> *Documentation of your best management practice plan developed under paragraph §60.5376b(d). You may update your best management practice plan to include additional steps which meet the criteria in §60.5376b(d).*

10.0 Compressors

API endorses the comments being submitted by GPA Midstream Association as it pertains to reciprocating and centrifugal compressors and provides the following additional comments.

10.1 Reciprocating and Centrifugal Compressors should be subject to a work practice standards with clear repair and delay of repair provisons instead of an emission standard.

Within Section IV.I.of the preamble (87 FR 74796), the EPA acknowledges *"over time, during operation of the compressor, the rings become worn, and the packaging system needs to be replaced to prevent excessive leaking from the compression cylinder."* EPA also provides its rationale for the proposed level of excessive leaking (87 FR 747996) as "*the 2 scfm flow rate threshold was established based on manufacturer guidelines indicating that a flow rate of 2 scfm or greater was considered indicative of rod packing failure."* In summary, the EPA anticipates emissions from rod packings over time even from reciprocating compressors that are properly operated and maintained.

Yet, at the same time, EPA proposes to establish the 2 scfm flowrate as a not-to-exceed standard of performance, such that a violation occurs if flow rate exceeds that value (87 FR 74797). In doing so, EPA fundamentally misconstrues the manufacturers recommendations. In practice, exceeding a manufacturer-recommended flow rate is an indication that a repair should be made. Exceeding that rate does not necessarily compromise operability of the unit and, in fact, the values are selected to allow continued operation for the period necessary to arrange for needed repairs to be made. EPA without explanation proposes to transform what in practice constitutes an action level into a regulatory cap that cannot be exceeded without the prospect of incurring a violation. EPA's proposal is at odds with the facts and is an unreasonable reinterpretation of standard maintenance practices.

Therefore, if EPA is intent on setting a numeric standard of performance, the value must be well above the 2 scfm that EPA believes to be the standard manufacturer recommendations. The value must accommodate operations for a reasonable and potentially significant period of time that may be needed to accomplish needed repairs. If EPA takes this path, a reproposal is necessary so that we can know the newly proposed value, understand EPA's rationale, and have an opportunity to submit comments on the record. Alternatively, we believe that the flowrate can be established as a work practice that would trigger a repair obligation rather than constitute a numeric emissions limitation. While it is true that flow can be measured here, it is not technically or economically practicable to install measurement systems that would assure complliance with a numeric emissions limitation. See CAA § 111(h)(2)(B).

10.2 Clarification is required for compressors with multiple cylinders or seals.

In the November 2021 preamble (86 FR 63216), EPA described the rod packing requirements as follows:

> *"We are proposing that BSER is to replace the rod packing when, based on annual flow rate measurements, there are indications that the rod packing is beginning to wear to the point where there is an increased rate of natural gas escaping around the packing to unacceptable levels. We are proposing that if annual flow rate monitoring indicates a flow rate for any individual cylinder as exceeding 2 scfm, an owner or operator would be required to replace the rod packing."*

In looking at documentation for the dry seal proposed requirements, the Natural Gas Star[85] report where this value was seemingly derived, it is stated, "*During normal operation, dry seals leak at a rate of 0.5 to 3 scfm across each seal (1-6 scfm for a two seal system), depending on the size of the seal and operating pressure…. An example of one type of tandem seal with leak rates ranging between 0.5 to 3 scfm for 1.5 to 10 inch compressor shafts, for compressors operating at 580 to 1,300 psig pressure.*"

In the proposed text provided in §60.5380b or §60.5385b(a), the distinction that the limits are per cylinder or seal is unclear. It would be impratcical for a compressor with multiple cyclinders (reciprocating) or seals (centrifugal) to operate the same as compressor with only a single cyclinder or seal. As the Natural Gas star report documents, it is also impractical to expect the same level of emissions from dry seals for various sized units.

Therefore, EPA must clarify that the emission threshold designated is by cylinder or throw (reciprocating) and per seal (centrifugal). We note that the following suggested redlines for NSPS OOOOb and EG OOOOc are consistent with §95668 (c)(4)(D) of the 2017 California's GHG Emissions Regulations, which this proposed standard was based:

> *§60.5385b(a): The volumetric flow rate, measured in accordance with paragraphs (b) of this section, must not exceed 2 standard cubic feet per minute (scfm) per individual cylinder. If the individual cylinders are manifolded to a single open-ended vent line, the volumetric flow rate must not exceed the sum of the individual cylinders multiplied by 2 scfm. You must conduct measurements of the volumetric flow rate in accordance with the schedule specified in paragraphs (a)(1) and (2) of this section.*
>
> *§60.5393c(a): The volumetric flow rate, measured in accordance with paragraphs (b) of this section, must not exceed 2 standard cubic feet per minute (scfm) per individual cylinder. If the individual cylinders are manifolded to a single open-ended vent line, the volumetric flow rate must not exceed the sum of the individual cylinders multiplied by 2 scfm. You must conduct measurements of the volumetric flow rate in accordance with the schedule specified in paragraphs (a)(1) and (2) of this section.*
>
> *§60.5380b(a)(4)(i): The volumetric flow rate must not exceed 3 standard cubic feet per minute (scfm) per seal. If the individual seals are manifolded to a single open-ended vent line, the volumetric flow rate must not exceed the sum of the individual seals multiplied by 3 scfm. You must conduct measurements of the volumetric flow rate in accordance with the schedule specified in paragraphs (a)(4)(ii) and (iii) of this section and determine the volumetric flow rate in accordance with paragraph (a)(5) of this section.*
>
> *§60.5392c(a)(1): You must conduct volumetric flow rate measurements from each centrifugal compressor wet and dry seal vent using the methods specified in paragraph (a)(2) of this section and in accordance with the schedule specified in paragraphs (a)(1)(i) and (ii) of this section. The volumetric flow rate, measured in accordance with paragraph (a)(2) of this section, must not exceed 3 standard cubic feet per minute (scfm) per seal. If the individual seals are manifolded to a single open-ended vent line, the volumetric flow rate must not exceed the sum of the individual seals multiplied by 3 scfm.*

---

[85] https://19january2021snapshot.epa.gov/sites/static/files/2016-06/documents/ll_wetseals.pdf

10.3 Conducting annual measurements on temporary compressors is logistically impractical and temporary compressors should be exempt from §60.5365b(b) and (c)(b).

Temporary compressors should be exempt from the monitoring requirments as it would be infeasible to conduct monitoring on a compresor that will be removed from a site after less than a year. Equipment that is intended for temporary use and is not a stantionary source should not not be subject to either NSPS OOOOb and EG OOOOc. API requests EPA make the following clarifications to address this concern:

> *§60.5365b(b): Each centrifugal compressor affected facility, which is a single centrifugal compressor. A centrifugal compressor located at a well site is not an affected facility under this subpart. A centrifugal compressor located at a centralized production facility is an affected facility under this subpart. A centrifugal compressor that is skid mounted or permanently attached to something that is mobile (such as trucks, railcars, barges, or ships) and intended to be located at a site for less than 12 consecutive months is not an affected facility under this subpart.*
>
> *§60.5365b(c): Each reciprocating compressor affected facility, which is a single reciprocating compressor. A reciprocating compressor located at a well site is not an affected facility under this subpart. A reciprocating compressor located at a centralized production facility is an affected facility under this subpart. A reciprocating compressor that is skid mounted or permanently attached to something that is mobile (such as trucks, railcars, barges, or ships) and intended to be located at a site for less than 12 consecutive months is not an affected facility under this subpart.*

10.4 Reciprocating Compressors

While API supports certain aspects of the Supplemental Proposal for reciprocating compressors, addiitonal clarifications must be made. The following amendments, in addition to the items outlined above and in comments submitted by GPA Midstream Association, would alleviate some of the significant technical cocnerns our members have with the proposed requirements.

- **Emissions from reciprocating rod packing vents that are routed to a process or flare should be considered an adequate alternative in reducing emissions.** EPA should continue to allow an option for rod packing vents to be routed to a control device for new, modified and existing facilities. The incremental benefit achieved between monitoring and subsequent repair (if applicable) versus capturing the vent to control device that achieves 95% destruction efficiency has not been substantiated by EPA within their cost benefit analysis. This is especially true for any compressor that already is designed and configured to route rod packing to a flare or other combustion device.

- **EPA should provide additional flexibility for addressing rod packing leaks by allowing operators to forgo annual emission measurements and replace rod packing annually.** Given the sheer number of compressors that will apply to NSPS OOOOb and EG OOOOc, EPA should provide flexibility by allowing operators the option to change out rod packing annually or 8760 hours (whichever comes first), which is similar in approach but more frequent than the current requirements in NSPS OOOO and OOOOa, or to perform the newly proposed annual monitoring and replacement of rod packing if emissions exceed to specific threshold as identified.

- **Repair parameters were omitted from the proposed regulatory text.** The EPA states their intent to define some repair parameters for reciprocating compressors in the preamble (87 FR 74798):

> *"The proposed NSPS OOOOb regulatory text also specifies that flow rate monitoring be conducted in operating or standby pressurized mode, and "repair" and "delay of repair" schedules, in addition to other clarifying requirements. The EPA is proposing to require conducting flow rate measurements during operating or standby pressurized mode because the measured emissions would be representative of actual emissions during operations. Repair schedules are proposed to require repair of equipment in a timely manner to mitigate emissions. Delay of repair would be allowed when owners and operators required more time to repair equipment based on scenarios beyond the owner or operator's control (e.g., issues with availability of equipment or where repair necessitates a compressor shutdown when redundancy of compressors is not available)."*

However, the repair and delay of repair schedules could not be located in the proposed regulatory text. As stated in Comment 10.1, the EPA should establish a monitoring schedule for reciprocating compressors with reasonable repair times. Further, allowances should be incorporated to address situations that delay repairs, appropriately.

California regulations governing rod packing emissions, upon which these proposed regulations are based, require repair within 30 calendar days from the date of the initial emission flow rate measurement. Furthermore, repair of a compressor typically cannot be performed while the compressor is in service, and some situations may arise that warrant delay of repair. We therefore request EPA amend the provisions in §60.5380b and §60.5385b to accommodate a work practice standard that includes clear provisions for repair or replacement and delay of repair or replacement that is consistent with §60.5397b(h)(3).

10.5 Centrifigal Compressors

10.5.1 Clarification is requested to the definition of centrifugal compressor.

Within the definition "centrifugal compressor" in §60.5430b and §60.5430c, EPA describes the compressor as "*discharging significantly higher-pressure natural gas by means of mechanical rotating vanes or impellers."* The phrasing of "significantly higher-pressure" should be further delineated to eliminate ambiguity. If left undefined the regulated operator does not have a clear understanding of what is affected and what is not affected.

The definition of centrifugal compressor as it was used in the initial NSPS OOOO rulemaking only affected wet-seal centrifugal compressors, which includes a relatively small population of affected facilities that were generally considered to discharge significantly higher-pressure natural gas. With the expansion of the NSPS OOOOb and EG OOOOc to also include dry seal compressors, which are more widely utilized, additional clarity is warranted.

In the oil and natural gas industry, compressors that boost natural gas pressures are normally designed to discharge natural gas greater than 300 pounds per square inch differential (psid). The original intent of EPA including this language was to exclude smaller compressors with low differential pressure (e.g., process compressors, vapor recovery units, and other low pressure service units). With this consideration, API recommends that EPA update §60.5430b to include a definition of significantly higher-pressure and includes the following language:

> *Centrifugal compressor means any machine for raising the pressure of a natural gas by drawing in low pressure natural gas and discharging significantly higher-pressure natural gas by means of mechanical rotating vanes or impellers. Screw, sliding vane, and liquid ring compressors are not centrifugal compressors for the purposes of this subpart. For the purposes of §60.5380b, significantly higher-pressure means having a design pressure differential greater than 300 pounds per square inch differential (psid).*

10.5.2 The emission limit for dry seal compressors should properly account for compressor size.

The origin of and basis for the proposed three (3) scfm limit for dry seal compressors is not provided within the EPA docket and associated references. API suspects that the genesis of this number did not consider variable compressor sizes, resulting in a low value for the standard that is not representative of all operations. In Section IV.G.1.b.iii of the Federal Register, the origin of this value is as follows: *"The 3 scfm volumetric flow rate emission limit is the same monitoring limit included in §95668(d)(4-9), California's Regulations*[86] *for Greenhouse Gas Emission Standards for Crude Oil and Natural Gas Facilities. California developed the 3 scfm emission standard because this was the equivalent to an average dry seal emission rate*[87]*."* Research into the underlying sources of the CARB regulation does not yield supporting information for the development of the 3 scfm standard. EPA should supplement the docket with information to support why this value is representative of the population of dry seal compressors across the nation (taking into consideration compressor size variability).

Larger compressors usually have larger shaft diameters, higher operating speeds, and greater operating pressures. These three variables all contribute factors to the amount of gas that might ultimately slip through the seals. The combination of these three factors will usually yield higher leak rates from seals as measured on a volumetric basis, thus larger compressors will have a higher baseline for normal operations.

Based on data submitted to the EPA pursuant to 40 CFR Part 98, Subpart W for the 2021 calendar year, dry seal compressor driver power output ranged between 5 – 42,000 horsepower and for wet seals the compressor driver power output ranged between 40 – 53,665 horsepower.[88] We do not believe compressors associated with the higher end of this range should be expected to operate the same as compressors closer to the lower end of this range. Table 2provides more details on our short analysis showing variable sizes of both dry and wet seal compressors as reference.

[88] Information was extracted from EPA's Envirofacts database using the GHG query builder: https://enviro.epa.gov/query-builder/ghg.

