REPORT OF AUTOPSY

Decedent: BABY BOY TRAISTER
Age: 0 Day(s)
Birth Date: 8/3/2019
Race: WH
Sex: M
Case No: 1903781

I. Intrauterine fetal demise
   A. Male fetus (447 g), 21 weeks and 6 days gestational age
   B. Outside hospital surgical pathology report of the placenta, fetal membrane, and umbilical cord by Robbie Graham, M.D.
      1. Very large placenta for gestational age; three-vessel umbilical cord with mild acute inflammation; no significant acute chorioamnionitis; placental disc with prominent intraparenchymal hemorrhage
   C. Outside hospital abdominal ultrasonographic finding of large echogenic mass along posterior gestational sac suggestive of blood clot
   D. No gross anatomical abnormalities
   E. No significant trauma
   F. Early, mild changes of decomposition (maceration)

II. Prenatal methamphetamine exposure
   A. Methamphetamine = 0.31 mcg/g (liver)
   B. Reported maternal history of methamphetamine use during pregnancy

CONCLUSION

After review of the autopsy findings and available investigative information, it is my opinion that the decedent, Baby Boy Traister, a 21-week and 6-day-old male fetus, died as a result of intrauterine fetal demise. Prenatal methamphetamine exposure likely contributed to death. There is no evidence of significant trauma or congenital abnormalities that caused or contributed to death.

CAUSE OF DEATH: INTRAUTERINE FETAL DEMISE
OSC: PRENATAL METHAMPHETAMINE EXPOSURE
MANNER OF DEATH: ACCIDENT

The facts stated herein are true and correct to the best of my knowledge and belief.
