Navy DDG(X) Next-Generation Destroyer Program: Background and Issues for Congress

Introduction

The Navy’s DDG(X) program envisages procuring a class of next-generation guided-missile destroyers (DDGs) to replace the Navy’s Ticonderoga (CG-47) class Aegis cruisers and older Arleigh Burke (DDG-51) class Aegis destroyers. The Navy wants to procure the first DDG(X) in FY2030. The Navy’s proposed FY2023 budget requests \$195.5 million in research and development funding for the program.

Navy Large Surface Combatants (LSCs)

Force-Level Goal

The Navy refers to its cruisers and destroyers collectively as large surface combatants (LSCs). The Navy’s current 355-ship force-level goal, released in December 2016, calls for achieving and maintaining a force of 104 LSCs. The Navy’s FY2023 30-year (FY2023-FY2052) shipbuilding plan, released on April 20, 2022, summarizes Navy and OSD studies outlining potential successor Navy force-level goals that include 63 to 96 LSCs.

Existing LSCs

The Navy’s CG-47s and DDG-51s are commonly called Aegis cruisers and destroyers because they are equipped with the Aegis combat system, an integrated collection of sensors and weapons named for the mythical shield that defended Zeus. The Navy procured 27 CG-47s between FY1978 and FY1988. The ships entered service between 1983 and 1994. The first five, which were built to an earlier technical standard, were judged by the Navy to be too expensive to modernize and were removed from service in 2004-2005. Of the remaining 22 ships, the Navy’s FY2023 budget submission proposes retiring 5 in FY2023, another 12 in FY2024-FY2027, and the final 5 in years after FY2027.

The first DDG-51 was procured in FY1985 and entered service in 1991. The version of the DDG-51 that the Navy is currently procuring is called the Flight III version. The Navy also has three Zumwalt (DDG-1000) class destroyers that were procured in FY2007-FY2009 and are equipped with a combat system that is different than the Aegis system. (For more on the DDG-51 and DDG-1000 programs, see CRS Report RL32109, *Navy DDG-51 and DDG-1000 Destroyer Programs: Background and Issues for Congress*, by Ronald O’Rourke.)

LSC Industrial Base

All LSCs procured for the Navy since FY1985 have been built at General Dynamics/Bath Iron Works (GD/BIW) of Bath, ME, and Huntington Ingalls Industries/Ingalls Shipbuilding (HII/Ingalls) of Pascagoula, MS. Lockheed

Martin and Raytheon are major contractors for Navy surface ship combat system equipment. The surface combatant industrial base also includes hundreds of additional component and material supplier firms.

DDG(X) Program

Program Designation

In the program designation DDG(X), the X means the precise design for the ship has not yet been determined.

Procurement Date for Lead Ship

As mentioned earlier, the Navy wants to procure the first DDG(X) in FY2030, though the date for procuring the first ship has changed before and could change again. Procurement of DDG-51s—the type of LSC currently being procured by the Navy—would end sometime after procurement of DDG(X)s begins.

Navy’s General Concept for the Ship

Figure 1 shows a Navy rendering of a notional DDG(X) design concept. The Navy approved the DDG(X)’s top-level requirements (i.e., its major required features) in December 2020. A November 2022 Congressional Budget Office (CBO) report on the Navy’s FY2023 30-year shipbuilding plan states that “the Navy has indicated that the initial [DDG(X)] design prescribes a displacement of 13,500 tons,” which would be about 39% greater than the 9,700-ton Flight III DDG-51 design.

Figure 1. Navy Rendering of Notional DDG(X) Design

Source: Slide 5 from briefing on DDG(X) program by Captain David Hart, DDG(X) Program Manager, January 12, 2022, presented at Surface Navy Association annual symposium.

The Navy envisages the DDG(X) as having (1) Flight III DDG-51 Aegis combat system elements; (2) more growth margin than the Flight III DDG-51 design, meaning more space, weight-carrying capacity, electrical power, and cooling capacity (aka SWAP-C) for accepting additional or higher-power equipment and weapons (including directed-energy weapons) over the ship's service life; (3) an integrated power system (IPS); (4) reduced vulnerability due to reduced infrared, acoustic, and underwater electromagnetic signatures; (5) increased cruising range and time on station; and (6) increased weapon capacity.