Table 2. Variation in Compressor Driver Output as Reported under EPA's Greenhouse Gas Reporting Program for Calendar Year 2021

Compressor Horsepower Driver Details as reported to EPA for Calendar Year 2021	Count of Compressors in Dataset	Compressor driver power output (Horsepower)		
		Average	Minimum	Maximum
Dry Seals				
Onshore natural gas processing	310	6,427	5	38,000
Onshore natural gas transmission compression	812	14,431	144	42,000
Underground natural gas storage	19	9,817	5,700	15,280
Wet Seals				
Onshore natural gas processing	199	9,426	40	53,665
Onshore natural gas transmission compression	345	5,027	990	30,000
Underground natural gas storage	22	3,910	1,275	9,800

10.5.3 Additional clarification is needed regarding the volumetric flow.

Both wet seal and dry seal systems often use an inert gas, such as nitrogen, for system blankets at positive pressure. That nitrogen vents through the same vent as the seal gas. So measured total vent rates may be overestimating the amount of methane or VOC being vented to atmosphere. Actual vent rates of methane and VOC could be under the standard, but the total volumetric flow could be over due to the nitrogen blanket. EPA should make clear that the standard could be interpreted as either total volumetric flow or methane and VOC flow depending on which method of monitoring is employed.

EPA should also expand the volumetric flow measurement options to allow for alternative ways to obtain the methane and VOC flow:

- Use of thermal mass meter or ultrasonic meter readings in conjunction with gas composition samples to calculate methane and VOC flow, or
- Flow balance equations (i.e., if the amount of inert gas into the system is metered, then that volume could be subtracted from the total flow measurement, thus yielding the methane and VOC only flow.)

10.5.4 The wet seal centrifugal compressor requirements must be clarified between NSPS OOOOb and EG OOOOc.

It is unclear why the standards between NSPS OOOOb and EG OOOOc for centrifugal compressor standards are different:

- NSPS OOOOb – Dry seal compressors and "self-contained wet seal compressors" can only comply with volumetric standard. All other wet seal compressors can only comply with the 95% capture and control requirement.
- EG OOOOc – Any wet seal compressor can either comply with volumetric standard or reduce emissions by 95% through a control standard.

The implications of the NSPS OOOOb regulations seem to be that the 3 scfm volumetric standard is equivalent to the 95% capture and control requirement. If this is the case, then it stands to reason that all centrifugal

compressors should be able to choose to comply with either the volumetric standard or the 95% capture and control practice.

If owners of centrifugal compressors had the option to comply with either standard, it obviates the need for a specially defined class of compressors: “Self-contained wet seal compressors.” Removing this definition from the rule would result in a more simple and straightforward understanding of the rule requirements. API proposes the NSPS OOOOb standards mimic the EG OOOOc standards.

10.5.5 The proposed requirements for Wet Seal Centrifugal Compressors do not consider our previous comments regarding the unique equipment design in the Alaskan North Slope.

On the Alaska North Slope (ANS) there is not a market for natural gas sales. Most of the gas that is produced with the oil is separated and either used as a fuel or is compressed (using large wet seal compressors) to be reinjected back down hole for gas lift or enhanced oil recovery. The wet seal compressors on the ANS were installed from the mid-1970s to the mid-1980s, when the oil fields there began to be produced.

Wet seal centrifugal compressors located on the ANS were originally designed and installed with a seal oil degassing system that captures most of the gas by volume then routes that gas to a flare, as described in our January 31, 2022 comment letter[89]. The ANS system design is simple. Rather than routing the sour seal oil directly to a degassing drum/tank (which vents to atmosphere), the sour seal oil is first routed to the sour seal oil traps. In these traps, most of the gas breaks out of the oil while remaining at a high enough pressure that it can enter the low-pressure flare header line. The gas that breaks out in these traps is routed to the flare, not vented. The sour seal oil is only then sent to the degassing drum / tank, where any remaining entrained gas breaks out and is vented to atmosphere. In 2010, EPA’s Natural Gas Star[90,91] program, in conjunction with BP, conducted an analysis of this wet seal degassing system design on the ANS at the Central Compressor Station. This analysis concluded that the sour seal oil degassing design employed on the ANS has greater than 99% emission control by volume. This same study is also cited by the CARB regulations references. It would stand to reason that this system of gas capture and control should be allowable to use the volumetric standard.

In summary, wet seal compressors with the sour seal oil traps in Alaska as described above, route the gas to the flare, not to the “compressor suction.” Because of this, these compressors would seemingly not meet the definition of “self-contained wet seal compressor.” However, there is language in that definition which suggests that the purpose of that definition is that degassed emissions do not route to atmosphere as proposed in §60.5430b and §60.5430c (***emphasis added***). Therefore, API offers the following redline for the definition of self-contained wet seal centrifugal compressor:

> *Self-contained wet seal centrifugal compressor means a wet seal centrifugal compressor system which has an intermediate closed process that degasses most of the gas entrained in the seal oil and sends that gas to either another process or combustion device* ~~*that is a closed process that ports the degassing emissions to the natural gas line at the compressor suction*~~ *(**i.e., degassed emissions are recovered**). The de-gas emissions are routed back to* ~~*suction*~~ *a process or combustion device directly from the intermediate closed degassing process* ~~*degassing/sparging chambers*~~*; after the intermediate closed process the oil is ultimately recycled for recirculation in the seals to the lube oil tank where any small amount of residual gas is released through a vent.*

---

[89] EPA-HQ-OAR-2021-0317-0808

[90] https://www.epa.gov/sites/production/files/2016-04/documents/smith.pdf

[91] https://www.epa.gov/sites/default/files/2016-06/documents/capturemethanefromcentrifugalcompressionsealoildegassing.pdf

Alternatively, as outlined in Comment 10.5.4, EPA could allow all centrifugal compressors the option to comply with the volumetric standard thereby obviating the need for a special definition for a “self-contained wet seal compressor.”

11.0 Leak Detection and Repair at Gas Processing Plants

API supports EPA’s proposal for bimonthly OGI monitoring for equipment leaks at gas processing plants. We also support incorporation of NSPS Vva into NSPS OOOOb and EG OOOOc as an alternative monitoring option with the additional simplifications EPA has proposed. While API also generally supports the use of Appendix K for OGI monitoring at gas processing plants, we have several comments with respect to proposed Appendix K as provided in Attachment A, which are in direct response to EPA’s solicitations within the preamble.

In addition to the above items, API offers the following comments concerning leak detection and repair requirements at gas processing plants.

11.1 Closed vent systems should be monitored annually using OGI or Method 21.

EPA is proposing initial and bi-monthly OGI or quarterly Method 21 monitoring of closed vent systems which are increased monitoring frequencies when compared with the existing annual Method 21 monitoring under NSPS OOOO, NSPS OOOOa, NSPS Vva, and other LDAR regulations. API’s previous comments on this topic[92] were intended to voice support for the use of OGI in monitoring closed vent systems and did not fully consider the implications and minimal environmental benefits of more frequent monitoring.

Closed vent systems have historically been subject only to initial and annual inspections due to their low leak rates. Closed vent systems rarely leak because of the small number of components and lack of constantly moving parts. The hard piping or ductwork in closed vent system do not experience the same wear and tear and potential for leaks as moving parts that generate friction. While OGI does not have the same proximity challenges as Method 21, more frequent monitoring of closed vent systems would still be impractical for both methods as parts of closed vent systems are considered difficult to monitor. More frequent inspections for closed vent systems at gas plants under NSPS OOOOb and EG OOOOc would also be more stringent than the requirements for refineries and chemical plants. Therefore, API recommends that for closed vent systems, hard piping be subject to an initial Method 21 or OGI inspection and annual AVO inspections and ductwork be subject to an initial Method 21 or OGI inspection and annual Method 21 or OGI inspections. If EPA decides to finalize the increased monitoring frequency for closed vent systems, they must provide additional justification including the additional environmental benefits expected from more frequent monitoring of equipment that rarely leak.

Emissions detected from closed vent systems do not constitute a violation of the “no identifiable emissions” standard provided work practice standards are fully implemented. See Comment 5.1 for a more detailed discussion.

---

[92] EPA-HQ-OAR-2021-0317-0808

11.2 The lack of a VOC or methane concentration threshold expands monitoring requirements with minimal, if any, environmental benefit.

As API noted in its prior comments[93], EPA should retain the current 10 percent by weight threshold for VOC and propose a similar concentration threshold for methane, which we suggested as 1 percent by weight threshold for methane. In the Supplemental Proposal, EPA is proposing that monitoring apply to each piece of equipment "that has the potential to emit methane or VOC", which is effectively a zero-applicability threshold for both methane and VOC.

Some streams at gas processing plants contain methane or VOC but in such low concentrations that monitoring would be meaningless as it would likely always result in no detected emissions. Examples of such streams include but are not limited to purity ethane, acid gas, ancillary chemicals, wastewater, and recycled water. The proposed monitoring of additional components with no appreciable amounts of VOC or methane adds costs and uses personnel resources with minimal, if any, environmental benefit.

In its existing LDAR regulations, EPA has recognized and reaffirmed the need for concentration thresholds to achieve cost-effective emission reductions. The agency has not provided sufficient justification for deviating from this longstanding practice with this rulemaking. Based on an initial review of EPA's TSD[94] from the November 2021 Proposal, API notes the following about EPA's analysis:

- EPA considers only components in VOC service and non-VOC service, which the agency appears to define as follows:

> *"In VOC service" is defined as a component containing or in contact with a process fluid that is at least 10 percent VOC by weight or a component "in wet gas service", which is a component containing or in contact with field gas before extraction. "In non-VOC service" is defined as a component in methane service (at least 10% methane) that is not also in VOC service.*

- EPA estimates VOC and methane emissions and therefore emission reductions and cost-effectiveness using only the following composition ratios identified in Table 10-8 of the TSD:

Component Service	Methane: TOC	VOC: TOC
VOC Service	0.695	0.1930
Non-VOC Service	0.908	0.0251

- EPA appears to treat the "potential to emit to methane" as equivalent to "in non-VOC service" in evaluating control options:

> *In addition to selecting one of the LDAR programs above, the EPA considered which components would be subject to the LDAR program. The current NSPS applies to components in VOC service (Option A). The EPA considered expanding the applicability to include components that have a potential to emit methane, which would add the components classified in this document as non-VOC service components (Option B).*

---

[93] EPA-HQ-OAR-2021-0317-0808
[94] EPA-HQ-OAR-2021-0317-0166

Therefore, EPA does not appear to fully consider the cost-effectiveness of a potential to emit applicability threshold. API reiterates that EPA should retain the current 10 percent by weight threshold for VOC and establish a similar concentration threshold for methane (suggested as 1 percent by weight). Refer also to Attachment A.

In Comment 11.3, API offers recommended redlines to address this concern. Regarding how to determine when a piece of equipment is not subject to monitoring, the language in §60.5400b(a)(2) should also be revised as appropriate.

11.3 EPA should clarify which equipment is included in the evaluation of capital expenditure.

The definition of equipment is unclear on which equipment is considered when evaluating whether a capital expenditure occurred because capital expenditure is a definition, not a standard or requirement. This lack of clarity could lead to varying interpretations and uncertainty on whether a capital expenditure occurred. For other regulations, EPA has clarified the scope of equipment considered for the affected facility[95]. For leak detection and repair, an appropriate scope would be to apply the same definition of equipment to the capital expenditure evaluation as the standards and requirements. Therefore, the definition of equipment should clearly specify it also applies to capital expenditure.

To address this and the previous comment, API offers the following recommended redlines to definitions in §60.5430b.

> *Equipment, as used in the standards and requirements and for purposes of evaluating capital expenditure in section 60.5365b(f)(1) of this subpart relative to the process unit equipment affected facility at onshore natural gas processing plants, means each pump, pressure relief device, open-ended valve or line, valve, and flange or other connector ~~that has the potential to emit~~ in methane or VOC service and any device or system required by those same standards and requirements of this subpart.*
>
> *In methane service means that the piece of equipment contains or contacts a process fluid that is at least 1 percent methane by weight. (The provisions of § 60.5400b(a)(2) specify how to determine that a piece of equipment is not in methane service.)*
>
> *In VOC service means that the piece of equipment contains or contacts a process fluid that is at least 10 percent VOC by weight. (The provisions of § 60.5400b(a)(2) specify how to determine that a piece of equipment is not in VOC service.)*

12.0 Overarching Legal Issues

12.1 The new source trigger date should be December 6, 2022, the date the Supplemental Proposal was published in the Federal Register.

In a memorandum associated with the Supplemental Proposal, EPA "solicits comments on whether CAA § 111(a) provides EPA discretion to define 'new sources' based on the publication date of the Supplemental Proposal and,

---

[95] U.S. EPA Applicability Determination Index Control Number: 0600027, Modification and Capital Expenditure Calculations, dated February 9, 2001.

if so, whether there are any unique circumstances here that would warrant exercising of such discretion in this rulemaking by the EPA."

API believes that not only does CAA § 111(a) allow EPA to define the new source trigger date based on the publication date of the Supplemental Proposal, but also in fact requires it. Further, as API provides below, there are significant circumstances here that would warrant EPA altering the new source trigger date to December 6, 2022.

As explained in our January 31, 2022 comment letter (EPA-HQ-OAR-2021-0317-0808) on the original NSPS OOOOb and EG OOOOc proposed rule, the original proposal was fundamentally incomplete because no proposed regulatory text was published or otherwise made available at the time of proposal. As a result, that proposal could not serve to set the new source trigger date for new requirements described in the proposed rule.

