of the public comment period is accurate and have a couple additional questions:

1. If the public comment period extends through May, does that move the expected SEIS publication past summer 2023, and if so, what is the new ETA?

2. After the 45-day comment period on the GRR/SEIS, what is the timeline that follows and which agencies are involved in decision making moving forward from there?

Extended public comment period for Notice of Intent to prepare an Environmental Impact Statement

We have published a Notice of Intent (NOI) to prepare an Environmental Impact Statement (EIS) in the Federal Register, here:

Blockedhttps://www.federalregister.gov/documents/2023/02/22/2023-03622/notice-of-intent-to-prepare-a-general-reevaluation-reportsupplemental-environmental-impact-statement

The Federal Register currently states that the public comment period for this NOI closes on March 24th. However, we will continue to accept public comments through May 8 via the following channels:
o Website:
Blockedhttps://www.honolulu.gov/alawai/contact.html<Blockedhttps://www.honolulu.gov/alawai/contact.html>.
o Email: alawai@honolulu.gov<mailto:alawai@honolulu.gov>.
o Mail: U.S. Army Corps of Engineers, Honolulu District, 230 Otake St. (Attn: POH-PPC, Ala Wai), Fort Shafter, HI 96858-5440.

Subject: SEIS

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

The manner in which the notification of USACE's intent to do a Supplemental Environmental Impact Statement (SEIS) was done once again showcases the disregard for the general public that was a main complaint in the earlier project. After many asks to USACE when this new study started, an email list was developed on the alawai.gov site for the public to sign up for notifications about meetings and other developments in the study. Yet the notice of filing for an SEIS did not get sent out.

Instead, the public was left to find out about it thru a letter that was sent out to union members encouraging them to write in to support this project because it will create jobs. It was only by chance that the public was forwarded this letter and thus found out about the project. Though unknown how the unions found out, taking the high road we can hope they found out thru a service which monitors the federal register rather than suspecting USACE sent them the notice urging them to support the study. But once again USACE has broken the trust it has so carefully been working on these past two years to build up with it's zoom meetings.

This intent to prepare an SEIS states that it will either reconfirm the original project – which the public thought had been taken out of consideration – or make a new recommendation. The thought of the original project being resurrected is mind boggling as for the past two years the public on the zoom meetings has been assured that it would not be.

USACE has stated that it will announce it's hybrid plan in June or July. Why is an SEIS being started ahead of that announcement? No attempt to explain to the public the process or reasoning has been made.

Until recently there was not even a notice on the alawai.gov site about this intent to file. Now there is a link with a notice the initial date of May 24 to submit testimony has been pushed back to May 8.

There is certainly now time for USACE to schedule a zoom or have the DDP hold an in person meeting with the public to explain what is going on and thus be able to submit informed testimony.

Mahalo,

Sidney Lynch

To Whom It May Concern,

Thank you for the opportunity to provide comments related to the General Reevaluation Report/Supplemental Environmental Impact Statement (GRR/SEIS) for the Ala Wai Canal Flood Risk Management Study, Honolulu, HI. I would like to express my concerns regarding the evaluation of the Mānoa Valley District Park detention basin listed as a project alternative in the GRR/SEIS.

The Mānoa Valley District Park is the second most used city park on Oahu, used by hundreds of Mānoa residents on a daily basis. On weekends, hundreds more citizens from outside the district use the park for a myriad of events; sports activities, senior citizen programs, open markets, and community gardening. Placing a detention basin with a six-foot high berm or excavation of the ground six-feet deep would create serious safety concerns for park users.

The Mānoa Neighborhood Board recently adopted a resolution opposing any flood control plan that requires the construction of a detention basin at Mānoa Valley District Park. I urge the USACE to carefully evaluate the safety and social impact on the community at large and address the potential flooding issue without the use of the park.

Alternative 2B.3, the Conveyance Plan, would seem to address the flooding problem in Mānoa without touching the park. The removal of albizia and non-native species which clog the streams and better routine removal of vegetation in Mānoa Stream, in addition to the conveyance method, may adequately protect Mānoa Valley residents and property in the event of a twenty-five-year to fifty-year storm.

RESOLUTION OPPOSING ANY FLOOD CONTROL PLAN THAT REQUIRES THE CONSTRUCTION OF A DETENTION BASIN AT MANOA VALLEY DISTRICT PARK

Mānoa Neighborhood Board No. 7
February 1, 2023

WHEREAS, the Ala Wai Watershed is an area of Honolulu that is an ahupua'a, from the mountains to the sea, in this case, from the Ko'olau ridge line to the ocean from Kaka'ako to Diamond Head and encompasses Makiki, Mānoa, and Pālolo Valleys; and

WHEREAS, in the Fall of 2018 Congress appropriated funds for the construction of the Ala Wai Flood Risk Management Project ("Project") to be supervised by the United States Army Corps of Engineers ("Army Corps"); and

WHEREAS, this Board passed two resolutions concerning the Project, the first in February 2019 asking that the Project be put on hold, and the second in December of 2020 requesting that the Army Corps seriously consider alternatives to its second version of the Project; and

WHEREAS, since neither the first nor the second version of the Project survived scrutiny, in November of 2021 the Army Corps embarked on a process to develop a scaled-down Project, one geared toward a twenty-five-year flood instead of a 100-year flood, this third version being labeled the Ala Wai Flood Risk Management General Reevaluation Study (GR) and for which the Army Corps is receiving up to $3 million in Federal funds; and

WHEREAS, the Army Corps held meetings and workshops as part of this GR in January, April, July, and December of 2022; and

WHEREAS, as of December 2022 there are four Alternatives (one Alternative is to do nothing) that have survived the screening process; and

WHEREAS, some measures may be found in more than one Alternative; and

WHEREAS, one feature of two of the three remaining Alternatives—Alternative 1, the Storage Plan, and Alternative 5, the Hybrid Plan--is a detention basin on the grounds of Mānoa Valley District Park; and

WHEREAS, the one plan without the Mānoa Valley District Park detention basin is Alternative 2B, the Conveyance (using Floodwalls) Plan, which has floodwalls at Kahana, Woodlawn Bridge, Koali Road, and the Ala Wai Canal, a detention basin at Makiki District Park, and pumps and flap gates; and

WHEREAS, at the December 2022 meeting, an Army Corps representative stated that the Mānoa Valley District Park detention basin could consist of a six-foot high earthen berm or excavation of the Park six feet deep or any combination of wall and excavation; and

WHEREAS, this detention basin would be constructed with one berm along Mānoa Stream ma kai of Kahaloa St. and then one berm parallel to Lowrey Ave. between the park and a row of residences; and

WHEREAS, the Mānoa Valley District Park is used by hundreds of Mānoa residents on a daily basis; and

WHEREAS, two baseball fields could potentially be in the excavated area; and

WHEREAS, residents along Lowrey Ave. could potentially have their backyard view of the Park obstructed by a six-foot berm; and

WHEREAS, on several occasions this Board has invited the Army Corps to make a presentation to the Board concerning the Mānoa Valley District Park detention basin; and

WHEREAS, the Army Corps has neither replied to this Board's requests nor made a presentation; and

WHEREAS, the Army Corps plans to release a Draft Report in May or June of this year and is soliciting comments during this period on its proposed alternative plans; now therefore,

BE IT RESOLVED that the Mānoa Neighborhood Board no. 7 urges the Army Corps to select a plan for Ala Wai flood control that does not involve the construction of a detention basin at Mānoa Valley District Park; and

BE IT FURTHER RESOLVED that copies of this resolution be sent to the Governor and Lieutenant Governor of the State of Hawai'i; to Senators Brian Schatz and Mazie Hirono; to Congressional Representatives Ed Case and Jill Tokuda; to the United States Army Corps of Engineers; to each member of the Hawai'i State Legislature; to the Mayor of the City and County of Honolulu; to the City's Department of Design and Construction; and to each member of the Honolulu City Council.

The Manoa Neighborhood Board No. 7 PASSED this resolution
By UNANIMOUS vote of 15-0-0
at the Wednesday, February 1, 2023 Regular Meeting.

To whom it may concern,

The submit formal comment feature on the federal register website is not functional and indicated email as a viable way to submit comment.

Comments:

Sufficient study and investigation has been conducted of the flood risks. Dialogue and alternative solutions are what is called for. If the GRR/SEIS is the best vehicle for this, then proceed. My concern is it is wasting tax dollars on more investigations and paperwork when engineered solutions in dialogue with the community is what's needed. An EA should be sufficient to proceed.

Subject: Comments concerning an SEIS for the Ala Wai project

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

I have attached comments concerning a possible SEIS for the Ala Wai Flood Risk Management Project.

Thank you.

Elton Fukumoto
Manoa Resident

United States Army Corps of Engineers
City and County of Honolulu
Department of Design and Construction

Dear Sir or Madam:

I am providing comments on the proposed flood control measures in the Ala Wai watershed during this 30-day scoping period for the draft Supplemental Environmental Impact Statement (SEIS) as set out in the *Federal Register* on February 22, 2023.

First, I think that the so-called Authorized Project, which is a combination of the first two versions, should not be the version selected because it is not within the original budget and does not do what it was supposed to do with respect to flood control. Second, my main point about the alternatives you are considering is that you should not construct a detention basin on the grounds of Manoa Valley District Park.

I wish we knew more about the height of the berms or depth of excavation planned, but since you have not provided any details about these features, I can only conclude at this time that any construction on Park grounds would be unwelcome.

Because hundreds of Manoa residents use the Park every day, this flood control measure will make the project overall quite unpopular. And not only with Manoa residents since people from outside the Valley use the Park on weekends.

Because flood control for Manoa is needed, please consider giving priority to your Conveyance Plan, perhaps with albizia control and better stream maintenance added. You know, much of the flooding can be lessened as long as the channels under the bridges are not clogged with albizia debris. In the old days, the City would position a crane on the Lowrey Ave. bridge to prevent debris build up at that point.

Thank you for taking comments.

Sincerely,

Elton Fukumoto
Manoa resident

Aloha, I have not been following the project as actively I would prefer, but I am aware of some of the solutions which seem to make much sense but are being rejected. For example, having a second outlet for the canal towards Diamond Head as originally planned, in my opinion, has great potential. It would not only to increase the outflow but increase the recreational aspect and speed up the cleanliness of the canal. I understand that the reason it is being ruled out is because it will not help with outflow; how is this true? I live near the diamond head end of the canal, and I would like to see it flow out through our direction.

v/r

Tim

Subject: Public Comment on Ala Wai flood control - deadline for comment May 8, 2023

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Here's a novel idea -- Waikiki's problems are solved IN WAIKIKI.

Why are we trying to fight nature? Use former wetlands like the vast Ala Wai golf course to handle 50 and 100 year floods. Let the hotels and condos, which should have never been built on wetlands in the first place, help fund modifications to channel/control floodwater and golf course repairs needed when damage occurs.

We can also:

1. reduce stormwater when it hits the ground by using the building code to compel commercial and residential properties to pave ALL flat surfaces with permeable materials.
2. tax property owners for every square foot of excessive impermeable lot coverage (e.g., the 2019 code requirement of 25% should be retroactive to ALL commercial and residential properties).
3. use Stormwater tax and fine revenues to fund permeable roadways and incentives/rebates for homeowners to capture rainwater as they are able.
4. dredge and maintain the Ala Wai so that it works optimally
5. install low energy-use impellers to draw water down the Alawai and increase flow

Two of the truly terrible ideas I've heard bandied about include sacrificing the Pal Eldredge baseball complex at Manoa district park for a retention basin (and another one in Palolo). Or, almost as bad, cutting through Kapiolani Park Trust land to create a second outflow near Kapahulu.

Please consider that in essence, Waikiki landowners are hoping to place the cost of their investment risk on the backs of mauka neighborhoods. The folks in Manoa and Palolo should not bear costs that belong to condo and hotel owners. I am STRONGLY against any part of Manoa district park being taken for the purpose of solving the problems at the Ala Wai/Waikiki.

RE: Ala Wai Canal Flood Risk Management Project--Supplemental Determination and EIS Preparation Notice

Thank you for the opportunity to provide comments regarding the above project.

A detention basin was incorporated in US Army Corps of Engineers (USACE) plans for a portion of the Chinese Cemetery property in Mānoa, but according to a local newspaper article, eliminated. The USACE previously noted regarding this site: *"The intent of this proposed retention basin was to capture flood waters from mauka areas of Manoa that would normally be channeled through Woodlawn Ditch. The water would be retained for a time and gradually released into Woodlawn Ditch which connects with Manoa Stream south of the Proposed Project Site. This would reduce the chance that flood waters from mauka Manoa would overwhelm Manoa Stream and eventually the downstream Ala Wai Canal."*

There are new developments since the USACE purported eliminated this site from its plan. First, the original 2017 USACE plan evaluated a much smaller footprint for the detention basin as to what could now be possible given the landowner's (Lin Yee Chung Association or LYCA) desire to remove the existing structures in search of higher recurring lease revenues. Second, the USACE could also evaluate rerouting East Manoa Road (see attached) since access to these homes would no longer be required. The City/USACE could lease the property from the LYCA. Without factor in rent increases, $15,000/month would total $11.7 million over 65 years – a pittance for the protection provided by such a facility and a great investment. While a lease model may not be the City's or USACE's desired landholding mechanism, the fact that LYCA is a nonprofit with a narrow purpose to maintain the cemetery, fee simple acquisition of the property would not be necessary. A discussion should at least take place to see if a meeting of the minds would result.

I suggest that elimination of this detention basin be reevaluated and a newer, larger, detention basin that would improve public health and safety, while reducing economic damages be considered as part of the EISPN. Working with the City, an even larger detention basin/park that will protect thousands of people downstream from catastrophic property and personal life damage while providing a stable revenue stream to the landowner. A win-win-win.

Aloha,

Daniel Dinell

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Think Big with Green Infrastructure:
- Reroute East Moana Rd, rip up existing pavement, build landscape berms (yellow line), add trees, walking paths, create a new park
- Results in better traffic flow, calmed, yet reduces emissions by removing stop signs; reallocate public roadway for people, not cars
- During heavy rains the yellow bounded area serves as a retention basin

Activation:
- Existing cemetery building mixed use for yoga, adult classes, youth, etc. by, and for, community
- Wooden adventure playground (like Higashihara Park on Hawaii island, picture below) at new Lin Yee Chung Park with limited vehicular parking to encourage biking/walking and neighborhood interaction

Result: protects and serves many, many thousand more people.

Subject: Manoa Stream and Palolo Stream flood control

From the Desk of Robert E. Fox
2022 University Ave.
Honolulu, HI 96822

Dear Sirs and Madams:

I am deeply concerned about your plans for the Manoa and Palolo Stream flood abatement program. I urge you to look into the **Friends of the Los Angeles River**, to get more information on the effects of cementing up the stream beds.
Los Angeles made that mistake in a bid to stop the flooding down the LA River and the San Gabriel River. We may have stopped a flood once upon a time, but the greater effect was the destruction of a habitat, the removal of permeable soil for the rainwater, and the waste of billions of gallons of water for drought stricken California. The consequences of Cement lined Sterile Rivers in the State of California are almost too gruesome to state. Gone are the birds, the insects, the small woodland creatures, but if you are concerned about flooding then gone are any control mechanisms at all regarding flooding. The accumulation of debris from human waste, litter, sewer systems etc. has made the Los Angeles River a cesspool of disease and contagion for all adjacent cities along its banks. The effect of the cement has been severe in many other ways. Homeless folks seem to think a cement bed is better than a weed patch, so the sides of the Los Angeles River are lined with homeless encampments. Their added debris only increases the stench and the pollution affecting the minimalized stream. When it really does rain, then people are washed along with the flow. If one wants to be capitalistic about the LA River, all land adjacent to and all Cities lining the River have almost no land value. That is impressive as the value of land in California is very high. As a real estate broker, I will not take a listing anywhere near the Rivers. There is little if any upward value growth, as the impact of the stench degrades any worth of land. The end of the La River and the San Gabriel River is Long Beach, CA, where I have participated in the community as Executive Director of the Council of Neighborhood Organizations for years. In an attempt to stop the litter, and I mean real litter like metal pipes, Styrofoam boxes, cardboard debris, shingles, glass bottles etc. the City of Long Beach spent a fortune on a floating Berm to try to gather this debris before it entered the sea. Unfortunately the power of the debris broke the berms created, and we are still having garbage flow into the ocean from the cemented rivers of LA.

Even now we are discovering that our aquifers on Oahu have been depleted and compromised. God forbid we should get into a conversation about the Halawa Aquifer. Instead of preventing the paving over of entire lots, the City sat back and watched the wholesale cementing of Monster Home Lots. That lack of enforcement has caused immense flooding throughout the neighborhoods. I live next door to a Monster Home in lower Manoa, and every time it has rained this year, we have rivers 8 inches or higher coming off one lot into Maile Way to an extent so overwhelming that the street drainage sewers cannot handle the load. Properties downstream from these Monster homes have their yards flooded out.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Now let's talk about Manoa Stream. We have never been conscious of the impact of our building upon that stream. The bridge which spans Woodlawn Drive is too low, and in heavy rains clogs up with debris, branches, and trees and garbage, overflowing into adjacent parking lots and grassy yards. No one thought that stream would get that high, but it did. Also in a major flood, the stream inundated the Hamilton Library on the Campus of the University of Hawaii Manoa. Clearly, we need a working solution to flooding.

I presume that with climate change the jet stream is also changing. We are seeing that effect even now with Atmospheric Rivers pounding California, Arizona and Colorado. These will only increase in severity. It is too late to turn back the clock of time. We now have to deal with what humankind has created. There are consequences to everything we do.
Therefore, in looking at the Manoa Stream and the Palolo Stream, I hope you realize that using an outmoded technique of cementing up the sides or cementing a catch basin is not the right solution. We have done that and it has failed.
It is my understanding that a more natural solution works better. The main reason for flooding is the lack of "retention" of the soil. In Manoa we have a very invasive species of trees. Albizia, which are growing along the streambed. Perhaps we should look into our environmental "handbook" and select trees which are native that are conditioned by evolution to have long "gripping" root systems. Clearly the islands have had trees for a million years. We need to see which trees we can plant which are natural to the streams of the islands. Clear-cutting the forests during the Sandalwood Boom of the 1800s created the conditions for the massive flooding which were endemic to Oahu in that Century. It was due to this clearcut flooding that Kamehameha III created the first zoning of the islands, The Great Mahele 1845 through 1855, which created dedicated farm/agricultural land, and dedicated watershed land. These were not capricious designations. They were deemed necessary for the survival of the people. They had learned the lesson of allowing the greed of sandalwood merchants to destroy the natural habitat of Hawaii. At one point the entire island of Oahu was clear cut in search of Sandalwood, Acacia. Let us not make a similar mistake now. We may need to remove the invasive Albizia Trees and any other bush which is not native in order to "reline the streams" with appropriate flood containing and mitigating plant life.
I believe a comprehensive cleaning, litter pick up and selective replanting of the sides of the Manoa stream is the major component for the solution of destructive flooding. Catch basins made of natural materials makes sense. Banks of watergrass which we can easily see in Kailua in the marsh land, may better prevent erosion and the acceleration of the speed of water during a downpour. Cement will only increase the speed of water, and will shoot it out to do more damage. I believe a manmade system of banking, flow alteration, and stepped buffering with plantings appropriate to the region is a far more sustainable method of flood control. Also using such a natural filtration system will minimize the mudflow and the contamination of the Ala Wai Canal. I suppose what I am proposing is a natural "Netting" in a natural catch basin system of many smaller, angled, stepped tiers as the stream approaches the Ala Wai will be a more sustainable and practical solution.
The added benefit is the replenishment of the aquifer of Manoa and Palolo areas. The entire Waikiki Ahupua'a can be protected for water replenishment and flood directing given some good old fashioned Hawaiian gardening techniques.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

When in doubt, just look at Hawaiian methods of the past. Generally, they worked far better than our "happy go lucky" cement over paradise methodology. I implore you to look deeper into this methodology so that we can preserve the land and the native habitat while preventing further flood damage.
I would like to propose a community design element meeting where at members of the public, including our Native Hawaiian elders, that can discuss the options and possibilities of this Manoa Stream and Palolo Stream flood abatement plan.
You may find that the wisdom of "old folks" is deep and compelling. Generational wisdom has been passed down despite the restrictions and prohibitions of the Church for ages. Let us not step forward without giving reverence to our Kapuna who have more knowledge of the land than any of you.

Much aloha
Robert E. Fox

HAWAIʻI STATE LEGISLATURE
Ka ʻAhaʻōlelo Mokuʻāina ʻŌ Hawaiʻi

STATE CAPITOL
415 SOUTH BERETANIA STREET
HONOLULU, HAWAIʻI 96813

April 12, 2023

Shawna Herleth-King
U.S. Army Corps of Engineers,
Honolulu District
230 Otake Street (Attn: POH-PPC, Ala Wai)
Fort Shafter, HI 96858-5440

Dear Ms. Herleth-King,

We are submitting comments on the *Supplemental Environmental Impact Statement for the Ala Wai Canal Flood Risk Management Study* on behalf of our constituents in Manoa, Makiki, Ala Moana, McCully-Moʻiliʻili, Kaimuki, Palolo, Kapahulu and Waikiki.

Many of them were largely unaware of the original Notice of Intent published in the Federal Register on February 22, 2023 that sought comments that were due by March 24, 2023.

We appreciate the extension of the comment period to May 8, 2023 (a new NOI was published in the Federal Register on March 23, 2023). However, the short lead-time between online posting of the proposed USACE-City plan on April 17, 2024 for discussion at the April 24, 2023 community forum minimizes the ability of neighbors and residents within the region to respond to the proposed plan and identify concerns about specific projects under the planned Supplemental Environmental Study being drafted for comment and review in Summer 2023.

We are especially concerned about the lack of outreach by the U.S. Army Corps of Engineers and City Dept. of Design and Construction into communities in which flood mitigation features may be proposed to be located (e.g., detention basins, berms around schools, floodwalls, pumps and nonstructural measures). These types of features were identified on Page 11 of the "Ala Wai Plan Formulation Tracker" and in the "Federal Register Alert" issued on February 22, 2023; *copies attached*).

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The Alert notified potential construction bidders and contractors in Hawaii of the project and encouraged them to submit comments on the project, which was described as a potential combination of (1) the Makiki District Park detention basin; (2) the Manoa Valley District Park detention basin; (3) the Ala Wai Golf Course detention basin; (4) the Kaimuki High School berm/floodwall; (5) the Kanaha floodwall; (6) the Woodlawn Bridge floodwall; (7) the Koali Road floodwall; and the (8) the Ala Wai Canal floodwall.

As you may be aware, the Ala Wai Canal Flood Risk Management Study completed in 2017 (authorized under Section 209 of the Flood Control Act of 1962) generated considerable community opposition over proposed USACE actions that impacted existing neighborhoods without adequate opportunities for review, comment and modifications.

We therefore encourage USACE and City agencies to provide written responses to questions from Ala Wai flood risk mitigation project participants that were submitted before the earlier March 24, 2023 deadline:

1. The USACE Supplemental Environmental Impact Statement should disclose the data and the assumptions that were relied upon in rejecting management of the watershed to reduce storm runoff volumes. USACE has repeatedly stated that management of the forest would not sufficiently reduce runoff from larger storm events; however, the agency has not revealed (a) how much runoff could be reduced through better management of the forest and (b) the assumptions and data that USACE has relied upon to reach its conclusion.
2. The SEIS should disclose the impact of debris coming from the upper watershed (e.g., from albizia and other non-native species) that can block streams and what mitigation measures should be undertaken. How will tree branches clog detention basins? How will tree branches clog areas through which water flows (under bridges, through culverts etc.)? How does clogging of waterways affect the modeling? How does USACE plan to address the massive amounts of debris that are likely to flow within the streams?
3. USACE should disclose what would happen to stormwater retained on the *mauka* side of the Ala Wai Canal that currently flow to the ocean, which would be blocked by proposed walls on the *mauka* side of the Ala Wai Canal and (b) a higher level of water in the Ala Wai Canal that occurs with the wall on the *makai* side of the Ala Wai Canal. How much

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

more water could flood the McCully/Mo'ili'ili region with the walls in place versus without them?

4. Has USACE evaluated the alternative of having Waikiki buildings move vulnerable elements (e.g., such as generators) to higher floors?
5. What is the greater threat to Waikiki: temporary flooding from infrequent storm events or long-term flooding from sea level rise?
6. USACE should disclose the assumptions and data behind its economic modeling of the flooding damage to Waikiki. Are the calculations based on the loss of revenue generated by tourist visits, or through damage to buildings themselves? Which buildings does USACE expect will be damaged? Are those buildings currently insured by flood insurance?

Thank you for the opportunity to submit comments regarding the process for the Supplemental EIS for the Ala Wai Canal Flood Risk Management Study.

Sincerely,

Carol Fukunaga

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

FEDERAL REGISTER ALERT©
February 22, 2023

Agency:
U.S. Army Corps of Engineers (USACE).

Subject:
Hawaii – Supplemental Environmental Impact Statement (SEIS) for the Ala Wai Canal Flood Risk Management Study in Honolulu.

Action:
Notice of intent.

Summary
The U.S. Army Corps of Engineers (USACE) announced its intent to prepare a Supplemental Environmental Impact Statement (SEIS) in connection with the Ala Wai Canal Flood Risk Management Study (Study) on Oahu near Honolulu, Hawaii. Acknowledging the need to reduce the risk to life, safety, and economic damages from flooding throughout the Ala Wai Watershed in Oahu, Hawaii, the USACE is reevaluating the Study, which was completed in 2017. The Study's recommended plan consisted of: (1) six in-stream debris and detention basins of varying height in the upper reaches of the watershed; (2) one standalone debris catching structure; (3) three multi-purpose detention basins; (4) floodwalls along the Ala Wai Canal averaging four feet in height and an earthen levee at the perimeter of an adjacent golf course averaging seven feet in height; (5) two pump stations to reduce the threat of interior flooding; and (6) a flood warning system. Per this notice, potential alternatives to reduce flood damages that will be considered under this planned SEIS include a combination of: (1) the Makiki District Park detention basin; (2) the Manoa Valley District Park detention basin; (3) the Ala Wai Golf Course detention basin; (4) the Kaimuki High School berm/floodwall; (5) the Kanaha floodwall; (6) the Woodlawn Bridge floodwall; (7) the Koali Road floodwall; and (8) the Ala Wai Canal floodwall.

Deadline:
Comments are due by March 24, 2023 and can be submitted by email to alawai@honolulu.gov. A Draft Supplemental EIS is expected to be available for review and comment in Summer 2023.

Relevance:
This project could create work opportunities for your members and contractors in Hawaii if it continues to proceed as planned.

Recommended Action:
Inform your members and contractor partners in Hawaii that the USACE has issued this notice and determine if your union will submit comments.

Agency Contact:
Shawna Herleth-King, USACE at (312) 846 – 5407 or shawna.s.herleth-king@usace.army.mil.

To Discuss Further:
Contact Andrew Siff at (202) 457 – 7756.

Subject: Scoping for Draft Supplemental EIS for Ala Wai Canal Flood Risk Management

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

This is a follow up comment as you begin drafting the supplemental EIS for the Ala Wai Canal Flood Risk Management Study.

You have prematurely concluded that the construction of six foot high walls along the Ala Wai Canal, as well as in other areas, constitute a minimal impactful to environmental resources. Please consider the impact to viewplanes. Views are going to be adversely affected for anyone walking mauka along any of the streets perpendicular to the Ala Wai Canal. The same is true for anyone walking or driving along Ala Wai Boulevard. Any honest assessment of visual impacts will recognize that the walls will have a significant adverse impact on visual resources.

Contact Mailing Address 2345 Ala Wai Blvd #1708 Message I have read the plans and just want you to know that I, like many of my neighbors, are totally against a flood wall along the Ala Wai canal! This is a peaceful and nice place we like to go, walk, sit and relax. A wall would take this all away! It would be ugly and totally change the appearance. And this all "just in case it floods in 20 to 50 years"? No thank you!

Subject: NOI for USACE Ala Wai project--The Outdoor Circle request for Full EIS

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Dear USACE Project Coordinators,

The Outdoor Circle agrees that the USACE Ala Wai Flood Control Project latest proposal for a Full EIS is required by interested parties and the complexity of the project. We fully support this.

We also request that the City and USACE fully commit to attend each affected neighborhood board to explain that residents need to submit even a letter like this one, and also to follow the process as it continues to unfold. Not doing so is poor judgement and will inevitably backfire. Find the resources to do this to actually authentically inform, educate, engage and commit to feedback on this mega project.

We remain a committed partner in this process and thank you for your kind help in making this as successful as possible from the community's perspective, which requires a robust, sustained and deep-reaching involvement.

Kind regards,

Winston Welch

Subject: Re: Scoping for Draft Supplemental EIS for Ala Wai Canal Flood Risk Management

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

This is my third comment for consideration in drafting the supplemental EIS for the Ala Wai Canal Flood Risk Management Study.

One issue that the Army Corps needs to more thoroughly consider is how sea level rise will undermine the effectiveness of the walls bordering Ala Wai Boulevard. The website Blockedhttps://www.pacioos.hawaii.edu/king-tides/map.html includes photographs that show the effect of king tides on Waikiki. Today's king high tides will be the sea level in the next decade or two. Water will flow into Waikiki from the makai side of the Ala Wai Canal. Imagine what it will look like when it is raining too. Here are some photographs from that website:

Subject: ALA WAI FLOOD CONTROL PROJECT / ALANAIO STREAM COMPONENT

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Dear Ala Wai Team,

I am an owner at the Marco Polo condominiums at the foot of Isenberg St. Situated as we are on the canal, there are likely to be great impacts by this project on our residents, buildings, and grounds, but my personal biggest concern about the planning relates to handling of the Alanaio Stream (aka Hausten Ditch). The stream flows directly between and around our residential building and parking structure, and I have yet to see anything specific about how that stream will be integrated into the project to prevent flooding our entire property. If floodwalls are necessary around the canal and the nearby Pālolo / Mānoa Stream, what's to keep the mountain floodwaters from diverting down a free-flowing stream / flood channel (which I think is why Hausten Ditch was cleared out a couple of years ago) and backing up in stream and over its banks when they reach the canal?

