

Release Date: November 29, 2022

Seasonal Assessment of Resource Adequacy for the ERCOT Region (SARA) Winter 2022/23

SUMMARY

Assuming that the ERCOT Region experiences typical winter grid conditions, ERCOT anticipates that there will be sufficient installed generating capacity available to serve the system-wide forecasted peak demand for the upcoming winter season, December 2022 – February 2023. As part of ERCOT's aggressive grid management planning, we have also included additional low-probability, high-impact risk scenarios.

The forecasted peak demand is 67,398 MW and is based on average weather conditions at the time of the winter peaks for years 2007 through 2021. This report does not contain a weather forecast for the winter season. The inclusion of 2021's extreme winter weather conditions increases the base forecast relative to last year's winter peak demand forecast. The forecast also incorporates expected load increases during the peak demand hour due to interconnection of Large Loads (such as crypto-mining facilities) to Transmission Service Provider networks.

About 87,300 MW of winter-rated resource capacity is expected to be available for the winter peak. This amount includes 150 MW of planned capacity expected to become operational by the start of the winter season based on the latest developer information. Two thermal generation resources—a coal and a gas-fired unit totaling 685 MW—are out of service for the duration of the winter season. The total resource amount also includes 947 MW of battery storage energy that is assumed to be available based on an analysis of average real-time reserves contributed by battery storage during the hours with the tightest reserves on July 13, 2022. This capacity estimate serves as a proxy for the amount expected during a tight reserve hour for the upcoming winter, and is an interim availability assumption to be used until a formal capacity contribution method is adopted for future SARA reports.

This report also identifies the aggregate amount of installed generation capacity for which Large Loads, such as crypto-mining facilities, are directly interconnected, and the expected peak reduction in available generation capacity attributable to these loads during hours with the highest risk of insufficient reserve capacity for the winter season. The background tab includes a detailed description of the methodology used to estimate the expected generator capacity reductions.

The winter SARA includes a typical thermal generating unit outage assumption of 9,966 MW during the winter months, which is based on historical winter outage data for the last three winter seasons: 2019/20, partial 2020/21 and 2021/22. (Unplanned outages during 2/15/21 through 2/28/21 are excluded in the base analysis to remove the outage impact of Winter Storm Uri.)

The winter SARA includes two Risk Scenario tabs: Base & Moderate Risk Scenarios, and Extreme Risk Scenarios. The most extreme Risk Scenario assumes a high peak load with extreme unplanned thermal plant outages based on historic observations, combined with additional outages due to a weather event comparable to Winter Storm Uri and extreme low wind power production. This scenario also assumes a reduction to weather-related and fuel limitation outages due to weatherization performed by generation owners and natural gas supply and pipeline operators, as well as other winter preparedness activities including capacity procured by ERCOT through the new Firm Fuel Supply Service.