In the Supplemental Proposal, EPA reasserted that, except for newly proposed standards in the Supplemental Proposal (such as the standards for dry seal centrifugal compressors), the new source trigger date will be the date the original proposal was published in the Federal Register. EPA explains that "CAA Section 307(d)(3) specifies the information that a proposed rule under the CAA must contain, such as a statement of basis, supporting data, and major legal and policy considerations; the list of required information does not include proposed regulatory text." (87 Federal Register (FR) R 74716).

EPA further explains that "the Administrative Procedures Act (APA), which governs most Federal rulemaking, does not require publication of the proposed regulatory text in the Federal Register" and instead specifies that "notice of proposed rulemaking shall include ''*either* the terms or substance of the proposed rule *or* a description of the subjects and issues involved.'' (Emphasis added)." *Id*. EPA concludes that "the APA clearly provides flexibility to describe the ''subjects and issues involved'' as an alternative to inclusion of the ''terms or substance'' of the proposed rule." *Id*.

As an initial matter, EPA's analysis on this point indicates that EPA believes the CAA and the APA provide the flexibility to select November 15, 2021 as the trigger date for new sources, but nothing in EPA's analysis specifically concludes or determines that it must use the November 15, 2021 date. API believes that EPA's rationale for using November 15, 2021 remains flawed for three reasons. The lack of regulatory text (which was neither in the Federal Register notice nor otherwise made available in the docket prior to the close of the comment period) prevents the original proposal from setting the new source trigger date.

First, the CAA § 111(a)(2) definition of "new source" uses the term "proposed *regulations*" in defining the new source trigger date. As we explained in our comments on the original proposal, a preamble unaccompanied by regulatory text is not a "regulation." Here, the preamble to the original proposal was simply a description of the proposed regulations, but by itself did not constitute a proposed regulation because nothing in the preamble was intended by the Agency to constitute an enforceable legal obligation. And it could not, as EPA co-proposed multiple concepts for singular facility types in the November 2021 proposal and requested comment that informed the November 2022 Supplemental Proposal's regulatory text.

For example, in the November 2021 proposal, EPA co-proposed quarterly and semi-annual fugitive emissions surveys for well sites with baseline emissions of 3 or more and less than 8 tons per year of methane. EPA then abandoned the baseline emissions approach in the November 2022 Supplemental Proposal in favor of an equipment threshold. In another example, EPA co-proposed to define affected well facilities in two ways for purposes of the liquids unloading standards. Under one approach, every well that undergoes liquids unloading would be an affected facility; under the other approach, the affected facility would be limited to wells that

undergo liquids unloading that is not designed to eliminate venting. These co-proposals, while limited to a subset of the affected facilities, evidence that EPA intended the November 2021 proposal to be conceptual and a means of informing the November 2022 regulatory text.

The November 2022 proposal is complex and requires affected facilities to parse complicated standards that will inform significant capital expenditures and expensive compliance programs. Given the ultimate complexity of the November 2022 regulatory text and scope of impact, the November 2021 proposal's conceptual offerings did not put the regulated community on notice of the "regulations" in any meaningful way that could inform billions of dollars in capital expenditures and compliance program development. Instead, the regulatory text made available in conjunction with the Supplemental Proposal comprises the proposed regulation because that regulatory text defines the enforceable legal obligations that EPA proposes to impose under this rule.

Thus, even if the original proposal may have satisfied the nominal procedural requirements specified by CAA § 307(d) and APA § 553(b) (which it does not for the reasons explained below), the original proposal was not a proposed "regulation" for purposes of setting the new source trigger date under CAA § 111(a)(2). This is particularly true in light of the clear purpose of CAA § 111(a)(2), which is to put affected facilities that are constructed, reconstructed, or modified after the date of a proposed regulation on notice of the requirements that will apply to those facilities upon the effective date of the final regulation. The absence of proposed regulatory text in the original proposal prevents such affected facilities from knowing with reasonable certainty the precise requirements that might actually apply, and thus prevents them from adequately planning for compliance.

Second, EPA's interpretation of CAA § 307(d) and APA § 553(b) is unreasonable and does not make sense in the broader context of these provisions. For example, EPA argues that the required content of a proposed rule specified in CAA § 307(d)(3) does not expressly require regulatory text, but the corresponding content requirements for a final rule (specified in CAA §§ 307(d)(4)(B)(i), (6)(A), and (6)(B)) similarly do not expressly require regulatory text. By EPA's reasoning, that means that the Agency is not required to provide regulatory text as part of a final rule. That is nonsensical. This is particularly true because the record for judicial review is limited to the materials prescribed by CAA §§ 307(d)(3), (d)(4)(B)(i), (6)(A), and (6)(B). CAA § 307(d)(7)(A). If proposed and final rules do not need to include regulatory text, then regulatory text would not be subject to judicial review. That is contrary to reason and the clear intent of the law.

In short, it is simply not plausible to argue that because CAA § 307(d) does not expressly require a proposed rule to include regulatory text; EPA is not required to make proposed regulatory text available at the time of the 2021 "proposal". When considered as a whole, CAA § 307(d) plainly requires rule text to be available.[96]

Third, and more broadly, EPA and the Biden administration made a political judgment to rush issuance of the original proposed rule because the rule constitutes a prominent plank of the administration's climate change regulatory agenda, and it was deemed expedient to issue the proposed rule in conjunction with the 2021 Conference of the Parties to the United Nations Framework Convention on Climate Change in Glasgow, Scotland.[97] The fact that EPA acknowledged the original proposal would require a Supplemental Proposal with

---

[96] EPA cites *Rybachek v. USEPA*, 904 F.2d 1276, 1297 (9th Cir. 1990) as supporting its position that proposed regulatory text is not necessary. That case is inapposite because the court relies on APA § 553(b)(3). While that provision applies to this rulemaking, the more specific requirements of CAA § 307(d) control here.

[97] EPA's press release for the original proposal is available at U.S. to Sharply Cut Methane Pollution that Threatens the Climate and Public Health | US EPA (""As global leaders convene at this pivotal moment in Glasgow for COP26, it is now abundantly clear that America is back and leading by example in confronting the climate crisis with bold ambition," said EPA Administrator Michael S. Regan**.** "With this historic action, EPA is addressing existing sources

actual regulatory text is plain evidence of the rush. The sheer size of the Supplemental Proposal – 146 pages in the Federal Register, *without* regulatory text (which is provided in the docket) – is further mute evidence of the incomplete nature of the original proposal.

We recognize that every administration has the right to set and implement its regulatory agenda. However, this Administration's desire to expedite issuance of the original proposed rule led to compromises in the usual regulatory procedures, including the decision not to make proposed regulatory text available. It would be unreasonable for affected facilities to bear the burden of those compromises. It is also arbitrary and capricious for EPA to decide to issue an admittedly incomplete proposed rule to satisfy political objectives, and, at the same time, assert that it is somehow complete enough to constitute a "proposed rule" that sets the new source trigger date.

As shown in the analysis above, nothing allows or requires EPA to utilize the November 15, 2021 date. Further, the failure of EPA to provide regulatory text in the November 15, 2021 proposal is reason enough for EPA to "warrant exercising" any discretion it does have with respect to the deadline.

Further, by utilizing November 15, 2021 as the relevant demarcation date, EPA will be including a significant number of sources that were new, modified, or reconstructed between November 15, 2021 and December 6, 2022. For a significant number of the affected facilities, operators will be required to retrofit those new, modified or reconstructed sources to comply with the regulations, including regulations not known to operators at the time of construction, modification or reconstruction. Many of these requirements involve either: (1) substantial capital expenditures for equipment (e.g., instrument air skids and/or generators for use of non-emitting pneumatic controllers); (2) engineering design (e.g., storage tanks, design for any covers and closed vent systems, among others); (3) acquisition (along with all other operators) of a substantial number of part and equipment (e.g., flow meters, calorimeters; and (4) substantial in-field resources for retrofits. Not knowing with reasonable certainty what the final rule would require would significantly complicate implementation of compliance measures, cause the rule to be much more costly for such sources than EPA predicts, and frustrate the regulatory purpose of setting the new source trigger date at the date of proposal (which clearly is intended to provide reasonable notice of the ultimate requirements so that planning can be done at the time of construction, reconstruction, or modification.

In addition, since the onset of the COVID pandemic and continuing to this day, there have been substantial supply chain disruptions, difficulty with obtaining parts and equipment and difficulty with finding personnel (either consulting or for employment) that can assist with implementation of the rule. These supply chain and personnel issues will increase given the extensive nature and reach of NSPS OOOOb alone (given all the operators that will need to comply) – not even accounting for other recent regulatory developments at the state and federal level (e.g., BLM waste prevention rule, Colorado regulatory requirements, and New Mexico requirements – to name a few). EPA will compound this supply chain and personnel concern by maintaining November 15, 2021 as the new source trigger date. EPA's motivation is further obscured given the sources constructed, modified or reconstructed between November 15, 2021 and December 6, 2022 are potentially subject to NSPS OOOOa and may ultimately be subject to EG OOOOc. Thus, API believes that EPA not only has the discretion but the requirement to assign December 6, 2022 as the new source applicability date. Even if this were not required, there is ample basis for EPA to do so for all the reasons previously stated.

---

from the oil and natural gas industry nationwide, in addition to updating rules for new sources, to ensure robust and lasting cuts in pollution across the country. By building on existing technologies and encouraging innovative new solutions, we are committed to a durable final rule that is anchored in science and the law, that protects communities living near oil and natural gas facilities, and that advances our nation's climate goals under the Paris Agreement."").

12.2 EPA's interest in promoting Environmental Justice is laudable, but EPA must be mindful of the Clean Air Act's boundaries in advancing these goals.

API explained in its comments on the original proposal that we support EPA's attention to potential Environmental Justice (EJ) issues and agree with EPA that the emissions standards prescribed by this rule will significantly reduce emissions from this sector and should result in corresponding risk reductions for all potentially affected individuals. The oil and natural gas industry's top priorities are protecting the public's health and safety – regardless of race, color, national origin, or income – and the environment. We strive to understand, discuss, and appropriately address community concerns with our operations. We are committed to supporting constructive interactions between industry, regulators, and surrounding communities/populations including those that may be disproportionately impacted.

Our comments also explained that, while API supports EPA's EJ goals, the Agency did not provide sufficient detail in the 2021 Proposal to allow API to comment in a meaningful way. EPA has provided additional clarity on two key EJ provisions in the Supplemental Proposal. They are addressed separately below.

12.2.1 Consideration of EJ Impacts in CAA § 111 Standard Setting

First, EPA proposes to require consideration of impacted communities when setting existing source emissions standards that take into consideration remaining useful life and other factors (RULOF). For example, if "a designated facility could be controlled at a certain cost threshold higher than required under the EPA's proposed revisions to the RULOF provision, and such control benefits the communities that would otherwise be adversely impacted by a less stringent standard, the state in accounting for RULOF could choose to use that cost threshold to apply a standard of performance." (87 FR 74824).

EPA believes that it has authority to prescribe such a requirement because "CAA section 111(d) does not specify what are the "other factors" that the EPA's regulations should permit a state to consider", and thus the Agency may "interpret[] this as providing discretion for the EPA to identify the appropriate factors and conditions under which the circumstance may be reasonably invoked in establishing a standard less stringent than the EG." *Id*.

EPA further explains that part of its responsibility in reviewing the adequacy of state CAA § 111(d) existing source emissions control programs is to "determine whether a plan's consideration of RULOF is consistent with section 111(d)'s overall health and welfare objectives." *Id*. "The EPA finds that a lack of consideration to [disparate health and environmental impacts] would be antithetical to the public health and welfare goals of CAA section 111(d) and the CAA generally." *Id*.

Lastly, EPA explains that the "requirement to consider the health and environmental impacts in any standard of performance taking into account RULOF is consistent with the definition of "standard of performance" in CAA section 111(a)(1)" which "requires EPA to take into account health and environmental impacts in determining the BSER." *Id*.

We applaud and support EPA's overall objective of addressing potential disparate impacts. But we are concerned that the Agency's proposal to require such impacts to be addressed when RULOF is considered in setting state standards is not legally supportable.

To begin, the term "other factors" is a generic term in and of itself. But as used in the context of CAA § 111(d), that term does not reasonably mean that EJ may be considered in standard setting. First, CAA § 111(d)(1) states that EPA's regulations "shall permit" states to consider RULOF in setting existing source emissions standards. This

language places responsibility on the states, in the first instance, to determine the "other factors" they deem relevant in setting standards upon consideration of RULOF. EPA's role is to review the state determination and not to preemptively specify what factors a state may or may not consider. If a state's identification and consideration of other factors is reasonable, then EPA cannot reject the state's determination on the grounds that EPA believes the term "other factors" should be given a different meaning. EPA's proposed approach is inconsistent with the role Congress intended the states to fulfill as part of the CAA's broader "cooperative federalism" scheme.

Second, the term "other factors" must be interpreted in context. By specifying that states may consider "remaining useful life," Congress indicated that source-specific factors are relevant to the states' determinations. Since the term "other factors" is a catch-all phrase that follows the more specific instruction to consider a source-specific factor, the term "other factors" must be construed in a similar light. This interpretation is particularly true given that "standards of performance" under CAA § 111(a)(1) are technology-based standards that reflect the best system of emissions reduction determined applicable to affected facilities. EPA's proposed interpretation of "other factors" is inconsistent with this source-specific, technology-based regulatory scheme.