Hopefully that's in the mix, but I am anxious to be assured that this waterway is being looked at closely, since it affects not only our building but all of the homes along the stream above us.

Mahalo for your consideration; I look forward to a reply (and will be attending the virtual meeting tomorrow).

Subject: Ala Wai Canal - Proposed substitution for 14/8/6 feet flood walls that the public will love!

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Hello,

I am the Area Manager for a flood barrier manufacturer called FloodBreak. We are a Houston-based design and manufacturer of flood barriers. We somehow lost contact and did not get on your design team's radar. Please forgive the late communication.

I would request a substitution of the USACE planned floodwalls with the permanently installed, horizontal popup flood barrier by FloodBreak. There are many benefits to all stakeholders and constituents. See below.

Our barriers are permanently installed at grade, passive and automatic eliminating any dependency for power or people to protect the dry side from floods. We have installed more than 2500 barriers around the world and faced many real world floods. We have a 100% performance track record against real floods. For example more than 50 of installed barriers activated against Hurricane Harvey, with all barriers working exactly as designed.

Our FreeView Barrier is designed for very long reaches 1000'+. With multiple panels we can easily protect a mile of length.

USACE Reference
Our first project was installed working with the USACE in the midwest. The barrier was 605' long and 4' high. See the two pictures below. The benefit to the FreeView Barrier for the Ala Wai Canal would be:

- Would provide proven, world class flood protection
- Could be activated totally passively based on hydrostatic pressure (no power or people) or with optional hydraulic lift on demand
- Barrier is horizontal at grade and allows 100% view of the water and surroundings (barrier is a surface grade)
- Barrier is horizontal at grade and allows access to the water (no walls or obstacles)
- Can be a walking, bike and vehicle path embedded in canal bank or cantilevered over water
- Can be designed for as long and as high as desired (very scalable - multiple 1000' sections for up to a mile long and up to 14 feet high)

lower manhattan coastal resiliency (lmcr) project / nycedc lower concourse park demolition / south battery park (bpcr) resiliency

The BMCR Project is an integrated coastal protection initiative part of the overall LMCR Project aimed at reducing flood risk due to coastal storms and sea level rise in Lower Manhattan.

The BMCR Project spans the Lower Manhattan coast from Montgomery Street to the northern end of Brooklyn Bridge and seeks to improve access to the waterfront and enhance public spaces in the community.

This project involves the installation of 193 flood gates, 186 of which are Floodbreak auto-passive flood barriers.
In addition, there will be wall construction at the same heigh as the flood gates, micropile installation, jet grouting, landscape – hard/softscape work, bike lane construction, & public amenities all across roughly four hundred thousand square feet of Manhattan.

Contractor: AECOM
Owner: NYCEDC

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Thank you for posting recordings and resources that allowed me to catch-up with this project.

As a resident in the inundation area and own property at 400 Hobron Ln. adjacent to Ala Wai Canal, this matter is very personal to me. My family is deeply concerned about the our personal safety, protecting property, community, and our state economy. We are also thinking about the long-term impact on future generations.

I have lived in various cities with water-related issues and have seen first-hand the consequences of inadequate flood protection. I agree with the hybrid alternative and believe that measures such as the Ala Wai Canal Floodwall and golf course detention basin are necessary. I also support the use of social vulnerability in evaluating alternatives.

For next steps, I support further development of non-structural and nature-based infrastructure, including daylighting streams and permeable pavement. I would love to see the golf course changed to improve its performance as a detention basin and restored to wetlands for public enjoyment. I also support additional consideration of storage-based solutions in Ala Moana Park.

I highly recommend enhancing aesthetics, experiences, recreation, mobility and public safety in this project due to their significant impact on economic investments. Coordination with streetscape projects such as the Ala Wai Streetscape Plan is also recommended.

Thank you for considering my comments.

Sincerely,
Lawrence Li

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Dear Ala Wai FRM,

I would like to make a personal comment and request concerning the Ala Wai. I live in Manoa, right next to the Manoa Chinese Cemetery's proposed site for Manoa Banyan Court Apartment Buildings. During the 2004 flood that destroyed houses and put cars in trees, knee-high muddy water rushed into my residence while my daughter (who was 9 years old at the time) had a sleepover.

I'm very concerned the Ala Wai Flood Risk Management team is not actively opposing the Manoa Banyan Court project and that the solutions it has been suggesting have been so large and invasive to the environment. Is there a way that the excess flood water can be used for the good of the community?

Thank you for your help!

Kind Regards,
Vernelle Oku

Subject: Feedback/Concerns on Alawai Flood Risk management update presentation

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Hello and thank you for the presentation

We are family owners and developers across Fern street which is about two blocks north of the Ala wai near the McCully area. Currently we are working on developing a Bill 7 affordable housing project to help address the housing crisis in Urban Honolulu.

We appreciate these Ala wai flood solutions you presented as clearly the flood would impact our developments.

We are also supportive of Alternative 5 (hybrid with Ala wai flood walls) and the golf course used as an emergency Detention Pond.

We have a few concerns:

* You mention non structural changes that owners maybe impacted. We are currently already at record high building cost to develop the bill 7 project but further cost for us to develop or change designs may have an impact on our project costs not to mention delay in approval of building permits from DPP. We also have existing multifamily units that are not to be developed on Fern street and concerned about the costs of the non structural requirements on the older buildings and whether it can be somewhat subsidized if it is really necessary
* Our Bill 7 Affordable housing project on fern street was developed as a result of the Ala Pono bridge project that is to connect McCully to Waikiki providing affordable housing renters access to Waikiki without need for car and as a result reduced our parking spaces on the development plans. We would strongly propose that Ala Pono bridge project not be impacted as a result of the Ala wai flood walls. If the Floodwalls do impact Ala pono we suggest they projects complement each other in some way.

Please do keep us informed of further developments Best Regards,

Steve Tran

I am making this statement before May 8th, in order to have standing.
I do hope you actually read this.
Since you obviously have not read the previous team's reports, nor delved into any of the history of our island, I thought this might be helpful.

There are reasons why we had a flood in 2006.
I do also suggest you analyze the possible shifting of the jet stream as this will have a rather substantial impact not only on Hawaii but the mainland.
Clearly, California is just now realizing this global phenomenon.
Sincerely,

Regarding the Ala Wai Flood Mitigation Project
For Government Consideration

The current amended EIS for the Ala Wai Flood plan does not reference the previous plans at all and thus dismisses all "findings" from the original 2015 declarations. Is this intentional or is this a case of lack of experience by the new "Team"? The data collected by the Army Corps of Engineers is unscientific in so much as they have mixed verbal historical testimony with detailed Atmospheric, water and flood data as has been collected since 2006. The conclusions are, therefore, suspect due to the methodology used. None of the "Data" contains any historic records before 2006, as if this island has not existed before that date. Certainly we have had rain events throughout the history of Oahu, but none of that historic record informs the Army Corps of Engineers. I put this forward, as there is a distinct and noticeable lack of major flooding before 1960 for the entire history of Oahu. Perhaps we can attribute that to several factors, not the least of which is the rapid building of structures with no regarding to the retention of permeable soil from the 1960s forward. Waikiki is the most obvious mass construction area, but this does not affect the new paradigm for flooding from the Manoa and Palolo. It might be advantageous to look at the construction which has occurred in both valleys as well as Moilili in order to discover what is different now from what existed before. The most obvious example is the Regency Tower's construction on Date Street. That one construction interrupted the natural system of flood abatement on Oahu.

There are no data points which adequately define a 100-year flood, a 50-year flood, a 10-year flood or any timed flood event within this proposal. These definitive items are metaphorically grabbed out of a bag of nonsense.
The collection of information does not specify causative factors for the flooding which has occurred. The data shows the aftereffects of the flooding but has no causative agents or situations which are imperative to form a correct solution to the observed effects of flooding.

The Army Corps of Engineers has changed "Teams of Experts" over and over, each new team has been untrained or not well informed in the previous work done, and with limited experience, if any, in island geography and atmospheric conditions attributable to island topography and the pushback from the local community. Every time the community tries to interact with the Army Corps of Engineers we are faced with polite deflection and misdirection, without any clear answers. The lack of a real engineer (Kelly) at the last WebEx meeting was indicative of the low esteem the Army Corps holds the Communities of Hawaii. The Army Corps knew that Kelly was on leave and would not be able to attend this confab. That shows the lack of real honesty by this new team in dealing with the public. This refusal to engage in a serious and meaningful manner shows lack of intent to find mutually agreed upon solutions. With a cut off date of May

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

8th for public input, it is nigh on to impossible for the community to arouse the local population to this threat potential.

There have been many suggested maps over the years from 2015 to the present, each of which would only be consistent if they each depend upon a different set of data points in order to create such differing solutions. If there is only one set of data, then the resultant strategies would be within a very slim parameter of variation.
From 11 watershed walls, to only 2 watershed walls, and then two huge catch basins with 6-foot walls along both sides of the Ala Wai cannot be concluded from the same data set. In court this will be shown to be specious at best.

- The five factors which guide any solution for possible flooding on a sizable scale are Velocity (of water) Volume (of water), Vortex, (directional flow) Viscosity (texture and content of water flow) and Duration of flow and water.
- The Velocity can be determined by the elevation and slope and soil permeability. The Volume can be calculated by measurement of rain fall.
- The Vortex can be measured or manipulated by walls, berms, barriers, and the size of impediments(bridges or debris)
- Viscosity can be mapped and measured by condition of stream bed, (undergrowth, Albizia sprouts, permeability of soils adjacent to flow etc. Also the inclusion of mud flow from saturated soils would impact viscosity.
- Duration is a matter of measured time of rainfall and storm event permeability of soil and all lingering drainage issues after the causative effect.

Given these parameters, we should look at the actual Manoa and Palolo Streams, the Manoa ditch by the Chinese Cemetery and the Makiki ditch. There exist bridges which will be barriers in a flood condition.
We have curvature of the stream beds, (S curves, etc.) which hinder flow and create volume back-ups, we have high containment walls already in place which may be problematic at the Woodlawn Terrace Bridge.
We have a present Built in convergence of the Palolo Stream into the Manoa Stream at right angles which serves as a "stop flow" action upon descending water from the Manoa Watershed. Once below the 150-foot elevation at the Palolo Manoa convergence the angle of the flow degrades (levels out) and thus slows the velocity of the water, reaching the Ala Wai Canal at a horizontal level with minimal velocity except for volume pressing from behind.
The Ala Wai serves as a level no flow holding tank for any additional water as the only access to the ocean is at the canal opening at Magic Island.
The purpose of the Ala Wai was to drain the swamp which was Waikiki through parts of Kapiolani Park. During the time of the King, Makee Island existed in what today is the area of the zoo and bandstand in Kapiolani Park. After the flat canal of the Ala Wai was created, those marsh lands, tidal pools and islands disappeared forever. Since the purpose of the canal was to drain the water from the area of Waikiki, no slope was engineered in its construction. Ala Wai is a flat bottomed holding area for water, which has been dredged several times due to the silt which comes down from the streams.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Currently there is a huge project to clarify the waters of the Ala Wai so as to restore its aquatic life and water quality. For years the residents of Waikiki and Moilili fished from the sides of the Ala Wai and from the bridges that spanned it. Eventually the quality of fish deteriorated until the last species was so contaminated that no one would dare eat them. I can assure you that what few Talapia still exist in the Ala Wai are not safe for consumption. Currently we have a program of tossing earthen/bacteriological balls in the waters to clarify the water. Progress is being made to restore it back to its original clarity.

Unless one wants to use gigantic pumps, the current proposed plans do not generate enough natural gravitational flow to affect the drainage to the sea as is needed via the Ala Wai. No silt abatement nor mitigation has been included in this plan. Due to this fact, the Army corps of Engineers has falsely concluded that 6 foot retaining walls are needed along the Ala Wai Canal, as they have not realized the actual issue is a flow velocity problem existing due to lack of slope and elevation.

Consequences economically will be catastrophic for Waikiki if this current 6-foot wall plan is adopted. This superb Tourist destination will be highly impacted by the removal of over 200 mature palm trees along the Ala Wai, the raising of a sidewalk by three feet with an additional 3 feet of wall, removing any scenic beauty regarding the natural landscape of the Ala Wai, or the mountains in the distance.
To remind this body, we made strict rules about Billboards years ago to preserve the natural beauty of the State. So, taking the beauty of Hawaii into consideration is not a frivolous act, but a substantive act with economic impact. As we formed the Outdoor Circle to protect the mature trees of Honolulu so we must act with caution in this project to preserve the mature landscapes of Moilili, Manoa and Palolo. Also the winds which come from the mountains at 3 PM every single day into Waikiki will be stopped by these proposed 6 foot walls. These constant winds keep the heat of Waikiki in check and as a consequence many residents live without air conditioners due to the regular breezes coming into the paved "jungle" of Waikiki. I own property one building away from the Ala Wai Canal in Waikiki on Lewers Street and I can attest to the importance of this daily wind which cools and purifies the air within the dense Cityscape which is Waikiki.

Therefore, we need an altered plan for the flood mitigation efforts from the Manoa Stream and the Palolo Stream which if we succeed may be a template for future flood control projects across the state and region.

We propose that the first line of flood defense is the maintenance of the Streams. The City said they would do this work, but they have failed. We propose a dedicated funding mechanism in the plan to pay the City and County to maintain the stream beds and side walls of all streams from the Koolaus. We currently have dedicated volunteers who trek along the stream beds to remove the invasive Albizia Tree saplings and sprouts. Without this work no matter what we do, we will have a blockade of the streams by the fragile breakage from the Albizia trees. In order to make this a permanent solution, we propose a program to remove the Albizia trees from both sides of the Manoa Valley and the Palolo Valley.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

A little history is important here, which the Army Corps of Engineers does not know about, as they never asked.
During the mid 1800s Oahu was basically denuded of mature trees due to over grazing of cattle and the intense cutting of the forest by merchant crews to harvest our sandalwood trees. Rather than culling out the sandalwood, they clear cut the mountains and dragged the trees down the slopes to waiting ships. A result of this clear cut was the importation of red wood from the Pacific Northwest for building on Oahu. Large trunks of trees were dragged behind great ocean liners to the Hawaiian islands. From this practice many of our homes were constructed with what came to be known as "salted redwood". The voyage over allowed seasalt to penitrate the trunks of the trees, and as such created a termite resistant wood, which is the foundation of many of our historic homes on this island. My home is constructed of salted red wood, and yes, my home is on the historic registry of homes for the State of Hawaii.
Another consequence of this clear-cutting of the forests was the constant threat of mudslides which destroyed many villages and killed many of our Hawaiian People. Due to this danger, in 1848 King Kamehameha III ordered the Great or Grand Mahele. This was the first time in the history of Hawaii that we have any sort of zoning, and more pertinently to most, the creation of privately owned property. Before 1848 all land was owned by the Royal House. In his wisdom to preserve the forests and protect the people, the king dedicated watershed lands. He also dedicated agricultural lands, public lands, and privately held lands, etc.
To reestablish the forests of Oahu, the king sent several ships to the Solomon islands with the specific purpose of bringing the fast growing Albizia trees to Oahu. At the time no one thought about invasive species, but they had a purpose in mind which was to recreate a forest of quick growing and fast multiplying trees across the mountain range. Albizias did that for certain. The trees grow 15 feet per year and spread their seeds up to a mile in every direction. Every homeowner in Manoa or Palolo knows that one must pull out the sproutlings before the tap root establishes itself. Once grown, we can cut the bark down to the ground around the whole tree to kill it, or cut into it with root killer, but once the trees are mature it costs over $10,000.00 per tree to remove them. Clearly this project is something the City and County should take on as stewards of our island. We propose in this plan a general funding for Albizia Removal. It will take approximately 10 years of pulling sprouts after the trees have been removed before we can be assured of relative success.
Now for the structural plan we propose for the mitigation of flooding.

We propose two large 8-10 foot diameter Conduits to be placed at flood stage height on either side of the Woodlawn Terrace Bridge. This requires scooping out the road on either side of the bridge to install these conduits, then recreating the roadways. These large pipes will funnel excess flood water downstream expanding the flow capacity of the Woodlawn Terrace Bridge by at least double to four times capacity. Flood gates may be installed which would be automatically opened upon the rise of flood water flow. During times of no flooding the doors remain closed to keep the interiors clean and unobstructed. The construction of curved cement Brick Block berms on either side of the mauka stream bed directing water to the funnels. (If necessary, cement walls, but graduated bricks with interspersed water grass is more sustainable.) is necessary to contain the flood within the banks of the stream bed. These "walls" would need to be at least 6 feet tall, which is why we suggest green berms so as to

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

blend into the nature landscape. The Flow out of these conduits would be more rapid than the flow from under the bridge due to smooth walls and unobstructed pathway. We may extend these conduits along the stream under the land for a good 40 feet to assure no overflooding upon water exit. Common Sense tells us that the conduits should be a different lengths to assist in even distribution of water.

We propose the "straightening of the S curve of the Manoa Stream. All the land is State Owned, so it is an easy proposition. We simply create a large 40 foot straight wide flood stream with high cement 6 to 10 foot brick and water grass berms on either side.
The concept of creating cement brick berms along the stream is to prevent the overflow of the stream into the dell of the university. As long as we plant these berms they will be attractive while serving their purposes. (The Hamilton Library was flooded by the Manoa Stream during a 40 day rain event in 2006) In order to prevent such events in the future, we must determine the low point of the stream above the slope of the hill which meanders into the campus of the University of Hawaii. Once you get to the Korean Institute of the University, the deep gorge of the Manoa stream is sufficient to prevent flood damage. There is a bride at Dole Street but it is high enough that we do not anticipate any flood activity from that. Below are student taro fields and the like,

We propose rebuilding the convergence walls of the Palolo Stream and Manoa Stream in a curve such that the flow from both rivers combine with curved and sloped walls in a compatible 45 degree flow angle creating a merge of velocities. Currently the Palolo Stream enters the Manoa Stream at a 90 degree angle.

We propose at the convergence of the Manoa Palolo Streams the installation at flood level height 8- 10 foot wide conduits, which will run underground to the sea maintaining the 150 foot drop slope which will, without pump mechanism, maintain a velocity of flow as it is disposed at least 8 feet deep under the water line These conduits would be installed along the streams course curving into the Ala Wai Canal without break straight through to the ocean at Magic Island. These conduits would be implaced beneath the Ala Wai Canal and run at least a football's field length beyond the entrance of the Ala Wai This method will also use the flood gate mechanism at the beginning and end of the conduits with accessory pump stations at the entrance and end of the enclosures. We certainly know how to do this work, as we had to replace all the sewer lines in Waikiki several years ago, to accommodate the "load". During that project we lined up the 8 foot wide ABS piping in the Ala Wai awaiting use.
Why are we suggesting the use of conduits.
For one reason they represent the expansion of the flow load by double in not more for the water flow, and we can arrange them to conform to the slope required to maintain the flow velocity required to empty into the sea. If we do not use this method, the water coming from the streams will merely inundate the Ala Wai which is level, and not have any directed velocity to go anywhere. (This is why the Army Corps of Engineers wanted to build 6 foot walls along the Ala Wai.) Their conclusions were correct, but they did not explore other options to create a more feasible outcome with less impact upon the environment or the economy of Oahu.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

As an historic aside, there used to be caves from the Manoa stream which angled through Moilili channeling pure springs up into Queen Kaahumanu's Summer house on Hausten Street. This system of underground caves prevented flooding in the lower Ahupua'a of Waikiki. With the construction of the Regency Tower, with the lack of knowledge of the engineers, 30 thousand tons of cement were dumped to solidify a foundation for that building, forever blocking the cave system and stopping the natural springs on Hausten. When that disaster happened, the springs of Hausten street were destroyed and the extensive ponds were cemented to hold water. A sad substitute for fresh spring water. Without removal of the Regency Tower, the natural cave system flood control cannot be restored, but the conduits proposed can mirror the effect of that natural system to the benefit of all.
We propose NO 6-foot walls along the Ala Wai or elsewhere, as they are not needed and constitute a visual blight, and economic detriment and a structurally unsound method without real use, and continued Blot upon the island of Oahu.

We also oppose the proposed catch basins at Manoa Valley Park and to the Ala Wai Golf Course. Catch Basins only protect the land below them. If we remediate the issue of flooding we will not need to "Protect" the Ala Wai Canal. If we use high berms along the stream bed of Manoa, we will not be exposing the low lying areas of the University to flooding. Thus the purpose of the catch basins is removed. No land will need to be eminently domained, no one loses their homes, and we all work together cooperatively in a shared solution.

Aloha,

I would like to voice my opinion that I am against the 6ft wall surrounding the Ala Wai as the final flood mitigation solution. There must be a better way to retain the beauty yet improve the functionality of the canal. I understand you are directed by Congress to only consider flood mitigation. Are esthetics and daily impact on community comfort metrics in your consideration? I walk and bike next to the Ala Wai on a daily basis and no longer being able to see the waterway while next to it will be tremendously disheartening and substantially impact the feel of the area. I understand you will be having a community meeting on May 15. Can you please let me and news outlets know the time and place of the meeting?

Thank you,
Yamato Sasaki

Contact Mailing Address 3504 Alani Drive Honolulu HI 96822 Message I do not support the idea of retainment walls to mitigate flooding in the ahupuaha of Waikiki. It doesn't make sense. Six foot walls around the Ala Wai? What about mitigating flooding around the University of Hawai`i? the university could use some retaining walls around buildings. What about the consideration of mitigating rising ocean levels, which is imminent. In addition, the Army Corps of Engineers still would need to work with other entities (the State of Hawaii and the Manoa Banyan Court Project) who propose to widen Manoa Stream and to build on top of Woodlawn Ditch. Those efforts should be worthy of investigation as they will change the environment of all of Manoa Valley and into Waikiki. I would also like to complain a bit about the lack of communication with homeowners who are directly impacted by this project. Why hasn't USACE and the City and County of Honolulu ever sent anything to homeowners who will be affected? Don't these agencies have an ethical responsibility? Apparently not.

Subject: Ala Wai Canal Flood Risk Management Project Supplemental Determination and EIS Preparation Notice

Hello:

The City and County of Honolulu's Department of Transportation Services will be submitting comments on the Ala Wai Canal Flood Risk Management Project Supplemental Determination and EIS Preparation Notice, and we're currently obtaining our Director's signature on the final response. Please see our attached draft response, which should be substantially similar to the final version; we'll send you the final response when available.

Thank you.

Sincerely,
Greg Tsugawa

MEMORANDUM

TO: Haku Milles, Director
Department of Design and Construction (DDC)

FROM: J. Roger Morton, Director
Department of Transportation Services (DTS)

SUBJECT: Ala Wai Canal Flood Risk Management Project Supplemental Determination and Environmental Impact Statement Preparation Notice

Thank you for the opportunity to provide written comments regarding the Ala Wai Canal Flood Risk Management Project Supplemental Determination and Environmental Impact Statement Preparation Notice. We have the following comments.

1. Project coordination.

    i. The DTS is actively coordinating with the United States Army Corps of Engineers (USACE) and the DDC on the Ala Wai Flood Risk Management Study (Study). A DTS representative will continue to be available to attend weekly Study coordination meetings with the Study's team, participate in the Study's public meetings, and coordinate the DTS' communications and projects with the Study.

    ii. The DTS currently has two ongoing projects in the Study area, (1) the Ala Wai Boulevard Complete Streets Project, located between Kapahulu and Kalakaua Avenues, and (2) the Ala Wai Bridge Project, spanning the Ala Wai Canal at Kalaimoku Street. The Study must ensure ongoing coordination between the DTS projects and the Study's flood risk management measures.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

iii. The DTS further encourages the DDC and the Study, to the extent feasible, to integrate active transportation resources into the project that compliment DTS' ongoing projects and provide mobility.

2. Street Usage Permit. A street usage permit from the DTS should be obtained for any construction-related work that may require the temporary closure of any traffic lane, sidewalk, bicycle lane, or pedestrian mall on a City and County of Honolulu street.

3. Bus Stops. Numerous bus stops are located within the Study area. Please coordinate any bus stop impacts/changes with DTS – Transportation Mobility Division (TMD). Contact DTS-TMD at TheBusStop@honolulu.gov

4. Neighborhood Impacts. The area representatives, neighborhood board, as well as the area guests, businesses, emergency personnel (fire, ambulance, and police), Oahu Transit Services, Inc. (TheBus and TheHandi-Van), etc., should be kept apprised of the details and status throughout the project and the impacts that the project may have on the adjoining local street area network.

5. Disability and Communication Access Board (DCAB). Project plans (vehicular and pedestrian circulation, sidewalks, parking and pedestrian pathways, vehicular ingress/egress, etc.) should be reviewed and approved by DCAB to ensure full compliance with Americans with Disabilities Act requirements.

Should you have any questions, please contact Greg Tsugawa, of my staff, at (808) 768-6683.

To: Ala Wai; earl.t.vaughn@usace.army.mil
Subject: NOI - Ala Wai Flood Project - Dave Watase's Public Comment #1 - Flood gate and pump

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Aloha,

My name is Dave Watase, I am a resident who lives within the Ala Wai Watershed and a key stakeholder in the 2017 Final Environmental Impact Statement (FEIS) for the Ala Wai Flood Project.

I am OPPOSED to the United States Army Corps of Engineers (USACE) plan to perform a Supplemental Environmental Impact Statement (SEIS) because it builds upon a flawed and outdated FEIS.

For the General Reevaluation Report, the USACE told us that the Ala Wai Flood Project began in 1998 and that all the community comments over the years will not be lost and taken into consideration. I for one have read all of the reports including the Ala Wai Management Implementation Plan April 1998, Ala Wai Watershed Analysis Final Report July 2003, USACE Manoa Stream Hydrology and Hydraulics Study October 2004, Manoa Technical Study Summary Final November 2008, Final Hydrology Report Ala Wai Watershed Project December 2008, 2015 Draft Environmental Impact Statement, 2017 Final Environmental Impact Statement, 2019 Engineering Documentation Report, The OceanIt SWIFT Report 2019, and I've attended nearly all USACE, OceanIt, City Council publicly held meetings since September 2015. I believe a significant amount of public comments were ignored. I don't believe anyone from the USACE has read through the material above with a critical eye. If that was done by any competent person the flaws and failures in the FEIS would have been noted and we wouldn't be again going in the wrong direction.

The concept of a flood gate and pump should be FURTHER EXPLORED because:

1. The concept of a flood gate and pump would eliminate the need for high walls around the Ala Wai Canal for the 100 year flood, as stated in the FEIS (Appendix H - Value Engineering);
2. The concept of a flood gate and pump mentioned in the FEIS would have a potential cost saving of $130 million and was too easily rejected without debate;
3. The Ala Wai Canal flood walls are susceptible to high tides, tidal surges, and sea level rise and can easily negate the flood protection benefits of the flood wall;
4. The Ala Wai Canal flood walls require 6-8 hours of capping of the interior storm drainage systems;
5. The flood gate and pump concept would preserve and improve our interior storm drainage systems which currently are influenced by high tides, tidal surges, and sea level rise;
6. The flood gate would remain closed should sea level rise occur and could incorporate a lock gate system for recreational users;
7. The flood gate and lock system should be in front of the Ala Moana Blvd. bridge;
8. The flood pump should be located on the Ala Wai Golf Course and transported to the Ala Wai Harbor via underground tunnels;
9. The flood pump inlets would be available from multiple source locations via pipe or tunnels such as (1) the far end of the Ala Wai Canal, (2) Manoa/Palolo Stream confluence, (3) the Ala Wai Golf Course detention basin, (4) incorporated into a modified OceanIt's SWIFT concept for the Manoa and Palolo tunnels;
10. The primary benefit of properly used and properly placed flood pumps are they can move large volumes of flood waters completely bypassing the Ala Wai Canal and can be operated before, during, and after the storm and not just during peak flows and critical times.

VALUE ENGINEERING PROPOSAL

PROPOSAL NO: 4 PAGE NO: 1 OF 4

DESCRIPTION: Provide pump station at Ala Wai canal exit to ocean

ORIGINAL DESIGN: There is no previous design

Meaning not considered in this EIS?

PROPOSED DESIGN: In addition to a flood gate (proposal #3), a pump station will be constructed and used in combination with the gate to provide flood risk management. The flood or tidal gate design would consist of a miter gate to cover a 120 ft wide opening built across the canal mouth 300 ft upstream from the Ala Moana Blvd Bridge. The miter gate would consist of 2-65 ft wide by 15 ft tall steel gates with concrete footing at invert -10 ft and top of gate at +5 ft elevation. The side structure on the left bank would be built with not more than 5 ft protruding into the canal (canal is 160 ft wide) while the right bank side structure would be built as part of the pump house sump and stilling basin. Assume the side walls (monoliths) would be 5 foot thick and the foundation slab to be 8 foot thick reinforced concrete. Bottom foundation would be 140 ft by 80 ft in size. Side walls would be 80 ft by 15 ft. The pump house design would be a pump house 400 ft long by 100 ft wide (of which 40 ft extends over/into the canal) with a roof line about 40 ft tall. The pump house would contain 10 pumps each 96-inch axial flow 800hp pumps (MWI pumps model no. NC396P37) plus sump, stilling basin, and other operating equipment. The sump would be located on the upstream end of the pump house upstream of the gate and be built in the canal, about 300 ft long by 40 ft wide, form the footing of the pump house over the canal, and have an invert elevation of -20 ft. Assume the entire sump to be built of reinforced concrete 3 ft thick with steel grates spaced throughout the walls on the canal sides. The stilling basin would be located on the downstream end of the pump house downstream of the gate and be about 100 by 40 ft, invert of -10 ft, about 120 linear ft of reinforced concrete wall 3 ft thick, also with steel grates spaced throughout the walls on the canal sides. The purpose of the stilling basin would be to help reduce turbulence from the pump outtake lines and along with the about 300 ft distance upstream form the Ala Wai Yacht Harbor, have a minimal impact to wave action in the harbor caused by the pumping activity. Next to the pump house, would be a 60 ft by 100 ft back-up generator house (if needed; it may all fit into the pump house). Access road, 15 ft wide, would be from Ala Moana Blvd and from Kalakaua Ave using the existing canal promenade walkway. There is a 75 ft wide access along the right bank (the promenade walkway width between canal and property boundary with Yacht Harbor Towers) and 50 ft wide access on the left bank using the Ala Wai Blvd road. Staging area to use park land at Ala Moana Beach Park. Promenade pedestrian access can be blocked during construction but access along Ala Wai Blvd to Harbor View Plaza building must be maintained.