Seasonal Assessment of Resource Adequacy for the ERCOT Region

Winter 2022/23

Release Date: November 29, 2022

Installed and Winter Capacity Ratings, MW

Resources, MW	Installed Capacity Rating 1/	Expected Capacity for Winter Peak Demand	
Thermal Resources, Installed winter-rated Capacity	70,250	65,940	Based on current Seasonal Maximum Sustainable Limits reported through the unit registration process
Hydroelectric, Peak Average Capacity Contribution	563	415	Based on 73% of installed capacity for hydro resources (winter season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Switchable Capacity Total	3,840	3,816	Installed capacity of units that can interconnect with other Regions and are available to ERCOT
Less Switchable Capacity Unavailable to ERCOT	-	-	Based on survey responses of Switchable Resource owners
Available Mothballed Capacity	-	-	Based on seasonal Mothball units plus Probability of Return responses of Mothball Resource owners
Capacity from Private Use Networks	9,575	3,348	Average grid injection during the top 20 winter peak load hours over the last three years, plus the forecasted net change in generation capacity available to the ERCOT grid pursuant to Nodal Protocols Section 10.3.2.4.
Operational Co-located Resources with Large Flexible Loads (LFLs)	2,996	1,715	Forecasted capacity of generation units with a co-located large load at the site. The methodology for calculating the capacity contribution is outlined on the Background tab.
Coastal Wind, Peak Average Capacity Contribution	5,144	2,363	Based on 46% of installed capacity for coastal wind resources (winter season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Panhandle Wind, Peak Average Capacity Contribution	4,247	1,443	Based on 34% of installed capacity for panhandle wind resources (winter season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Other Wind, Peak Average Capacity Contribution	25,953	4,929	Based on 19% of installed capacity for other wind resources (winter season) per ERCOT Nodal Protocols Section 3.2.6.2.2
Solar Utility-Scale, Peak Average Capacity Contribution	14,055	1,529	Based on 11% of rated capacity for solar resources (winter season) per Nodal Protocols Section 3.2.6.2.2
Storage, Peak Average Capacity Contribution	2,764	947	Based on the average real-time contribution of Energy Storage Resources to Physical Responsive Capability (PRC) during the hours with the tightest reserves on July 13, 2022. The 947 MW amount is a conservative proxy for the expected amount available during a tight reserve hour for the winter season, and is an interim availability assumption for use until formal capacity contribution method is adopted for future SARA reports
RMR Capacity to be under Contract	-	-	
Capacity Pending Retirement	-	-	Announced retired capacity that is undergoing ERCOT grid reliability reviews pursuant to Nodal Protocols Section 3.14.1.2
Non-Synchronous Ties, Capacity Contribution	1,220	720	Based on net imports during winter 2020/2021 (Winter Storm Uri) Energy Emergency Alert (EEA) intervals
Planned Thermal Resources with Signed IA, Air Permits and Adequate Water Supplies	182	149	Based on in-service dates provided by developers
Planned Coastal Wind with Signed IA, Peak Average Capacity Contribution	-	-	Based on in-service dates provided by developers and 46% winter capacity contribution for coastal wind resources
Planned Panhandle Wind with Signed IA, Peak Average Capacity Contribution	-	-	Based on in-service dates provided by developers and 34% winter capacity contribution for panhandle wind resources
Planned Other Wind with Signed IA, Peak Average Capacity Contribution	-	-	Based on in-service dates provided by developers and 19% winter capacity contribution for other wind resources
Planned Solar Utility-Scale, Peak Average Capacity Contribution	7	1	Based on in-service dates provided by developers and 11% winter capacity contribution for solar resources
Planned Storage, Peak Average Capacity Contribution	23	-	Installed capacity based on in-service dates provided by developers. The capacity contribution is considered to be incorporated with the 947 MW aggregate contribution value reported in the operational Storage line item

[a] Total Resources, MW

140,819 87,316

1/ Installed capacity ratings are based on the maximum power that a generating unit can produce during normal sustained operating conditions as specified by the equipment manufacturer.

Capacity changes due to planned repower/upgrade projects are reflected in the operational units' ratings upon receipt and ERCOT approval of updated resource registration system information. Interconnection requests for existing resources that involve MW capacity changes are indicated with a code in the "Generation Interconnection Project Code" column.

Although seasonal capacity ratings for battery energy storage systems are reported above, the ratings are not included in the operational/planned capacity formulae. These resources are assumed to provide Ancillary Services rather than sustained capacity available to meet system peak loads.

The capacities of planned projects that have been approved for Initial Synchronization at the time of report creation are assumed to be available for the season regardless of their projected Commercial Operations Dates.

Planned projects for which maximum seasonal sustained capacity ratings have been provided are used in lieu of capacities entered into the online Resource Integration and Ongoing Operations - Interconnection Services (RIOO-IS) system.

Installed capacity ratings are based on the maximum power that a generating unit can produce during normal sustained operating conditions as specified by the equipment manufacturer. These ratings reflect the latest information in the Resource Integration and Ongoing Operations - Resources Services (RIOO-RS) system.

Seasonal Assessment of Resource Adequacy for the ERCOT Region Winter 2022/23

Planning Reserve Margins

	Winter
Peak Demand Forecast, MW	67,423
Rooftop PV Forecast Reduction, MW	(25)
Adjusted Peak Load Forecast, MW	67,398
Total Resources, MW	87,316
Emergency Resources Deployed by ERCOT, MW ¹	3,701
Planning Reserve Margin ²	37.1%

Formula: PRM = (Total Resources / (Adjusted Peak Demand - Emergency Resources)) - 1

¹ The derivation of the emergency resource amount is described in the Scenario Assumptions Details tab.

² The Planning Reserve Margin (PRM) is the forecasted capacity reserve that can cover higher-than-expected peak demand and lower-than-expected resource availability when looking at months or longer in the future. This is in contrast to operating reserve measures that focus on actual available capacity during real-time and hour-ahead operating periods. Consequently, the PRM is not an appropriate measure of capacity reserves when operations timeframes are being considered.