Third, unlike other standards under the CAA, CAA § 111 does not require or allow for standards to be based on an assessment of impacts regarding health or the environment. Where the CAA confers such authority, it does so expressly and usually in a context where criteria exist to determine the adequacy of such standards. For example, CAA § 112(f) requires impacts to health and the environment to be considered in determining whether "MACT"[98]-based NESHAPs are adequately protective to health and the environment. The statute specifies that EPA must provide an "ample margin of safety," as defined in the Benzene Waste NESHAP. CAA § 112(f)(2)(A), (B). The Title I air quality program is also designed in this fashion – with the National Ambient Air Quality Standards (NAAQS) established as the benchmark for acceptable air quality and the guidepost for formulating appropriate state programs.

Here, CAA § 111 does not provide any indication that EPA must or may consider health or environmental impacts associated with air emissions from affected facilities in determining BSER and in setting emissions standards. For over 50 years, CAA § 111 has properly been construed as a technology-based program designed to prescribe standards based primarily on consideration of the best available technologies that are adequately demonstrated and not cost prohibitive. EPA's goals here are important but would require standards to be based on impacts analyses of air emissions from affected facilities – an approach that is not incorporated into the CAA § 111 standard setting process.

EPA also states that not considering impacts would be "antithetical to the public health and welfare goals of CAA Section 111(d) and the CAA generally." There is no doubt that protecting public health and welfare are overarching goals of the CAA. That aspiration does not in itself confer regulatory authority that is not otherwise prescribed by the statute. Congress carefully designed the regulatory tools it intends EPA to use to accomplish an adequate degree of protection to health and welfare. For the reasons explained above, CAA § 111(d) does not require or allow for consideration of health or environmental impacts in standard setting.

Lastly, EPA argues that considering EJ impacts in state standard setting "is consistent with the definition of "standard of performance" in CAA Section 111(a)(1)" and that states must consider such impacts "just as the EPA is statutorily required to take into account these factors in making its BSER determination." *Id*. at 74824. More specifically, EPA asserts that the definition of "standard of performance" "requires the EPA to take into account health and environmental impacts in determining the BSER." *Id*. We respectfully disagree, as there is no language

---

[98] Maximum Achievable Control technology

in the CAA § 111(a)(1) definition of "standard of performance" that requires or allows health or environmental impacts associated with air emissions from affected facilities to be factored into standard setting.

As explained above, that definition requires standards of performance to primarily be based on technology and cost considerations. The only exception is that "nonair quality health and environmental impact[s] and energy requirements" also must be taken into account in setting standards of performance. CAA § 111(a)(1). The statute thus is clear that the only "health and environmental impacts" that may be considered in setting a standard of performance are ***nonair*** health and environmental impacts. That provision traditionally has been interpreted to require EPA to consider cross-media impacts (e.g., wastewater created by an air emissions scrubber) so as not to create a different environmental issue through technical requirements meant to address air quality. Because the analysis that EPA would require here would focus on air emissions impacts, it cannot be grounded in the requirement to consider ***nonair*** quality health and environmental impacts. Moreover, because the statute specifies that only nonair quality health and environmental impacts may be considered in standard setting, EPA is precluded from interpreting general language in CAA § 111(a)(1) or 111(d)(1) as somehow authorizing consideration of air quality-based health or environmental impacts.

For all of these reasons, EPA should reconsider the proposed requirement to require consideration of EJ impacts when states or EPA implement the RULOF provision.

12.2.2 Requirement that states provide for "meaningful engagement" in their CAA § 111(d) programs.

The Supplemental Proposal provides further details and additional explanation of the proposal to require states to provide for "meaningful engagement" as part of their CAA § 111(d) regulatory programs. According to EPA, "[t]he fundamental purpose of CAA section 111 is to reduce emissions from certain stationary sources that cause, or significantly contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare" (87 FR 74827). As a result, EPA asserts that "a key consideration in the state's development of a state plan, in any significant plan revision, and in the EPA's development of a Federal plan pursuant to an EG promulgated under CAA section 111(d) is the potential impact of the proposed plan requirements on public health and welfare." *Id*. "A robust and meaningful public participation process during plan development is critical to ensuring that the full range of these impacts are understood and considered." *Id*.

The "meaningful engagement" requirement is grounded in the assertion that "a fundamental purpose of the Act's notice and public hearing requirements is for all affected members of the public, and not just a particular subset, to participate in pollution control planning processes that impact their health and welfare." *Id*. at 74828-9. In explaining the legal basis for this requirement, EPA states that "[g]iven the public health and welfare objectives of CAA section 111(d) in regulating specific existing sources, the EPA believes it is reasonable to require meaningful engagement as part of the state plan development public participation process in order to further these objectives." "Additionally, CAA section 301(a)(1) provides that the EPA is authorized to prescribe such regulations ''as are necessary to carry out [its] functions under [the CAA].'' The proposed meaningful engagement requirements would effectuate the EPA's function under CAA section 111(d) in prescribing a process under which states submit plans to implement the statutory directives of this section." *Id*. at 74829.

API supports full and fair public process in the development and implementation of CAA programs, including state CAA § 111(d) programs. All affected entities should have a reasonable opportunity to know about and participate in the development of regulations that affect their interests. In that light, we offer the following comments on the proposed "meaningful engagement" requirement.

First, CAA § 111(d) states only that EPA shall establish a "procedure similar to that provided by section 7410 of this title under which each State shall submit to the Administrator a plan." This requirement to establish a "procedure" for "submit[ting] … a plan" unambiguously is directed only at the review and approval process as between the states and EPA and is not directed at the plan development process that must be followed by the state. In other words, CAA § 111(d) directs EPA to emulate only some of the CAA § 110 requirements – not all of them.

Thus, CAA § 111(d) does not allow EPA to impose upon the states any measures related to the process by which they develop their plans. It only provides authority to set up a process by which EPA reviews and approves the adequacy of standards of performance and the measures adopted by the states to implement and enforce such standards.

Second, to the extent that a "reasonable notice" standard applies to the development of state plans under CAA § 111(d), it is the states' responsibility to ascertain what is reasonable – not EPA's. CAA § 111(d) is one of many CAA provisions where Congress intentionally split responsibility between EPA and the states. Indeed, under this "cooperative federalism" scheme, "air pollution control at its source is the primary responsibility of States and local governments." CAA § 101(a)(3). In the earliest days of the CAA, the U.S. Supreme Court confirmed that the CAA "gives the Agency no authority to question the wisdom of a State's choices of emission limitations" if the limitations accomplish the goals of the CAA. *Train v. NRDC*, 421 U.S. 60, 79 (1975).

Implicit in the notion of cooperative federalism is that states not only have wide latitude to determine appropriate emissions limitations, but also have similarly wide latitude in the legal and regulatory processes by which such limitations are established. Thus, to the degree a "reasonable notice" obligation is imposed upon the states by CAA § 111(d), the states have primary authority and responsibility to determine how to implement this requirement. While EPA has responsibility to review and approve state programs, it may not require states to follow what it believes to be the most reasonable notice procedures. Instead, EPA must approve any state notice requirements that are facially reasonable, even if those are not the procedures EPA itself would have selected.

Third, even if EPA has authority to define what constitutes "reasonable notice" during the development of state plans, the proposed "meaningful engagement" requirement goes beyond what EPA may reasonably require. To begin, the term "notice" unambiguously means notification of those with interest in the matter at hand. The proposed requirements to engage with particular groups in particular ways (e.g., states must seek to overcome "barriers to participation" by "pertinent stakeholders") and make targeted outreach go well beyond the nominal statutory obligation of notification. EPA may "think [its] approach makes for better policy, but policy considerations cannot create an ambiguity when the words on the page are clear." *SAS Institute Inc. v. Iancu*, 138 S. Ct. 1348, 1358 (2018). Congress has imposed no explicit requirements and stated no intent in CAA § 111 or anywhere else in the CAA related accomplishing any particular environmental justice goals or outcomes. The word "notice" cannot carry as much meaning as EPA believes it should.

As for CAA § 301, it has long been understood that that provision does not "provide [EPA] Carte blanche authority to promulgate any rules, on any matter relating to the Clean Air Act, in any manner that the [EPA] wishes." *North Carolina v. EPA*, 531 F. 3d 896, 922 (D.C. Cir. 2008) (internal quotes and citations omitted). Here, CAA § 301(a)(1) is inapplicable because creating a new category of procedural requirements is not "necessary" for the Administrator "to carry out his functions under this chapter." CAA § 301(a)(1). As noted above, EPA's intentions are commendable. But the proposed "meaningful engagement" procedures are not "necessary" as that term is used in CAA § 301.

Lastly, EPA's proposed "meaningful engagement" procedures are are not adequately clear and objective. As noted above, Congress has not spoken in the CAA to the issue of environmental justice. EPA and interested parties are without guidance as to whether the issue should be addressed under the CAA and, if so, how.[99] Moreover, EPA's criteria for determining the adequacy of state "meaningful engagement" efforts are vague and EPA's authority under its proposed rules to accept or deny a state's efforts is not bounded by any readily objectively discernable principles. For example, how does EPA determine the manner of required engagement with any particular stakeholders? How does EPA decide what constitutes an actionable "linguistic, cultural, institutional, geographic, [or] other barrier" and, where such barriers are determined to exist, whether the state's proposed approach is sufficient? What measures are needed for state programs to be adequately inclusive? These are all weighty questions that the statute does not expressly address and that EPA leaves fundamentally uncertain in its proposed rule. As a result, the proposed rule is vague, unmoored to the statute, and unless corrected, would be arbitrary and capricious. *Motor Vehicle Mfrs. Assn. v. State Farm*, 463 U.S. 29, 43 (1983).

For these reasons, "meaningful engagement" should be encouraged by EPA but cannot be a required element of approvable state CAA § 111(d) programs.

12.3 EPA does not explain the legal basis for its proposal to empower third parties to conduct remote monitoring that may trigger enforceable obligations by affected facilities.

In the original proposal, EPA presented a preliminary concept that would "take advantage of the opportunities presented by the increasing use of [advanced methane detection systems] to help identify and remediate large emission events (commonly known as "super-emitters")" (86 FR 63177). EPA sought comment on "how to evaluate, design, and implement a program whereby communities and others could identify large emission events and, where there is credible information of such a large emission event, provide that information to owners and operators for subsequent investigation and remediation of the event." *Id*.

As we explained at the time, API concurs with the importance of identifying and addressing large emissions events. Emissions from such events have the potential to be much greater than those from normal operations at a given facility. API shares EPA's interest in seeking to reduce the incidence of such large emissions events.

We noted in our comments that the proposed "Super Emitter Response Program" was unique in that it would be the first time under the CAA that EPA asserts authority to create regulatory obligations for affected facilities based on monitoring conducted by unaffiliated third parties. We further noted EPA did not explain the legal basis for establishing such a requirement and explained that an explanation from EPA was essential to understanding whether such a novel provision is legally viable.

Unfortunately, the Supplemental Proposal does not provide the needed explanation. That failure to explain the legal underpinnings of such a key element of the proposal violates the CAA § 307(d)(3)(C) requirement to include as part of the proposed rule "the major legal interpretations underlying the proposed rule." If not cured, it also would render the final rule arbitrary and capricious because EPA would have failed to address and explain a key factor underlying this aspect of the final rule.

---

[99] It is notable that the 2022 "Inflation Reduction Act" included the most significant amendments to the CAA in decades and specifically targeted Environmental Justice concerns, yet Congress stopped short of amending CAA § 111 or the other existing substantive CAA programs to require or allow consideration of EJ. In other words, Congress expansively addressed EJ, but did so by providing copious funding to address the issue and chose not to create obligation or authority to otherwise address or consider EJ in implementing the existing CAA substantive programs.

To be sure, the Supplemental Proposal includes a lengthy discussion in the preamble called the "Statutory Basis of Super-Emitter Program" (87 FR 74752). For some four pages, EPA delves deeply into two explanations as to how it believes "the proposed super-emitter response program … fits within the EPA's authority under section 111 of the CAA." *Id*. In particular, EPA explains how the program might be justified by treating super-emitting events as an affected facility warranting a § 111 emissions standard and, alternatively, how the "super-emitter response program can be justified as part of the standards and requirements that apply to individual affected/designated facilities under this rule" (either as an added compliance assurance measure or as additional equipment leak work practices). *Id*. at 74752-4.

As for those suggestions, API disagrees with EPA's contention that it has authority to treat super-emitting events as an affected facility warranting a § 111 standard of performance. Rather, at most, EPA has the authority to consider identification of super-emitter events as "monitoring" for an affected facility. As such, super-emitters may only be regulated at facilities that already are subject to NSPS OOOOb or EG OOOOc for other reasons. In other words, if a thief hatch on an NSPS OOOOb storage vessel were left open, it could (if meeting the threshold – and subject to the legal concerns set forth below) be considered a super-emitter, and EPA could require corrective action to close the thief hatch. This would be similar for emissions above the threshold from an unlit flare or control device that is mandated by NSPS OOOOb or EG OOOOc (once applicable). However, a super-emitter cannot arise from equipment at a stationary source that is not already an affected facility.

In other words, if an aerial survey identified emissions from a thief hatch on a storage vessel that is not subject to NSPS OOOOb, and the storage vessel is not yet subject to EG OOOOc, then this cannot be a super-emitter affected facility subject to the regulations and for which an operator has to take corrective action. EPA's preamble appears to support this approach in several places, but does not specifically state this in the rule. Thus, as written, it appears that one could identify a super-emitter at a stationary source that has no affected facilities or from equipment that is not an affected facility. EPA has not justified that super-emitters – many of which are malfunctions – are or can be independently considered "affected facilities" under CAA § 111.

An in any event, nowhere in this lengthy discussion – nor in any other part of the preamble or supporting documents – does EPA explain where in the CAA it finds authority to empower third parties to submit monitoring information to an affected/designated facility that triggers regulatory obligations for the facility under the rule. The need for a legal explanation is particularly necessary here, given that this is the first time that EPA has sought to establish such a requirement under CAA § 111 or, to our knowledge, under the CAA as a whole.