The operations and timing of the flood pumps and gate are not well explained for review and comment.

ADVANTAGES:

1. Gates to be closed prior to the storm and with pumping provides additional storage within the canal walls prior to the flood peak. In HEC-HMS model, pumping limited only to elevation -5 ft.
2. With optimization of pumping and gate openings during and after the flood peak, this alternative can provide 1% ACE event level of protection and replace all the measures currently part of the TSP (Alt 3a). Alternative would only consist of this one measure. Project impacts would only occur in this one location. No detention basins and floodwalls would be needed.

Hello! No upstream detention basins needed and no concrete floodwalls around the Ala Wai Canal needed. This one measure replaces all measures ... what does that tell you?

15

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Pumps run only before big storms, better locations are available.

VALUE ENGINEERING PROPOSAL

PROPOSAL NO: 4 PAGE NO: 2 OF 5

DESCRIPTION: Provide pump station at Ala Wai canal exit to ocean

DISADVANTAGES:

1. Changes the canal ecosystem during large storm events. By shutting out tidal influence and pumping out canal and then having canal fill with flood runoff (freshwater) before mixing again with ocean water when gates are opened would result in killing of fish species. Although most fish and other aquatic species in canal are mostly invasive species, the rapid mixing of ocean and freshwater would create ecosystem havoc. Some floating runoff debris and dead fish would be released into the small boat harbor even with floating trash boom in place. The rapid mixing would also result in density currents mobilizing bottom sediments into and out of the canal. These sediments could have an impact to the yacht harbor and near ocean environment.
2. Location of pump house near residential apartments (Yacht Harbor Towers) would result in noise issues to residents when pumps are running. Noise abatement in structure is needed.
3. Gate and pump house structures to impact view-plane along canal between Ala Moana Blvd and Kalakaua Ave. ← Better locations available, split locations, near intersect, pipe to mouth
4. Gate and pump house structures to impact recreational uses, canoes, kayaks, and small boats, when gates are closed and pumps are turned on. ← Minimal impact only closed on big storm
5. Gate opening during and after peak flow event may create turbulence or unwanted currents into yacht harbor. ← Minimal impact, controlled opening or wait for stream to refill canal slowly.

JUSTIFICATION:

This proposal meets the functional requirements of the project at a reduced first cost.

MUTUALLY EXCLUSIVE:

N/A

Gates don't have to be reopened until stream water refills the Ala Wai Canal back to sea level or controlled refilling with both stream and ocean waters.

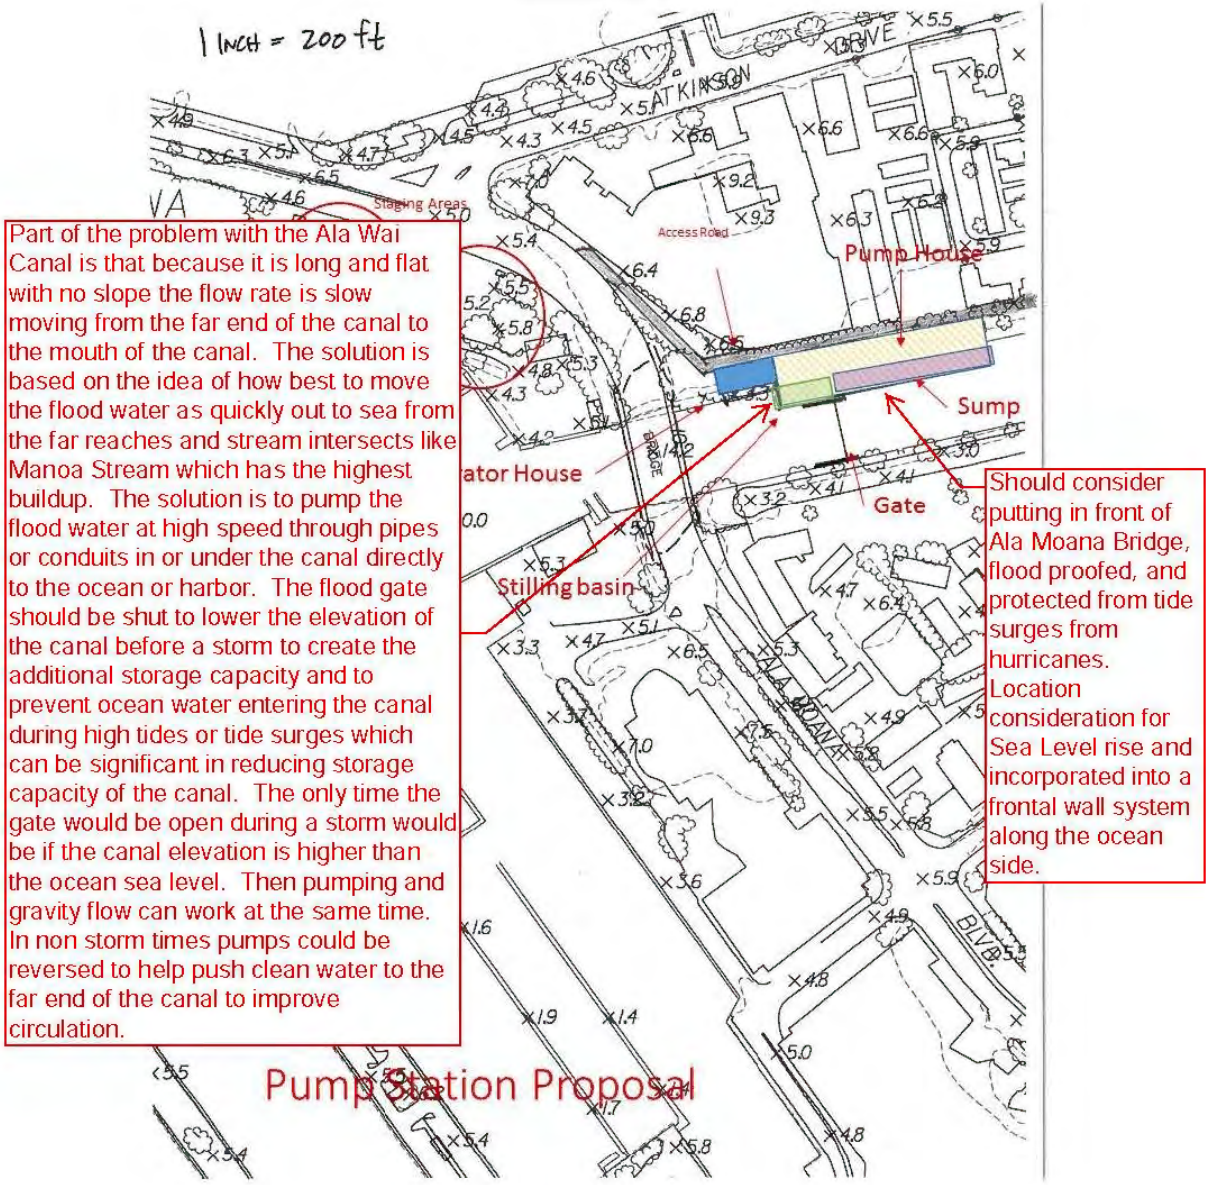
16

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

VALUE ENGINEERING PROPOSAL

PROPOSAL NO: 4 PAGE NO: 3 OF 5

Drawing No. 1



Part of the problem with the Ala Wai Canal is that because it is long and flat with no slope the flow rate is slow moving from the far end of the canal to the mouth of the canal. The solution is based on the idea of how best to move the flood water as quickly out to sea from the far reaches and stream intersects like Manoa Stream which has the highest buildup. The solution is to pump the flood water at high speed through pipes or conduits in or under the canal directly to the ocean or harbor. The flood gate should be shut to lower the elevation of the canal before a storm to create the additional storage capacity and to prevent ocean water entering the canal during high tides or tide surges which can be significant in reducing storage capacity of the canal. The only time the gate would be open during a storm would be if the canal elevation is higher than the ocean sea level. Then pumping and gravity flow can work at the same time. In non storm times pumps could be reversed to help push clean water to the far end of the canal to improve circulation.

Should consider putting in front of Ala Moana Bridge, flood proofed, and protected from tide surges from hurricanes. Location consideration for Sea Level rise and incorporated into a frontal wall system along the ocean side.

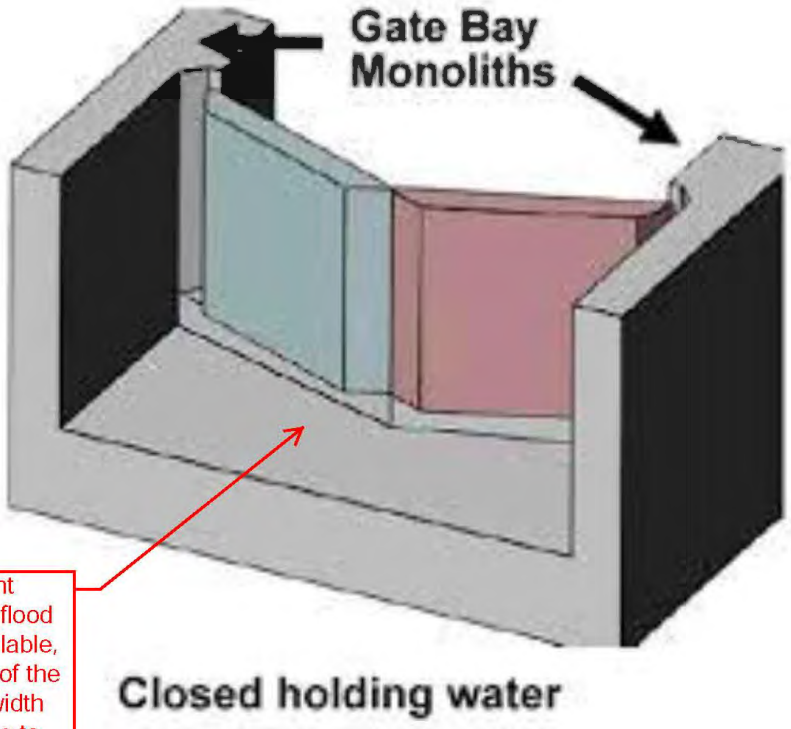
17

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

VALUE ENGINEERING PROPOSAL

PROPOSAL NO: 4 PAGE NO: 4 OF 7

Drawing No. 2



Many different options for a flood gate are available, the because of the pumps, the width does not have to be as wide as the canal.

Miter Gate Drawing

A variant to this design is to use sluice gates instead of miter gates. This would require at least one sluice gate to be 30 feet wide to allow for boat and dredging barge passage. Sluice gates would rise above canal when open and be very tall, sticking at least 16 feet high above the canal, creating a much bigger view-plane problem.

Drop gates, like the London Flood Barrier, could also be used. These gates would rise up from the bottom of the canal when closed.

We need to protect the residents and financial hub of the state that is Waikiki. Perhaps the quickest method, the 6 ft flood walls, could be attractive & temporary as more comprehensive methods are accomplished over time? Let's be sensible about this and not let the perfect be the enemy of the good enough for now in such a crucial threat situation. Mahalo!

Message Aloha mai kākou,

It is difficult to comprehend why the USACE neglects to include nature-based solutions starting mauka in the Mānoa and Pālolo Valleys through the Ala Wai Canal to the Pacific Ocean. IUCN (International Union for Conservation of Nature) the largest global organization whose science-based approach to solving devastating impacts to Island Earth, strongly recommends the use of nature-based solutions so society, economies and nature can thrive together! A six foot wall would be another meaningless bandaid on a larger issue and a waste of energy - as they say in Hawai'i, POHŌ! Aloha, Aloha McGuffie

Subject: SUGGESTIONS: CANAL FLOOD WALLS / NH CULTURAL CONSULTATION / ALA NAIO STREAM

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Dear Ala Wai Team,

Obviously one of the most contentious issues in current plan for the Ala Wai canal flood prevention project is the proposed six foot wall around the canal.

There has been discussion of an elevated berm with walking path to solve some of the "wall issues" issues (at least on the makai side - although I note the mauka side is almost equally frequently used). If a wall is indeed ultimately constructed, please consider constructing it where the current bike path is located (see photos) instead of right next to the canal; the existing palms could then be saved and the bikepath / walkway (which would not be used during a flood anyway) could be relocated between the berm and the (brand new) retaining wall.

Also, during the online public meeting last week there was again discussion about including Native Hawaiian cultural consultation in the planning of the project. It appears that this still has not been done. The Mō'ili'ili (and Waikīkī) areas have been populated by native groups long before the canal was dug, and there is a lot to be learned from the understanding of the natural flooding and wetlands in this region that could be used to advantage.

Finally - I submitted another email regarding consideration of the Ala Naio Stream (AKA Hausten Ditch), but since I have not seen a reply or acknowledgement of receipt I wanted to make sure to mention it again. Discussion of this waterway during the public meeting did not dispel fears of backup and induced flooding in the stream on a scale that would be even worse for upstream properties than it would be if the walls were not constructed. It would be really good to have your engineering people who can address this (and other technical issues) at the next meeting on 15 May.

Mahalo

Subject: NOI - Ala Wai Flood Project - Dave Watase's Public Comment #2 - Concerns with the 2017 Final Environmental Impact Statement - Hydrology and Hydraulic Engineering

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Aloha,

My name is Dave Watase, I am a resident who lives within the Ala Wai Watershed and a key stakeholder in the 2017 Final Environmental Impact Statement (FEIS) for the Ala Wai Flood Project.

I am OPPOSED to the United States Army Corps of Engineers (USACE) plan to perform a Supplemental Environmental Impact Statement (SEIS) because it builds upon a flawed and an outdated FEIS.

I'd compare the NOI and SEIS to trying to build a bridge on sinking sand. The Hydrology and Hydraulic Engineering is the basis and foundation for which the project is built upon. Having a solid foundation and one that is plumb and square is most important. In this instance the USACE should "do nothing" and start all over because somehow the best alternatives like flood gate and pumps and underground tunnels are being rejected and probably 90% of the community generated measures which involve ecosystem restoration are ignored.

The Hydrology and Hydraulic Engineering data used in the 2017 FEIS was outdated and nearly 10-years old and will be over 15-years old if used for the SEIS. The FEIS Appendix A (temporarily uploaded to my cloud and linked for your convenience, please download 49.4MB) [Blockedhttps://res-h3.public.cdn.office.net/assets/mail/file-icon/png/pdf_16x16.png] Appendix A - H-H.pdf<Blockedhttps://1drv.ms/b/s!AiaSquflq9j6gfJthsAYNrcWyG1lpQ> is nearly identical to the USACE's Final Hydrology Report Ala Wai Watershed Project dated December 2008 (temporarily uploaded to my cloud linked for your convenience, please download 3.5MB) [Blockedhttps://res-h3.public.cdn.office.net/assets/mail/file-icon/png/pdf_16x16.png] 17 - 7_Final AlaWai_hydrology_Report_081205.pdf<Blockedhttps://1drv.ms/b/s!AiaSquflq9j6gfJTEohZGTqH0FQMyg> .

Two of the three significant storms selected to be the basis for calibrating the flood models occurred in 2006 and 2004 only a few years from the date of the report and does not reflect a broad enough range of historic storms for the Ala Wai Canal which is nearly 100 years old. Neither the 2006 and 2004 overtopped the Ala Wai Canal and Waikiki had zero property damage. These two storms are not considered historically large storms over the past 100-years and only stand out because both of these storms caused notable property damage to areas exclusively above the Ala Wai Canal.

1

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The December 30, 2006 storm was not significant in size did not top the Ala Wai Canal but was preceded 40-days of straight rain which had saturated the ground causing immediate runoff. Since historic data is not collected on ground saturation levels and the methodologies do not incorporate a ground water saturation coefficient it does not make sense why this typical storm was selected.

The October 30, 2004 storm did not top the Ala Wai Canal, however caused $85 million in property damage. The storm was estimated to be a 20-year storm and the flood damage can be directly attributable to poor maintenance of the stream near the Woodlawn bridge. The original 1974 Woodlawn bridge drawing has design capacity of 8,300 cfs. Silt buildup had reduced the capacity in half and debris blocked an additional 25% of the capacity allowing only 25% of the designed capacity to pass through and approximately 2,000 cfs overflowed down to the University of Hawaii.

As a resident within the Ala Wai Watershed, I can attest to the development changes to our watershed since 2008. The high cost of housing has pushed many homeowners to CPR and ADU options expanding the hard surfaces on their properties, investors have bought properties and built "monster homes" with up to 10-bedroom 10-bath homes and paved the whole property with concrete. Waikiki has seen many new hotels and the complete teardown and rebuild hotel projects. The Ala Moana and Kakaako area has experienced a huge influx of luxury condo developments. These all impact the runoff coefficients and it is clear that the data is deficient and not up to date.

Example 1: The next two exhibits "USACE's FEIS Appendix A, page 53 of 435" and "USACE's Final Hydrology Report Ala Wai Watershed Project dated December 2008, page 49 of 119" will display that the sub-basin analysis has not been updated and both are exactly the same. This is independent from the rainfall and flow gauge data from the selected storms.

USACE's FEIS Appendix A, page 53 of 435

[cid:80ed7c47-3d65-4f5e-b798-8a2abfab55e9]

USACE's Final Hydrology Report Ala Wai Watershed Project dated December 2008, page 49 of 119 [cid:32407a42-8bcb-4bad-839d-7f5213adf567]

Example 2: The next two exhibits "USACE's FEIS Appendix A, page 34 of 435" and "USACE's Final Hydrology Report Ala Wai Watershed Project dated December 2008, page 30 of 119" will serve as proof that the data was not updated by examining the number of annual peaks available for analysis. In the case of the FEIS Final Hydrology Report page dated 2/11/2017 the mention of "to present" relating to the collected stream gauges data is not current as it is identical to the December 2008 report. The total number of annual peak figure would be higher each year for each location from 2008.

USACE's FEIS Appendix A, page 34 of 435

[cid:e306b9e6-04e1-4a41-84ec-9411af31208e]

USACE's Final Hydrology Report Ala Wai Watershed Project dated December 2008, page 30 of 119

[cid:cb0160a7-bbe8-47e2-a63a-a41da5465b68]

The methodology used to formulate the hydrology models for the FEIS are best fit for flat areas and do not account areas like Manoa and Palolo with steep ridgelines thousands of feet in height that potentially act as sails to capture stormwater at angles. The surface area of theses ridgelines can quadruple the 2-dimensional surface area. The FEIS disclaims this fact by stating "The Thiessen Polygon Method does not account for orthographic rainfall effect in mountain areas." It's no wonder the flood modeling doesn't resemble anything in the Ala Wai Canal's 100 year history.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

USACE's FEIS Appendix A, page 58 of 435

[cid:dc8127f6-6132-4bb1-a58b-35382a133c85]

T

Clearly, the FEIS is not based on rocket science because if NASA was told to predict the location that the Apollo space capsule will land in the Pacific Ocean and one methodology predicted near Japan and the other methodology predicted off the coast of California and NASA picked the middle point. I definitely would not jump in on the spaceship for a ride. That is the analogy I use to demonstrate Final Hydrology and Hydraulics Report for the FEIS. If you look at the figure below which has the Final discharge values for several locations, as an example for the mouth of the Ala Wai Canal the Final flow discharge is 19,500 CFS. It is derived by averaging several methodologies ranging from 17,700 CFS to 28,200 CFS. This tells me that none of the methodologies are rocket science and no one methodology can accurately compute the flow discharge for a given rated storm and the results are not certain.

USACE's FEIS Appendix A, page 129 of 435

[cid:0b75099e-f3d9-4c83-a7ab-b1479bfc24ed]

There is a lack rainfall gauges and locations of convenience and not optimum locations, some too close together, The St. Louis Heights ridgeline has nothing and missing are data from the highest points in the Manoa Valley sub-watershed. The sub-basins without coverage used interpolation results from triangulation using locations outside the Ala Wai Watershed. This interpolation severely weakens the accuracy of the data being used in each sub-basin and skews the flood modeling to be unrealistic to which design measures and flood damage figures are generated.

USACE's FEIS Appendix A, page 30 of 435

[cid:7a51b34a-8aca-411f-b789-c085bd59d273]

Annual rainfall data should not play a part in generating flood modeling for significantly large meteorological events like the 100-year flood. Why? Because every Ala Wai Watershed resident understands that the 1% or 2% chance storm will most likely be a downgraded hurricane, have high winds, generate tide surges, and blanket rain (mostly uniform downpour) our little Ala Wai Watershed which only around 8 miles long. It is totally unrealistic to assume that Waikiki and the lower portions of the watershed like Kapahulu, Moiliili, McCully, Lower Makiki, and Ala Moana will have less rainfall than the upper portions of the watershed and can survive a significantly large storm for several hours with the interior stormwater drainage system shut closed for several hours. We are not trying to protect from a passing storm cloud but downgraded hurricane that can park itself over our whole island for a significant time. The USACE's Ala Wai Canal flood wall measure will cause and result in severe flooding and property damage.

USACE's FEIS Appendix A, page 31 of 435

[cid:c7696e31-923f-4bcc-b62a-78f92203a8cf]
The chart below lists the Rain Gages used to collect raw data used to generate the flood modeling for the Ala Wai Flood Project. It doesn't matter if you have a mega-million dollar supercomputer with the latest state of the art flood modeling software the results are only as good as the data you feed into it. Out of the 13 rain gauges used, 2 of them are outside the Ala Wai Watershed, and only 7 of them have real time recording. I think we all understand that 10" of rain in an hour and 10" of rain in a day can result in a significant difference in peak stream flows and critical times for a given location along the path to the ocean.

3

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The USACE selected 3 significant storms to calibrate the modeling for the FEIS. The December 1967 flood is the only storm selected that barely overtopped the Ala Wai Canal near the Manoa Stream confluence causing $10,000 (1964 dollars) of recorded property damage and for the most part Waikiki was left untouched and other portions of the Ala Wai Canal fine. The question is what real-time rainfall data is available to support the December 1964 storm. The Lyon Arboretum began in 1975 and the Kanewai Field began in 1999. So, the most significant storm that the USACE is using to generate flood modeling in their Hydrology report and updated HEC-RAS (2020 EDR) modeling really has no real-time recording from the largest sub-watershed of Manoa Valley. Additionally, H-1 Kapiolani began in 2005 also could not be used for the December 1964 storm resulting in only 4 real-time rain gauges for input data of which one is outside the watershed (Waikiki Zoo).

It should also be noted that the other 2 storms in 2004 and 2006 used to calibrate the modeling for the FEIS also lack real-time rain gauge data. H-1 Kapiolani gage which began in 2005 would not be applicable for the October 30, 2004 storm and Pukele Stream gage which stopped in 2005 would not be applicable for the November 31, 2006 storms.

Additional concerns are the validity of the recorded data because it involves 3 independent operators (National Weather Service, US Geological Survey, and Board of Water Supply). Questions abound on whether there are consistent and uniform policies and standards to ensure accurate data collection, the precision of the measurement equipment, the precautions taken to calibrate and certify the equipment, and checks and balances to ensure that the data is not compromised, corrupt, or deficient. It should be noted that disclosures are made throughout the hydrology report admitting the lack of reliable data and that is generally the norm.

However, that being the norm in itself does not justify or make it acceptable for the USACE to promote erroneous flood modeling representation which instigate fear in the population. It is negligent for the USACE to make statements that the FEIS is "estimated to be 99.9 percent reliable in protecting parts of Honolulu, Hawaii, from a flood which has a 1 percent chance of occurrence in any given year" and then a few year later negated the statement by the release of the Engineering Documentation Report dated July 2020 (EDR). The EDR disclosed that over half of the design elements of the project to fail based on updated flood models and were not economically justified and feasible. Good news to the community! The EDR made a significant shift in design elements from one primarily of detention to one of conveyance for the upper watershed which in itself should deem the FEIS as faulty or incomplete and void any attempt to update the project via SEIS. You have to ask yourself what going on because the EDR states a cost of $376 million in July 2020 and in January 2021 ballooned to over $651 million is cost.

USACE's FEIS Appendix A, page 32 of 435

[cid:c18bd555-f8c8-4913-969e-c25f44cfd787]

The 2015 Draft EIS and 2017 Final EIS mention that flood models were created for as small as the 2-year flood however no is not included in the FEIS. The lowest flood modeling found is shown below which has the 5-year (20% chance - Pink) and 500-year (.2% chance - Lt. Blue) which were generated using the 3 selected storms for calibration. A 1-year flood should have a 100% chance of occurring in any given year and my understanding it should resemble a flood that someone experiences once every single year and so forth for the 2-year, 5-year, 10-year, 20-year, 50-year, 100-year, 200-year, and 500-year flood. For most of us, we will experience a 50-year flood in our lifetime and a few will experience a 100-year flood in their lifetime.

Even a 7th grade science experiment requires making a hypothesis or prediction. Generally speaking, if things go wrong there are tell tail signs. The USACE flood 5-year flood model in PINK as shown in the figure below has never happened (tell tail sign). The biggest flood in the history of the Ala Wai Canal (100 years) occurred in December 1967 when I was in 3rd grade at Hokulani Elementary School and the overtopping of the Ala Wai Canal was limited to an area near Manoa Stream confluence.

4

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Now common sense would say that if historic data were properly used to create flood modeling that it should resemble similar past rated storms. A previously rated 100-year flood could be downgraded in the future if the same magnitude storm occurs more frequently. Climate change may increase the frequency of larger storms and flood modeling should constantly be updated as new data becomes available.

USACE's 2015 Draft EIS Appendix B - Economics, page 10 of 81

[cid:8ec921fc-72c7-49c0-ad2a-941b65cff605]

Should the USACE have any question, I'd be happy to meet with your Project Team.

Mahalo,
Dave Watase

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

4.4.1 October 2004 Storm Calibration for Mānoa-Pālolo Area

The calibration for the storm of October 30, 2004, was based on the method used in the previous Mānoa Watershed Project hydrologic study. The calibration parameters used for the Mānoa sub-watershed in the Mānoa Watershed Project hydrologic study were used for the HEC-HMS model in the Ala Wai Watershed hydrologic study. The gage weights for sub-basins in Mānoa valley were the same as those used in the Mānoa Watershed Project described earlier. The main task of the calibration for the Ala Wai Watershed hydrologic study focused on the Pālolo sub-watershed and the area downstream of Kānewai Field gage, to the USGS stream gage 16247100. This stream gage is located on Kaimukī High School and had full stream flow records for the event. Gage weights were used for calibration purposes. The Thiessen polygon method was initially applied to determine the gage weight for each sub-basin. Figure 4-5 shows the Thiessen polygons for the October 2004 storm for the Ala Wai Watershed. The Thiessen polygon method does not account for orthographic rainfall effect in mountain areas. After taking into consideration the rainfall pattern, data quality, and storm movement and distribution, the final gage weights and relevant 24-hour rainfall of the October 2004 storm for each sub-basin were determined as shown in Table 4-4. (Note: 'MP' is used to abbreviate the Mānoa-Pālolo area.)

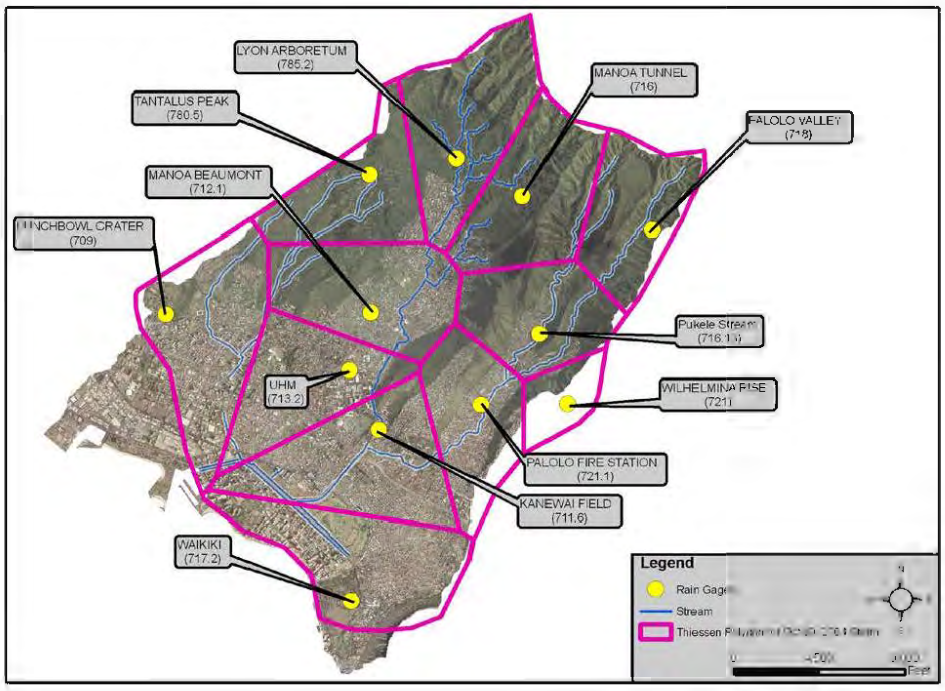

Figure 4-5. Rain Gages and Thiessen Polygons for the October 30, 2004

Subject: RE: Ala Wai Canal Flood Risk Management Project Supplemental Determination and EIS Preparation Notice

Hello:

Please see the DTS' attached final response to the Ala Wai Canal Flood Risk Management Project Supplemental Determination and EIS Preparation Notice, signed by our Director; a physical copy should be arriving at DDC shortly.

Thank you.

Sincerely,
Greg Tsugawa

Subject: Ala Wai Canal Flood Risk Management Project Supplemental Determination and EIS Preparation Notice

Hello:

The City and County of Honolulu's Department of Transportation Services will be submitting comments on the Ala Wai Canal Flood Risk Management Project Supplemental Determination and EIS Preparation Notice, and we're currently obtaining our Director's signature on the final response. Please see our attached draft response, which should be substantially similar to the final version; we'll send you the final response when available.

Thank you.