	Base & Moderate Risk Scenarios	Extreme Risk Scenarios
Adjusted Peak Load Forecast	Based on average weather conditions at the time of winter peak using weather from 2007-2021. The forecast accounts for increase load changes due to additions of rooftop solar systems as well as new large loads (crypto-mining and other data center facilities) connected directly to Transmission Service Providers' networks.	
Load Adjustments	Based on weather conditions at the time of winter peak using weather from 2011.	Based on weather conditions at the time of winter peak using weather from 2021.
Typical Planned Outages, Thermal	Based on the historical average of planned outages for December through February weekdays, hours ending 7 am - 10 am, for the last three winter seasons (2019/20, 2020/21 and 2021/22). Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators.	Based on an estimate of the amount of planned thermal outages expected during a weather event comparable to Winter Storm Uri. It is assumed that severe weather alerts issued by ERCOT will prompt generation owners to postpone planned outages if they are able to do so, and return units to service if the units are able to be returned early. The estimate is derived by calculating the reduction in hourly average planned outages that occurred in response to Winter Storm Uri. Prior to the storm event, planned outages averaged 1,511 MW for the period 2/1/2021 through hour-ending 1:00 am on 2/13/2021 (when planned outages dropped significantly). During the course of the storm, planned outages averaged 455 MW. This represents a 70% decrease in planned outages. The 70% reduction percentage was multiplied by the typical unplanned outage amount of 1,183 MW to derive the 355 MW used for the outage assumption.
Typical Unplanned Outages, Thermal	Based on the historical average of Unplanned outages for December through February weekdays, hours ending 7 am - 10 am, for the last three winter seasons. Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators. Winter Storm Uri-related Unplanned outages between 2/15/21 to 2/28/21 were excluded from this calculation.	
Unplanned Outage Adjustments, Thermal	The High Unplanned Outage Adjustment is based on the 90th percentile of historical forced outages for December through February weekdays, hours ending 7 am - 10 am, for the last five winter seasons (2017/18 -2021/22); the adjustment is the 90th percentile value, 12,232 MW, less the typical forced outage amount of 8,783 MW, or 3,449 MW. To account for weatherization-related outage improvements during typical winter weather events, the percentile value was lowered from the 95th percentile used for last year's winter SARA to the 90th percentile. Winter Storm Uri-related Unplanned outages between 2/15/21 to 2/28/21 were excluded from this calculation. The outages for the High Unplanned Outage Adjustment include an incremental amount from Private Use Network (PUN) generators; specifically, the 90th percentile amount less the 50th percentile amount. See the Background tab for more information on the treatment of PUN capacity. Outage history excludes units that are not expected to be available for the peak period of the upcoming seasons. These unavailable units are comprised of units that have retired, have announced upcoming retirements, are under extended outage, are mothballed, or are unavailable switchable generators.	Based on an estimate of high thermal outage amounts using historic observations from multiple winter seasons, plus an adjustment for additional outages associated with a weather event comparable to Winter Storm Uri. The high estimate is based on the 90th percentile of the historical forced outage level for December through February weekdays, hours ending 7 am - 10 am, for the last five winter seasons (2017/18 -2021/22); the adjustment is 12,232 MW less the typical forced outage amount of 8,783 MW. Winter Storm Uri-related Unplanned outages between 2/15/21 to 2/28/21 were excluded from this calculation. The outage amount associated with an extreme weather event is based on the peak outage amount during Uri that was due to weather-related causes and lack of fuel. This amount, 19,219 MW, is reduced by 90% to reflect the expected impact of weatherization improvements and other winter preparedness activities stemming from new weatherization standards and initiatives such as the Firm Fuel Supply Service. This reduced outage amount is expressed as a percentage of total thermal winter-rated installed capacity at the time of Winter Storm Uri. The resulting 3% is then multiplied by the winter-rated installed thermal capacity in this SARA report to derive an outage increase of 2,193 MW. Outage history excludes units that are not expected to be available for the
Wind Output Adjustments	The adjustment is based on the 10th percentile of hourly wind capacity for the daily period hour-ending 7 am - 10 am for the months of December through February. The capacity values are derived from annual hourly simulated wind output profiles for the period 1980 - 2021 inclusive. The profiles reflect hourly weather conditions for each of the 42 simulated weather years. A profile is developed for each current operational wind site as well as each planned wind site included in the SARA report. This low wind output level is 5,085 MW. The adjustment is the Winter Peak Average Capacity Contribution, 8,773 MW, less 5,085 MW. The methodology report for profile development is available at: https://www.ercot.com/files/docs/2021/12/07/Report_ERCOT_1980-2020_WindSolarDGPVGenProfiles.pdf	The adjustments are based on the minimum hourly wind capacity value for the daily period hour-ending 7 am - 10 am for the months of December through February. The capacity values are derived from annual hourly simulated wind output profiles for the period 1980 - 2021 inclusive. The profiles reflect hourly weather conditions for each of the 42 simulated weather years. A profile is developed for each current operational wind site as well as each planned wind site included in the SARA report. This extreme low wind output level is 640 MW. The adjustment is the Winter Peak Average Capacity Contribution, 8,773 MW less 640 MW.
Solar Output Adjustments	No solar adjustments are included in the Risk Scenarios since solar output is negligible during most of the daily winter peak demand hours.	
Emergency Resources Deployed by ERCOT prior to EEA Declaration	An amount is only shown if Capacity Available for Operating Reserves, line item [f], is at or below 3,000 MW. Consists of the sum of (1) expected Emergency Response Service (1,049 MW) and TDSP Distribution Voltage Reduction (562 MW), and (2) the expected peak consumption by operational LFLs at co-located and standalone sites (411.3 MW and 150 MW respectively), which is assumed to be available for curtailment based on ERCOT requests to address an imminent capacity reserve shortage. The ERS and Distribution Voltage Reduction amounts reflect a 2% gross-up to account for avoided transmission losses. Other resources that may be available include voluntary customer Demand Response (including customer installation of backup generators), switchable generation resources currently serving the Eastern Interconnection, and additional DC tie imports subject to availability.	
Emergency Resources Deployed by ERCOT	An amount is only shown if the sum of Capacity Available for Operating Reserves (line item [f]) and line item [g] is at or below 2,300 MW. Consists of the sum of expected Load Resources Available for Responsive Reserves for the winter season (1,481 MW) and TDSP load management programs (47.4 MW). Each of these amounts reflect a 2% gross-up to account for avoided transmission losses. Other resources that may be available include voluntary customer Demand Response (including customer installation of backup generators), switchable generation resources currently serving the Eastern Interconnection, and additional DC tie imports subject to availability.	