We also note that EPA provides a lengthy discussion of the policy rationale that stands behind the proposed Super-Emitter Response Program, including an extensive explanation of how EPA believes that "[t]he design of the super-emitter response program ensures that the EPA will make all of the critical policy decisions and fully oversee the program." *Id*. at 74749-51. In EPA's view, "the qualified third party would essentially only be permitted to engage in certain fact-finding activities and issue fact-based notifications within the limited confines that EPA has authorized." *Id*. at 74750. Moreover, such notifications "originating from third parties would not represent the initiation of an enforcement action by the EPA or a delegated authority." These arguments indirectly speak to EPA's assertion of possible legal authority, but the policy rationale by itself cannot legally justify EPA's novel proposal to empower citizens to develop and submit information that triggers legal obligations for affected/designated facilities.

We lastly note that, in our comments on the original proposal, we explained that CAA § 304 expressly prescribes a role for citizens in CAA implementation by authorizing them to file civil lawsuits challenging alleged violations of, among other things, CAA § 111 emissions standards. We pointed out that Congress did not provide similar express

language in CAA § 111 or elsewhere in the CAA authorizing citizen monitoring as provided in the proposed super-emitter response program. In this context, the absence of such language should be construed as a limitation on EPA's authority to allow such monitoring and such an absence is not an implicit delegation of authority from Congress to EPA.

As a further note on the relevance of CAA § 304, that section prescribes strict criteria for obtaining injunctive relief to address alleged CAA violations – including prior notice, opportunity for the government to take the lead on an enforcement action, standing to bring an enforcement case, proof of liability, and sufficient rationale to support injunctive relief. The proposal runs counter to CAA § 304 by enabling citizens to obtain injunctive relief through the super-emitter response program (in this case, investigation, corrective action, root cause analysis, and related measures) without satisfying the procedural and substantive criteria that must be met to obtain such relief under CAA § 304.

12.4 The 100 kg/hr emissions threshold for defining a "super-emitter" is not adequately justified.

As a wholly different concern, EPA proposes to "define a super-emitter emissions event as any emissions detected using remote detection methods with a quantified emission rate of 100 kg/hr of methane or greater." *Id*. at 74749. While EPA provides a lengthy explanation of how that threshold was determined and why EPA believes it is appropriate, the overarching rationale is that the Agency believes that this threshold captures "very large emissions events." *Id*. Indeed, the term "super-emitter" clearly was coined to describe the intended scope of coverage.

Yet just a few months ago, when addressing essentially the same issue under Subpart W of the Greenhouse Gas Reporting Program, EPA proposed to establish a new reporting requirement for "other large release events," which EPA proposed to define as "events that release at least 250 mtCO_2e per event." 87 Fed. Reg. 36920, 36982 (June 21, 2022). In explaining its rationale for setting this threshold, EPA explains that, "[w]hile some sources covered by subpart W methodologies, such as equipment leaks, may represent ''malfunctioning'' equipment, these sources are ubiquitous across the oil and gas sector [and] are generally small." *Id*. The proposed 250 mt reporting threshold is intended to capture "large emissions events." *Id*. EPA derived the value by assessing "other emissions sources that [it] considered large." *Id*. The threshold was expressly designed to be considerably lower than the emissions rates estimated for the largest release events (e.g., Aliso Canyon or Ohio well blowouts), and compares favorably to a similar reporting requirement under Subpart Y for petroleum refinery flares. *Id*. at 36983.

Despite the obvious similarities between the proposed Subpart W large emissions event proposal and the proposed NSPS OOOOb and EG OOOOc super-emitter proposal, EPA fails to mention the Subpart W proposal when explaining in the NSPS OOOOb and EG OOOOc proposal its rationale for establishing the emissions threshold for super-emitting events. The omission is particularly striking given the significant differences between the two proposals as to what EPA believes to be a large-emitting event. For example, EPA proposes to apply a kg/hr metric in NSPS OOOOb and EG OOOOc versus an event-based metric for Subpart W. Additionally, the proposed NSPS OOOOb and EG OOOOc threshold of 100 kg/hr is facially much lower than the 250 mt per event threshold in Subpart W. The Subpart OOOOb and OOOOc proposal would define events as "super-emitting" that EPA in the Subpart W proposal dismisses as "ubiquitous" and "generally small."

Clearly, the two proposed rules are contradictory in many relevant aspects. EPA has not provided any explanation in the NSPS OOOOb and EG OOOOc original or Supplemental Proposals as to why the proposed definition of "super-emitter" makes sense in light of the proposed rules for large event release reporting under Subpart W.

Lack of such an explanation would render this aspect of the final NSPS OOOOb and EG OOOOc rule arbitrary and capricious. Moreover, even if EPA provides an explanation in the final rule, the definition of "super-emitter" is of central relevance to the Super-Emitter Response Program and, thus, failure to provide an opportunity for public notice and comment on its explanation would violate the CAA § 307(d) procedural rulemaking requirements.

12.5 EPA's proposed approach to reconciling the applicability of NSPS OOOO, OOOOa, OOOOb, and EG OOOOc is contrary to law and unreasonable.

In our comments on the original proposal, we noted that the proposal did not include any discussion or analysis of the complex issues surrounding the applicability of the various NSPS OOOO subparts. We pointed in particular to the complexities related to the fact that the various subparts do not completely overlap – Subpart OOOO applies only to volatile organic compounds (VOCs), Subparts OOOOa and OOOOb apply to VOCs and greenhouse gases (GHGs), and EG OOOOc applies only to GHGs. Also, the affected/designated facilities are not the same under these rules. We also highlighted the question of whether a source that is an affected facility that is regulated as a new source under an existing NSPS can also be an "existing" facility under a subsequent CAA § 111(d) rule. Another important omission was any citation or explanation/analysis by EPA of the applicable law.

The Supplemental Proposal does not resolve these issues. To be sure, EPA provides an explanation of how it believes "the proposed EG OOOOc [will] impact sources already subject to NSPS KKK, NSPS OOOO, or NSPS OOOOa." (87 FR 74716). But that explanation is fundamentally incomplete because EPA still does not provide any legal analysis explaining how or why its proposed analysis is required or allowed under the law. The full extent of EPA's legal discussion on this topic is the conclusory assertion that:

> *Under CAA section 111, a source is either new, i.e., construction, reconstruction, or modification commenced after a proposed NSPS is published in the Federal Register (CAA section 111(a)(1)), or existing, i.e., any source other than a new source (CAA section 111(a)(6)). Accordingly, any source that is not subject to the proposed NSPS OOOOb as described is an existing source subject to EG OOOOc.*

Id. at 74716.

That simple explanation does not provide sufficient detail on the key legal questions we presented in our prior comments. For example, EPA does not explain how the law requires or can be interpreted to require a source to be regulated as a "new" source under a prior NSPS and, at the same time, be regulated as an "existing" source under a subsequent CAA § 111(d) program. It is clear that EPA presumes that this is how the law works. For example, the Agency repeatedly asserts that Subpart OOOOc standards "would satisfy compliance with" previously applicable NSPS – clearly implying that both standards would apply. See *Id.* at 74716-8. But the Supplemental Proposal does not explain why this outcome (applicability of both new and existing source standards to the same affected/designated facility) must or may be prescribed under the law.

EPA's silence on this important matter is particularly pronounced because EPA has never taken the position a that previously applicable NSPS continues to apply to an affected facility that triggers the applicability of a subsequent standard. For example, VOC emissions from storage vessels are regulated under both Subpart OOOO and Subpart OOOOa. It is easily conceivable that a given storage vessel might have triggered Subpart OOOO because it was constructed one month after that standard was proposed and then subsequently triggered Subpart OOOOa because the storage vessel was modified two months after that standard was proposed. It is well understood that, in such a circumstance, the Subpart OOOO storage vessel requirements cease to apply after the corresponding

Subpart OOOOa requirements are triggered. The approach to reconciling applicability suggested in the Supplemental Proposal cannot be reconciled with EPA's historic practice.

More broadly, EPA fails in both the original and Supplemental Proposals to explain how the law must or can be construed to determine what standard applies to a given source when: (1) the source is regulated as a new source under a prior version of an NSPS (such as Subpart OOOO) and then triggers a subsequent version of that new source standard (such as Subpart OOOOa); (2) the source is regulated as a new source under an existing new source standard (such as Subpart OOOO or OOOOa) and is in existence when a subsequent Section 111(d) existing source standard is proposed (such as EG OOOOc) and subsequently take effect; and (3) a source is regulated as an existing source under a Section 111(d) standard (such as EG OOOOc) and is subsequently modified or reconstructed such that it triggers a corresponding new source standard (such as NSPS OOOOb).

In sum, EPA fails to acknowledge the complexities and ambiguities as to how the law applies to this situation and fails to provide relevant legal analysis on these points. Unless EPA corrects these problems, the final rule will be both procedurally flawed (for failure to satisfy the CAA § 307(d)(3) obligation for EPA to address in the proposed rule that major legal interpretations underlying the proposed rule and to provide an opportunity for public comment) and arbitrary and capricious (for failure to address key factors underlying applicability of the various subparts). We note the legal basis for the applicability scheme for these rules is an issue of central relevance because the scope of applicability is fundamental to proper implementation and coordination of these rules.

12.6 EPA must provide more flexibility for approving state programs.

The Supplemental Proposal includes a lengthy discussion of the approach and criteria by which EPA proposes to review and approve/disapprove state CAA § 111(d) existing source programs. We have comments and recommendations on several elements of EPA's proposed approach.

All of our comments flow from the fundamental guiding principle that EPA is required to approve state programs that satisfy CAA § 111(d) standard setting criteria and cannot approve state programs that do not meet those criteria.[100] EPA correctly sums up this principle when it states "that its authority is constrained to approving measures which comport with applicable statutory requirements" (87 FR 74826 n. 274). The problems with EPA's proposal regarding approval of state programs all are grounded in violations of this principle.

To begin, EPA exceeds its authority by seeking in many places to impose its own preferences on state programs rather than recognizing that it must approve any state program that meets the statutory criteria – even programs that include elements that EPA itself would not choose, but that objectively do meet statutory standard setting requirements. In other words, if a state program meets express statutory requirements or otherwise is grounded on a reasonable construction of statutory requirements, EPA has no choice but to approve the program.

For example, EPA repeatedly and wrongly asserts that its "presumptive standards" must be used to judge the adequacy of state programs. See, e.g., *Id*. at 74812 ("a state program must establish standards of performance that are in the same form as the presumptive standards"); *Id*. ("EPA is also proposing to interpret CAA section 111 to authorize states to establish standards of performance for their sources that, in the aggregate, would be equivalent to the presumptive standards"). Using EPA's presumptive standards as a measure of acceptability is wrong because a state's obligation under CAA § 111(d) is to establish standards of performance based on BSER.

---

[100] The only other state obligation is to satisfy the nominal procedural requirements that EPA establishes for submission, review, and approval of state CAA § 111(d) programs.

CAA §§ 111(a)(1) and (d)(1). EPA's "presumptive standards" do not constitute BSER. Rather, they represent EPA's notion of what emissions standard might reasonably satisfy EPA's BSER determinations. But the statute unambiguously provides that states have authority and responsibility to fashion a standard that meets BSER and is not limited to the "presumptive standard" that EPA thinks is best.

Notably, EPA clearly understands that is what the statute requires. EPA itself states that "Section 111(d) does not, by its terms, preclude states from having flexibility in determining which measures will best achieve compliance with the EPA's emission guidelines. Such flexibility is consistent with the framework of cooperative federalism that CAA section 111(d) establishes, which vests states with substantial discretion" (87 FR 74812). EPA's acknowledgment that it is the states' obligation to determine what measures "best" satisfy EPA's BSER determination is a correct statement of the law and contradicts the idea that EPA gets to decide what is "best" and impose that judgment on the states.

On a related note, EPA here indicates its commitment to faithfully implementing the "framework of cooperative federalism that CAA section 111(d) establishes," which necessarily requires EPA to defer to (and approve) state measures that satisfy the law, even when such measures do not satisfy EPA's own preferences. See also *Id*. at 74826 (EPA proposing to defer to the state's discretion to impose more costly controls). Yet on the other hand, a primary rationale for the proposed prescriptive measures for reviewing and approving/denying state programs is concern about inconsistency from state to state (e.g., *id*. at 74818 ("two states could consider RULOF for two identically situated designated facilities and apply completely different standards of performance on the basis of the same factors")) and the possibility that certain state programs will be less stringent than EPA believes they should be (e.g., *id*. at 74817 (lack of a clear framework might allow states to "set less stringent standards that could effectively undermine the overall presumptive level of stringency envisioned by the EPA's BSER determination and render it meaningless")). EPA cannot have it both ways – i.e., support state flexibility when it promotes EPA's preferred outcomes and discourage state flexibility when needed to achieve such outcomes. Such an inconsistent approach is facially arbitrary. It is easily resolved by allowing the state flexibility that EPA acknowledges to exist and, in any event, that is demanded by the statute.

Another flaw in EPA's approach is its proposal to give substantive meaning to the statutory obligation that it must approve state plans that are "satisfactory." CAA § 111(d)(2)(A). For example, EPA explains that "it is the EPA's responsibility to determine whether a state plan is "satisfactory" (87 FR 74818). EPA further explains that "the most reasonable interpretation of a ''satisfactory plan'' is a CAA section 111(d) plan that meets the applicable conditions or requirements, including those under the implementing regulations that the EPA is directed to promulgate pursuant to CAA section 111(d)." *Id*. See also *id*. at 74824 ("CAA section 111(d)(2)'s requirement that the EPA determine whether a state plan is ''satisfactory'' applies to such plan's consideration of RULOF in applying a standard of performance to a particular facility. Accordingly, the EPA must determine whether a plan's consideration of RULOF is consistent with section 111(d)'s overall health and welfare objectives.").