Sincerely,
Greg Tsugawa
City and County of Honolulu

MEMORANDUM

TO: Haku Milles, P.E., Director
Department of Design and Construction (DDC)

FROM: J. Roger Morton, Director
Department of Transportation Services (DTS)

SUBJECT: Ala Wai Canal Flood Risk Management Project Supplemental Determination and Environmental Impact Statement Preparation Notice

Thank you for the opportunity to provide written comments regarding the Ala Wai Canal Flood Risk Management Project Supplemental Determination and Environmental Impact Statement Preparation Notice. We have the following comments.

1. Project coordination.

   i. The DTS is actively coordinating with the United States Army Corps of Engineers (USACE) and the DDC on the Ala Wai Flood Risk Management Study (Study). A DTS representative will continue to be available to attend weekly Study coordination meetings with the Study's team, participate in the Study's public meetings, and coordinate the DTS' communications and projects with the Study.

   ii. The DTS currently has two ongoing projects in the Study area, (1) the Ala Wai Boulevard Complete Streets Project, located between Kapahulu and Kalakaua avenues, and (2) the Ala Wai Bridge Project, spanning the Ala Wai Canal at Kalaimoku Street. The Study must ensure ongoing coordination between the DTS projects and the Study's flood risk management measures.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

iii. The DTS further encourages the DDC and the Study, to the extent feasible, to integrate active transportation resources into the project that compliment DTS' ongoing projects and provide mobility.

2. Street Usage Permit. A street usage permit from the DTS should be obtained for any construction-related work that may require the temporary closure of any traffic lane, sidewalk, bicycle lane, or pedestrian mall on a City and County of Honolulu street.

3. Bus Stops. Numerous bus stops are located within the Study area. Please coordinate any bus stop impacts/changes with DTS – Transportation Mobility Division (TMD). Contact DTS-TMD at TheBusStop@honolulu.gov

4. Neighborhood Impacts. The area representatives, neighborhood board, as well as the area guests, businesses, emergency personnel (fire, ambulance, and police), Oahu Transit Services, Inc. (TheBus and TheHandi-Van), etc., should be kept apprised of the details and status throughout the project and the impacts that the project may have on the adjoining local street area network.

5. Disability and Communication Access Board (DCAB). Project plans (vehicular and pedestrian circulation, sidewalks, parking and pedestrian pathways, vehicular ingress/egress, etc.) should be reviewed and approved by DCAB to ensure full compliance with Americans with Disabilities Act requirements.

Should you have any questions, please contact Greg Tsugawa, of my staff, at (808) 768-6683.

Subject: NOI - Ala Wai Flood Project - Comment #3 - TUNNELS

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Aloha,

My name is Dave Watase, I am a resident who lives within the Ala Wai Watershed and a key stakeholder in the 2017 Final Environmental Impact Statement (FEIS) for the Ala Wai Flood Risk Management Project.

I am OPPOSED to the United States Army Corps of Engineers (USACE) plan to perform a Supplemental Environmental Impact Statement (SEIS) because it builds upon a flawed and outdated FEIS.

I am OPPOSED to the General Reevaluation Study's Prospective Plan elements of an Ala Wai Canal Flood Wall and believe a better alternative is the CONCEPT OF USING TUNNELS that can capture flood waters in the upper watershed and using elevation and head pressure convey the flood waters completely bypassing the Ala Wai Canal. Tunnels are not susceptible to high tides, tide surges from hurricanes, and sea level rise. The upper watershed flood waters that are removed via tunnels do not have to be a dealt with in the lower watershed. Tunnels can be adapted or extended to higher elevations for additional inlet sources, can be designed to have multiple inlets at different elevations.

The Honolulu City Council formed a Permitted Interaction Group which hired OceanIt to develop alternatives to the FEIS. OceanIt's alternative primarily focused on addressing the 100-year flood flows from the upper watershed and did not address the flows from the lower portions of the watershed. OceanIt's plan would have to be used in conjunction with another alternative to address the 100-year flows from the lower watershed.

OceanIt's Report:

* Makiki tunnel 12' diameter has a potential capacity of 2,559 cfs
* Manoa tunnel 12' diameter has a potential capacity of 3,178 cfs
* Palolo tunnel 12' diameter has a potential capacity of 3,150 cfs

Tunnels can be extended and increased in diameter or doubled up. Many factors affecting the flow are elevation and pipe friction which will increases with length. The higher up the watershed the smaller the flows. Flows may not be consistently available and an adjustable inlet weir would provide flexibility. The benefit of tunnels are that all flows are removed out of the equation for the duration of the storm because it completely bypasses the lower watershed and the Ala Wai Canal.

1

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

OceanIt's Report:

Manoa and Palolo tunnel has an estimated cost of $262 million (direct and indirect cost) and includes tunnels extending a quarter mile out into the ocean. These tunnels are 12' in diameter and have one inlet. The 12' tunnels transitions to three (3) 6' diameter tunnels going out into the ocean.

Instead of going a quarter of a mile out into the ocean and to avoid potential environmental setbacks, the outlet should be near the Ala Wai Boat Harbor near Magic Island.

Cost saving from the elimination of taking the tunnels out into the ocean will be around $97 million (direct and indirect costs) and should be repurposed for going to the Ala Wai Board Harbor. OceanIt's plan does not include Engineering and Project Management. However, the tunnel engineering designs should be far less complex than building a wall around the Ala Wai Canal to which every foot has to be carefully examined to deal with historic walls, protected trees, utilities, and other unknow factors. Even the project management should be so much more simplified by tunneling underground with less issues to deal with. I'd compare the Ala Wai Flood wall to the RAIL going down Dillingham and verse the tunnel as building the RAIL in on open farmland in Kapolei. Big difference and less chance for change orders and cost increases which government projects are know for. Additional saving may be incurred by combining starter shafts and tunnels. Reusing the starter shafts for a pump station and adding additional tunnels for the flood pump. Tunnels, Flood gate and pump, and the Ala Wai Golf Course detention basin can be built independently and work in conjunction to increase flood protection. Flood pumps via tunnels to the Ala Wai Boat Harbor are not susceptible to high tides, tide surges and sea level rise especially if worked in conjunction with a flood gate. (See diagram below the OceanIt stuff)

Jeff Herzog referred this alternative idea as the Octopus Plan where the pumping station on the Ala Wai Golf Course was like the head of the Octopus. In reality, it acts as a centralized switch for both the upper watershed tunnels and lower watershed flood pump. Expansion of the concept would include additional inlet pipes extended to different locations.

Manoa tunnel - RED (gravity flow, multiple inlets, could be switched to be pump assisted) tunnel could be extended to the Manoa District Park (protecting UHM, Lowery Bridge, East Manoa Bridge, and Woodlawn Bridge)

Palolo tunnel - PINK (gravity flow, multiple inlets, could be switched to be pump assisted)

GREEN tunnel (Kanewai Park to feed the Ala Wai Golf Course Detention Basin, inlet 25+ feet MSL, would allow the AWGC berm to be increased in height to have more detention capacity. AWGC is approximately 5 million square feet in area and every foot of storage is approximately 5 million cubic feet of storage. AWGC detention basin can be a series of several detention basins that can be opened up or spilled into the next so as to use as needed for the unexpected. The AWGC detention basin can have an inlet weir below Date Street Bridge which will provide minimal detention storage. If the berms are built higher and flows captured upstream then for bigger storms where increase storage capacity is needed then the weir can be closed and the AWGC would operate above ground level. The first source for detention storage would created by lower the Ala Wai Canal with a flood gate and the AWGC detention basin would be the last used option. The AWGC potentially could hold 40-50 million cubic feet of flood water.

Currently, the General Reevaluation Study, the USACE stated that the AWGC detention basin will hold 300 ac-ft which is about 13 million cubic feet.

Ala Wai Golf Course Flood Pumping Station and switch station - YELLOW - Purpose to bypass the Ala Wai Canal and move flood waters from the Manoa/Palolo Stream confluence to the Ala Wai Boat Harbor. The flood pump in conjunction with a flood gate could lower the canal ahead of a storm to create 20-40 million cubic feet of detention storage. The Ala Wai Golf Course Detention basin

[cid:33cdba27-2f2b-4c8e-8525-c8ebb28c0ba0]

UPPER WATERSHED:

* Manoa gravity flow tunnel (inlet Manoa District Park, inlet St. Francis, inlet Kanewai Park, Ala Wai Golf Course Switch Center/pumping station, tunnel to Ala Wai Harbor outlet platform);
* Palolo gravity flow tunnel (inlet Palolo Ave. Bridge, inlet Palolo/Manoa Stream confluence, Ala Wai Golf Course Switch Center/pumping station, tunnel to Ala Wai Harbor outlet platform);
* Makiki gravity flow tunnel (inlet Nehoa/Makiki, inlet Nehoa/Pensacola, route under Piikoi to Ala Moana Beach Park, then to Ala Wai Harbor outlet platform);

LOWER WATERSHED:

* FLOOD GATE/LOCK (Ala Moana Boulevard Bridge)
* Worked in conjunction with a flood pump, canal can be lowered before a storm below sea level (2 million cubic feet of storage per 1' canal elevation);
* Instead of building above ground walls for detention storage use existing canal which originally is 25' in depth;
* Would protect and improve existing storm drainage infrastructure capacity by increasing the head pressures which is only 1-2' above high tide;
* Would protect the Ala Wai Canal from tide surges up to the height of the Ala Moana Boulevard Bridge;

3

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

- If sea level occurs, the flood gate would remain closed and the Ala Wai Canal could act as a storm water collection basin;
- Recreational users would use the flood lock system;
- Natural flows without a storm are around 1,200 cfs and would have to be pumped all the time;
- In time of storms, anytime the canal elevation is higher than the ocean, the flood gates can be open to utilize the Ala Wai Canal natural drainage in conjunction to a pump;
-
- FLOOD PUMP (located at the Ala Wai Golf Course built on land, underground using the tunnels launch shaft)
  - Inlet at Manoa Stream Confluence;
  - Inlet at Ala Wai Golf Course Detention Basin;
  - Outlet via tunnel to Ala Wai Harbor;
  - Switchable to Manoa tunnel inlet and outlet;
  - Switchable to Palolo tunnel inlet and outlet;
  - Can work in conjunction or independent of the Manoa and Palolo tunnels;

The tunnels could have multiple inlets at different elevations and if an inlet highest up runs low on flow, can be shutdown to refill the tunnels above to build up head pressure (in a similar way as a toilet), and valves can be at additional downstream inlets. The higher up the tunnels extend up the watershed the less volume of flood waters are available to bypass the Ala Wai Canal.

The Ala Wai Canal and lower portions of the watershed are flat and gravity flows in the canal are estimated to be 1-2 feet per second. Obstructions are the Kalakaua Bridge with arched supports limiting the flow capacity of the canal. The solution is to pump the flood waters from the point of highest concentration (Manoa/Palolo Stream confluence) about a mile to the Ala Wai Boat Harbor.

High tides average around 2', King tides 2.7' and intermediate sea level rise 2.7 - 3.2'. Even without sea level rise, a 2' tide surge would provide only a few feet of increased cross-sectional surface area for increase flows at the Ala Wai Canal Harbor. The Ala Wai Canal is about 200' wide so increased outflow from a flood wall is very limiting and even if 5' cross-sectional was gained at high tide. That would provide 1,000 square feet of cross-sectional area times the velocity of the flow and assuming the flows are around 2 feet per second that would only provide 2,000 cfs and the tunnels would outperform the wall. A 4,000 cfs pumping station at the Manoa/Palolo stream confluence via tunnel to the Ala Wai Harbor would outperform the above ground flood walls.

Should you have questions, please do not hesitate to contact me.
Dave Watase

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Figure 4 shows the locations and the approximate traces of the three tunnels.

The watershed consists of many sub-watersheds that drain water from different areas into local drainage channels and finally into the Ala Wai Canal through Makiki, Manoa and Palolo streams. Figure 5 shows the hydrological schematic of the watershed feeding the Ala Wai Canal including contributions from the lower Ala Wai watersheds like Waikiki and Kaimuki.

The left portion shows the Makiki watershed schematic with its reaches identified with a "K." The Manoa schematic is in the center with its reaches identified with a "M." The Palolo schematic is on the right side with its reaches identified with a "P."

The water intake points for the tunnels were selected to optimize the tunnel discharge, by evaluating the elevation of the intake point, tunnel length and the tunnel diameter. The optimum intake points for maximizing discharges are identified in the schematic and are shown in green.

Table 3. SWIFT discharge for different tunnel sizes for Palolo Watershed

The tunnels are designed to discharge directly into the ocean and bypass the lower watershed completely. In order to evaluate the resulting flood reduction impact in the Ala Wai Canal vicinity and Waikiki, Oceanit ran the hydraulic models developed by the USACE with the flow elimination simulated at the tunnel starting points (reflected in Figure 5 above).

Oceanit integrated the tunnel concept into the 100-year event HEC-RAS model without features. Initially, Oceanit experimented with using three 10-foot diameter tunnels located in the upper regions of sub-watershed Makiki, Manoa, and Palolo. With the tunnels, the HEC-RAS modeling results showed an elimination of flooding at the University of Hawaii and a notable reduction of inundation in the lower watershed area. For example, flow depth in the McCully-Mo'ili'ili area was reduced by 0.5 feet on average, and up to 1 foot on the east side of Kalakaua Ave. However, due to the widespread inherently large amount of rainfall from a 100-year storm event, the inundation levels in the lower watershed would still be significant, even with the tunnels.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

alignment corridors are approximately shown in Figure 1, but the outfall locations are not specific in this figure.

Figure 1 – Approximate Manoa Tunnel and Palolo Tunnel Alignment Corridors

In the vicinity of the main shafts near the coast, anticipated subsurface conditions are assumed to be similar to those in the vicinity of the Beachwalk Wastewater Pump Station to Ala Moana Park Sewer project.[1] The subsurface conditions near the shafts, and heading both inland within the lower coastal plain and offshore to the outfalls are assumed to generally consist of a highly complex local geology that includes highly variable deposits due to the mixing and interfingering of coral, coral reef limestone, beach sand, lagoonal deposits, bedded deposits of alluvial silts, sands, and clays carried down from the mountains, and bedded volcanic deposits. The resulting geology can include bedded tuffaceous silts and sands, more recent alluvial deposits with cobbles and boulders, and interbedded coralline deposits and coral reef limestone, overlain by very soft lagoonal deposits. The youngest sediments are the silts and clays deposited in the Ala Wai Canal.

Calvin Say and all council members, Ala Wai Watershed flood control, and Anton Kruskey Do you want to compromise the Waikiki and "Hawaii Sense of Place"?

None of the Army Corp of Engineers proposals should be enacted. Massive stretches of concrete are not the answer. I have been responding with positive suggestions since 2015 and the ACE. Please see the following:

What can the community do in a proactive way? Please list your own suggestions.

List the immediate or medium or long term suggestions—that is, what is possible (not what is a problem):

Immediate suggestions to mitigate possible flooding in the Ala Wai Watershed:
--3-4 foot earthberms around Ala Wai School, Iolani School, Hokulani School, Noelani School.
--detention basin extending to the whole of the golf course by lowering the elevation by 3-4 feet. (with a small underground outflow pump) --detention basin at Kaimuki HS track and field –detention basin at Kanewai Field --raise Ala Wai Blvd berm with sidewalk and bike path and visually appealing 3-4 foot blue stone lava rock railing/barrier along the Waikiki edge of the canal –hold off/stop any bridge over the Canal or pumping stations in the Canal on either the makai or mauka sides of the Canal

Plans requiring long-range planning:
--relief tunnel from Palolo Stream under City Mill and Kaimuki HS grounds and Ala Wai Golf Course to the Canal --relief tunnel from Manoa Stream under Kaimuki HI grounds and Ala Wai Golf Course --relief tunnel from the Diamond Head end of the Canal to the Kapahulu groin

Please add to these lists in a proactive way.

Subject: NOI - Ala Wai Flood Project - Dave Watase's Public Comment #4 - Walk the Ala Wai Canal, Users, and Neighborhood Boards

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Aloha,

My name is Dave Watase, I am a resident who lives within the Ala Wai Watershed and a key stakeholder in the 2017 Final Environmental Impact Statement (FEIS) for the Ala Wai Flood Project. I am OPPOSED to the United States Army Corps of Engineers (USACE) plan to perform a Supplemental Environmental Impact Statement (SEIS) because it builds upon a flawed and outdated FEIS. I am OPPOSED to the General Reevaluation Study's Prospective Plan elements of an Ala Wai Canal Flood Wall and it will have irreversible negative impacts on the community.

It doesn't take a rocket science to recognize the flaws in the FEIS and many were so obvious that an 8th grader could figure it out. Yet, the USACE consistently ignored and dismissed valid community concerns. The common response was that the USACE met all requirements, procedures and notices, the selected alternatives were extensively vetted, examined by several tiers of experts on the mainland in order to secure Congressional funding, and that it was needed to save our lives and property. Who were we to question the something that had been approved by the best hydrology and hydraulic experts in the United States. We quickly realized that once the USACE completed 35% Engineering and cost feasibilities studies that it was nearly impossible to counter without our ideas and concerns having the same level of design support. This is why, right now, it is vitally important that the General Reevalution Study have conceptual alternatives that will in fact work, be economically feasible, and most importantly be accepted by the community.

On June 17, 2019 the USACE held the Ala Wai Industry & Innovation Day at the Honolulu Country Club and one statement I still remember. USACE's Denis Hoerner from New Orleans said that he was in charge of the walls around the Ala Wai Canal and that it was the first time he was able to visit the site and his comment was that "the canal looked a lot different in real life than from Google Maps". That explained a lot to me to have someone 8,000 miles away that never previously set foot on the island or talked to those living around the Ala Wai Canal be in charge of designing a flood wall for our protection. How would he know that the flood modeling looked off and unrealistic? Had he walked by the Makiki Stream with the plans he would have known it was missing a flood gate and would require a pump or the walls would have to retreat further up Makiki Stream to match the canal height walls. He would have immediately recognized that the Hausten's Ditch Detention basin was above the surrounding ground level elevation and wouldn't work or that the Ala Wai Elementary School and Iolani School would also need a flood wall and berm. He would have questioned why are there two pumping stations at the far end of the canal, a quarter mile walking distance away from the ocean, and designed for to handle peak flows only to be pumped into an already full canal with a 2-mile path to the ocean. He would have recognized the impossibility of building upon a 100-year historic wall and any wall would have to be substantially setback, and that space requirements would be difficult. So much more!

1

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The USACE must take a walk along the Ala Wai Canal and the Ala Wai Promenade to visualize the impacts a 6' high wall will have to the views and existing walls. The Ala Wai Canal is used by many for recreation and I've attached a few Youtube videos links for you to watch. Especially, for those decision makers outside of the State of Hawaii.

Take a stroll around the Ala Wai Canal and Ala Wai Golf Course:

Blockedwww.youtube.com

Take a stroll around the Ala Wai Promenade:

It should be noted that the lower terrace of the Promenade experiences backflow flooding from the drainage pipes with a King Tides of 2.7' MSL. The lower end of Ala Wai Boulevard at the cul-de-sac near the Ala Moana Boulevard Bridge also experiences backflow flooding from the storm drainage pipes with a King Tide of 2.7' MSL. Kalakaua Avenue Bridge has arch supports and most likely will be an obstruction to flows. Makiki Stream confluence will have to be gated with a 6' wall and would require a flood pumping station or the EDR's Makiki Bypass. However, the EDR's Makiki Bypass would be susceptible to high tides, tide surges, and sea level rise and potentially risk backflow scenarios. The Makiki Bypass would most likely be submerged and would have very restrictive flows due to the low head pressure and wouldn't work as planned. Please study the area as you take a walk.

Most Neighborhood Boards only pass a handful of resolution per year. Many resolutions are debated to death or take several months to pass. The Ala Wai Flood Project FEIS and EDR definitely caught the attention of the communities. It is rare that several Neighborhood Boards each with a diverse group of independently minded individuals can come together with interest of the Ala Wai Flood Project.

Attached are Neighborhood Board Resolutions regarding the FEIS and the EDR:

Resolution Concerning the Ala Wai Canal Project

WHEREAS, in the past several decades catastrophic flooding events have occurred more frequently in the United States and the rest of the world; and
WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Canal Project (the "Project"), also referred to as the Ala Wai Flood Mitigation Project, in response to the potential of a catastrophic flooding event (100-year storm) within the Ala Wai Watershed; and
WHEREAS, the Project includes, among other features, the construction of detention basins in Mānoa and Palolo Valleys, Makiki, Kanewai Park, the Ala Wai Golf Course, Ala Wai Park (Hausten Ditch) and an average four-foot reinforced solid concrete wall which extends as high as four and a half foot in certain segments surrounding portions of the Ala Wai Canal and Ala Wai Promenade; and
WHEREAS, the Ala Wai Watershed contains within it such areas of Honolulu as Manoa Valley, Pālolo Valley, Makiki, Tantalus, McCully, Mo'ili'ili, St. Louis Heights, Kapahulu, Kaimuki, Kapi'olani, Ala Wai, Ala Moana, and Waikīkī ; and
WHEREAS, the Kaimuki Neighborhood Board heard presentations by residents or property owners who live next to or within a proposed detention basin; and
WHEREAS, these residents stated that they did not receive proper notice of the Project and were not given an adequate amount of time to respond to the Draft Report/Environmental Impact Statement ("EIS") of the Project; and
WHEREAS, 'Iolani School, located on the Ala Wai floodplain, wrote a letter to the USACE in 2015 in which it claimed that neither it nor the other stakeholders were adequately engaged in an evaluation of the Project and urged that the Draft Report/EIS be reviewed and reissued for further public comment; and
WHEREAS, it is the sense of the Kaimuki Neighborhood Board that public awareness of this Project is insufficient to have the Project move forward; and
WHEREAS, Congress in the Fall of 2018 appropriated money to fund the federal portion of the proposed cost of the Project, leaving only the State funding as the final hurdle before commencement of construction; now, therefore,
BE IT RESOLVED by the Kaimuki Neighborhood Board that the USACE should put a hold on any further advancement of the Project until the very people who are supposed to benefit from the Project having future opportunity to consider and weigh in on the Project and alternatives to it; and
BE IT FURTHER RESOLVED that the Kaimuki Neighborhood Board requests that the Thirtieth Legislature of the State of Hawaii, Regular Session of 2019 defer appropriating any funds for the Project during this calendar year; and
BE IT FURTHER RESOLVED that copies of this resolution be transmitted to USACE, the members of Hawaii's Congressional delegation, the Governor of Hawaii, each member of the Hawaii State Legislature, the Mayor of Honolulu, and Honolulu City Council.

Submitted to the Kaimuki Neighborhood Board No. 4 on Wednesday, April 17, 2019.

This resolution was ADOPTED by the Kaimuki Neighborhood Board No. 4 by ROLL CALL VOTE at their Wednesday, April 17, 2019 meeting. Submitted by the: Sharon Schneider, its Chair.

KAIMUKI NEIGHBORHOOD BOARD NO. 4
RESOLUTION CONCERNING THE REVISED PLAN FOR THE ALA WAI FLOOD RISK MANAGEMENT PROJECT

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Flood Risk Management Project (the "Project"), in order to mitigate the effects of a potentially catastrophic 100-year flooding event within the Ala Wai Watershed; and

WHEREAS, the Kaimuki Neighborhood Board #4 ("Board") and six other Neighborhood Boards in the affected watershed passed resolutions in early 2019 requesting that the State Legislature defer appropriating any funds for the Project until community stakeholders' concerns were sufficiently addressed, including consideration of alternatives to the Project; and

WHEREAS, the Hawaii State Legislature declined to appropriate funds for the Project in the 2019 and 2020 Sessions; and

WHEREAS, based on the new 1D/2D modeling and new data, the USACE presented in August of this year a significantly revised flood mitigation plan in which the detention basins in the upper Manoa, Palolo, and Makiki Valleys were removed and new features added, such as a 40-foot-tall pumping station and miter gate set in the Canal itself in a protected scenic view plane, a Makiki Bypass conduit along the Ala Wai Promenade which may adversely affect the protected Exceptional Tree Grove, and high walls around the Canal and Ala Wai Park, and the continued existence of the Kanewai Park Multipurpose Detention Basin with 9' berms adjacent to Hokulani Elementary School, and areas mauka of the Ala Wai Canal would still be flooded under this revised proposal; and

WHEREAS, community members and recreational users have not had a full opportunity to absorb, understand, and react to these changes in the Project; and

WHEREAS, the community and the City Council have presented alternative proposals or alternative features to be incorporated into the current USACE plan; and

WHEREAS, this Board would like the USACE to evaluate seriously the proposals from the City Council and from the community; now, therefore,

BE IT RESOLVED that the Board requests of USACE that its environmental assessment process and any potential environmental impact statement process include technical engineering review of the City Council proposal and of the four community-generated alternatives listed in the Report of the City Council's Permitted Interaction Group on the Project; and

BE IT FURTHER RESOLVED that the USACE should ensure that it properly inform the public, residents, condominium associations, recreational clubs, and schools of the USACE's schedule of public engagements with respect impacts affecting the Kaimuki Neighborhood District Map; and

BE IT FURTHER RESOLVED, the Board requests the USACE establish an official Community Advisory Group that consists of members representing each of the neighborhood board communities of the Ala Wai Watershed; and

BE IT FURTHER RESOLVED that the Board also requests that the City and County of Honolulu defer entering into any partnership agreement with the USACE until community concerns are sufficiently addressed; and

BE IT FINALLY RESOLVED, that copies of this resolution be transmitted to the USACE to be included in the material for its environmental assessment, the Governor of the State of Hawaii, the Mayor of the City and County of Honolulu, all members of the Honolulu City Council, all members of the Hawaii State Legislature, the Director of the State Department of Land and Natural Resources, the Director of the State Department of Budget and Finance, the Director of the State Office of Environmental Quality, the Director of the City Department of Design and Construction, and the chairs of the Ala Moana-Kakaako, Makiki-Lower Punchbowl-Tantalus, Manoa, McCully-Moiliili, Diamond Head-Kapahulu-St. Louis Heights, Palolo, and Waikiki Neighborhood Boards in the City and County of Honolulu.

Passed by Unanimous Consent (10-0-0) at Kaimukī Neighborhood Board #4 Meeting

Resolution Relating to the Proposed Ala Wai Canal Project

WHEREAS, in the past several decades approaching climate change, catastrophic flooding events have occurred more frequently in the United States and the rest of the world; and

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Canal Project (the "Project"), also referred to as the Ala Wai Flood Mitigation Project, in response to a 1% potential of a 100-year storm catastrophic flooding event within the Ala Wai Watershed; and

WHEREAS, the Project includes among other proposals the construction of large detention basins within the Ala Wai Golf Course, Kanewai Park, Ala Wai Park, Hausten Ditch, Makiki, and Manoa and Palolo Valleys; a reinforced solid concrete wall extending as high as four and a half feet along the perimeter of the Ala Wai Canal and the Ala Wai Promenade, and 45-foot high pump stations within and around the Ala Wai Golf Course; and

WHEREAS, the Ala Wai Watershed contains within it such areas of Honolulu as Kapahulu, St. Louis Heights, Palolo Valley, Kaimuki, Moili'ili, McCully, Ala Wai, Waikiki, Kapiolani, Ala Moana, Makiki, Manoa Valley and Tantalus; and

WHEREAS, following the Project's single area-wide public presentation by the USACE on November 5, 2015, the Diamond Head/Kapahulu/St. Louis Heights Neighborhood Board voted on November 12, 2015, to disagree with the USACE determination that the Project would have "no adverse effect"; and

WHEREAS, 'Iolani School, located on the Ala Wai floodplain, stated in a letter to the USACE in 2015 that area stakeholders were not adequately engaged in evaluation of the Project, and urged that the Draft Report/EIS be reviewed and reissued for further public comment; and

WHEREAS, public concerns relating to the Project at area Neighborhood Board meetings have centered on the proposed detention basins consuming private properties; proper maintenance of the detention basins to protect the public health; industrial pump stations proposed to be 45 feet high in and around the Ala Wai preservation area; and concrete walls along the perimeter of the Ala Wai Canal, which is listed on the Hawaii State Register of Historic Places; and

WHEREAS, property owners and residents who live next to or within proximity to a proposed detention basin are now reported to have not received proper notice of the Project and were not given an opportunity to respond to the Project's Draft Report/Environmental Impact Statement ("EIS"); and

WHEREAS, in the fall of 2018 Congress appropriated funding for the federal portion of the proposed cost of the Project, leaving only the State funding as the final hurdle before commencement of construction; now, therefore,

BE IT RESOLVED that the Diamond Head/Kapahulu/St. Louis Heights Neighborhood Board agrees that public input and full public awareness of the impacts of this Project have been insufficient to have the Project move forward; and

BE IT FURTHER RESOLVED that the Diamond Head/Kapahulu/St. Louis Heights Neighborhood Board agrees that the USACE should put a hold on any further advancement of the Project until the people directly impacted by the Project have had the opportunity to consider and respond to the proposed Project and all alternatives; and

DIAMOND HEAD/KAPAHULU/ST. LOUIS HEIGHTS NEIGHBORHOOD BOARD NO. 5 THURSDAY, FEBRUARY 14, 2019

BE IT FURTHER RESOLVED that the Diamond Head/Kapahulu/St, Louis Heights Neighborhood Board joins the Manoa Neighborhood Board in requesting that the Thirtieth Legislature of the State of Hawaii, Regular Session of 2019 defer appropriating any funds for the Project during this calendar year; and

BE IT FINALLY RESOLVED that copies of this Resolution be transmitted to the USACE, the Hawaii Congressional delegation, the Governor of Hawaii, all members of the Hawaii State Legislature, the Mayor of Honolulu, the Honolulu City Council, and all area Neighborhood Boards.