The Navy states that the baseline DDG(X) design, like the Flight III DDG-51 design, is to include 96 standard Vertical Launch System (VLS) cells, with an ability to incorporate 12 large missile launch cells in place of 32 of the 96 standard VLS cells. It is also to include two 21-cell Rolling Airframe Missile (RAM) launchers and an ability to be built with an additional mid-body hull section, called the Destroyer Payload Module (see **Figure 1**), that would provide additional payload capacity. The Navy states that

The Future Naval Force Study (FNFS) and the Future Surface Combatant Force Analysis of Alternatives (FSCF AoA) identified the requirement for future large surface combatants (LSCs) to be capable of hosting directed energy (DE) weapons, larger missiles for increased range and speed, increased magazine depth, growth in organic sensors, and an efficient integrated power system to manage the dynamic loads... [S]tudies were performed from FY 2018 to FY 2020 that considered modification of existing surface combatant and amphibious ships in addition to new concepts. These studies concluded that a new material solution via DDG(X) is required to deliver the necessary margins and flexibility to succeed the DDG 51 Class as the next enduring LSC.... By including the DDG 51 FLT III combat system elements in the DDG(X) baseline, Navy is taking an “evolutionary” (vice “revolutionary”) approach to the [DDG(X)]class, incorporating a critical lesson learned from the successful evolution of the DDG 51 Class from [the Aegis cruiser design].

Potential Procurement Quantities

The Navy has not specified how many DDG(X)s it wants to procure. The Navy's FY2023 30-year shipbuilding plan projects LSCs being procured in FY2030 and subsequent years in annual quantities of one to three ships per year.

Potential Unit Procurement Cost

In constant FY2019 dollars, the Navy wants the first DDG(X) to have a procurement cost of \$3.5 billion to \$4.0 billion, and for the 10th ship in the class to have a procurement cost of \$2.1 billion to \$2.5 billion. The November 2022 CBO report estimates the DDG(X)'s average procurement cost in constant FY2022 dollars at \$3.1 billion to \$3.4 billion—about 35% to 43% more than

the Navy's estimate (shown in the CBO report) of \$2.3 billion to \$2.4 billion. The CBO and Navy estimates are about 41% to 55%, and 5% to 9%, respectively, more than the DDG-51's procurement cost of about \$2.2 billion.

Issues for Congress

Issues for Congress regarding the DDG(X) program include the following: (1) Would a new LSC larger than the Flight III DDG-51 design be consistent with the Navy's Distributed Maritime Operations (DMO) concept, which envisages a future fleet with a smaller proportion of larger ships and a larger proportion of smaller ships? (2) The Navy in the past has studied options for a lengthened version of the DDG-51 that would displace between 11,000 and 12,000 tons. Would the DDG(X) be more cost-effective than a lengthened DDG-51? (3) Has the Navy accurately identified the DDG(X)'s required operational capabilities? (4) Why is there a 35% to 43% difference between the CBO and Navy estimates of the DDG(X)'s average procurement cost? (5) Would future Navy budgets permit the procurement of DDG(X)s in desired numbers while adequately funding other Navy priorities, particularly if the DDG(X)'s procurement cost turns out to be closer to CBO's estimate? (6) Has the Navy taken adequate steps to mature DDG(X) technologies and mitigate technical, schedule, and cost risk in the DDG(X) program? (7) Has the Navy planned adequately for the transition from DDG-51 procurement to DDG(X) procurement, and for resulting impacts on the shipbuilding industrial base?

FY2023 Funding Request and Congressional Action

The Navy's proposed FY2023 budget requests \$49.7 million for Project 0411 (DDG[X] Concept Development) within Program Element (PE) 0603564N (Ship Preliminary Design & Feasibility Studies), which is line 47 in the Navy's FY2023 research and development account, and \$145.8 million for “DDG(X) Power & Propulsion Risk Mitigation & Demonstration,” which forms part of Project 2471 (Integrated Power Systems [IPS]) within PE 0603573N (Advanced Surface Machinery Systems), which is line 49.

The House Armed Services Committee's report (H.Rept. 117-397 of July 1, 2022, page 473) on the FY2023 National Defense Authorization Act (NDAA) (H.R. 7900), the Senate Armed Services Committee's report (S.Rept. 117-130 of July 18, 2022, page 444) on the FY2023 NDAA (S. 4543), and the Senate Appropriations Committee's explanatory statement for the FY2023 DOD Appropriations Act (S. 4663), released on July 28, 2022 (pages 180 and 186), recommend approving the Navy's FY2023 funding requests. The House Appropriations Committee's report (H.Rept. 117-388 of June 24, 2022) on the FY2023 DOD Appropriations Act (H.R. 8236) recommends reducing the request for line 47 by \$13.244 million and reducing the request for line 49 by \$58.179 million (page 198). Section 121 of S. 4543 would prescribe certain aspects of the program. Section 121 is discussed on pages 5-6 of S.Rept. 117-130.