So, by EPA's reasoning, all elements of its CAA § 111(d) implementing regulations become mandatory state obligations because, if a state does not in EPA's eyes satisfy the regulations, the state program is not "satisfactory" to EPA. Similarly, EPA gets to decide whether a state plan is "satisfactory" based on EPA's judgment as to whether the plan meets EPA's conception of the "overall health and welfare objectives" of CAA § 111(d). In other words, EPA uses the term "satisfactory" to bootstrap its own policy and legal preferences into mandatory approvability criteria.

EPA's interpretation is inconsistent with the plain words of the statute and, in any event, unreasonably expands EPA's authority to prescribe or prohibit particular outcomes under state CAA § 111(d) programs. The statute

simply says that state plans must be "satisfactory." The word "satisfactory" naturally connotes that EPA must approve any state plan that meets the statutory standard setting criteria and that otherwise meet the nominal procedural rules that EPA is required to establish to guide submission and review/approval of state plans. The word "satisfactory" does not reasonably confer upon EPA the authority to demand particular outcomes (e.g., meeting EPA's self-determined "health and welfare objectives") or to impose substantive constraints not otherwise specified by CAA § 111(d). EPA's effort to give more meaning to the word "satisfactory" is inconsistent with the law and a misplaced effort to expand the Agency's authority under CAA § 111(d).

Lastly, EPA explains that when a state decides to establish a standard of performance based on consideration of remaining useful life and other factors, it must "determine and include, as part of the plan submission, a source-specific BSER for the designated facility" (87 FR 74821). EPA then prescribes criteria that the state must follow in determining BSER and setting a corresponding emissions standard. *Id*. This is the first time in this rulemaking (and, to our knowledge, the first time ever) that EPA has interpreted the statute as authorizing and requiring a state to conduct a BSER analysis under CAA § 111(d) rather than setting standards of performance based on an EPA BSER determination.

We agree with EPA that, when a state considers RULOF in setting emissions standards for a particular source or group of sources, it necessarily must conduct a BSER analysis as part of its analysis. When a state considers RULOF, EPA's own BSER analysis ceases to have meaning because fundamental elements of that analysis – such as the cost assessment and determination that a particular emissions control method is feasible or has been adequately demonstrated – cease to apply to the source(s) covered by the state RULOF analysis.

EPA asserts that "the statute requires the EPA to determine the BSER by considering control methods that it considers to be adequately demonstrated, and then determining which are the best systems by evaluating: (1) The cost of achieving such reduction, (2) any non-air quality health and environmental impacts, (3) energy requirements, (4) the amount of reductions, and (5) advancement of technology" and that "a state must also consider all these factors in applying RULOF for that source." *Id*. We agree that the statute requires the first three criteria to be considered in determining BSER. We agree that application of these criteria is consistent with the principle that state CAA § 111(d) plans must meet the statutory standard setting criteria. We do not agree that the statute specifies or requires that BSER also must be based on an assessment of "the amount of reductions" or "advancement of technology." A state has the discretion to consider these factors, but EPA cannot impose these factors on a state because the statute itself does not require that they be considered.

EPA goes on to assert that a state BSER analysis "must identify all control technologies available for the source and evaluate the BSER factors for each technology, using the same metrics and evaluating them in the same manner as the EPA did in developing the EG using the five criteria noted above." *Id*. We disagree. The state clearly must determine BSER based on the express statutory criteria. But the law does not require a state BSER analysis to "identify all control technologies available for the source," "use the same metrics," or provide an evaluation "in the same manner" as EPA used in developing its BSER analysis. These may represent EPA's preferred method of determining BSER, but nothing in the law requires a state to follow EPA's preferred method or authorizes EPA to reject a state standard that is based on a BSER determination that employs a different approach than EPA's.

12.7 EPA does not have authority to approve more stringent state programs that are based on consideration of remaining useful life and other factors.

In the original proposal, EPA offered an extensive explanation of why it now believes it has authority to approve state § 111(d) programs that are more stringent than would be required by application of the BSER determined by

EPA. That position is expanded in the Supplemental Proposal by EPA's assertion that "states may consider RULOF to include more stringent standards of performance in their state plans" (87 FR 74825). This position represents a complete reversal of the current Subpart B provision limiting application of "RULOF" to establishing less stringent measures (See 86 FR 63251).

EPA now asserts that the term "other factors" is ambiguous and that EPA "may reasonably interpret[] this phrase as authorizing states to consider other factors in exercising their discretion to apply a more stringent standard to a particular source" (87 FR 74825). Moreover, EPA now rejects the idea that the § 111(d) Subpart B variance provisions are relevant in interpreting the scope of the Agency's authority to approve more stringent standards based on consideration of RULOF. *Id*. EPA also rejects its prior analysis of the legislative history on the grounds that it provides no meaningful guidance to EPA. *Id*. at 74826. Lastly, EPA argues that its new interpretation is consistent with the purposes of CAA § 111(d) – i.e., "to require emission reductions from existing sources for certain pollutants that endanger public health or welfare." *Id*.

EPA's attempt to reverse its position here is misplaced and is not supported by the law. First, as we discuss above, the term "other factors" is not a carte blanche invitation from Congress for EPA to create whatever plausibly "reasonable" new authorities or constraints it might conceive. The term "other factors" must be interpreted in context. As EPA itself explains, the term "remaining useful life … is a factor that inherently suggests a less stringent standard." *Id*. In this context, it stands to reason that Congress intended the term "other factors" to be interpreted such that "other factors" are applied in the same way (to reduce rather than increase stringency). Because the term "other factors" is a catch-all phrase that follows the more specific instruction to consider a source-specific factor, the term "other factors" must be construed in this manner.

Second, EPA's position is grounded in its assertion that states are not required "to conduct a source-specific BSER analysis for purposes of applying a more stringent standard" because "[s]o long as the standard will achieve equivalent or better emission reductions than required by EG OOOOc, the EPA believes it is appropriate to defer to the state's discretion to, e.g., choose to impose more costly controls on an individual source." *Id*. at n. 273. At the same time, EPA correctly notes that "its authority is constrained to approving measures which comport with applicable statutory requirements." *Id*. at n. 274; see also *Id*. at 74813 (EPA may not approve and thereby "federalize" state programs that apply to pollutants and/or affected facilities not covered by Subpart OOOOc).

It is inconsistent and arbitrary for EPA to assert that a state must conduct a new source-specific BSER analysis if it wants to use RULOF to establish a less stringent standard than would be required under EPA's BSER determination (see *Id.* at 74821), while a state is not similarly constrained when establishing more stringent standards. EPA's assertion that a more stringent standard does not require a BSER analysis because it "will achieve equivalent or better emissions reductions than required by EG OOOOc" cannot be squared with the requirement that alternative state measures must "comport with applicable statutory requirements" – which in this case include the unambiguous requirement that BSER and corresponding emissions standards must be demonstrated in practice and cost effective. EPA's suggestion that it may defer to (and approve) more stringent state requirements simply because they are more stringent is wrong because that approach does not ensure that the more stringent standards meet the statutory standard-setting criteria.

12.8 The proposed well closure requirements are not needed as a practical matter and mostly beyond EPA's authority as a legal matter.

In the original proposal, EPA raised in concept the possibility of setting standards "to address issues with emissions from abandoned, or non-producing oil and natural gas wells that are not plugged or are plugged

ineffectively" (86 FR 63240). We explained in our comments that emissions from abandoned wells are not as great as EPA suggests and that issues related to well closure are more appropriately addressed by the states and BLM. We also explained that, if EPA decided to move ahead with such standards, the possibility of requiring a demonstration of financial capacity should not be a part of that proposed rule given EPA has no authority under the Clean Air Act to impose a financial assurance requirement.

In the Supplemental Proposal, EPA proposes regulations governing well closures in both NSPS OOOOb and EG OOOOc (87 FR 74736). The proposed rules closely track the concept outlined in the original proposal – including a requirement for developing and submitting a well closure plan within 30 days of the cessation of production from all wells at a well site, which must describe the steps that will be taken to close the well, proof of financial assurance, and a schedule for completing the closure. *Id*. Monitoring must be conducted after closure to demonstrate that there are no emissions from the closed well. *Id*. And changes in ownership must be reported on an annual basis during the life of a well. *Id*.

In light of this proposal, we reiterate our prior argument that the CAA does not grant EPA authority to impose financial assurance requirements.[101] We add that EPA did not respond to these comments in the Supplemental Proposal. We further note that EPA did not explain the legal basis for the proposed financial assurance requirements in either the original or Supplemental Proposal. Indeed, EPA cites no legal authority and provides no legal analysis for any aspect of the proposed well closure standards. Such an explanation is needed for such a key and novel aspect of this proposed rule so that interested parties have the opportunity to formulate and submit comments on EPA's legal rationale. CAA § 307(d)(3). The final rule will be procedurally deficient if EPA does not cure this problem.

Lastly, EPA provides little new evidence or arguments in the Supplemental Proposal as to why well closure standards are warranted. EPA appears to rely on the more extensive discussion provided in the original proposal. Notably, that discussion focuses on "abandoned wells" (i.e., "oil or natural gas wells that have been taken out of production, which may include a wide range of non-producing wells") "that are not plugged or are plugged ineffectively." (86 FR 63240). The discussion particularly targets "orphan wells" – i.e., those that have been abandoned and for which "there is no responsible owner." *Id*. EPA explains that the proposed well closure standards constitute a "potential strateg[y] to reduce emissions from these sources." *Id*. at 63241.

EPA explains in passing that states and other federal government agencies regulate well closures and have programs to address abandoned and orphan wells. Yet EPA does not conduct an in-depth assessment of these programs or make any attempt to distinguish how much of the perceived problem with abandoned or orphan wells relates to wells that pre-date the current federal and state programs versus wells that are regulated by such programs. In other words, EPA asserts that well closure standards are needed to address the problem of emissions from abandoned or orphan wells but does not determine that current state and federal programs are somehow deficient and, therefore, need to be supplemented by EPA standards going forward.

If EPA had delved more deeply into the current state of affairs, it would have seen that industry, states, and other federal government agencies are making great progress in addressing abandoned and orphaned wells. For example, the federal Bureau of Land Management highlights on its website its extensive regulatory and non-regulatory efforts to address orphan wells, including the hundreds of millions of dollars allocated by Congress in

---

[101] Comment 10.1.1 on page 40 in EPA-HQ-OAR-2021-0317-0808

the recent "Bipartisan Infrastructure Law" to support tribal, state, and federal efforts in this area. EPA does not even mention the Bipartisan Infrastructure Law in the original or Supplemental Proposals.

Before finalizing the proposed well closure standards, EPA needs to consider more closely the current regulatory landscape, the extensive non-regulatory measures focused on abandoned and orphaned wells, and the expansive voluntary efforts by industry to address this important issue. Those factors are critical to understanding whether EPA rules are needed and, if so, how they should be designed and implemented.

12.9 The Supplemental Proposal would impose unreasonable, impractical, and unduly burdensome certification requirements.

The applicability of several elements of the proposed rule depends on a certification of technical infeasibility that must be executed by a professional engineer or other qualified individual. Examples include the use of an emissions control device to handle associated gas (see, e.g., proposed § 60.5377b(b)(2)), the continued use of pneumatic pumps driven by natural gas (see, e.g., § 60.5393b(c)), and the use of emitting gas well unloading methods (see, e.g., §60.5376b(c)(2)(ii)(B)(2)). EPA imposes these certification requirements out of concern about the possible "abuse" of these provisions such that they might open a "loophole" in the regulations (87 FR 74776). EPA stresses that it, "wants to make it clear that in the case that such a certification is determined by the Agency to be fraudulent, or significantly flawed, not only will the owner or operator of the affected facility be in violation of the standards, but the person that makes the certification will also be subject to civil and potentially criminal penalties." *Id*. Thus, the proposal raises the serious prospect of individual, personal liability, not only for fraudulent certification, but also for technically erroneous (i.e., "significantly flawed") certifications.

As we discussed in our comments on the original proposal, we support these opt out provisions as a practical matter. We agree that non-emitting measures and methods should be used where they are technically feasible and cost effective. But EPA rightly understands that non-emitting approaches are not always practicable and that imposing an absolute requirement would constitute an unwarranted prohibition on necessary operations, such as liquids unloading, in many situations. The proposed alternative measures are a common-sense solution.

But our comments on the original proposal also expressed the concern that EPA has not asserted an adequate legal basis for identifying non-emitting techniques as BSER and establishing them as a standard, but at the same time creating opt outs. We pointed out that the need to allow for technical infeasibility exceptions to the proposed non-emitting standards indicates that the non-emitting standards are not permissible under CAA §111 because non-emitting standards are not "adequately demonstrated" if opt outs are needed to make them feasible and workable.

We reiterate those concerns about the legal basis for EPA's opt-out approach because onerous and potentially punitive certification requirements make the opt out approach even more legally tenuous. To begin, such certification requirements will significantly limit the situations where an opt out can be employed. As a result, what otherwise might be a reasonably viable alternative to an unworkable zero-emissions standard is unnecessarily complicated by strict certification requirements tied to an undefined standard that will be difficult to apply and limit the usefulness of the alternative. That heightens the concern that creating an opt out is unlawful circumvention of the obligation to demonstrate that BSER and the corresponding standards of performance are adequately demonstrated and cost effective.