Richard Figliuzzi, Chair

RESOLUTION CONCERNING THE REVISED PLAN FOR THE ALA WAI FLOOD RISK MANAGEMENT PROJECT

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Flood Risk Management Project (the "Project"), in order to mitigate the effects of a potentially catastrophic 100-year flooding event within the Ala Wai Watershed; and

WHEREAS, the Palolo Neighborhood Board #6 ("Board") and six other Neighborhood Boards in the affected watershed passed resolutions in early 2019 requesting that the State Legislature defer appropriating any funds for the Project until community stakeholders' concerns were sufficiently addressed, including consideration of alternatives to the Project; and

WHEREAS, the Hawaii State Legislature declined to appropriate funds for the Project in the 2019 and 2020 Sessions; and

WHEREAS, based on the new 1D/2D modeling and new data, the USACE presented in August of this year a significantly revised flood mitigation plan in which the detention basins in the upper Manoa, Palolo, and Makiki Valleys were removed and new features added, such as a 40-foot-tall pumping station and miter gate set in the Canal itself in a protected scenic view plane, a Makiki Bypass conduit along the Ala Wai Promenade which may adversely affect the protected Exceptional Tree Grove, and high walls around the Canal and Ala Wai Park, and the continued existence of the Kanewai Park Multipurpose Detention Basin with 9' berms adjacent to Hokulani Elementary School, and areas mauka of the Ala Wai Canal would still be flooded under this revised proposal; and

WHEREAS, community members and recreational users have not had a full opportunity to absorb, understand, and react to these changes in the Project; and

WHEREAS, the community and the City Council have presented alternative proposals or alternative features to be incorporated into the current USACE plan; and

WHEREAS, this Board would like the USACE to evaluate seriously the proposals from the City Council and from the community; now, therefore,

BE IT RESOLVED that the Board requests of USACE that its environmental assessment process and any potential environmental impact statement process include technical engineering review of the City Council proposal and of the four community-generated alternatives listed in the Report of the City Council's Permitted Interaction Group on the Project; and

BE IT FURTHER RESOLVED that the USACE should ensure that it properly inform the public, residents, condominium associations, recreational clubs, and schools of the USACE's schedule of public engagements with respect impacts affecting the Palolo Neighborhood District Map; and

BE IT FURTHER RESOLVED, the Board requests the USACE establish an official Community Advisory Group that consists of members representing each of the neighborhood board communities of the Ala Wai Watershed; and

BE IT FURTHER RESOLVED that the Board also requests that the City and County of Honolulu defer entering into any partnership agreement with the USACE until community concerns are sufficiently addressed; and

BE IT FINALLY RESOLVED, that copies of this resolution be transmitted to the USACE to be included in the material for its environmental assessment, the Governor of the State of Hawaii, the Mayor of the City and County of Honolulu, all members of the Honolulu City Council, all members of the Hawaii State Legislature, the Director of the State Department of Land and Natural Resources, the Director of the State Department of Budget and Finance, the Director of the State Office of Environmental Quality, the Director of the City Department of Design and Construction, and the chairs of the Ala Moana-Kakaako, Makiki-Lower Punchbowl-Tantalus, Manoa, McCully-Moilili, Diamond Head-Kapahulu-St. Louis Heights, Kaimuki, and Waikiki Neighborhood Boards in the City and County of Honolulu.

The Palolo Neighborhood Board No.6 adopted this resolution at its Wednesday, February 10, 2021 regular Board meeting, by 8-0-0

/s/ Josh Frost
Joshua Frost, #6 Palolo Neighborhood Board Chair

Resolution Concerning the Ala Wai Canal Project

WHEREAS, in the past several decades catastrophic flooding events have occurred more frequently in the United States and the rest of the world; and

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Canal Project (the "Project"), also referred to as the Ala Wai Flood Mitigation Project, in response to the potential of a catastrophic flooding event (100-year storm) within the Ala Wai Watershed; and

WHEREAS, the Project includes, among other features, the construction of detention basins in Mānoa and Palolo Valleys, Makiki, Kanewai Park, the Ala Wai Golf Course, Ala Wai Park (Hausten Ditch) and an average four-foot reinforced solid concrete wall which extends as high as four and a half foot in certain segments surrounding portions of the Ala Wai Canal and Ala Wai Promenade; and

WHEREAS, the Ala Wai Watershed contains within it such areas of Honolulu as Manoa Valley, Pālolo Valley, Makiki, Tantalus, McCully, Mo'ili'ili, St. Louis Heights, Kapahulu, Kaimuki, Kapi'olani, Ala Wai, Ala Moana, and Waikīkī ; and

WHEREAS, the Mānoa Neighborhood Board heard presentations by residents or property owners who live next to or within a proposed detention basin; and

WHEREAS, these residents stated that they did not receive proper notice of the Project and were not given an adequate amount of time to respond to the Draft Report/Environmental Impact Statement ("EIS") of the Project; and

WHEREAS, 'Iolani School, located on the Ala Wai floodplain, wrote a letter to the USACE in 2015 in which it claimed that neither it nor the other stakeholders were adequately engaged in an evaluation of the Project and urged that the Draft Report/EIS be reviewed and reissued for further public comment; and

WHEREAS, it is the sense of the Mānoa Neighborhood Board that public input and public awareness of this Project is insufficient to have the Project move forward; and

WHEREAS, Congress in the Fall of 2018 appropriated money to fund the federal portion of the proposed cost of the Project, leaving only the State funding as the final hurdle before commencement of construction; now, therefore,

BE IT RESOLVED by the Manoa Neighborhood Board that the USACE should put a hold on any further advancement of the Project until the very people who are supposed to benefit from the Project have had an adequate opportunity to consider and weigh in on the Project and alternatives to it; and

BE IT FURTHER RESOLVED that the Mānoa Neighborhood Board requests that the Thirtieth Legislature of the State of Hawaii, Regular Session of 2019 defer appropriating any funds for the Project during this calendar year; and

BE IT FURTHER RESOLVED that copies of this resolution be transmitted to USACE, the members of Hawaii's Congressional delegation, the Governor of Hawaii, each member of the Hawaii State Legislature, the Mayor of Honolulu, and Honolulu City Council.

This resolution was ADOPTED by the Mānoa Neighborhood Board No. 7 by UNANIMOUS CONSENT, 14-0-0 (**AYE**: Andersen, Armstrong, Borland, Budar, Chun, Fukumoto, Funk, Harrison, Hoe, Koff, Quadri, Rotter, Tom, and Watson; **NAY**: ~~None~~; **ABSTAIN**: None) **at its Wednesday, February 6, 2019 meeting.**

Submitted by: _____
Ben Rotter, its Chair.

RESOLUTION CONCERNING THE REVISED PLAN FOR THE ALA WAI FLOOD RISK MANAGEMENT PROJECT

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Canal Project (the "Project"), officially referred to as the Ala Wai Canal Flood Risk Management Project, in order to mitigate the effects of a potentially catastrophic 100-year flooding event within the Ala Wai Watershed; and

WHEREAS, this Board and six other Neighborhood Boards passed resolutions in February of 2019 requesting that the State Legislature defer appropriating any funds for the Project until community stakeholders' concerns were sufficiently addressed, including consideration of alternatives to the Project; and

WHEREAS, the Hawaii State Legislature declined to appropriate funds for the Project in the 2019 and 2020 Sessions; and

WHEREAS, based on the new 1D/2D modeling and new data, the USACE presented in August of this year a significantly revised flood mitigation plan in which the detention basins in the upper Manoa and Palolo Valleys were removed and new features added, such as a Woodlawn Bridge bypass, two floodwalls at Manoa Marketplace, a berm in Manoa District Park, higher walls along parts of the Ala Wai Canal, and a 40-foot-tall pumping station set in the Canal itself; and

WHEREAS, community members have not had a full opportunity to absorb, understand, and react to these changes in the Project; and

WHEREAS, the community and the City Council have presented alternative proposals or alternative features to be incorporated into the current USACE plan; and

WHEREAS, this Board would like the USACE to evaluate seriously the proposals from the City Council and from the community; now, therefore,

BE IT RESOLVED that the Board requests of USACE that its environmental assessment process and any potential environmental impact statement process include technical engineering review of the City Council proposal and of the four community-generated alternatives listed in the Report of the City Council's Permitted Interaction Group on the Project; and

BE IT FURTHER RESOLVED that the USACE should ensure that it properly inform Manoa residents who are stakeholders or who reside next to Manoa Stream of USACE's schedule of public engagements and of significant changes to their plans with respect to Manoa Valley; and

BE IT FURTHER RESOLVED that the Board also requests that the City and County of Honolulu defer entering into any partnership agreement with the USACE until community concerns are sufficiently addressed; and

BE IT FURTHER RESOLVED that copies of this Resolution be transmitted to the USACE (to be entered into the material for its environmental assessment), the Governor of the State of Hawaii, the Mayor of the City and County of Honolulu, members of the City Council of Honolulu, all members of the Hawaii State Legislature, the State Department of Land and Natural Resources, the Department of

Budget and Finance, the Office of Environmental Quality, and the City and County of Honolulu's Department of Design and Construction.

This resolution was ADOPTED by the Mānoa Neighborhood Board No. 7 by a roll call vote of 9-0-1 (AYE: Budar, Carroll, Fukumoto, Funk, Grace, Kawano, Koff, Watson, and Zane; **NAY**: None; **ABSTAIN**: Armstrong) **at its Wednesday, December 2, 2020 meeting.**

RESOLUTION

REQUESTING THE ARMY CORPS OF ENGINEERS TO CONSIDER ADDITIONAL COMMUNITY FEEDBACK BEFORE PROCEEDING WITH THE ALA WAI FLOOD MITIGATION PROJECT

WHEREAS, in the past several decades catastrophic flooding events have occurred more frequently throughout the world; and

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Canal Project (the "Project"), also referred to as the Ala Wai Flood Mitigation Project, in response to the potential for a catastrophic flooding event (100-year storm) within the Ala Wai Watershed; and

WHEREAS, the Project includes, among other features, the construction of detention basins in Manoa and Palolo Valleys, Makiki, Kanewai Park, the Ala Wai Golf Course, Ala Wai Park (Hausten Ditch) and an average four-foot reinforced solid concrete wall which extends as high as four and a half feet in certain segments surrounding portions of the Ala Wai Canal; and

WHEREAS, the Ala Wai Watershed contains within it such areas of Honolulu as Manoa Valley, Palolo Valley, Makiki, Tantalus, McCully, Moiliili, St. Louis Heights, Kapahulu, Kaimuki, Kapiolani, Ala Wai, Ala Moana, and Waikiki; and

WHEREAS, the McCully-Moiliili Neighborhood Board No. 8 has heard testimony from concerned residents, including property owners who live next to or within a proposed detention basin; and

WHEREAS, many residents have stated that they did not receive proper notice of the Project and did not have adequate time to respond to the Project's Draft Report/Environmental Impact Statement ("EIS"); and

WHEREAS, Iolani School, located on the Ala Wai floodplain, wrote a letter to the USACE in 2015 in which it claimed that neither it nor other stakeholders were adequately engaged in an evaluation of the Project and urged that the Draft Report/EIS be reviewed and reissued for further public comment; and

WHEREAS, Congress in the Fall of 2018 appropriated money to fund the federal portion of the proposed cost of the Project, leaving only the local portion of the Project's funding remaining; now, therefore,

BE IT RESOLVED, the McCully-Moiliili Neighborhood Board No. 8 requests the USACE to put on hold on any further advancement of the Project until the impacted residents and other stakeholders have had adequate opportunity to consider and provide input, so that USACE can revise the proposed alternatives, as necessary; and

BE IT FURTHER RESOLVED, the Board requests that the Hawaii State Legislature defer appropriating funds for the Project until the impacted residents and other stakeholders are properly consulted, and significant concerns are satisfactorily addressed; and

BE IT FINALLY RESOLVED, that copies of this resolution be transmitted to the USACE, the Governor of Hawaii, all members of the Hawaii State Legislature, the Mayor of the City and County of Honolulu, all members of the Honolulu City Council, and the chairs of the Ala Moana-Kakaako, Makiki-Lower Punchbowl-Tantalus, Manoa, Diamond Head-Kapahulu-St. Louis Heights, Palolo, Kaimuki, and Waikiki Neighborhood Boards in the City and County of Honolulu.

This resolution was ADOPTED by the McCully-Moiliili Neighborhood Board No. 8 at its March 7, 2019, regular meeting, 11-0-0 (AYE: Araceley, Barber, Devilbiss, Fujishige, LaHaela Walter, Robotti, St. Sure, Streitz, Takamura, Vares, Zibakalam; NAY: None; ABSTAIN: None).

RESOLUTION

CONCERNING THE REVISED PLAN FOR THE ALA WAI FLOOD RISK MANAGEMENT PROJECT

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Flood Risk Management Project (the "Project"), in order to mitigate the effects of a potentially catastrophic 100-year flooding event within the Ala Wai Watershed; and

WHEREAS, the McCully-Moiliili Neighborhood Board ("Board") and six other Neighborhood Boards passed resolutions in early 2019 requesting that the State Legislature defer appropriating any funds for the Project until community stakeholders' concerns were sufficiently addressed, including consideration of alternatives to the Project; and

WHEREAS, the Hawaii State Legislature declined to appropriate funds for the Project in the 2019 and 2020 Sessions; and

WHEREAS, based on the new 1D/2D modeling and new data, the USACE presented in August 2020 a significantly revised flood mitigation plan in which the detention basins in the upper Manoa, Palolo, and Makiki Valleys were removed and new features added, such as a 40-foot-tall pumping station and miter gate set in the Ala Wai Canal itself, a Makiki Bypass conduit along the Promenade, and high walls around the Canal and Ala Wai Park; and

WHEREAS, community stakeholders and the City Council have presented alternative proposals or alternative features to be incorporated into the current USACE plan, but no formal advisory group has been established to help guide the Project from the community perspective; and

WHEREAS, the Project indicates there will be widespread flooding in the low-lying communities mauka of the Canal, including large portions of the McCully-Moiliili community; and

WHEREAS, the general community, including recreational users in and around the Canal, have not had a full opportunity to absorb, understand, react to, and evaluate the tradeoffs of these changes in the Project; now, therefore,

BE IT RESOLVED, the Board requests of USACE that its environmental assessment process and any related environmental impact statement process include technical engineering review of the City Council proposal and of the community-generated alternatives; and

BE IT FURTHER RESOLVED, the USACE should ensure that it properly inform the public, condominium associations, recreational clubs, and schools of the USACE's schedule of public engagements, in particular with respect to impacts occurring within the McCully-Moiliili Neighborhood District Map; and

BE IT FURTHER RESOLVED, the Board requests the USACE establish an advisory group that consists of members representing each of the neighborhood board communities of the Ala Wai Watershed; and

BE IT FURTHER RESOLVED, the Board also requests that the City and County of Honolulu defer entering into any partnership agreement with the USACE until community concerns are sufficiently addressed; and

BE IT FINALLY RESOLVED, that copies of this resolution be transmitted to the USACE to be included in the material for its environmental assessment, the Governor of the State of Hawaii, the Mayor of the City and County of Honolulu, all members of the Honolulu City Council, all members of the Hawaii State Legislature, the Director of the State Department of Land and Natural Resources, the Director of the State Department of Budget and Finance, the Director of the State Office of Environmental Quality, the Director of the City Department of Design and Construction, and the chairs of the Ala Moana-Kakaako, Makiki-Lower Punchbowl-Tantalus, Manoa, Diamond Head-Kapahulu-St. Louis Heights, Palolo, Kaimuki, and Waikiki Neighborhood Boards in the City and County of Honolulu.

This resolution was ADOPTED by the McCully-Moiliili Neighborhood Board No. 8 at its March 4, 2021, regular meeting, 7-0-0 (AYE: Allred, Barber, Fujishige, Kippen, Peck, Prellberg, Streitz; NAY: None; ABSTAIN: None).

February 26, 2019

Ways and Means Committee
State Senate of Hawaii

Committee Members:

The Makiki/Lower Punchbowl/Tantalus Neighborhood Board No. 10, held a hearing, February 21,2019 on the Ala Wai Project from the U S Army Corps of Engineers. There were over thirty community members present and after extended discussion, we passed the two resolutions below. Please consider them and attach them to your recommendations.

Motion I

"BE IT RESOLVED by the Makiki/Lower Punchbowl/Tantalus Neighborhood Board No. 10 will meet with the affected Neighborhood Boards and the USACE to provide information to the communities. We will also work with the City Council. We are concerned with the lack of public communication on the Project.

Motion II

"BE IT RESOLVED by the Makiki/Lower Punchbowl/Tantalus Neighborhood Board No. 10 that the USACE should put a hold on any further advancement of the Project until the very people who are supposed to benefit from the Project have had an adequate opportunity to consider and weigh in on the Project and alternatives to it; and

BE IT FURTHER RESOLVED that copies of this resolution be transmitted to the members of Hawaii's Congressional delegation, the Governor of Hawaii, each member of the Hawaii State Legislature, the Mayor of the City and County of Honolulu, and each Councilmember of the City and County of Honolulu."

Sincerely,

John A Steelquist, Chair

Oahu's Neighborhood Board System - Established 1973

MAKIKI/LOWER PUNCHBOWL/TANTALUS NEIGHBORHOOD BOARD NO. 10

RESOLUTION CONCERNING THE REVISED PLAN
FOR THE ALA WAI FLOOD RISK MANAGEMENT PROJECT

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Flood Risk Management Project (the "Project"), in order to mitigate the effects of a potentially catastrophic 100-year flooding event within the Ala Wai Watershed; and

WHEREAS, six Neighborhood Boards in the affected watershed passed resolutions in early 2019 requesting that the State Legislature defer appropriating any funds for the Project until community stakeholders' concerns were sufficiently addressed, including consideration of alternatives to the Project; and

WHEREAS, the Hawaii State Legislature declined to appropriate funds for the Project in the 2019 and 2020 Sessions; and

WHEREAS, based on the new 1D/2D modeling and new data, the USACE presented in August of this year a significantly revised flood mitigation plan in which the detention basins in the upper Manoa, Palolo, and Makiki Valleys were removed and new features added, such as a 40-foot-tall pumping station and miter gate set in the Canal itself in a protected scenic view plane, a Makiki Bypass conduit along the Ala Wai Promenade which may adversely affect the protected Exceptional Tree Grove, and high walls around the Canal and Ala Wai Park, and the continued existence of the Kanewai Park Multipurpose Detention Basin with 9' berms adjacent to Hokulani Elementary School, and areas mauka of the Ala Wai Canal would still be flooded under this revised proposal; and

WHEREAS, community members and recreational users have not had a full opportunity to absorb, understand, and react to these changes in the Project; and

WHEREAS, the community and the City Council have presented alternative proposals or alternative features to be incorporated into the current USACE plan; and

WHEREAS, this Board would like the USACE to evaluate seriously the proposals from the City Council and from the community; now, therefore,

BE IT RESOLVED that the Board requests of USACE that its environmental assessment process and any potential environmental impact statement process include technical engineering review of the City Council proposal and of the four community-generated alternatives listed in the Report of the City Council's Permitted Interaction Group on the Project; and

BE IT FURTHER RESOLVED that the USACE should ensure that it properly inform the public, residents, condominium associations, recreational clubs, and schools of the USACE's schedule of public engagements with respect to impacts affecting the Makiki - Lower Punchbowl - Tantalus Neighborhood District Map; and

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

BE IT FURTHER RESOLVED, the Board requests the USACE establish an official Community Advisory Group that consists of members representing each of the neighborhood board communities of the Ala Wai Watershed; and

BE IT FURTHER RESOLVED that the Board also requests that the City and County of Honolulu defer entering into any partnership agreement with the USACE until community concerns are sufficiently addressed; and

BE IT FINALLY RESOLVED, that copies of this resolution be transmitted to the USACE to be included in the material for its environmental assessment, the Governor of the State of Hawaii, the Mayor of the City and County of Honolulu, all members of the Honolulu City Council, all members of the Hawaii State Legislature, the Director of the State Department of Land and Natural Resources, the Director of the State Department of Budget and Finance, the Director of the State Office of Environmental Quality, the Director of the City Department of Design and Construction, and the chairs of the Ala Moana-Kakaako, Palolo, Manoa, McCully-Moiliili, Diamond Head-Kapahulu-St. Louis Heights, Kaimuki, and Waikiki Neighborhood Boards in the City and County of Honolulu.

Adopted by the MAKIKI/LOWER PUNCHBOWL/TANTALUS NEIGHBORHOOD BOARD NO. 10 at its regular meeting of February 18th, 2021, by a vote of 9-4-2 (Aye: Chang, Char, Farden, Carson, Ross, Lee, Nakahara, Cambe, Ritchie; Nay: Agustin, Kawano, Mitchell, Tipton; Abstain: Steelquist, Young).

RESOLUTION CONCERNING THE ALA WAI CANAL FLOOD MITIGATION PROJECT

WHEREAS, in the past several decades, catastrophic flooding events have occurred more frequently in the United States and the rest of the world; and

WHEREAS, the United States Army Corps of Engineers ("USACE") has developed plans for the Ala Wai Canal Project (the "Project"), also referred to as the Ala Wai Flood Mitigation Project, in response to a 100-year storm and a potential catastrophic flooding event within the Ala Wai Watershed; and

WHEREAS, the Ala Moana-Kaka'ako Neighborhood Board No. 11 ("the Board") passed a resolution in February 2019 requesting that the Hawaii State Legislature defer appropriating any funds for the Project until sufficient community stakeholder concerns have been addressed, including consideration of alternative projects; and

WHEREAS, community members have continued to express concerns regarding public engagement on the planning and design of the Ala Wai Flood Mitigation Project, predicted efficacy of the improvements, and overall project costs; and

WHEREAS, the USACE recently announced changes to the recommended plan for the Ala Wai Flood Mitigation Project, including removal of large detention basis in Makiki and Pālolo, and establishment of an integrated system of distributed flood control features in Mānoa; and now therefore

BE IT RESOLVED that the Board requests that the environmental impact statement review process allow further community input on the design of the Ala Wai Flood Mitigation Project; and

BE IT RESOLVED that the Board also requests that the City and County of Honolulu defer entering into any partnership agreements with the USACE until community concerns are sufficiently addressed; and

BE IT FURTHER RESOLVED that copies of this resolution be transmitted to the U.S. Army Corps of Engineers, the City and County of Honolulu Department of Design and Construction, Department of Land and Natural Resources, the Office of Environmental Quality Control, and appropriate City and State elected officials.

ADOPTED by the Ala Moana-Kaka'ako Neighborhood Board No. 11 at its regular meeting on Tuesday, October 22, 2019, by a vote of 6-0-2.

RYAN TAM
Chair

ALA MOANA-KAKA'AKO NEIGHBORHOOD BOARD NO. 11

RESOLUTION REGARDING ALA WAI FLOOD MITIGATION PROJECT ALTERNATIVES

WHEREAS, the United States Army Corps of Engineers ("USACE") is revising plans for the Ala Wai Flood Mitigation Project, in cooperation with State and City agencies in order to address community vulnerabilities associated with a 100-year storm and a potential catastrophic flooding event within the Ala Wai Watershed; and

WHEREAS, the USACE's Engineering Documentation Report eliminates 6 upstream detention basins in Manoa, Palolo, and Makiki, and evaluates the addition of a new bypass culvert under the Ala Wai Promenade, a new pump station and miter gate extending across the Ala Wai Canal near the Manoa confluence, higher walls and berms around the Ala Wai Canal and Ala Wai Golf Course, and other flood mitigation measures; and

WHEREAS, the recommended plan and proposed flood barrier systems will not prevent widespread flooding in the low-lying communities mauka of the canal, including parts of the Ala Moana community; and

WHEREAS, there have been multiple community efforts to develop comprehensive, effective, and cost-effective alternatives, such as the Oceanit SWIFT tunnel and other community generated alternatives; and now therefore,

BE IT RESOLVED that the Board requests that the USACE and partner agencies incorporate ways to equitably protect all communities mauka of the Ala Wai Canal from flooding, as well as Waikiki; and

BE IT RESOLVED that the Board requests that the USACE and partner agencies consider these other community alternatives for project development, supplemental environmental analysis, and consideration; and

BE IT FURTHER RESOLVED that copies of this resolution be transmitted to the U.S. Army Corps of Engineers, and appropriate City and State agencies and elected officials, and neighborhood boards.

ADOPTED by the Ala Moana-Kaka'ako Neighborhood Board No. 11 at its regular meeting on Tuesday, October 27, 2020, by a unanimous vote of 9-0-0.

Notes on the Ala Wai Canal: Its Development and Impacts

Luciano Minerbi
Professor of Urban and Regional Planning
University of Hawaii

Waikiki Ahupua'a Pre- Ala Wai Canal

The orography of the Waikiki Ahupua'a includes several sub-watershed below the Ko'olau Mountain Range. They are the Makiki Sub-watershed, the Manoa Sub-watershed, the Palolo Sub-watershed, and, makai of them, the Ala Wai Sub-watershed and the Waikiki Sub-watershed. The Makiki Stream is fed by its 4 tributaries, the Manoa Stream by its 7 tributary and Palolo Stream by its 3 tributaries.

It is important to recognize that, before the construction of the Ala Wai Canal, all the above-mentioned three streams converged and then diverged again to reach the ocean in three different and direct outlets or stream mouth called "Muliwai" in the Hawaiian Language. This natural hydrographic configuration was unfortunately altered by the flawed construction of the Ala Wai Canal in the 1920, which reduced three Muliwai to only one outlet located at the current Ala Wai Boat Harbor. The Territory of Hawaii maps of the late 1880s and early 1900 document this fact.

The Hawaii Registered Map of Waikiki No. 1398 by S. B. Bishop dated 1881 clearly shows (from the east to west) the Pahoa Stream, and the Kalia Stream flowing into the Kukainaki Muliwai (river mouth); the Pahoa Stream and the Kalia Stream going into the Apuakehau Stream and into its muliwai into the Ocean at Hamohamo. The Paakea Stream enters the Piinaio Stream that reaches the Ocean at his Kahawai mouth, south of McCully Street at the location of current Fort De Russy.

The Hawaii Registered Map No 2848 Waikiki Fisheries of June 1909 by M.D. Monsarrat also clearly depicts these three different streams reaching the Ocean.

In this map the first (unnamed) stream, near Kapiolani Park outlets at Hamohamo Fisheries through the H.M. Liliukalani Lands, the second was the Apukehau Stream abutting into the Ocean between the Moana Hotel and the Seaside Hotel in Waikiki. The third was the Piinaio Stream collecting the water from its two tributary streams, Maunahala Stream and Makiki Stream, with its outlet reached the ocean at Kalia Fisheries, south of Punahou Street.

The Waikiki Ahupua'a Old Breadbasket

The construction of the Ala Wai Canal effectively destroyed the self-sufficient diversified food basket production system of taro, banana, rice fields and fowls of the large Moiliili District mauka of Waikiki and also obliterated the abundant fresh fish production raised by the dozen Waikiki ponds by land-filling of Waikiki with the earth dredged out from the canal.

The Early Design of the Ala Wai Canal

Appropriately, the early design of the Canal mimicked the natural stream hydrography: an April 1917 Waikiki Map by Wright-Harvey-Wright, as reported by Ross (2007), depicts three proposed drainage channels to reach the ocean in Waikiki (although one was marked "withdrawn"). The design of the Ala Wai Canal (1921-1928) originally envisioned –two outlets at both end of the canal-- but what instead was actually built was only the Western outlet at the Ala Wai Boat harbor, while the East outlet near the Aquarium at Kapiolani Park was unfortunately not realized. It is notable that the 1912 map of Chas.V.E. Dove Map of Honolulu depicts in dotted lines the road subdivision of Moiliili and the Ala Wai Channel, with the two outlets clearly marked. A note explains that this plan was approved by L.E. Pinham, the president of the Board of Health and approved by the Territorial Board of Health February 21, 1906.

The Flowed Construction of the Ala Wai Canal

With only one ocean outlet into the Ala Wai Harbor currently the Ala Wai Canal continues to slow down the natural flows of the 3 named streams to the ocean. One result is that the water accumulates, back-up and stagnates particularly at the eastern end of the canal. It is waiting only the next exceptional event to overflow and flood.

What is Needed to Ameliorate the Situation

The ocean outflow section from the Ala Wai Canal should be bigger than the sum of all sections of the streams coming into the canals so as to avoid water in the canal to stagnate and make flooding possible when more water comes in that what goes out into the ocean. If it is determined this to be the case, then it is the ocean water outlets than needs to he enlarged to decrease flooding by allowing the water in the canal to have an opening of adequate section into the ocean.

Two opening into the ocean at the opposite sides of the Ala Wai Canal – at it was originally designed in 1906 -- will also improve water quality, decrease pollution by avoiding stagnating water at the Diamond Head side of the in the canal. The real permanent solution to these problems and for lessening flood risk would be then to open the second outlet going to the Kapiolani Park near the aquarium and under a bridge for Kapahulu Street.

The Uneven Height of Ala Wai Canal Banks and Walls

The Ala Wai Canal edges are uneven in height: the Makai (ocean) side bank is about two feet higher than the Mauka (mountain) side: so that if a flood or a tsunami wave raises the water in the canal above two feet or more, the Waikiki district is protected and the Moiliili district will be flooded. If any money is available –for fairness-- it should be used first to raise the Moiliili bank to the same height of the Waikiki one.

The USACE Plan

USACE Plan 2-A proposes a 4-foot concrete wall to protect from flooding the entire length of the Waikiki side of the Ala Wai Canal and a 4-foot wall to protect the Moiliili side of the Ala Wai Canal.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

But the Plan 3-A, selected by USACE, does not have a wall at the Manoa-Palolo channel to effectively protect the Moiliili districts, so that flood water will hit and immediately inundate Iolani School and the Ala Wai Elementary School as well all the condominiums and walk-up apartments located in the area.

Actually if the two walls are constructed as in Plan 3 A on all Waikiki makai side but only ½ the Moiliili mauka side of the canal that would exacerbate flooding in terms of volume, velocity and power at the Iolani School Site into Moiliili much more than current condition without that wall because the flood water will disperse on the larger surface of the Moiliili district.

Moreover and importantly, if the walls on the two sides of the canal are not designed and built by USACE both at the same height from the water level, flood will go on one side only, the Moiliili side. Now Waikiki side is much more protected than the Ala Wai side because the existing walled bank of the Waikiki side is about two feet higher than the one on the Moiliili side. Therefore the priority and urgent need is to raise the Moiliili and the Manoa Palolo channel wall and bank two feet to make it level with the Waikiki side, before other improvements.

Findings

In sum, the construction of the Ala Wai Canal precipitated the destruction of the Waikiki Food shed with loss of crops, fish food and fowl. It made possible the real estate development of the Waikiki resort district. The current flowed design of the canal with only one outfall is a key factor in the deterioration of water quality with stagnation and pollution in the canal east side, and the increased risk of flooding well over the historical and natural hydraulic conditions of three original stream ocean outlets or muliwai. The proposed remediation by USACE Plan 3-A uses apparently a hydraulic model that will exacerbate flooding by not protecting the Moiliili side instead of preventing it.