Seasonal Assessment of Resource Adequacy for the ERCOT Region

Background

The Seasonal Assessment of Resource Adequacy (SARA) report is a deterministic approach to considering the impact of potential variables that may affect the sufficiency of installed resources to meet the peak electrical demand on the ERCOT System during a particular season.

The standard approach to assessing resource adequacy for one or more years into the future is to account for projected load and resources on a normalized basis and to require sufficient reserves (resources in excess of peak demand, on this normalized basis) to cover the uncertainty in peak demand and resource availability to meet a probabilistic reliability standard.

For seasonal assessments that look ahead less than a year, specific information may be available (for example, an anticipated common-mode event such as a system-wide heat wave) which can be used to consider the range of resource adequacy outcomes in a more deterministic manner.

The SARA report focuses on the availability of sufficient operating reserves to avoid emergency actions such as deployment of voluntary load reduction resources. It uses operating reserve thresholds of 2,300 and 1,000 MW, respectively, to indicate the risk that an Energy Emergency Alert Level 1 (EEA1) and Level 3 (EEA3) may be triggered during the time of the forecasted seasonal peak load. These threshold levels are intended to be roughly analogous to the 2,300 and 1,000 MW Physical Responsive Capability (PRC) thresholds for EEA1 and EEA3 with controlled outages ordered by ERCOT, respectively. However, PRC is a real-time capability measure for Resources that can quickly respond to system disturbances. In contrast, the SARA operating reserve reflects additional capability assumed to be available before energy emergency procedures are initiated, such as from Resources qualified to provide non-spinning reserves. Additionally, the amount of operating reserves available may increase relative to what is included in the SARA report due to the market responding to wholesale market price increases and anticipated capacity scarcity conditions. Given these considerations, ERCOT believes that the 2,300 and 1,000 MW reserve capacity thresholds are reasonable indicators for the risk of Energy Emergency Alerts given the uncertainties in predicting system conditions months in advance.