Moreover, the proposed certification requirements are unreasonably onerous because, in each case, the certifying individual must essentially prove a negative – that the otherwise applicable zero-emissions approaches

are "technically infeasible." There is no definition of technical infeasibility in the proposed rules, but the words could be construed as setting an exceedingly high bar, such that a given non-emitting technique is "infeasible" based solely on a technical assessment of whether it can theoretically be physically applied in the given situation. So, for example, that might require a non-emitting technology to be applied because it is technically theoretically possible, even though it would be inordinately expensive. This outcome would not be lawful because it would violate the statutory requirement that BSER and the corresponding standard of performance must be cost effective.

And, in any event, a "technical infeasibility" standard allows for second guessing by regulators or citizen enforcers, which invites a "battle of the experts" in potential enforcement actions. All of this diminishes the possibility that the opts outs can be implemented with reasonable certainty.

Lastly, the express threat of possible personal liability on the part of certifiers surely will limit the number of individuals willing to make the needed certifications, particularly in light of the uncertainties described above about what will be needed as a practical matter to demonstrate "technical infeasibility." The clear opportunity and possibility of second guessing will be further material disincentives.

We provide here three recommended solutions to these problems. First, rather than creating opt outs that require case-specific certification, EPA should establish the opt outs in the final regulation as regulatory alternatives that may be employed if specified criteria in the rule are met. This is the usual method of prescribing standards of performance and regulatory compliance alternatives, and it would not be difficult for EPA to structure the rule in this fashion.

Second, as explained above, one of the legal flaws in EPA's opt-out scheme is that technical feasibility is the only governing criterion. The cost of implementing the default zero-emitting standard is not a consideration. As a result, the proposed opt-out approach unlawfully evades the obligation that cost must be considered in prescribing CAA § 111 standards of performance. This flaw is easily cured by including cost as a consideration in implementing the opt-out provisions.

Third, if EPA retains the requirement for case-specific certifications, EPA should revise the required certification. The proposed regulatory text of each certification includes the following sentence: "Based on my professional knowledge and experience, and inquiry of personnel involved in the assessment, the certification submitted herein is true, accurate, and complete." See, e.g., § 60.5377b(b)(2). This should be revised to specify that the certification is based on "reasonably inquiry," as is required for certifications under the Title V operating permit program. The revised certification could read as follows: "Based on reasonable inquiry, including application of my professional knowledge and experience and inquiry of personnel involved in the assessment, …." A "reasonable inquiry" standard would not shield a certifier from outright fraud but would provide more latitude for reasonable differences of opinion as to technical infeasibility.

12.10 EPA should not define and impose practical enforceability requirements without first developing a consistent approach for all EPA programs.

In the original proposal, EPA proposed "to include a definition for a 'legally and practicably enforceable limit' as it relates to limits used by owners and operators to determine the potential for VOC emissions from storage vessels that would otherwise be affected facilities under these rules" (86 FR 63201). EPA explained that "[t]he intent of this proposed definition is to provide clarity to owners and operators claiming the storage vessel is not an affected

facility in the Oil and Gas NSPS due to legally and practicably enforceable limits that limit their potential VOC emissions below 6 tpy." *Id*.

In our comments on that proposal, we urged EPA to defer final action on the proposed definition until such time as the Agency undertakes a broad-based rule that would provide a single, consistent approach across all affected CAA programs. Such an approach would prevent potential inconsistencies among the various CAA programs (e.g., an effective emissions limit used to avoid major New Source Review (NSR) permitting might, at the same time, not be effective for purposes of the OOOOb and/or EG OOOOc storage vessel standards); would avoid the possible implication that the "effectiveness" criteria established under EG OOOOc should be applied under other CAA programs (i.e., how can an emission limit be both effective and not effective at the same time), and allow EPA to establish reasonable transition rules so that affected sources and states have time to revise existing emissions limitations as needed to meet the new effectiveness criteria.

In addition, few existing sources have express emissions limitations for methane or GHGs. Yet, EPA has newly proposed a 20 tpy methane applicability trigger for the Subpart OOOOb and OOOOc storage vessel standards (in addition to the 6 tpy VOC trigger) (87 FR 74800). As a result, many potentially affected/designated facilities likely will seek to rely on VOC emissions limitations as a surrogate for methane emissions. The use of surrogates in establishing effective potential to emit (PTE) limits is another cross-cutting issue for which EPA should establish a unitary CAA approach rather than the proposed piecemeal, rule-by-rule approach.

We raise these issues again because EPA recently announced its intention to issue national guidance on establishing effective limits on potential to emit.[102] That effort appears to be driven by a July 2021 report from the EPA Inspector General that criticized the Office of Air and Radiation for not responding to a series of 1990's era D.C. Circuit decision that vacated or remanded the then "federal enforceability" criteria that applied across EPA's CAA regulatory programs.[103] EPA intends to issue national guidance by October 2023.

EPA's announced plan to establish national rules for effective limits on PTE and to do so in the relative near future lends strong additional support to our request that EPA should not address these issues in a premature and piecemeal fashion in the EG OOOOc rule.

13.0 Other General Comments

13.1 Due to the unreasonably short duration of the comment period for the Supplemental Proposal, API has been unable to respond to all of EPA's comment solicitations.

The proposed NSPS OOOOb and EG OOOOc are both complex rules that will apply to hundreds of thousands of facilities not previously subject to regulation under CAA. Because of the wide variety of conditions faced by these facilities, and the novel nature of a first ever existing source rule, many stakeholders requested an extension of the comment period in order to provide the agency with well-developed information necessary to promulgate an environmentally protective, technically feasible, and cost-effective rule. Concurrent with this rulemaking there are additional and overlapping regulatory developments on this subject matter including the Inflation Reduction Act Methane Emissions Reduction Program, EPA's Redesignation of Portions of the Permian Basin for the 2015 Ozone

---

[102] *NAAQS, Regional Haze & Permit Program Implementation Updates*, Presentation by Scott Mathias, Director Air Quality Policy Division, OAQPS, to AAPCA Fall Meeting (Sept. 29, 2022).

[103] *EPA Should Conduct More Oversight of Synthetic-Minor-Source Permitting to Assure Permits Adhere to EPA Guidance, Report No. 21-P-0175*, memorandum from Sean W. O'Donnell to Joseph Goffman (July 8, 2021) at 17.

National Ambient Air Quality Standards, EPA's Proposed Updates to the National Ambient Air Quality Standards for PM and the Bureau of Land Management's proposed Waste Prevention Rule that all must be reviewed in accordance with the overlapping aspects of these various actions.

To provide a complete set of comments on a rulemaking as broad, impactful, precedent setting, and complex as proposed within NSPS OOOOb and EG OOOOc, API requested an additional 60 days to gather information and submit comments. Not only did EPA decline API's and other stakeholders' reasonable request for a 60-day extension of the comment period, EPA did not grant even an additional two weeks as the Agency did for the initial proposal[104], which was smaller than the Supplemental Proposal. As we have stated in Comment 12.1*,* we recognize that every administration has the right to set and implement its regulatory agenda. Nevertheless, that this Administration would expedite issuance of the original proposed rule to align with COP26[105], delay issuance of the Supplemental Proposal to align with COP27[106], and then deny the request of pertinent stakeholders to have adequate time to provide fully-informed feedback to EPA, undermines this Administration's stated goals of reducing emissions in the service of political optics. API has developed as complete a set of comments provided herein as time has allowed. However, much of the information EPA requested, as well as additional information API wanted to provide, is not included herein due to the arbitrary and unnecessarily imposed timing constraints of the comment period for the Supplemental Proposal. We restate our industry's shared goal with EPA of reducing emissions from oil and natural gas operations across the value chain. We remain concerned that this Administration will rush to the completion of a final rule that is not cost-effective, technically feasible, or legally sound. We strongly encourage EPA to adopt the recommendations in our comments to enable the final rule to meet these critically important criteria.

13.2 EPA should reduce burden associated with the collective recordkeeping and reporting requirements.

Proposed NSPS OOOOb and EG OOOOc include onerous recordkeeping and reporting that exceed typical levels of compliance assurance and are a significant cost to operators to track and maintain. EPA should continue to focus on having operators track the most necessary information to obtain assurance.

In this proposal,

- EPA increased the recordkeeping and reporting requirements without adequately justifying increased costs with respect to the administrative burden these proposed changes would require, including numerous technical demonstrations and engineering statements. Increased costs associated with administrative burden are disproportional to benefit – because benefit is marginal when compared to other mechanisms that are already in place and proposed elsewhere in this rulemaking that focus on necessary information to assist in ensuring compliance.
- EPA continues to ignore the scale of affected/designated facilities that will become subject to these provisions over time, which is well over the tens of thousands.
- EPA has included reporting requirements that are outside the Agency's jurisdiction in requiring details on well ownership transfers.

---

[104] https://www.federalregister.gov/documents/2021/12/17/2021-27312/standards-of-performance-for-new-reconstructed-and-modified-sources-and-emissions-guidelines-for
[105] https://www.epa.gov/newsreleases/us-sharply-cut-methane-pollution-threatens-climate-and-public-health
[106] https://www.epa.gov/newsreleases/biden-harris-administration-strengthens-proposal-cut-methane-pollution-protect

API recognizes that it is appropriate to maintain sufficient records to demonstrate compliance. However, it is API's view that it is excessive to require such a significant level of detail to be both documented and submitted for all of the affected/designated facilities in this proposal. EPA should simplify the recordkeeping and reporting requirements to those that assure compliance without additional administrative burden. Only elements needed for compliance assurance should be requested within the annual report as supporting records retained by companies can be made available upon request from the Agency.

API has provided some initial comments on certain recordkeeping and reporting aspects of proposed NSPS OOOOb and EG OOOOc throughout this comment letter, but due to the short comment period have not had adequate time to fully assess the impact of what EPA has proposed. Some initial thoughts on the proposed draft reporting form template include the following:

- One initial concern is that many companies do not allow the use of workbooks containing macros as a cybersecurity measure and the current draft workbook contains macros. If the form is dependent on the macro formatting, this may be an issue for some reporters using the form.
- We do not support the reporting of additional information related to well transfers (including name, phone number, email, and mailing address) as proposed §60.5420b(b)(1)(v).
- The control device and closed vent system tabs are set up where multiple affected facilities that route to a single control device or through the same closed vent system cannot be identified on a single row. This will result in redundant and duplicate information being reported.
- Certain selection options for “Deviation Category” the “Description of Deviation” and “Type of Deviation” cells are automatically blacked out and do not allow an operator to provide additional context. The operator should have the ability to add free text in these areas and provide additional information as needed.

We will continue to review the recordkeeping and reporting requirements proposed within these rules along with the draft reporting form (EPA-HQ-OAR-2021-0317-1536_content) and continue to provide EPA feedback on ways to streamline the template.

13.2.1 CEDRI System Concerns

Our members have concerns with the practical implications with reporting through CEDRI when/if there is a system outage. Specifically, we request EPA evaluate the following language as proposed under NSPS OOOOb and EG OOOOc, but note these concerns also apply to NSPS OOOOa:

- §60.5420b(e)(2): We believe this paragraph should be removed or, at a minimum, be inclusive of the compliance end period and the compliance submittal date. Staff scheduling submittal may choose to do so prior to 5 days before the compliance submittal date. If EPA is requiring the use of the reporting form within CEDRI, then it should not be in deviation on the operator in any circumstance.

- §60.5420b(e)(4): The requirement for the reporter to notify EPA immediately upon discovery of an outage is unduly burdensome for the reporter. EPA should manage the reporting system and notify registered users of an outage.

- §60.5420b(e)(5)(iii): It is unclear what EPA is intending for a reporter to include as far as “a description of measure taken to minimize the delay in reporting”. EPA should be taking action to minimize the delay in reporting if there is a CEDRI system outage. The regulated entity has no additional recourse in this instance.

- §60.5420b(e)(6): System outage should warrant automatic claims to those submitting reports. Operators should not be penalized when the only method for submittal is not available and out of their control.

- EPA should implement a secure process, similar to EPA's e-GGRT program, to prevent those who are not owners or operators or are authorized representatives of an affected facility from submitting to CEDRI for any affected facility.

13.3 EPA should clarify its statements regarding the Crude Oil and Natural Gas source category and the extent of crude oil operations for purposes of this rulemaking.

Within proposed NSPS OOOOb and EG OOOOc the Crude Oil and Natural Gas source category is defined consistent with historical definitions finalized in NSPS OOOO and NSPS OOOOa:

> *Crude oil and natural gas source category means:*
>
> *(1) Crude oil production, which includes the well and extends to the point of custody transfer to the crude oil transmission pipeline or any other forms of transportation; and*
> *(2) Natural gas production, processing, transmission, and storage, which include the well and extend to, but do not include, the local distribution company custody transfer station.*

In footnote 301 (87 FR 74833), EPA states:

> 301 "*For purposes of the November 2021 proposal and this supplemental proposed rulemaking, for crude oil, the EPA's focus is on operations from the well to the point of custody transfer at a petroleum refinery, while for natural gas, the focus is on all operations from the well to the local distribution company custody transfer station commonly referred to as the ''city-gate''.*

We do not believe that EPA intends to regulate crude oil operations beyond the point of custody transfer from a well to a transmission pipeline and we request that EPA clarify and correct these statements in the final rule to align with the definition of the source category as proposed.