This is because (a) lack of adequate sized and number of ocean outlets, (b) current channel walls not at equal heights, (c) USACE choice (Plan 3-A) of building only a makai wall for the Waikiki side and not a mauka wall for Moiliili to continue to protect the Moiliili side of the Manoa Palolo Canal, and (d) USACE lack of detail of what a 4 foot wall really means (if from the current one or raising both channel walls at the same level to avoid flooding on one side).

Conclusions

In my opinion planning and construction would be better spent to: (a) open a Kapiolani Park ocean outlet for the Ala Wai Canal -- as originally designed in 1906, (b) raise the Moiliili and Manoa Palolo Canal side banks at the same level as the one of Waikiki (c) only in a second phase raise both walls, as more money becomes available to reach a same higher elevation.

C&C OF HONOLULU COMMITTEE ON
PUBLIC INFRASTRUCTURE, TECHNOLOGY AND SUSTAINABILITY
JUNE 19, 2019
TESTIMONY BY LUCIANO MINERBI

Thank you for the opportunity to testify. I support the C&C resolution 19-145 because real co-design is needed among the stakeholders affected by the USACE plan for flood risk minimization in the Ala Wai Canal.

Specifically the area of Iolani High School and Ala Wai Elementary School and adjacent low rise and high-rise properties, including the famed 100th Infantry Battalion Memorial Building, will be affected without a floodwall protection at Manoa-Palolo Canal right side.

The alternative selected by USACE 3-A-2-2 does not protect the Moiliili Neighborhood because the early flood model of July 2015 was wrong and its flood map in the final EIS document (at page 110) was wrong by indicating no flood where actually it will surely occur without flood-wall protection at the Iolani School and Ala Wai Elementary School site precisely where the there is a lower elevation of the bank of the canal.

More over terminating the proposed Moiliili flood wall at Ala Wai instead of running it around the site and up to protect the right side of the Manoa-Palolo Canal to Date Street will exacerbate an extreme flood event that will enter lower Moiliili with greater violence than without this incomplete floodwall.

The 3A alternative is to spend more than *300 million of dollars (*)* for a 100-year flood to protect Waikiki, but a 50 or a 10-year flood likely to come sooner and flood the working class Moiliili neighborhood at the Iolani-Ala Wai site.

In conclusion, a floodwall is needed to be constructed with much greater urgency at the right side of the Manoa-Palolo Canal to connect with the Moiliili floodwall of the Ala Wai Canal.

Not doing so, in my opinion, is a breach of two federal executive orders:
EO 12898 (Federal Actions to Address Environmental Justice in Minority Population and Low-Income Population) and
EO 13045 (Protection of Children from Environmental Health Risk and Safety Risk).

Therefore I ask that protection be provided also at these two school sites as part of the USACE plan and that dredging of the Ala Wai Canal be done immediately.

Respectfully submitted as an individual, as a resident of Moiliili, and an expert in my field.

Moiliili needs better flood protection

By Luciano Minerbi

The banks of the Ala Wai Canal are not at the same height. The Moiliili side is two feet lower than the Waikiki one. Moiliili will be inundated by a major flood well before Waikiki precisely at that low elevation point where the Manoa-Palolo Drainage Canal enters the Ala Wai Canal.

Iolani School and Ala Wai Elementary School, with hundreds of students and staff; the many people living in the area's residential properties; and the famed 100th Infantry Battalion Memorial Building all will be flooded without a berm protecting the Iolani school side of the Manoa-Palolo canal.

But the U.S. Army Corps of Engineers' selected alternative does not shield the Moiliili neighborhood with on-site protection ("Engineers propose changes to Ala Wai flood project," Star-Advertiser, Sept. 28). The map in the final environmental impact statement (EIS) indicates no flood where one surely will occur because of the low elevation.

Terminating the Moiliili floodwall at Ala Wai Canal, without protecting the Iolani side of the Manoa-Palolo Canal to Date Street, will exacerbate a flood event with greater violence, velocity and duration entering lower Moiliili, and the area will retain floodwater longer without a pump at the University Avenue site.

The alternative to spend about $350 million for a 100-year flood to protect Waikiki, but not Moiliili for a 30- or 50-year flood that is likely to come much sooner, is not OK.

Not protecting a working class and ethnic minority population like that in the Moiliili neighborhood also breaches two federal executive orders: Environmental Justice in Minority Population and Low-Income Populations (EO 12898) and Protection of Children from Environmental Health Risks and Safety Risks (EO 13045).

The EIS generated an inadequate estimate of the actual socioeconomic assets and demographic weight of the Moiliili neighborhood, leading to the choice of a flawed alternative in the recommended plan. The economic cost of a flood to the Moiliili working families, many in the hotel and service sectors, should not have less weight than the damages to the cars in the garages of Waikiki. The EIS did not process the 2005 book, "Mo'ili'ili — The Life of a Community," to calculate the link between the cultural-historical values with the economic values of the many assets of this neighborhood.

Importantly, we should refute the statement that it is "an unacceptable tradeoff" to protect the Iolani School site because "additional induced damages in Waikiki would greatly exceed any benefit associated with Iolani School."

Expanding the intake holes of the Manoa-Palolo canal into a much-extended retention basin inside the Ala Wai Golf Course will instead ensure that the excess floodwater will flow into the golf course and not on the Waikiki side. Thus an improved Army Corps plan should certainly protect lower Moiliili, which has a higher probability to flood than Waikiki.

The city, state and federal partnership can hopefully agree on a just process to implement stream maintenance with new construction, by integrating a) low-impact design and b) constructed wetlands with living machines, as green infrastructure of a "sponge" watershed, so as to address simultaneously pollution with flood control.

Integrated ecological and flood control planning generate quite different design solutions than flood control alone. Moving forward with cleaner water, the original design of the 1920s for two ocean outlets can then become the definite solution to the Ala Wai Canal problem.

ISLAND VOICES

Luciano Minerbi is a retired professor of urban and regional planning at the University of Hawaii at Manoa.

BRUCE ASATO / BASATO@STARADVERTISER.COM

Heavy rains from the remnants of Hurricane Lane in August 2018 turned the water brown in the Ala Wai Canal and the Manoa-Palolo Drainage Canal, which borders Iolani School and feeds into the canal.

TESTIMONY ON THE ALA WAI CANAL FLOOD REDUCTION

WATERSHED HISTORY

1 PRE ALA WAI CANAL DEVELOPMENT 3 VALLEYS, AT LEAST 3 STREAMS AND 3 MULIWAI.

2 THE ALA WAI CANAL WAS CONCEIVED WITH 3 OCEAN OUTLETS, DESIGNED WITH TWO, AND BUILT WITH ONLY ONE: THAT IS THE PROBLEM TODAY.

FLOOD MITIGATION ALONE ARE NOT GREEN INFRASTRUCTURE

3 THE DESIGN FOR FLOOD MITIGATION ALONE IS QUITE DIFFERENT FROM THE DESIGN OF AN INTEGRATED POLLUTION REDUCTION AND FLOOD MITIGATION ATTAINED BY THE "SPONGE CITY APPROACH" (SEE SCIENTIFIC AMERICA ARTICLE WITH EXAMPLES FROM CHINA AND RUSSIA).

THEREFORE, POLLUTION REDUCTION WITH GREEN INFRASTRUCTURE WITH NATIVE PLANTS IN THE ALA WAI GOLF COURSE AND IN KAPIOLANI PARK SHOULD BE CONSIDERED WITH A SECOND OCEAN OUTLET.

MOILIILI IS NOT PROTECTED BY THE USACE PLAN

4 MOILIILI SIDE OF THE CANAL IS TWO FEET LOWER THAN THE WAIKIKI SIDE SO IT WILL FLOOD WELL BEFORE WAIKIKI EXACTLY WHERE THE MANOA PALOLO CANAL ENTERS INTO THE ALA WAI CANAL.

5 THE USACE MAY 2017 PLAN DOES NOT REALLY PROTECT-ON SITE MOILIILI-, BUT IT EXACERBATES FLOODING, EXTENT, INTENSITY, AND DURATION WITH ITS INCOMPLETE WALL ON THE MOILIILI SIDE OF THE CANAL.

6 THE USACE MAY 2017 PLAN DOES NOT PROPERLY ACCOUNTS FOR THE REAL ECONOMIC VALUE OF MOILIILI BY NOT EXPLICITELY CONSIDERING THE HISTORIC, CULTURAL,

1

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

ENVIRONMENTAL AND DEMOGRAPHIC VALUE OF THIS NEIGHBORHOOD SO THAT THE CURRENT COST /BENEFITS ANALYSIS EXCLUDES PROTECTION MEASURES FOR MOILIILI LIKE A PUMP AND A BERM AT THE IOLANI SIDE OF THE MANOA-PALOLO CANAL.

7 THE USACE MAY 2017 PLAN DOES NOT DESIGN THE ALA WAI GOLF COURSE AS AN EXPANDED RETENTION BASIN WITH ENLARGED AND ADDITIONAL INTERCEPTS LANES TO CHANNEL WATER INTO THE GOLF COURSE BEFORE HITTING MOILIILI AND WAIKIKI NEIGHBORHOODS.

RECOMMENDATION

8 THE USACE AND STATE EIS SHOULD BE RADICALLY IMPROVED BY ADDRESSING THE POINTS I JUST RAISED FOR MO'ILI'ILI AND FULLY CONSIDERS THE SUGGESTIONS MADE BY THE "PROTECT OUR ALA WAI WATERSHED".

9 THE MOILIILI NEIGHBORHOOD BOARDS AND NEIGHBORHOOD REPRESENTATIVES SHOULD BE VIGILAN T AND ASSIST USACE TO AMEND AND IMPROVE ITS ALA WAI CANAL FLOOD RISK MANAGEMENT STUDY AND EIS TO ENSURE PROTECTION AND FLOOD REDUCTION MANAGEMENT FOR THE MOILIILI NEIGHBORHOOD.

November 7, 2019

Respectfully submitted to Mo'ili'ili Neighborhood Board no. 8

ALA WAI CANAL FLOOD RISK MANAGEMENT PROJECT
SUPPLEMENTAL NEPA PUBLIC SCOPING MEETING – COMMENT SHEET

November 14 & 21, 2020

Thank you for participating in the Public Scoping Meeting on the ALA WAI CANAL FLOOD RISK MANAGEMENT PROJECT SUPPLEMENTAL NEPA. This comment period is intended to assist the team in developing the Draft NEPA Document for publication. Please use this form to submit any questions or comments you may have about the environmental, NEPA, archaeological, or cultural impacts of the proposed action. Completed forms may be emailed to AlaWaiFloodProject@usace.army.mil by **December 8, 2020** for inclusion to the Draft NEPA document, scheduled for publication in February 2021.

Thank you for the opportunity to comments on the NEPA adequacy of the USACE Ala Wai Flood Risk Management Project, Honolulu, Hawaii Engineering Documentation Report Engineering Documentation Report (EDR) July 16, 2020. This EDR is related to the USACE Ala Wai Canal Flood Risk Management Study, O'ahu, Hawaii Feasibility Study with Integrated Environmental Impact Statement (EIS) Interim Final Report May 1917. Comments and suggestions I made to that May 1917 documents are recalled here to see if they have been addressed or not in the EDR.

My comments are focused mainly the McCully-Moiliili Neighborhood N.8 of the City and County of Honolulu because it is adversely impacted by the above plans, unless they are indeed corrected and suggestion to reduce flood risk are actually implemented for this neighborhood as an essential and an integral part of a finalized USACE Ala Wai Canal Flood Risk Management Plan.

I have been living in this watershed for about 50 years. I and the residents and businesses of this area will be adversely affected. I am motivated by my continue community services as a past vice chair of the Neighborhood Board No. 8, past long range planning chair of the Moiliili Community Center, former commissioner of Housing and Community Development with the City and County of Honolulu, and emeritus professor of urban and regional planning with the University of Hawaii at Manoa.

My comments are those of an individual and an expert in my field that were made to USACE, the City and County and the affected Neighborhood Boards at several community meetings. They are included below in chronological order to see which suggestions are addressed by USACR EDR in system modification, or not yet.

* Luciano Minerbi, Draft only February 8, 2016 "Notes on Ala Wai Canal its Development and Impacts".
* Luciano Minerbi, June 19, 2019, City& County of Honolulu Committee on Public Infrastructure, Technology and Sustainability. Testimony.
* Luciano Minerbi, July 3, 2019 Testimony on Resolution No 19-14-145.
* Luciano Minerbi, October 6, 2019 "Ala Wai Canal Flood Protection Needs for Lower Moiliili Neighborhood". Handout.
* Luciano Minerbi, October 13. 2019 "Moiliili Needs Better Flood Protection". Island Voices Honolulu Star Advertiser.

The spirit and the letter of NEPA is fully realized only when documents by USACE, the State of Hawaii and the City and County are explicit in their respective authority in finalizing risk minimization from flood, storm surge, sea level, by integrated environmental maintenance with flood protection so as to comply with the following Executive Orders: EO 11514, Protection and Enhancement of Environmental Quality, EO 11988 Floodplain Management, EO 13690 Federal Flood Risk Management Standards, EO 11990 Protection of Wetlands, EO 12898 Environmental Justice, EO 13045 Protection of Children from Environmental Risks and Safety Risks, and EO 13112 Invasive Species. Comments and suggestions by community members address and are pertinent to these EO themes. Thank you very much. Sincerely

---

EDITORIAL | ISLAND VOICES

Column: Malama Ala Wai watershed ecosystem

By Luciano Minerbi - May 11, 2022

A recent editorial called for prioritizing green remedies and ecosystem resiliency while mitigating flood risk in the Ala Wai watershed ("Craft a holistic Ala Wai solution," Star-Advertiser, Our View, April 20). It requires an integrated natural resource management plan for the Waikiki ahupua'a, historically a wetland. Residents requested this all along. Also, University of Hawaii graduate planning students in 2001 were already advocating the integration of indigenous Hawaiian land and resources management techniques.

Available now is a useful tracking spreadsheet by the U.S. Army Corps of Engineers (ACE) listing about 200 measures that are "under consideration" or are already "screened out" when they are not within its authority or study scope. But this relegates to an afterthought essential environmental design measures.

An integrated ecological and flood control design solution would have different configurations than the one focusing on flood alone. Instead, a "co-design" approach engages federal, state, county and community partners in collaboration at each step of the process.

I hope officials populate and share the 200 measures with their own assessments by revealing in the spreadsheet which agency would be the leading one, and which other would be listed in a supporting role. A good example is how the Ala Wai Watershed Collaboration describes proposed linked measures, such as ones for the Ala Wai Golf Course and the Ala Wai Canal.

An appropriate engineering solution addressing simultaneously overlapping risks — potential imminent riverine flood and tsunami, and sea level rise — has a quite different design from one addressing only riverine flood. The same applies to ecosystem restoration — inclusive of pollution abatement, water quality, debris management and channel cleanups, invasive species control, forest management, coastal flooding and cultural recreational uses.

Evaluation should not be limited to what is permitted by the authority of ACE. There are other entities involved: the Environmental Protection Agency and several presidential executive orders requiring compliance with protection and enhancement of environmental quality; federal flood risk management standards; protection of wetlands; invasive species; environmental justice; and protection of children from environmental risk and safety risk. In fact, Hawaii's 1st Circuit Court in 2019 correctly reminded us that the state needs an acceptable environmental impact statement (EIS) to commit funds.

Good documentation allows each organization to clarify its kuleana, what they can accomplish or not and propose additional resources needed from funding authorities. Agencies should have institutional memory and document what was done in the past for this watershed. "Complying by referencing" previous studies and then updating what is missing can help the EIS be done more efficiently.

The Ala Wai Watershed Analysis already in 2003 recommended detailed ecosystem restoration measures. The Ala Wai Canal Flushing System and the Ala Wai Golf Course Detention System engineering studies done previously designed a multipurpose wetland for sediment, filtration, irrigation and vegetated marsh to greatly improve water quality. This is key for flood protection of Moiliili and Waikiki because it diverts storm waters from the Manoa-Palolo Canal right into the golf course.

The ocean water pumped up at Kapahulu into the Ala Wai Canal east end keeps its water moving and clean. These two measures make feasible the second ocean outfall at Kapiolani Park, well away from Waikiki.

Most importantly, after three decades, we deserve a planning framework that explicitly addresses how environmental justice serves all the affected neighborhood, including McCully-Moiliili, in terms of risks, flood reduction and ecosystem restoration. This would move forward the aspiration of the recent editorial.

Aloha,

My name is Dave Watase, I am a resident who lives within the Ala Wai Watershed and a key stakeholder in the 2017 Final Environmental Impact Statement (FEIS) for the Ala Wai Flood Project.

This is the short version on the poor engineering application with the flood pumps in the 2017 FEIS which included two separate flood pumping stations one next to the Waikiki Library and the other near the AWGC driving range.

Purpose:

The flood pumps were needed to pump the stormwater into the Ala Wai Canal floodwalls whenever the flap gates are closed and the canal is above ground level.

Poor application:

* Directly hooked up without a collector or detention basin behind it and would have to be designed to handle the peak flows;
* With use of a detention basin behind the pumps could reduce the pump size requirements and cost;
* The hydrograph show that 75% of the peak flows would last for a duration of about an hour and this capacity would be underutilized for the rest of the storm;
* The peak flows pretty much coincide with the peak flows for the Ala Wai Canal in other words when canal is already full;
* Basically, whatever is pumped into the canal would have to be detained until the Manoa/Palolo Stream flows subside, then have to travel 2 miles at approximately 1 fps to exit at the Ala Wai Harbor;
* This seems like such a waste of pumping power which can be run several hours before a storm to lower the canal if worked in conjunction with a flood gate;
* If the flood pumps were designed to handle the peak flow of 3,600 cfs and run full blast for 8-hours the pumps could evacuate up to 100 million cubic feet of stormwater;
* One option would be to pump it down Kapahulu Avenue to the ocean a quarter of a mile away but that option most likely will be resisted;
* However, it would almost have a similar effect of having a second opening at the far end of the canal;
* Mike Elholf a local hydraulic engineer and contractor said a small 50-100 cfs pump could be used to pump clean ocean water into the far end to circulate and flush the canal and move over 4-8 million cf in 24 hours, this pump system can be separate and specific to improve circulation in the canal;

1

* With pipes and tunnels, the pumping station could be consolidated and constructed anywhere with in reach and in a location with least impacts;
* Having a central pumping station with multiple inlet locations provides flexibility and avoid repetitive redundancy requirements;
* My recommendation is to place the pumping station on the Ala Wai Golf Course (AWGC) and since the total volume from the Kapahulu end is not significant use the canal as the conduit to the Manoa/Palolo confluence pump inlet, from there the pump will send the flows via tunnels or pipes to the Ala Wai Harbor;
* Peer Engineering suggest the combining of pump station #1 and #2 to eliminate redundancy;
* Peer Engineering also suggested a pump station #3 near the University Avenue storm drainage outlet;
* Flood walls would most likely require a pumping station for Kapahulu confluence at the Manoa/Palolo Stream;
* Flood walls would most likely require a Makiki flood gate and Makiki Promenade Bypass or pumping station;
* Hausten's Ditch will have to be figured out;
* Flood walls would require a method to take care of interior drainage because Waikiki and the lower watershed will not be all blue skies when the big one hits;
* For comparison, the USACE said the Ala Wai Golf Course detention basin in the Perspective Plan has 300 ac-ft. of storage which equates to 13 million cubic feet;
* A 3,600 cfs pumping station can remove 13 million cubic feet out to the ocean in 60 minutes, bypassing the canal, and not susceptible to high tides, tide surges, and sea level rise.

Aloha,

My name is Dave Watase, I am a resident who lives within the Ala Wai Watershed and a key stakeholder in the 2017 Final Environmental Impact Statement (FEIS) for the Ala Wai Flood Project.

Just want to point out the FLAWED Hausten's Ditch Detention Basin in the FEIS. The detention basins walls and berms are all above ground level in the grass area in front of the coconut trees and includes a baseball field as pictured below. The Hausten's Ditch gate will be closed to allow the floodwaters to flow above ground in the FEIS Ala Wai Flood walls (average 4'). No explanation on how the blocked stormwater will fill the detention basin since it too is above ground. The picture shows the University Avenue and this area of the street is relatively flat. Under the University Avenue is also a major 10'x8' storm drainage conduit.

The General Reevaluation Report's Prospective Plan calls for 6' high walls around the Ala Wai Canal. It will require taking care of the stormwater from the Hausten's Ditch when blocked off or be the cause of flooding.

Aloha USACE & C&C: I add a list of themes I trust will be addressed in the Ala Wai watershed EIS. They summarize what was provided in more detail in my previous e-mail.
Mahalo for your consideration.
Luciano Minerbi

THEMES TO FULLY INVESTIGATE AND DESIGN IN THE ALA WAI NEW EIS Submitted by Luciano Minerbi May 7, 2023
Email: luciano@hawaii.edu<mailto:luciano@hawaii.edu>

AlaWai Golf Course: It should be designed with the greatest capacity as a Detention Basin to receive storm water by fully utilizing its acreage and depth, as the best features for flood mitigation in the entire watershed.

Manoa-Palolo Canal: recognize that the protection of the Iolani School site west of the Manoa-Palolo Canal needs to extend up to Date Street. Provide design and modeling details on how at least two conveyance conduits would direct floodwater into the Ala Way Golf Detention Basin to really protect Moiliili and the Waikiki neighborhoods. Provide pumps and movable dikes at this location to really divert this floodwater into the Ala Wai Golf Course Detention Basin.

Moiliili Drainage: provides interior drainage pumps to ensure that during storm events they convey the accumulated floodwater from the streets into the Ala Wai Golf Course and Canal.

AlaWai Canal: recognizes that Waikiki is two feet higher than Moiliili and that any improvements to the canal walls must make them at the same level on all sides. Recognize that the site where the Manoa-Palolo Canal reaches the Ala Wai Canal is lower than Waikiki and needs protection.

Canal Walls: water in the canal would be higher than along the surrounding areas. Explain how the Culverts operating in the Makiki and would avoid backflows.

AlaWai Pumps: Provide pumps in the Ala Wai Canal to keep water circulating and flowing to the Ocean both at the AlaWai Boat Harbor, the AlaWai Kapahulu outlet.

Kapahulu Side of Ala Wai Canal and Kapahulu Groin Site: fully assess feasibility of Reverse Pump and water wells to periodically flush the Ala Wai Canal by keeping water quality, velocity, temperature, dissolved oxygen at acceptable levels with ocean water or pumped from the Kapahulu Groin as suggested in the OEQC Dec 31, 1976 report "Improvement of Ala Wai Canal" by Cox and Miller; DLNR Noda 1993 report and in the DLNR Mitsunaga 2015 report and in the Stantec report June 1, 2022 at page 60-61.

1

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Watershed-wide Flood Detention Basin: redesign the Ala Wai Golf Course and the Kapi'olani Park as constructed wetlands with Hawaiian plants for water circulation and pollution abatement. For major flood events, divert the water overflow from the Ala Wai Golf Corse into Kapi'olani Park, so that both form a giant detention basin and constructed wetlands.

Integrated Agency Authority: ensure that the Ala Wai planning and design solution of the EIS does emerge in MOA and MOU from the effective collaboration by DLNR, C&C and USACE.

Viability of Design Solutions: ensure that the EIS spell out how, when and by whom maintenance is to be provided to the features of the Ala Wai Watershed flood mitigation plan.

dominic.milles@honolulu.gov

Dear Haku Milles:

Please accept the following as my public comment pertaining to the Supplemental Environmental Impact Statement Preparation Notice (EISPN) for the proposed Ala Wai Canal Flood Risk Management Project.

Clarifying Questions:

How was the storm protection level chosen (i.e. 50-year modeled event vs. 100-year modeled event)? My understanding was that the previous Ala Wai proposal was attempting to mitigate a 100-year flood event, and this current proposal will attempt to mitigate a 50-year event. What factors go into this requirement for protection level?

How will the proposed system perform WHEN it is overwhelmed by a storm event in excess of the design storm? Beyond the breaking point, how will the proposed system perform, especially compared to a No Action Alternative? I'm concerned that there might be more risk when floodwalls overflow, and then potentially trap water in areas not designed to flood at all, causing more damage, especially to public health, as standing water after flooding is acutely dangerous to anyone who remains in the area.

How is "value" determined (both for life and property), in choosing what areas to protect and how to protect them? Is property value based on assessments (so value of buildings themselves) or revenue generation (commercial or rents)? There's phrasing in one of the presentations, "would not benefit most socially vulnerable communities," which was used as justification for removing a protection measure. What is meant by this? Is life risk from flooding lower in socially "non-vulnerable" communities? What is the life risk in general from flooding? How many people have died historically from catastrophic flooding events in the area?

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

General Comments:

This is an over-engineered solution to address a hypothetical or modeled flood event problem; not a real-world flooding problem. Any flood event exceeding the modeled event could be more catastrophic than no action. A 51-year storm will overwhelm a system designed for a 50-year storm. It's not a question of IF, it's of WHEN. Communities on the "other side" of any floodwall will be immediately flooded, with no viable drainage options. Standing water will remain longer, and cause more risk to public health.

This assumes that models and projections are accurate, AND that the system remains in working order AS DESIGNED throughout the flooding event. Loss in power could render pumps useless and debris caused before or even *during* the flooding event can clog drains/culverts. Our existing stormwater systems are not well-maintained (filled/clogged with debris/silt); how can we be confident that the proposed system will be adequately maintained and ready for the designed flood event?

These flood models are showing a 50-year flood event much worse than we've seen in the past 100 years, and worse than what current FEMA Flood Maps appear to indicate. Please elaborate on this difference. I suspect that projections for climate change (sea-level rise, loss of forest/watershed, more-intense rain storms) and development (increase in impervious surfaces) are probably driving these drastic model forecasts. If that's true, we should work to *reduce* the source of the problem (e.g. fight climate change, save our green space, reduce impervious surfaces), as opposed to just build a wall that we think might be high enough to protect from a model of it.

50-year flood as modeled for the Ala Wai Flood Project

FEMA shows most of Manoa as Zone X (outside a 500-year flood event)

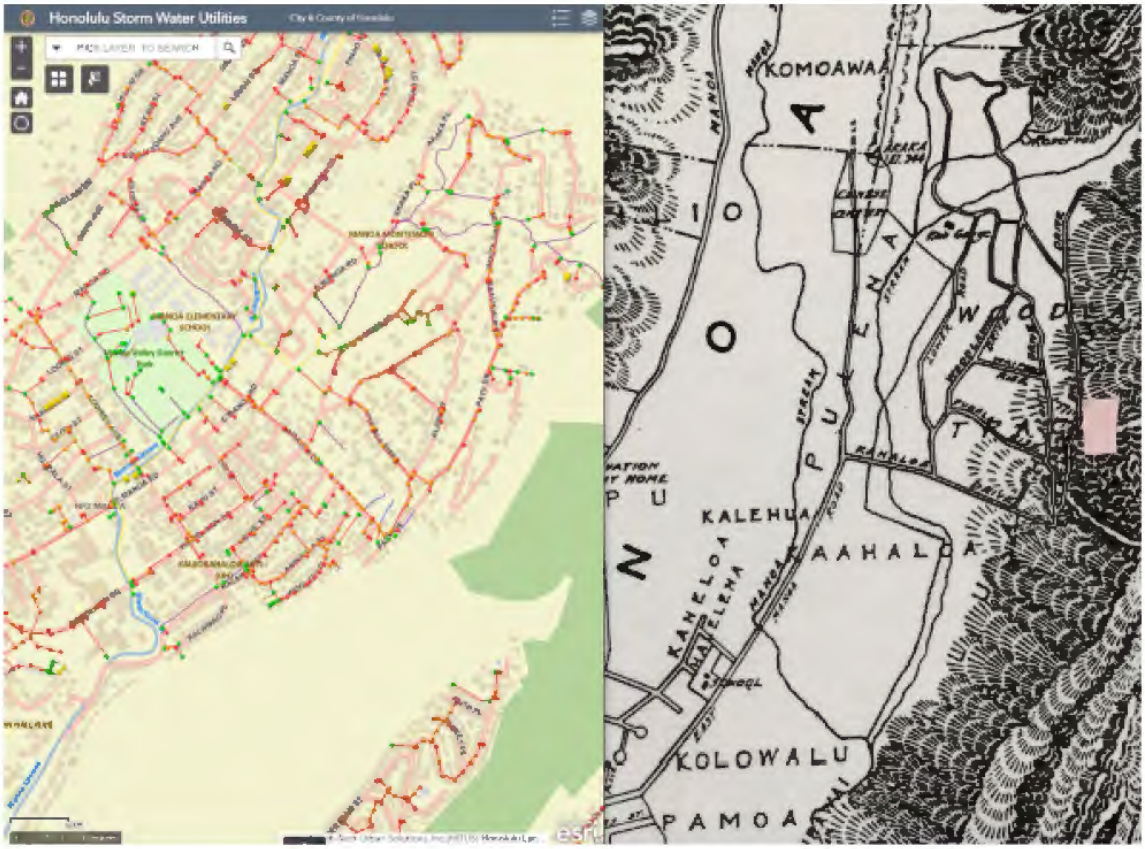
Modeled 50-year flood vs. Current FEMA Map

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

An ounce of prevention is worth a pound of cure. Reducing excessive surface water runoff from entering our rivers and streams in the first place should be the primary focus. This will help with EVERY storm event, from an annual storm to a 100-year storm. Less stormwater entering our systems is always a benefit. On its own, our island would be very effective at managing rainwater. It's our impact, from actions such as over-development that reduces ground permeability and green space, that is making this flooding problem worse for our future.

Suggestions:

Please revisit the Woodlawn area (previously referenced as the Woodlawn Ditch in the original Ala Wai EIS). The stated objective of this project is to reduce riverine flood hazards to property and life safety in the Ala Wai watershed, but for whatever reason, it appears that natural stream systems in the Woodlawn area of Manoa Valley were reclassified as "drainage ditches" at some point in the past (as shown in the map comparisons below). Those "feeders" on the Woodlawn side of Manoa, although currently considered part of a "drainage system", appear to be natural rivers and streams, and therefore should be considered in this project, as water from them should be considered "riverine flooding". The 50-year flood model with No Action shows significant flooding in the Manoa area, specifically in the section where Woodlawn "ditch" meets Manoa Stream.



CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Current Honolulu Stormwater Map (Left) compared to 1920 Map of Manoa (Right). Note that in 1920 there were two streams through most of Manoa; today what was once a stream on the Woodlawn side has been reclassified as city stormwater drainage ditches (purple lines, top right of map on Left) and redirected through Woodlawn Ditch to meet Manoa Stream before the Manoa District Park.

Please revisit watershed health. I realize that this project is focused on riverine flooding, but river water comes from somewhere: it's not just conjured into a river or stream. Riverine flooding will reduce if the source of that surface water is better managed through a healthier watershed. And the argument that watershed health alone can't protect against some modeled catastrophe and therefore should be dismissed is fundamentally flawed. A real storm can run the entire gamut of possibilities, so the modeled measure is completely arbitrary, and only provides statistical protection against the modeled event. Floodwalls and detention basins provide specific protections up to some specified flooding level, which is brittle in the sense that a larger flood will completely defeat the protection and could cause even more damage than nothing at all. In contrast, watershed health buffers against every storm event, providing meaningful protection from every storm. Most critically, it could buffer enough to mitigate a potential catastrophe, for example by making a currently-modeled 40-year storm look more like a 25-year storm, which would be much more manageable.

Thank you for your consideration,
Seth Kamemoto

From: Dave Watase
Sent: Sunday, May 7, 2023 4:01:31 PM (UTC-10:00) Hawaii
To: Ala Wai; earl.t.vaughn@usace.army.mil
Subject: NOI - Ala Wai Flood Project - Dave Watase's Public Comment 9 - FEIS flood walls and berms

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Aloha,

My name is Dave Watase, I am a resident who lives within the Ala Wai Watershed and a key stakeholder in the 2017 Final Environmental Impact Statement (FEIS) for the Ala Wai Flood Project. I have the same concerns for the FEIS Ala Wai Canal flood walls (average 4' in height) as for the 6' high walls around the Ala Wai Canal for the General Reevaluation Study. I OPPOSE the use of 6' high flood walls around the Ala Wai Canal and question if the wall hydrology and hydraulics were done accurately.

One major difference between the 2015 Draft EIS (DEIS) and the FEIS is that sea level rise (50-years in the future 2075) was added into the hydrology and hydraulic computations. Clearly, the increased sea level rise had a significant impact on the flood modeling depth. Flood damage figures increased across the board including areas in higher grounds and with an increase to $1.14 billion (in the FEIS) from $317 million (in the DEIS).

USACE's project manager, Jeff Herzog, said that the FEIS was designed to accommodate an intermediate sea level rise of 2.7' MSL. Honolulu has average high tides throughout the year of 2.0', King Tides of up to 2.7'. In the worst case scenario a total of 4.7'-5.4' MSL would have to be accommodated on the drawings. The wall edge of the Ala Wai Canal ranges from around 4'-6' MSL and is around 5' MSL across the Manoa Stream Confluence. Without the FEIS floodwalls, the maximum velocity is dependent on the difference in height of the canal flood water at the Manoa Stream Confluence and the height of the ocean at the Ala Wai Harbor. At low tide this would be 5' of difference that would generate the velocity of the flows. It should be noted that the Ala Wai Boulevard is around 6" below the edge of the wall height and much of Ala Wai Canal's surrounding interior storm drainage systems have very little head pressure to generate velocities. High tides and when Manoa Stream flows raise the level of the canal, the immediate interior storm drainage systems become nonfunctional and could even backflow.

Already when we have King Tides of approximately 2.7' MSL some sections of our roadways experience backflow from their storm drainage outlets.
[cid:724fd094-dc6d-4911-a6fd-8fa37b0ed349]

This is the same location without a King Tide. The picture below and above are located at the end of Ala Wai Boulevard near the Ala Moana Boulevard Bridge.

What should also be noted is that the limited potential for volume exiting the Ala Wai Canal is limited to the available cross-sectional area under the Ala Moana Boulevard Bridge. The cfs exiting the Ala Wai Canal is not dependent on the depth of the canal and another way of looking at it is as if the ocean level is the solid base of the canal. Whenever the

1

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

ocean level is higher than the Ala Wai Canal no storm water will be able to exit until the canal is higher and only then will water build up to generate a slope which will dictate the velocity of the flow. The USACE needs to evaluate the actual additional cfs flows exiting the canal as a result of the 6' Ala Wai Canal walls and berms. The Ala Wai Canal is about 200' across near the Ala Moana Boulevard Bridge and the height of the flows at this point seem to be only a few feet of added benefit. This means 200-600 cross-sectional area and when multiplied by the projected velocity gain will produce the cfs. At 1 fps it would barely increase conveyance and the result is more detention.

[cid:2d82a3c1-9a32-4bd7-a567-16ccf5d329b8]

[cid:e4f1d63a-f498-4afb-893e-795c14d6a9e8]

The problem with the General Reevaluation Study is that the USACE for the most part has for the longest time not set a target storm for protection. Recently, we have been told it is a 50-year flood. So, the first question that comes to mind is what happens when a storm greater than the 50-year model hits. Will the flood walls and berms be overtopped? The FEIS indicated that even the 4' average flood walls would have residual flooding in Waikiki because of the because the floods are flashy in nature (not consistent in flows), this flashiness could easily erode segments of earthen berms unless scouring protection is provided to withstand overtopping. As we all know, holding back water creates catastrophic flood damage when dams and walls fail. The FEIS in the Engineering peer review have legitimate concerns regarding the flood walls primarily because of the porous coral substrate which can be prone to liquification and lose its supporting capacity resulting in walls tipping over. The porous coral substrate is like a sponge that will let water through under pressure possibly requiring micro piles under every inch of the wall or sump pumps and larger footings. The idea of an elevated walkway and bike path half and half wall could be a solution but will most likely require removing an additional lane of traffic along Ala Wai Boulevard, eliminate a parking lane, eliminate right turn lanes, and require handicap ramps at ever intersection and access to the canal steps. I don't think you can relocate the coconut trees to the edge of the original Ala Wai Canal wall even if you put a sloped earthen embankment.

[cid:f449e616-3dca-42c9-a2ef-a2df5cbabb46]

Sump pumps and micro piles?

[cid:90794879-87bf-4427-9a9e-bca2f551ae00]

Concern regarding potentially damaging the 72" sewer force main serving all of Waikiki

[cid:5d44b24d-55f7-47b9-a2f9-2764caad4f9d]

The FEIS impact on interior drainage is flawed. Only assessed pipes larger than 18" and only did modeling for a 10-year storm for 1-hour duration. A lot of backflow flooding can result from storm drains smaller than 18" and the flood flaps would be closed for an estimated 6-hour duration.

[cid:6da578af-8b54-4071-8955-a83d059796aa]
The Residual Flood Modeling with the FEIS flood walls only accounting for 18" and larger pipes and only for the 10 year flood with a duration of 1-hour. Should have been studied for the 100-year flood for 6- hours duration.

[cid:077833a1-1b1f-4a37-b7ee-e00598656ad6]
The Makiki Stream will require a something to prevent backflow flooding up stream. The FEIS failed to address this mistake. The EDR included a poorly thought out solution called the Makiki Bypass.

[cid:ce6a0011-372f-4b91-b840-31d0e5ac035a]

2

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

The EDR's Makiki Bypass which would have to include a flood gate. It would be susceptible to high tides, tide surges, and sea level rise. At high tide 80% of it would be submerged and there is limited head pressure to establish the proper flow velocity to handle the needed cfs, especially in a storm condition. The other big thing is that the Ala Moana Neighborhood Board was very critical in their comments to going under the Ala Wai Promenade with historic walls and designated trees.

[cid:f675fb6f-245f-4bd1-840b-35291a8aa66d]

The EDR's Makiki Bypass a 10' x 20' conduit pass though under the Ala Wai Promenade in addition to building the flood walls. Good luck!

[cid:04cc1057-ec24-46cb-8ed8-c27b074e6a70]
[cid:a62eef96-b2ef-44a1-8724-a05779bc3574]

The Kalakaua Bridge does not have adequate cross-sectional clearance to accommodate increased flows. The higher the wall the greater the restriction.

[cid:f19e9a88-c030-4f2e-9058-63b496b087e4]

December 2021 storm caused Kalakaua Avenue to flood near the Royal Hawaiian Shopping Center because the Waikiki's interior drainage did not have adequate head pressure to push the flood waters to the Ala Wai Canal. This storm was not even a 50-year or 100-year storm and if you combine a 10, 20, 50, 100-year flood with storm drainage flap gates it would result in severe flooding. The big storms, or a downgraded hurricane could park itself in Manoa Valley and Palolo Valley and uniformly dump rain across both the upper and lower Ala Wai Watershed which is only 16.2 square miles and 7 miles long from top of the watershed to the ocean.

Waikiki Flood<Blockedhttps://www.youtube.com/watch?v=X-dQB3462tg>
Hawaii, Oahu, Waikiki rain, storm, flood Blockedwww.youtube.com

The Ala Wai Canal's interior storm drainage system is tidal influenced and has very little room to spare. Much of it is submerged with a King Tide. It won't take much sea level rise to shutdown our whole interior storm drainage system and the flood walls no matter how high will not help one bit and everything will have to be redesigned at that time. It is better now, to incorporate a solution to both the 50-100 year flood with making our interior storm drainage system more resilient to climate change, sea level rise, and tide surges. Pictured below is the University Avenue storm drainage culvert completely submerged during a King Tide.

[cid:9ccb2e0a-5573-4107-bc53-a836afa648b0]

The Ala Wai Canal according to an April 1998 Study on the Ala Wai Watershed states that the Ala Wai Canal can carry a maximum of 5,200 cfs at a velocity of 1 foot per second. The distance from the Manoa Stream Confluence to the Ala

3

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Wai Harbor is approximately 1 mile and at a velocity of 1 fps would take the flood water about 1-1/2 hours to reach the Ala Wai Harbor. The Ala Wai Canal is flat and can generate no velocity by itself. As the floodwaters rush into the Ala Wai Canal, the waters rise because of the no slope condition, the rising waters basically create it's own slope and the maximum velocity of the existing flood waters from the Ala Wai Canal would be dependent on the height of the canal walls.

[cid:98282a1d-d9f3-4807-96bb-dbb674b1036e]

The FEIS has several versions of wall profiles and is not consistently put together. Below is the latest version at 35% engineering and should include 2.7' of sea level rise and accommodate for high tides. What I want to point out is that the MSL is 2.0 which would only factor in the regular high tides. King Tides are 2.7' MSL and to take sea level rise into consideration you would have to add an addition 2.7' for a total of 5.4' (for 2075). The wall profiles don't reflect any accommodation to sea level rise. The other big thing to notice is that the flow cross-section would be 1' x 200' which would increase the capacity cfs by 200 x the velocity of the flow. There seems to be about 2' spare from the water elevation to the top of wall but even factoring this in has very limited capacity improvements. I'd like a hydraulic engineer to examine and determine the maximum flows that can be determined by the energy of the height of the water at the Manoa Confluence to push out the water less the friction of the canal. We all know water flows downhill and nothing will leave the canal until it is higher than the ocean.

The Engineering Documentation Report's - Grand Flood mitigation element: A 4,000 cfs flood pump built in the middle of the Ala Wai Canal with a flood gate, bridge and mosaic

Right of the bat - what's the thinking. Although, this flood pump has a detention basin behind it ... lesson learned from the FEIS. A 4,000 cfs pump can empty the back half of the canal 10' deep in about 30-40 minutes and can empty the General Reevaluation Study's 300 ac-ft AWGC Detention Basin in about 54 minutes. This is a crazy idea because if the front end of the canal is running at capacity, the flood pump will have to remain idle and for most of the time ... that's probably what will happen. Constructing a flood pump in the middle of the canal with water all around got to be twice as costly as building it on land. This flood pump would evacuate a very small portion of the total volume from a 100-year storm. If the big storm doesn't follow the exact calibration of the model then the whole plan fail. A 4,000 cfs pump if utilized right can be run for the full 8-hour peak duration of the storm's hydrograph and completely bypass the Ala Wai Canal with a tunnel or pipe going under the canal or another route to the ocean or harbor.

4000 cfs x 60 sec/min x 60 min/hr x 8 hours = 115,200,000 cubic feet (better use if placed on the AWGC in conjunction with tunnels and a flood gate)

Based on the updated modeling hydrograph curve data the 100-year flood over a 24-hour period will generate 347 million cubic feet of water. Really, what good is a few million cubic feet of detention storage using Kaimuki High School. Potentially the Manoa and Palolo tunnels combined can evacuate 6,000 cfs and completely bypass the Ala Wai Canal. Tunnels are immune to tide surges, sea level rise, and high tides.

The General Reevalution's Grand Flood mitigation element: The Ala Wai Flood Walls

According to the USACE's plan ... the 6' high flood walls would require Kalakaua Avenue Bridge and McCully Street Bridge which are major ingress and egress for Waikiki. Just blockage alone should be a no starter and disqualify high walls around the Ala Wai Canal. But it doesn't end there and includes Date Street, Kapiolani Boulevard, and King Street which are also major thoroughfares. The FEIS hydrographs show high volumes of flow for at least 6-hours duration.

[cid:fa0777be-76b0-4034-a8ce-7653f8c96900]

I believe the best solutions are those that can work independent from the Ala Wai Canal.

* Manoa, Palolo, and Makiki Tunnels;
* Flood pump and switching station on the Ala Wai Golf Course;
* Flood gate (lock gate for recreational user if sea level rise occurs);
* Ala Wai Golf Course Multiple Detention Basins with flood waters captured upstream at a higher elevations;
* If a flood gate and pump system is built then the Ala Wai Canal can also be lowered to increase detention capacity;
* Any time the canal water elevation is higher than the ocean the flood gates can be opened to allow additional releases
* Everything would still have to be vetted by the communities;
* An idea that would have to be run by the paddlers would be to have an outflow riser that doubles as a canoe launch near Magic Island at the Ala Wai Harbor, if not it would be piped underwater at near that location (see diagram below).

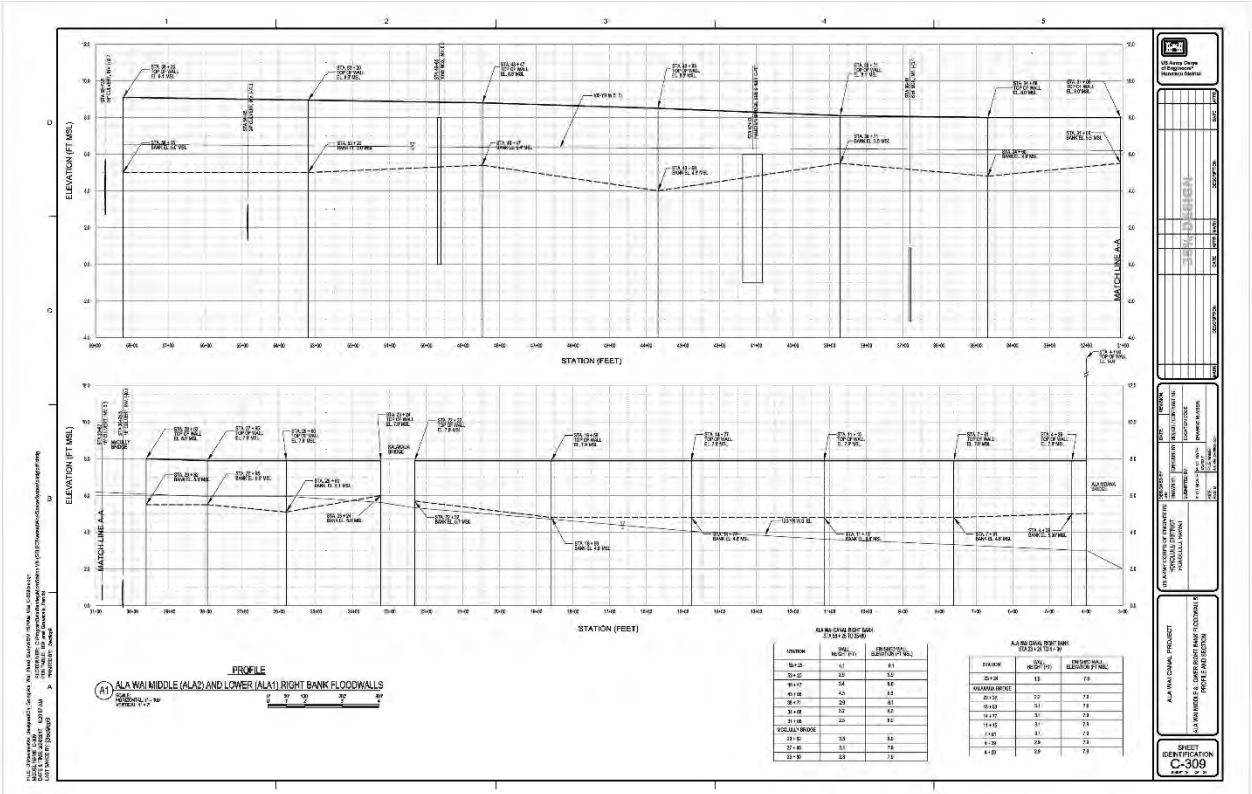
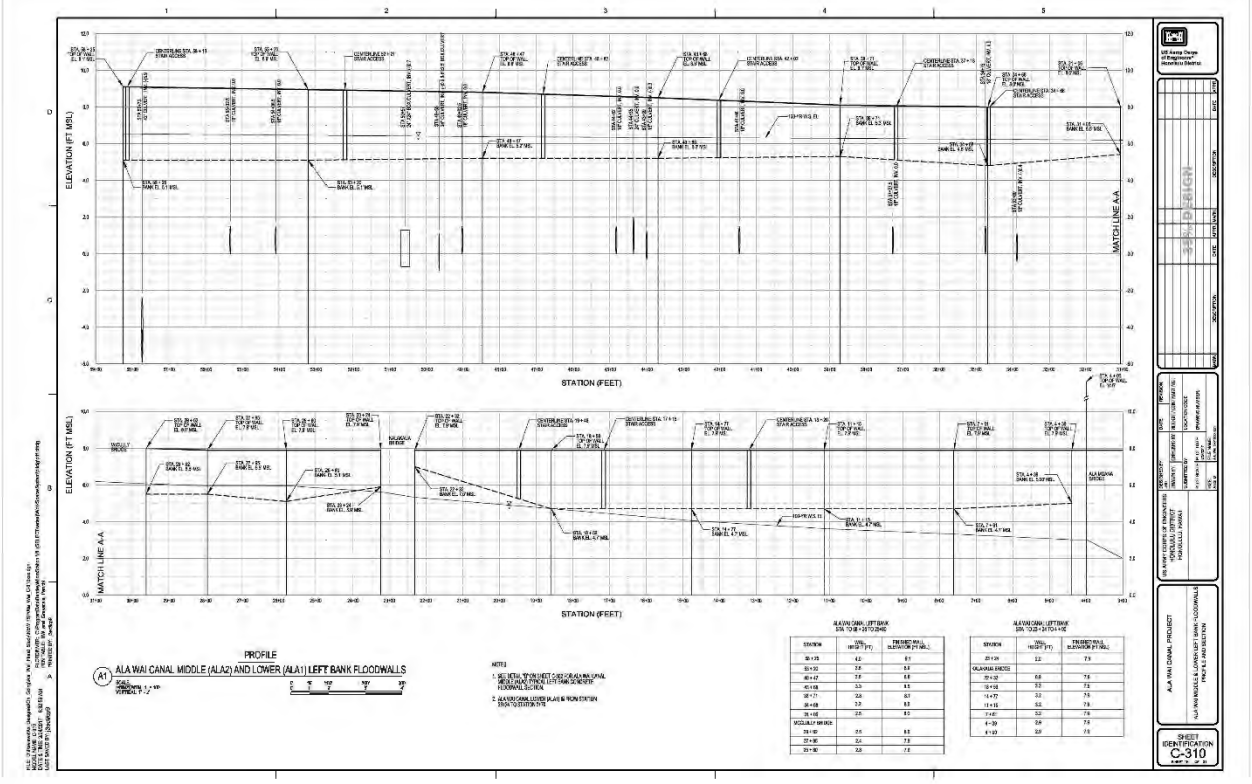
CONTROLLED UNCLASSIFIED INFORMATION (CUI)





CONTROLLED UNCLASSIFIED INFORMATION (CUI)

3.5. *Problem:* Flooding. Flood hazards in Waikiki and areas surrounding the Ala Wai Canal are one of the least well-known public health and safety problems. The actual design-capacity of the Canal provides for about a "10-year" storm flow (DLNR, January 26, 1994). This is a very small capacity which does not meet current City drainage standards. A suitable design standard in conformance with City drainage standards in this urban area would be at least a capacity for a "100-year storm". A "10-year" storm has a 10 percent chance of occurring once in any year. In recent history, the most severe event was a "30 to 40-year" rainfall which occurred in 1968. A 100-year storm has a one percent chance of occurring in any year. (See Figure 22A)

To improve the flood carrying capacity of the Ala Wai Canal requires that the cross-sectional areas of the Canal be increased, especially from the location of the McCully Street Bridge, all the way to the ocean. The problem is that the Canal is 100 yards wide upstream of this bridge, but it narrows to about 75 yards to pass under this and the two bridges downstream - Kalakaua and Ala Moana.

In the event of an extremely serious rainstorm, the Canal will overflow its banks, first on the mountain-side, then on the Waikiki side. Water would overflow into Waikiki. Waikiki's storm drains in the area between Kalakaua and the Canal would back-up and overflow because they could not drain the rainwater into the flooding Canal. Basement sump pumps in many of the larger buildings and garages in Waikiki would be flooded and unable to remove water from low-lying areas.

In some cases, pumps which move sewage from buildings into the City sewers (or even the City sewage pumping station on Kuhio Avenue) could be flooded and fail. These events would halt the movement of raw, untreated sewage out of Waikiki.

All of Waikiki would be covered with a layer of silt, mud and debris. Traffic would be snarled and it would take some time for the area to become passable. Clean-up and return to normalcy would take longer.

All the tributary streams to the Ala Wai Canal have less than a 100-storm capacity, even though some of them are hardened channels constructed primarily to drain water from the urban

FLOODING

- **The Canal has only a 10-year flood capacity, and can carry a maximum of about 5,200 cubic feet per second (cfs) of water at a velocity of one foot per second.**
- The 100-year flood has an estimated peak discharge of 22,400 cfs, more than four times the Canal's capacity.
- **The most recent severe storm recently was in 1968, somewhat less than a 50-year event (19,247 cfs).**
- Since 1968 there have been only two rainfall events (1968 and 1971) approximately equal to or exceeding the 10-year event.
- Waikiki storm drains in the area between Kalakaua Avenue and the Canal will not function under higher Canal flows (probably those less that the 10 year flows).
- **Maintenance dredging does not significantly improve the flood carrying capacity of the Canal.**
- Three types of flooding threaten Waikiki.
  - tsunami (from the ocean)
  - hurricane storm waves (from the ocean)
  - Ala Wai Canal flooding (from rainfall)
- The Flood Insurance Rate Map flood elevations and water flow velocities are higher for non-Ala Wai Canal flooding.

Figure 22. Swollen Ala Wai Canal After Minor Rains.

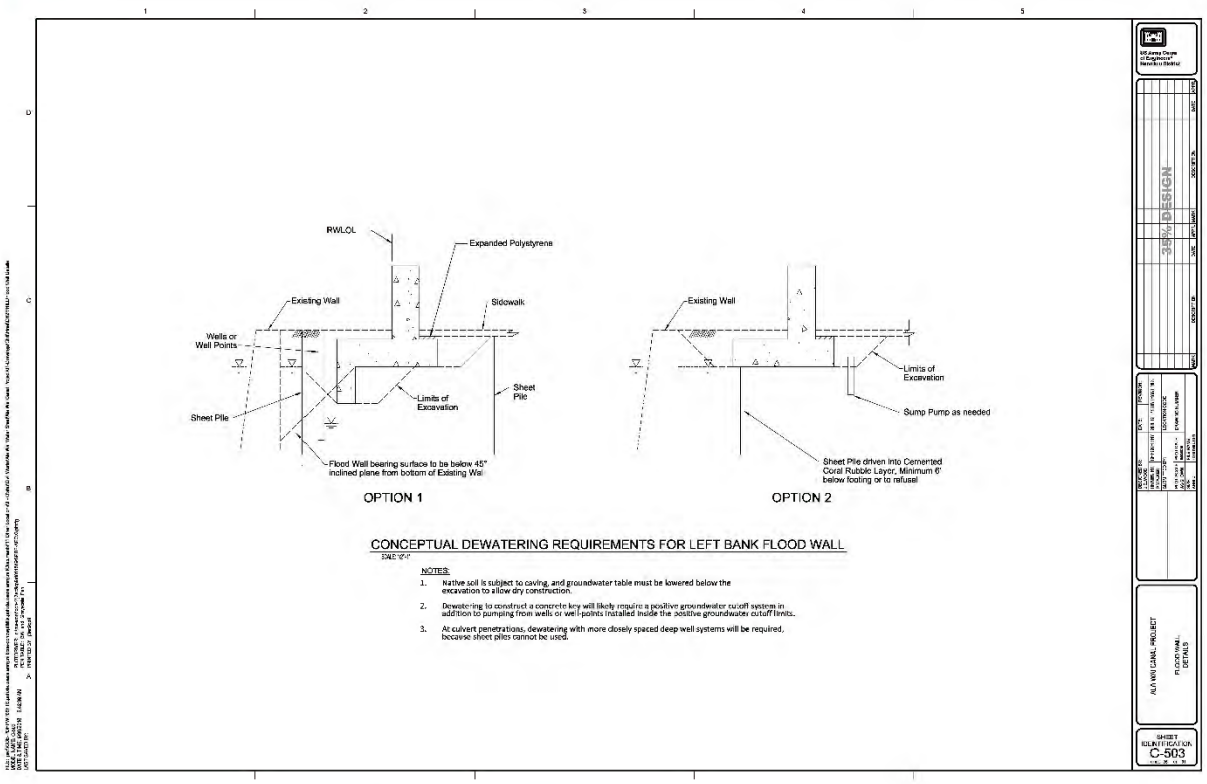
CONTROLLED UNCLASSIFIED INFORMATION (CUI)

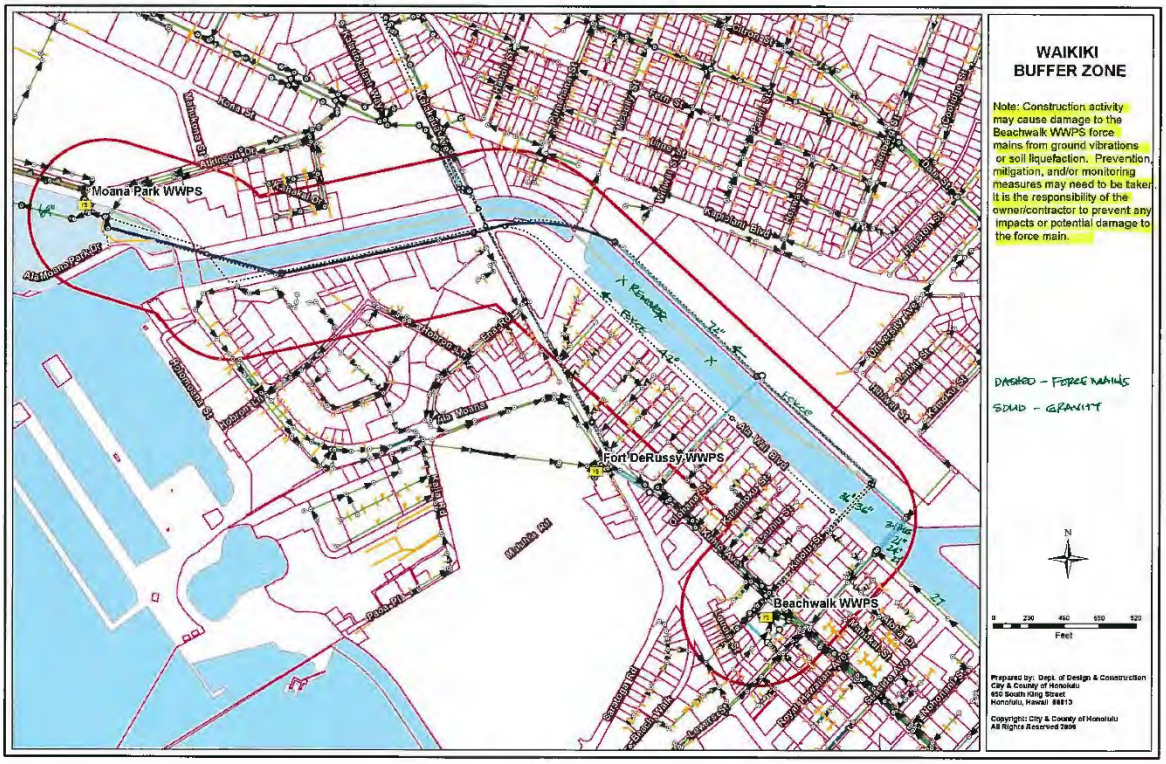
CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Final Panel Comment 4
Site conditions for the Ala Wai Canal left bank floodwall may not have sufficient space to design an adequate factor of safety against sliding and overturning.