The SARA report is intended to illustrate the range of resource adequacy outcomes that might occur. It serves as a situational awareness tool for ERCOT operational planning purposes, and helps fulfill the "extreme weather" resource adequacy assessment requirement per Public Utility Commission of Texas rule 25.362(i)(2)(H). In addition to a base scenario, several other scenarios are developed by varying the value of load forecast and resource availability parameters. The variations in these parameters are based on historic ranges of the parameter values, known changes expected in the near-term, or reasonable assumptions regarding potential future events.

Thermal Outage Accounting

Directly comparing SARA thermal unplanned (previously "forced") outage scenario capacity with outage amounts listed in ERCOT outage reports — such as the Unplanned Resource Outages Report — will yield misleading results. The reason is that the SARA report consists of multiple resource availability line items, and thermal outages for certain resource types are reflected elsewhere in the SARA reports rather than the thermal outage scenario line items. As a result, the SARA thermal outage scenario amounts will always be less than what is typically shown in other outage reports. The main differences include the following:

- Outages for Private Use Network (PUN) generators are incorporated in the line item called "Capacity from Private Use Networks." This is an aggregate estimate of the amount of capacity available for the ERCOT grid during the highest 20 seasonal hourly demands for the last three years and incorporates average generator outage amounts over those hourly intervals. Additionally, the aggregate estimate reflects PUN owner decisions to supply power to their industrial loads versus export to the grid. PUN outages are thus already reflected in the SARA available resource capacity estimate.
- Extended outages are reported in the SARA Capacities tab in a line item called "Operational Capacity Unavailable due to Extended Outage or Derate." Extended Outages are those forced outages that are expected to last a minimum of 180 days as reported by the resource owner via submission of a Notice of Suspension of Operations (NSO) form. These outages are thus already reflected in the SARA available resource capacity estimate.
- The capacity of Switchable Generation Resources (SWGRs) that are assumed to serve a neighboring grid for the season is deducted from available resource capacity, so outages associated with these SWGRs are not reflected anywhere in the SARA report.

To more closely align the SARA with other outage reports based on ERCOT Outage Scheduler data, a modification was made to the treatment of outages classified as *Unavoidable Extensions*, or UEs. UEs are defined as "a Planned or Maintenance Outage that is not completed within the ERCOT-approved timeframe and extended." For past SARA reports, if the original outage was classified as Planned in the Outage Scheduler, then the UE would continue to be classified as Planned. If the original outage was classified as Forced, then the UE would continue to be classified as Forced. In contrast, for other ERCOT outage reports, UE outages are all classified as Forced (Unplanned). SARA reports now treat all UEs as Unplanned. While this category change does not impact the total base outage amount, it does increase the high and extreme unplanned thermal adjustments used in several risk scenarios.

Operational Co-located Resources with Large Loads

Due to a new influx of Large Flexible Loads (LFLs) co-located with operational generation resources, an interim solution was implemented to better account for the peak contributions of these resources. The new interim methodology utilizes the 20 hours over each of the past three years with the lowest average Physical Responsive Capability. The methodology compares historical load zone prices to an ERCOT determined (and industry backed) estimate of the bitcoin mining breakeven cost. This breakeven cost was estimated at \$86/MWh and is based on the economics of an Antminer S19 bitcoin mining rig as of early November. If the historical load zone price for the generating unit's respective load zone was below the breakeven threshold then the generator's peak winter capacity contribution was netted with the total expected co-located load at the site according to internal tracking of LFL projects. If the historical load zone price was greater than the breakeven threshold then the co-located load was assumed to be fully curtailed and consuming only 3% of the load's maximum capability. The 3% assumption accounts for the idle power draw of ASIC miners and necessary auxiliary cooling on site. In the case of a generation resource outage, the co-located load was assumed to be a net consumer on the grid if the price was below the cutoff. However, instances of these sites behaving as net loads are captured in the load forecast and is thus not accounted for in the co-located peak contribution calculation as to avoid double counting. In cases of a co-located site acting as a net load for any hour analyzed within the calculation procedure, the peak contribution of the generation resource was recorded as 0 MW. The estimated contributions for each co-located resource were summed for all 20 hours and then averaged to calculate the total contribution. This value is reflected in the Operational Co-located Resources with Large Flexible Loads (LFLs) item on