Basis for Comment
Ala Wai Canal FS/EIS Draft Report Appendix A2, Plate 11, TSP 35% Design sheets C-103, C-309 and C-316 indicate construction of "inverted T" shaped floodwalls for Hausten Ditch Detention Basin and the right bank (mountain side) Ala Wai Canal with foundations 3 feet below grade and 9.5 feet wide, with a key to resist sliding an additional 3 feet deep. Report Appendix A2, Plate 11, TSP 35% Design sheets C-310 and C-311 indicate construction of "L" shaped floodwalls for the left bank (ocean side) of the Ala Wai Canal with no foundation heel, no key, and the toe foundation 1 foot below grade. The report does not include specific geotechnical data or floodwall design calculations. The Panel expects that geotechnical data and design loading for floodwalls on both sides of the canal would be similar; thus, the floodwall foundations would also be similar. However, as indicated above, the foundations are very dissimilar. USACE Engineer Manual (EM) 110-2-2502 Retaining and Flood Walls does not provide guidance for the use of "L" shaped floodwalls, though the same general design process for "inverted T" shaped walls can be applied to "L" shaped walls. While EM 110-2-2502 addresses only specific design methodologies, conservative rule-of-thumb professional judgment would begin with a floodwall foundation width equal to wall height, with the foundation heel equal to approximately 2/3 the foundation width and the foundation toe equal to approximately 1/3 the foundation width (Federal Emergency Management Agency [FEMA] Engineering Principles and Practice Chapter 5F). The "L" shaped left bank floodwall includes a foundation equal to only 2/3 the wall height, with all foundation in the toe and no foundation heel. Therefore, the Panel is concerned that the "L" shaped left bank floodwall foundations may not have sufficient factor of safety to resist sliding and overturning. Ordinarily, this matter would be corrected during the Preconstruction Engineering & Design (PED) phase and increased incremental cost would be covered by the project contingency. However, the left bank site conditions may not provide adequate available space for construction of either the floodwall design indicated in Detail C of Sheet C-311 or any other cantilever design resulting from a re-evaluation of foundation conditions. The already narrow available left bank work area is complicated by existing, possibly historic, canal wall stone work, existing utilities (street lighting and hydrants observed on Google Earth) and trees (indicated on plan drawings and artist renderings), and proximity of heavy vehicular and pedestrian traffic. If a left bank flood wall foundation designed with an adequate factor of safety against sliding and overturning cannot be constructed within the available site without impacts to site constraints, then a significant change in the TSP 35% design may be required. This change may be so major as to change the design concept and cause more environmental impacts to existing canal stone walls, utilities and trees, and traffic. Furthermore, the design is not aligned with the currently assessed level of risk assigned at this stage in the SMART Planning process.

Significance – Medium





CONTROLLED UNCLASSIFIED INFORMATION (CUI)

At the Manoa-Palolo canal, water overtops the right bank and will inundate the area around the Iolani School. An economic analysis was performed to determine whether extending the floodwall upstream to the Date St. Bridge can be incrementally justified. This analysis showed the floodwall extension to be economically infeasible.

At several locations along the streams modeled, hydraulic jumps appear. These jumps occur at the upstream side of various bridges and culverts and are mainly a result of changes in topography and channel slope as the stream bed transitions from the steep uphill areas to the flatter valley areas.

In general, implementation of the recommended plan reduces peak flows entering the Ala Wai Canal system and the floodwalls protect the surrounding area from damage due to flooding. Plate 4 shows the water surface profiles of the modeled stream for the TSP.

8 INTERIOR DRAINAGE

Along both banks of the Ala Wai canal, there are numerous drainage outlets from the storm sewer system. These outlets will require the installation of flap-gates to prevent water from backing up and inundating areas beyond the floodwalls. During storm events, these flap-gates will close and prevent water from draining into the canal. This will cause residual flood inundation to the areas protected by the floodwalls. This residual flooding is not expected to be significant due to it being shallow sheetflow and not dep ponding.

To determine impacts of storm drain or storm sewer outfalls being shut during periods of high water surface elevation in the Ala Wai Canal with the project floodwalls, stormdrains greater than 18-inch diameter pipes along the Ala Wai Canal (21 out of 43 outfalls) were analyzed for backwater impacts. Only the larger stormdrain pipe or culvert sizes were chosen for this analysis since these stormdrains had drainage areas larger than 4 acres and pipe sizes greater than 18-inches. Many of the small outfalls only drain the Ala Wai Boulevard roadway, those of single 18-inch or less diameter pipes (22 out of 43 outfalls), have very minimal drainage areas, will only have minor impacts to Ala Wai Boulevard in case of backwater, and would have only minor residual damages if any.

To evaluate the interior flooding due to backwater in gravity storm drains, the coincident frequency assumption is that the interior flooding input for these gravity outlets to the canal would use the 10% 1-hour rainfall intensity volumes and given the flashy nature of runoff in the watershed, the gates could be closed for up to 6 hours depending on the riverine flood event. Next the pipe and channel storage; i.e. volume capacity; for those stormdrain outfalls were determined based on the pipe or culvert sizes and lengths. Then using existing topographic data to determine the street elevation of stormwater inflow grates and overbank conditions, excess volumes which exceeded the storm drain capacities were mapped assuming that the shallow flooding, up to 1 foot depth, would spread following the local topology with roads serving as the primary channels of this

This is flooding from a King Tide along the Promenade side of the Ala Wai Canal near the Ala Moana Blvd. Bridge. Future conditions will raise the canal water elevation approximately an additional 2.7' for intermediate sea level rise 50-years in the future.

Supposedly, the route of the USACE's EDR Makiki Bypass, a 10' in height x 20' in width concrete conduit to be built down the Promenade. It will be difficult to built without damaging the trees with exceptional designation and most likely require the reconstruction of the walkway, lighting and utilities.

The blue line indicates the approximate sea level elevation of +5.0 MSL with high tides and future intermediate sea level rise. The Makiki Bypass with walkway, ground covering and conduit thickness will be underwater and will require head pressure or flooding conditions upstream to force the floodwater through the Makiki Bypass.

Subject: EPA's scoping comments on the General Reevaluation Report/Supplemental Environmental Impact Statement for the Ala Wai Canal Flood Risk Management Study, Honolulu, Hawai'i

Dear Shawna Herleth-King -

The Environmental Protection Agency has reviewed the Federal Register Notice published on February 22, 2023 requesting comments on the Army Corps of Engineers' decision to prepare a General Reevaluation Report and Supplemental Environmental Impact Statement (SEIS) for the subject project. Our comments are provided pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality regulations (40 CFR Parts 1500-1508) and our NEPA review authority under Section 309 of the Clean Air Act.

The project area watershed encompasses 12,064 acres and includes the Makiki, Mānoa, and Pālolo streams, which flow to the Ala Wai Canal, a 2-mile-long, man-made waterway constructed during the 1920's to drain coastal wetlands and develop the Waikīkī District. The Corps has estimated that Waikīkī beach, along with its 54,000 residents and nearly 80,000 daily visitors, faces a 1 percent chance of a major flood each year that risks loss of life and would cause $1.14 billion in damage to more than 3,000 structures. The proposed action would consider alternatives that include floodwall construction along various reaches of the upland streams and direct stormwater to detention basins to minimize these risks.

The EPA has provided comments and recommendations on some variation of this project since 2004, most recently on the 2015 - 2017 Draft and Final EISs. Since 2021, the EPA has participated in numerous interagency meetings to discuss new evaluation reports, criteria for alternatives and designs, and studies needed to evaluate impacts to resources. The EPA will work with the Corps and continue to support alternatives that:

- Provide a level of protection that reduces flood impacts to life and property to the greatest extent possible;
- Identify and combine non-structural and nature-based features with structural flood risk measures;
- Protect aquatic resources, including corals;
- Avoid or minimize adverse effects from climate change and expected sea level rise;
- Address community and environmental justice concerns; and

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

- Improve or avoid adverse impacts to water quality by addressing continued concerns about dispersing contaminated sediments to the nearshore environment.

We offer for your consideration the following scoping comments and applicable new climate change and environmental justice guidance for use in the preparation of the reevaluation report and SEIS.

Purpose and Need

The SEIS for the proposed project should clearly identify the underlying purpose and need that forms the basis for proposing the range of alternatives (40 CFR 1502.13) The Notice of Intent states that purpose of this SEIS is to confirm or modify the authorized project or propose new recommendations because 2020 designs were found to lack the economic justification necessary for continued federal involvement. Although economic justification is necessary, the EPA recommends that this SEIS focus primarily on ways to meet the need to eliminate or minimize flood risk and protect life and property.

The EPA notes that the suite of structural features now proposed is not designed to provide the same level of flood protection against the 1% annual exceedance probability (AEP) flood or 100-year storm event as previous iterations of the project. The EPA understands that the Corps has not yet conducted Hydrologic and Hydraulic (H&H) modeling to determine the level of the proposed projects' performance, and recommends that the SEIS include the appropriate level of modeling in order to compare solutions that would be needed to achieve the 1% AEP level and/or potential FEMA certification with the proposed actions in this SEIS. For the SEIS, outline the parameters and inputs of an Ala Wai H&H model to determine performance for the major damage reaches, and discuss residual and incremental risk and uncertainties in this context. Discuss what mitigation measures, if any, may be needed to address incremental risks.

Alternatives Analysis

Alternatives currently under consideration have reduced costs by eliminating several upland detention basins and other features from earlier versions of the project. The EPA recognizes that continued public involvement and interagency coordination have narrowed the range of alternatives to the following:

- Alternative 1 (Storage Cornerstone) primarily focuses on increasing storage in detention basins throughout the watershed to reduce flood risk.

- Alternative 2B (Conveyance Cornerstone) focuses on increasing conveyance throughout the watershed through the construction of floodwalls along the Ala Wai Canal and at other select locations in combination with one detention basin.

- Alternative 5 (Hybrid) is the Tentatively Selected Plan to increase both storage and conveyance throughout the watershed. It includes the Ala Wai Golf Course Detention Basin, Ala Wai Canal Flood Wall and Kaimuki High School Floodwall extension, Woodlawn Bridge Floodwall and Koali Road Floodwall.

- The EPA understands that a Nonstructural Alternative is under development and may include floodproofing, elevating or removing structures from the floodplain, dry proofing structures, and/or an early flood warning system but would not include any in-stream or nearshore work. EPA recommends that options or designs that maximize natural and nature-based features,

mimic the natural resiliency that nature can provide, and be designed with consideration of environmental quality benefits.

In the SEIS discuss these alternatives, in whole or in combination, in the context of the Corps' authorities and detail how they fulfill the project's purpose and need. Address whether there are any management measures or alternative actions that may fall outside the Corps' jurisdiction but may compliment or help achieve the Corps' goals or objectives or avoid significant environmental impacts (40 CFR Section 1502.14(c)).

Impacts Analysis

The EPA offers the following recommendations for analyzing and disclosing impacts:

- Include appropriate baselines for the resources of concern with an explanation as to why those baselines were selected; Discuss the degree to which the action may adversely affect special districts, highways, or cause loss or destruction of important scientific, cultural, Native Hawaiian, or historical resources.

- Include a description of the affected environment that focuses on each affected resource or ecosystem. Identify the affected environment through perception of meaningful impacts and natural boundaries rather than predetermined geographic areas. Discuss the degree to which potential effects or mitigation measures are highly uncertain or technically or scientifically controversial.

- Focus on resources of concern, i.e., those resources that are most "at risk" and/or are significantly affected by the proposed project, before mitigation. Identify which resources are analyzed, which ones are not, and why. For this project, discuss the degree to which the action may adversely affect water quality and aquatic resources in the nearshore environment, as identified by state and federal resource agencies.

- Identify all other on-going, planned, and reasonably foreseeable projects in the study area. Where studies exist on the environmental impacts of these other projects, use these studies as sources for quantifying impacts. Refer to the CEQ report, *Considering Cumulative Impacts under NEPA*[1] and an additional systematic way to analyze cumulative effects jointly prepared by EPA and California Department of Transportation,[2] as the methodology has wide applicability beyond just transportation projects.

- When impacts occur in combination with other trends and reasonably foreseeable effects, discuss mitigation thresholds and success criteria, when such mitigation may be implemented and whether contingency plans exist. Clearly state who would be responsible for mitigation measures and how mitigation implementation would be ensured.

[2] https://dot.ca.gov/programs/environmental-analysis/standard-environmental-reference-ser/other-guidance#cumulative

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

Protection of Corals and Aquatic Resources

Follow Clean Water Act (CWA) Section 404 and 404(b)(1) guidelines in evaluating potential impacts to Waters of the United States and associated aquatic resources. Continue to engage with the National Marine Fisheries Service, United States Fish and Wildlife Service, and State of Hawai'i in the preparation of a Fish and Wildlife Coordination Act resource assessment, as well as Endangered Species Act and Essential Fish Habitat consultations, as relevant, to ensure potential impacts to biological resources are properly evaluated. In consultation with all resource agencies, identify and analyze all appropriate impact avoidance and minimization measures, and the potential need for compensatory mitigation (e.g., translocation of corals in the nearshore environment) for any unavoidable impacts.

Climate Change and Adaptation

On January 9, 2023, the Council on Environmental Quality (CEQ) published interim guidance[3] to assist federal agencies in assessing and disclosing climate change impacts during environmental reviews. CEQ developed this guidance in response to EO 13990, *Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis*. This interim guidance is effective immediately. CEQ indicated that agencies should use this interim guidance to inform the NEPA review for all new proposed actions and may use it for evaluations in process, as agencies deem appropriate, such as informing the consideration of alternatives or helping address comments raised through the public comment process. EPA recommends that the Corps utilize this guidance to help outline the framework for its climate change discussion in the Feasibility Study to ensure robust consideration of potential climate impacts, mitigation, and adaptation issues.

As discussed in this guidance, consider: (1) the potential effects of a proposed action on climate change, including by assessing both GHG emissions and reductions from the proposed action; and (2) the effects of climate change on a proposed action and its environmental impacts. An accurate and clear climate change analysis will help promote climate change resilience and adaptation and prioritize the need to ensure climate-resilient infrastructure and operations by considering the reasonably foreseeable effects of climate change on infrastructure investments and the resources needed to protect such investments over their lifetime.

Include a discussion of the comparative resiliency of the alternatives, e.g., expected rise in sea levels and stronger or more frequent storm events, as well as a discussion of the particular aspects of the project design that promote effective adaptation, to help decision makers, stakeholders, and the public identify and assess reasonable courses of action.

Environmental Justice -Protecting Community Health

The recent Executive Order 14096 on *Revitalizing Our Nation's Commitment to Environmental Justice for All*[4] requires, among other things, that environmental reviews under NEPA a) analyze direct, indirect, and cumulative effects of Federal actions on communities with environmental justice concerns; b) consider best available science and information on any disparate health effects (including risks) arising from exposure to pollution and other environmental hazards, such as information related to the

[3] https://www.federalregister.gov/documents/2023/01/09/2023-00158/national-environmental-policy-act-guidance-on-consideration-of-greenhouse-gas-emissions-and-climate; 2023-01-CEQ interim guidance on GHG emissions and climate change.pdf (energy.gov)

[4] https://www.whitehouse.gov/briefing-room/presidential-actions/2023/04/21/executive-order-on-revitalizing-our-nations-commitment-to-environmental-justice-for-all/

race, national origin, socioeconomic status, age, disability, and sex of the individuals exposed; and c) provide opportunities for early and meaningful involvement in the environmental review process by communities with environmental justice concerns potentially affected by a proposed action (Sec. 3). The EPA recommends that the SEIS clearly identify how the NEPA process and analysis were developed with the *Assistant Secretary of the Army for Civil Works Memorandum for Commanding General, U.S. Army Corps of Engineers, Implementation of Environmental Justice and the Justice40 Initiative* (March 15, 2022)[5] and its *Interim Environmental Justice Strategic Plan* (December 16, 2022)[6] to improve outreach, access civil works information and technical services, and maximize benefits to disadvantaged communities to achieve environmental justice.

EPA recommends that the Corps continue with the robust outreach approaches that maximize community participation by identifying an array of community representatives and other stakeholders who have deep community knowledge and desire to address disproportionate adverse impacts in the community. Maintain continued meaningful community engagement throughout the planning process to ensure ample time to incorporate community feedback into the project. Identify and commit to all available measures to avoid, minimize, or mitigate any disproportionate human health and environmental effects on low-income or minority communities resulting from construction and operation of the project (e.g., redesigning the Manoa-Palolo canal floodwall to optimize space, respect aesthetics and consider the feasibility of a silent pile driver).

We appreciate the opportunity to coordinate early and are available to discuss our comments or provide additional information upon request. Please contact Robin Truitt, the lead reviewer at (415) 972-3702 or Truitt.Robin@epa.gov. We look forward to our continued participation in the NEPA process.

Sincerely,

ROBERTA TRUITT

Subject: NOI - Ala Wai Flood Project - Dave Watase's Public Comment 10 - Ecosystem Restoration

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

Aloha,

My name is Dave Watase, I am a resident who lives within the Ala Wai Watershed and a key stakeholder in the 2017 Final Environmental Impact Statement (FEIS) for the Ala Wai Flood Project.

I've created a timeline that generally describes the Ala Wai Canal's project history. It may not be fully accurate because of my limited understanding and my involvement is post September 2015. However, I think it is important have a broad understanding of what happened in the past because as we all know people change jobs, people retire, and government administrations change. I also believe that it is important that the decision makers at the very least skim through the studies dating back to 1998.

In 1998 the Ala Wai Project began as an ecosystem restoration project conducted by the State's Department of Land and Natural Resources (DLNR) primarily focused on contamination and water quality issues.

In 2001 the USACE conducted the Ala Wai feasibility study and technical flood study in partnership with DLNR. At the time the USACE's policy required that project investigations adopt a system approach and through their Environmental Operating Principles create mutually supporting economic and environmentally sustainable solutions.

In 2003, the Ala Wai Canal Project feasibility study was expanded to include flood mitigation and ecosystem restoration and involved the USACE engaging with the community resulting in the Ala Wai Watershed Analysis Final Report dated July 2003.

The October 2004 flood which caused $80 million in property damage to the University of Hawaii and $5 million to residents in Manoa increased the focus to include the upper watershed and gave rise to the USACE's Manoa Stream Hydrology and Hydraulics Study October 2004, the Manoa Technical Study Summary Final November 2008, and the Final Hydrology Report Ala Wai Watershed Project December 2008. Around this time, the USACE worked to increase the study scope to include the whole Ala Wai Watershed via cost sharing agreements and to include flood damage reduction and ecosystem restoration features.

In 2012 the Ala Wai Canal Project was rescoped at a time when the USACE was trying to streamline their civil works project process and established the 3x3x3 methodology limiting the feasibility studies to 3-years, $3 million, 3 levels. The Ala Wai Canal Project feasibility study was adjusted to fit the 3x3x3 methodology and SMART Planning Process and the elimination of ecosystem restoration as a project purpose to be able to meet the new restraints.

1

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

It should be noted that DLNR at the time objected to the elimination of ecosystem restoration features from the project and refused to sign the Tentatively Selected Plan. The DLNR reluctantly agreed because the USACE explained that ecosystem restoration could be added by separate authorities such as Section 206 of WRDA 1996, Aquatic Ecosystem Restoration or Section 1135, WRDA 1986, Environmental Restoration. Prior to the 3-years completion date, it was determined that a comprehensive sea level rise analysis was omitted from the 2015 Draft EIS and the public was never able to comment on it as it was completed behind closed doors and only unveiled in the 2017 Final EIS. There has always been a debate between the C&C of Honolulu and State DLNR on sponsorship. The C&C of Honolulu did not want to take responsibility for maintenance of the Ala Wai Canal Project.

In 2018 the C&C of Honolulu became an active participant in the project after Congress appropriated funds for the $345 million project and when the State promised to provide the funding in the amount of $125 million via a memorandum of agreement between the Governor Ige and Mayor Caldwell. The State's funding was not secured and the project was halted. The USACE conducted an Engineering Documentation Report in July 2020 with a project cost of $376 million. And now we are in the General Reevaluation Study (GRS) which began in June 2021.

This project has stretched on for decades and it is important to understand the history. Having read all of the studies going back to 1998 the bulk of the community generated concerns center around ecosystem restoration and this time around seems to be no different. It seems obvious that ecosystem restoration and flood mitigation go hand in hand and even if initiated separately should be done at the same time.

The USACE conducted 10 community engagement activities for the GRS beginning in November 2021 and the most recent one on April 24, 2023. However, for the longest time, the plan and the goals were unclear for the public to make comment. Alternatives were weeded out without discussion or debate. Only recently through the NOI was the Prospective Plan disclosed and that was further refined on the April 24, 2024 by eliminating the Makiki District Park Detention Basin and Manoa District Park Detention Basin. Out of 223 total management measures 200 were from the public. My guess is that most of the public measures were related to ecosystem restoration because that is what is most important to them. Those measures are most important to them because it is what they see annually which are the smaller and more frequent storms. The average person may not realize that a detention basin designed for the 100-year flood may let a 20-year flood pass through and cause them flooding. The average person may not realize that flood walls around the Ala Wai Canal will not help prevent flooding in the upper watershed.

My suggestion is that the USACE do both ecosystem restoration and flood mitigation at the same time because historically ecosystem restoration was included in the projects and it was the USACE that separated it and chose only pursued flood mitigation.

Attached is an article regarding a USACE project for New York and New Jersey. It seems to include ecosystem restoration at the same time. "The plan also calls for integrating natural solutions such as wetlands restoration and creation of "living shorelines," with features such as oyster colonies designed to blunt the force of incoming waves in several spots to complement the man-made engineering projects."

Sincerely,
Dave Watase

Storm protection plan draws scrutiny

By Wayne Parry

Associated Press

PERTH AMBOY, N.J. >>

People are asking questions about a storm protection proposal for New York and New Jersey that would be among the most massive and costly flood control projects ever done in America, aiming to prevent the type of catastrophic flooding caused by Superstorm Sandy in 2012.

At a public hearing Wednesday night on the U.S. Army Corps of Engineers' proposed $52 billion project, some wanted to know where all the water that would be thwarted by storm gates would go instead.

Others wanted to know why the plan doesn't solve more of the problem.

And one had a pointed question for the Army Corps.

"When has the Army Corps of Engineers ever beaten Mother Nature?" asked David Merwin, who lives in a Raritan bay-front community in Old Bridge, N.J. "Where have you done a project where you won?"

The hearing in a yacht club in the blue-collar Raritan Bay community was among the first public hearings on a massive storm protection plan unveiled by the Army Corps in September.

The agency proposes building movable barriers and gates across bays, rivers and other waterways in the two states hardest-hit by the October 2012 storm.

It includes building sea gates on several industrial canals, bays and other urban waterways in New York City, the tidal straits that separate Staten Island from New Jersey and at the mouths of New Jersey's Hackensack and Passaic rivers in the Meadowlands region.

The gates would remain open during calm periods and could be closed when major storms approach. But the proposed barriers have drawn they don't adopt the more farranging option. Her community was devastated by Sandy.

"It would solve the problem for the whole area, millions of people," she said. "They are engineers and they're wonderful, and they know how hard it is to persuade politicians to spend money. But people whose houses could be wiped out want this done."

Bryce Wisemiller, a project manager with the Army Corps, said there are two main reasons the more extensive option was not chosen.

"Tremendous cost and tremendous time period," he said.

The agency uses a costbenefit analysis to look at how much damage could be prevented by a project compared with how much it would cost to build it, Wisemiller said. Using those calculations, the corps tentatively chose the current option, he said.

Bruce Hoch of West Orange, N.J., said Sandy was one of the most expensive storms in U.S. history, adding he could make a good case for spending more to protect more.

"Sandy caused $70 billion in damages," he said. "I could do a cost-benefit analysis (to support) that."

The costlier option would benefit 94% of the study area in the two states; the currently chosen option would benefit 62% of it.

The Army Corps will make its final recommendation on the project to Congress in late 2024, Wisemiller said.

When has the Army Corps of Engineers ever beaten Mother Nature?"

David Merwin

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

opposition from property owners who worry about how they would look, and environmentalists concerned about adverse effects on water quality and natural ecosystems.

Shore-based barriers including flood walls, levees and elevated walkways would be built in Brooklyn, Queens and Manhattan in New York, and Jersey City and Newark in New Jersey.

The plan also calls for integrating natural solutions such as wetlands restoration and creation of "living shorelines," with features such as oyster colonies designed to blunt the force of incoming waves in several spots to complement the man-made engineering projects.

Work would not begin until 2030 at the earliest and would not be completed until 2044.

The plan tentatively chosen by the Army Corps was one of five options that varied from doing nothing to doing much more than what is currently proposed.

The most ambitious option would include more flood control measures in more places in New York and New Jersey, including 7.4 miles of flood barriers along the two states' shorelines centered on New York Harbor that would be — by far — the longest storm barrier in the world, according to the corps.

That plan would cost more than twice as much as the option currently under consideration: $112 billion. Yet it drew some support at Wednesday's meeting. Sara Jane Millard, a London native living in Manasquan, N.J., asked representatives of the Army Corps why

Resident of Raritan Bay community in Old Bridge, N.J.

An enormous pile of debris sits on the oceanfront in Long Branch, N.J., two weeks after Superstorm Sandy pummeled the New Jersey coast.

SUBJECT: Comments on the Ala Wai Flood Control Project

To whom it may concern,

On behalf of the Directors and members of the Hawai'i Forest Industry Association (HFIA), please consider our comments on the Ala Wai Flood Control Project.

Since 1989 HFIA has been the voice of Hawaii's Forest Industry. A healthy and responsible forest industry involves planted and native forest management as well as broader resource management. We pride ourselves in our many projects and programs that promote healthy and productive forests.

Healthy forests provide many services to Hawaii's wildlife and residents, including but not limited to:

- Cleaning our drinking water
- Minimized soil erosion
- Provide shelter for endangered species and wildlife
- Purify the air we breathe
- Facilitate Native Hawaiian cultural practices
- Provide recreation, such as hiking & bird watching
- Anchor our economy, creating the climate and beauty that draws people to our islands

Considering the wide ranging benefits of healthy forests, including flood control, we hope that the U.S. Army Corps of Engineers will continue to utilize forest and resource management whenever and wherever possible, as it has for many years via its Natural Resource Program. When it comes to flood control we encourage the U.S. Army Corps of Engineers to utilize reforestation and growth of healthy forests to the extent possible.

We hope that the U.S. Corps of Engineers can move this project forward in the most effective and sustainable way possible while continuing their Natural Resource Management Programs and efforts widely. We encourage making those efforts optimally visible to the public and engaging with the public to maximize participation in those programs.

Mahalo for your time and consideration,

Guy Cellier

Guy Cellier, President

Hawaii Forest Industry Association

Established in 1989, HFIA's is a nonprofit organization founded by people committed to sustainable forest management. HFIA's mission is to promote healthy and productive forests and a sustainable forest industry through management, education, planning, information exchange, and advocacy. HFIA has over 130 members including woodworkers, landowners, sawyers, foundations, foresters, growers, educators, environmentalists, architects, millers, ranchers, and others interested in HFIA's mission and goals.

Subject: Comment for the EISPN of the Ala Wai Canal Flood Risk Management Project

CAUTION: Email received from an EXTERNAL sender. Please confirm the content is safe prior to opening attachments or links.

To the Accepting Authority:

The number one stated goal of the GRR is to "redefine the flood problems and risks in the Ala Wai watershed by updating hydrology, physical, biological, and socioeconomic conditions." In this "update" I highly suggest that a more expansive and holistic view of the watershed be studied, and more specifically that more waterways than enumerated on Figure 1 "Overview of the Ala Wai Watershed" as included in the EISPN document, but rather ALL of the water sources contributing to the watershed, be adequately studied.

A number of waterways in Manoa have been excluded I believe erroneously from the study; these waterways will have an impact and need to be duly considered. Specifically the multiple waterways which converge into what at one time was referred to as the Woodlawn Stream, the lower portion of which was channelised to join into the Manoa Stream. Throughout the vast majority of length of these waterways they are in their natural state, with water running through intermittently at different levels along the different paths. A ditch by any records in planning documents of multiple municipalities, and from how the USACE even seems to define it based on their own writings, is "an artificial, human-made channel that was not formerly a stream. Many waterways appear to be ditches but actually are altered streams that were straightened or moved". (This is the most efficient, but again generally widely corroborated definition I've stumbled across, found here Blockedhttps://www.oregon.gov/ODA/shared/Documents/Publications/NaturalResources/StreamsideAreas.pdf)

Whether or not a small Makai portion at the bottom has been channelized does not make all the upper portions no longer natural waterways. However the USACE seems to think that all of these waterways are part of a man-made system, and that therefore it is out of their purview:

From the "Summary of the Ala Wai Public Workshop held on April 8, 2022 focusing on management measure development and screening within the Manoa sub-watershed.":

f. Woodlawn stormwater drainage ditch: A community member raised concerns for the stormwater ditch upstream of the Kahaloa St. bridge in Manoa, which is known to flood nearby homes. Provision, modification, and/or maintenance of drainage systems to capture and convey interior runoff in urban areas is a non-Federal responsibility; therefore, cannot be included in a recommendation made as a result of the GR report. This study can, however, make modifications to natural stream channels or previously modified natural waterways that help reduce backup within adjacent drainage systems. In other words, the study can consider modifications to Manoa Stream which may help to reduce backup to the nearby drainage ditch.

CONTROLLED UNCLASSIFIED INFORMATION (CUI)

At some point this mistake seems to have occured, to look from the Ala Wai, mauka, and once seeing a concrete portion of a waterway stop looking further upland to see what is above and how it might be classified. It has perpetuated to the point of folly, wherein these various natural water paths have not been allowed to have been studied because of a difference and confusion of terms, and that subsequent mis-classification.

I have spoken to people in DLNR about these waters and they have agreed they appear to be natural drainage, perhaps an intermittent tributary, though to settle on a precise definition would require some study. The fact that the city's stormwater GIS map calls it a ditch, and the unfortunate but common issue that it doesn't appear at all on other maps (like many many waterways in the US according to the EPA) does not mean that in what should be such a comprehensive study as that undertaken in concert by the City and the USACE these other water systems shouldn't be given adequate consideration.

I would say this omission ought to be rectified in this new EIS, along with a truly comprehensive study of all aspects of the watershed and its current health. One cannot legitimately propose solutions, or expect to be supported in conclusions, to a problem one doesn't legitimately understand in full.

Sincerely,

Whitney Bosel

1.16 Additional Public Engagement After NOI and EISPN

Three additional public engagement opportunities have occurred since the closing date for the NOI and EISPN public notices. The first of three virtual 'Talk Story' meetings was held May 15, 2023, at 12:00 p.m. HST. The second virtual 'Talk Story" was held June 5, 2023, at 12:00 p.m. HST. The last virtual 'Talk Story' was held June 26, 2023, at 12:00 p.m. The recordings of the three 'Talk Stories' are available in their entirety at https://www.honolulu.gov/alawai/public-engagement.html.