13.4 Applicability for Inactive sites and Reactivation of Inactive Sites

Many sites may periodically shut-in or depressurize all or partial equipment, where the entire site might be inactive or certain equipment might be inactive. We believe this is an appropriate criterion for exemption for all affected or designated facilities under NSPS OOOOb and EG OOOOc. At a minimum, we seek clarification as the status of inactive facilities and depressurized equipment as they pertain specifically to fugitive emission monitoring (Comment 2.5) and the retrofit of pneumatic controller and pneumatic pump provisions under EG OOOOc. We do not believe it is EPA's intent to require facilities that are not in active operations to retrofit the pneumatic controllers at the facility to non-emitting nor would it be appropriate for equipment that has been depressurized and inactive to be screened for fugitive emission monitoring.

Additionally, some inactive sites or equipment might be put back into service, where the applicability under NSPS OOOOb versus EG OOOOc must be delineated. One example is under *Pennsylvania's § 127.11a. Reactivation of sources*, which allows: *"a source which has been out of operation or production for at least 1 year but less than or equal to 5 years may be reactivated and will not be considered a new source if the following conditions are satisfied…".* EPA already has included language addressing this concept as it pertains to storage vessels. We

believe EPA should extend this concept to all affected and designated facilities. If a site that was inactive were to become active, there should be adequate time for the site to comply with the provisions within EG OOOOc.

13.5 The Social Cost of Greenhouse Gases

API shares the Administration's goal of reducing economy wide GHG emissions. And while API further appreciates EPA's decision to accept comments specifically on the EPA's SC-GHG Report, we have a number of questions and concerns about EPA's unilateral development of SC-GHG estimates, the anticipated role of these new estimates in Agency rulemaking, and the SC-GHG Report's apparent inconsistency with the Administration's stated intent to collaboratively and transparently develop and revise SC-GHG estimates through the Interagency Working Group ("IWG").

In Attachment B, API explains how EPA's development of the SC-GHG Report appears inconsistent with the approach to which the Biden Administration committed in E.O. 13990 and other administrative directives, and why those inconsistencies call into question the rationality, defensibility, and durability of both EPA's agency-specific estimates as well as the administration-wide estimates developed by the IWG. We also describe how EPA's SC-GHG Report contains almost no discussion reflecting that EPA examined reasonable alternatives in scientific literature to its various technical choices, reflects no meaningful consideration of relevant analyses and recommendations previously submitted by API and others, and therefore appears to be based on a selective and incomplete application of important substantive and procedural recommendations, including the full suite of recommendations that the National Academies of Science, Engineering, and Medicine provided to the IWG.

13.6 Cross Reference and other Minor Clarifications

Below are some cross reference and other typos we have identified within the prosed NSPS OOOOb and EG OOOOc regulatory text.

- Subpart OOOOc makes eight references to a §60.5933c, one of which gives its title as "Alternative Means of Emissions Limitation." However, there is no actual section in EG OOOOc with that number or title.
- §60.5413b(d)(11)(iii): *A manufacturer must demonstrate a destruction efficiency of at least 95.0 percent for THC, as propane. A control device model that demonstrates a destruction efficiency of 95.0 percent for THC, as propane, will meet the control requirement for 95.0 percent destruction of VOC and methane (if applicable) required under this subpart.*
- §60.5370b(a)(1)(iii) refers to §60.5385b(a)(3), which does not appear to exist.
- The additional citations should be checked for correct cross referencing: §60.5420b(c)(2)(ii)(B), §60.5410b(f)(2)(iv)(B), §60.5420b(b)(10)(vi), and §60.5420b(c)(12).

Attachment A

Responses to EPA Solicited Comments for Use of Optical Gas Imaging in Leak Detection

Responses to EPA Solicited Comments for Use of Optical Gas Imaging (OGI) in Leak Detection

VI.C OGI Monitoring Requirements – Specifying Dwell Time to Account for Scene Complexity

[T]he EPA is soliciting comment on how dwell time could be based on the scene while still accounting for the differences in the complexity of scenes or ways to create bins for “simple” and “complex” scenes.

Response: *The most intuitive method to differentiate between “simple” and “complex” scenes would be to base it on the number of components being imaged and viewing distance. An example of a “simple” scene would be a scene of 20-25 components viewed at a distance of < 15-25 feet. This approach offers a high probability of leak detection by a technician. The high probability of detection is supported by existing operating envelope testing conducted by camera manufacturers which demonstrated consistent image detection at these distances at delta-T as low as 2 degrees C. Moreover, the number of components being limited to 25 in a simple scene means a technician is likely to have great discernment or granularity of the image which improves their ability to detect image of a leak. “Complex” scenes would be when there are greater than 25 components or viewing distances greater than 25 feet.*

VI.C OGI Monitoring Requirements – Ensuring OGI Camera Operators Survey a Scene is Adequate Without Specifying Dwell Time

The EPA is also soliciting comment on ways to similarly achieve the goal of ensuring that OGI camera operators survey a scene for an adequate amount of time to ensure there are no leaks from any components in the field of view without specifying a dwell time.

Response: *The “simple” scene criteria offered previously ensures that a technician has optimum image detection consistent with operating envelopes of camera. Specifying a dwell time for these types of scenes would be irrelevant as the technician will be looking closely at the scene in their viewfinder looking to detect any imagery. Placing a constraint of dwell time would complicate their efforts and distract from their efforts at viewing the scene. A well-trained technician who consistently passes their performance audits will be expected to make a diligent and careful survey of the components in the scene.*

VI.C OGI Camera Operators – Performance Audit Frequency

The EPA believes that it is important to verify the performance of all OGI camera operators, even the most experienced operators, on an ongoing basis. Nevertheless, the EPA is requesting comment on whether there should be a reduced performance audit frequency for certain OGI camera operators, and if so, who should qualify for a reduced frequency, what the reduced frequency should be, and the basis for the reduced frequency.

Response: *The performance audit requirements can become a significant time-consuming activity for site(s) with large numbers of technicians in their survey crew. In the initial stages of OGI monitoring implementation, more frequent performance audits have a key role to play in ensuring technician efficacy. However, technician monitoring proficiency will increase quickly over time as their monitoring experience and time doing surveys increases. The*

agency's reference to the MTEC study clearly documented this to be the case. As such, for technicians who consistently have satisfactory performance audits, it is appropriate to extend the interval between audits for those technicians. A simple methodology to do so is to follow a "skip period" approach to performance audits. For technicians who pass four consecutive quarterly performance audits, then their audit interval should be extended to semi-annual. For technicians who pass two consecutive semi-annual performance audits, then their audit interval should be extended to annual. If a technician does not pass a semi-annual or annual audit or conduct a monitoring survey during the previous 12 months per Section 10.5 of Appendix K, then quarterly performance audits would be restarted.

VI.C OGI Surveys – Length of Survey Period

[T]he EPA has heard anecdotally that this may have more to do with the number of hours the OGI camera operator has surveyed during the day, such that it is more appropriate to limit the hours of surveying per day than it is to mandate rest breaks at a set frequency. The EPA is seeking any empirical data on the topic of the necessity of rest breaks when conducting OGI surveys or the link between operator performance and length of survey period.

***Response**: Fatigue potential is directly related to duration of continuous viewing through the camera and holding the camera in viewing position for extended periods. OSHA already has appropriate guidelines for ergonomics in the work place which include eye strain etc. Sites already have rigorous guidelines and safeguards for ergonomics, heat stress, etc. EPA should not attempt to develop regulatory standards for technician rest breaks. The agency should simply state that the monitoring plan incorporate appropriate rest breaks for technicians and simply state a rest break is required if the technician has been conducting a continuous viewing through OGI camera for 20 minutes or more. It is important to note that technicians would rarely have a 20-minute continuous viewing scenario. The primary monitoring method is to survey a component or scene for 1-2 minutes and then move to next location. When moving viewing locations, the technician would lower the camera to a neutral position and not be "viewing" though camera.*

VI.C Adequate Delta-T – OGI Camera

The EPA is proposing that the monitoring plan must describe how the operator will ensure an adequate delta-T is present to view potential gaseous emissions, e.g., using a delta-T check function built into the features of the OGI camera or using a background temperature reading in the OGI camera field of view. […] [A] commenter stated guidance should be added for operators who are using a background temperature reading in the OGI camera field of view. The EPA is requesting comment on ways that an OGI camera operator can ensure an adequate delta-T exists during monitoring surveys for cameras that do not have a built-in delta-T check function.

***Response:** The simplest and most straightforward way for a technician to ensure adequate delta-T is to utilize the camera's function to display the temperature of the equipment or background behind the component being surveyed for leaks. Most, if not all, OGI cameras in use for leak surveys have this ability currently. As such, if the technician knows the ambient temperature, then it is a simple step to add/subtract the background from ambient to determine delta-T. The elegance of this approach is it allows the technician to adjust their angles or take additional steps in*

real-time during the survey process to ensure the delta-T of the operating envelope is maintained during any survey step.

VI.C Daily OGI Camera Demonstration Prior to Imaging to Determine Maximum Distance for Imaging

[O]ne commenter suggested that instead of having different operating envelopes for different situations and having to decide which envelope to use, the OGI camera operator should conduct a daily camera demonstration each day prior to imaging to determine the maximum distance at which the OGI camera operator should image for that day. The EPA believes that this type of determination would be more difficult and costly than creating an operating envelope, as it would require OGI camera operators to have necessary gas supplies on hand and take time to do this determination daily, or potentially multiple times a day. Nevertheless, the EPA is requesting comment on this suggestion, as well as how such a demonstration could be used if conditions on the site change throughout the day, at what point would the changed conditions necessitate repeating the demonstration, and how changes in the background in different areas of the site (such as to affect the delta-T) would be factored into such a demonstration.

Response: *Use of pre-defined operating envelopes through testing as prescribed in Section 8.0 of Appendix K is a highly useful and pragmatic methodology to determine detection capability and restrictions for monitoring surveys. It is expected that most OGI camera manufacturers plan to have completed the development of the operating envelopes after Appendix K is promulgated. However, the option for a site to do a daily or site-specific distance check utilizing a known gas concentration and flow rate at actual metrological conditions prior to conducting monitoring surveys should remain an option for a site.*

The reasons for retaining an option for a daily distance check are two-fold. First, a site may be conducting monitoring surveys with an OGI camera that does not yet have established operating envelopes. This could occur for a site using an OGI camera new to market or simply that initial monitoring surveys are planned to improve emissions reductions potential prior to the manufacturer publishing operating envelopes. Second, a site may believe that monitoring conditions for a given survey or site are unique with respect to pre-defined operating envelopes and want to ensure that the guidance on delta T and distance are appropriately set for the technicians' survey task. It is logical to include this option in Appendix K.

With respect to changing conditions, technicians should already be trained in recognition of factors (e.g., meteorological conditions) which would impact the leak detection capability. When conditions are significantly different then the technicians should switch to another operating envelope or conduct another distance check verification. This is already adequately addressed in Section 9.2.3. language.

Comments for Appendix K

"Appendix K. The EPA is not including a requirement to conduct OGI monitoring according to the proposed appendix K for well sites or centralized production facilities, as was proposed in the November 2021 proposal. Instead, the EPA is proposing to require OGI surveys following the procedures specified in the proposed regulatory text for NSPS OOOOb (at 40 CFR 60.5397b) or according to EPA Method 21." [FR74723]

Comment: *This is the correct decision and recognizes the fundamental differences between upstream production and other industry sectors.*

Definition of fugitive emissions component. The EPA is proposing specific revisions to the definition of fugitive emissions component that was included in the November 2021 proposal. First, the EPA is proposing to add yard piping as one of the specifically enumerated components in the definition of a fugitive emissions component. While not common, pipes can experience cracks or holes, which can lead to fugitive emissions. The EPA is proposing to include yard piping in the definition of fugitive emissions component to ensure that when fugitive emissions are found from the pipe itself the necessary repairs are completed accordingly. [FR 74723]

Comment*:* *Cracks or holes in piping have never been considered fugitive components in any other rule for Leak Detection and Repair (LDAR) in any industry sector by the agency. These types of events represent potential loss of containment and are already repaired or corrected per industry practice and code.*

Definition of fugitive emissions component. Based on changes made and discussed under section IV.A.1.a.ii of this preamble, the EPA is proposing to define fugitive emissions component as any component that has the potential to emit fugitive emissions of methane or VOC at a well site, centralized production facility, or compressor station, including valves, connectors, pressure relief devices, open-ended lines, flanges, covers and CVS not subject to 40 CFR 60.5411b, thief hatches or other openings on a storage vessel not subject to 40 CFR 60.5395b, compressors, instruments, meters, and yard piping. [FR 74736]

Comment*:* *The agency has consistently set VOC and VHAP content criteria in all previous fugitive emissions component monitoring requirements. These thresholds were typically defined as "in VOC service" which specified 10% VOC as the appropriate level where the emission reduction potential from leaking components was cost-beneficial. The agency stated that no data had been offered to support a one percent methane threshold and that produced water and wastewater streams can be significant sources of emissions. In the cited reference document ''Measurement of Produced Water Air Emissions from Crude Oil and Natural Gas Operations.'' Final Report. California Air Resources Board. May 2020, it stated that concentrations of compounds in the liquid phase were the best prediction of expected air emissions. This is correct and makes the point of industry comment to set a definitive threshold where cost beneficial emissions can be expected. Emissions potential is directly related to the concentration of methane and/or hydrocarbon in the process stream. Small concentrations of VOC (<10 wt%) and methane do not represent significant emissions potential; a fact that the agency has recognized in multiple updates to fugitive emission regulations.*

The apparent agency approach was simply to set the threshold at a single molecule which is inconsistent with decades of regulatory approaches to fugitive emission control methodology. As the relative proportion of VOC or methane in the given component goes down, the cost effectiveness of LDAR gets increasingly less favorable until, when the amount of VOC or methane approaches zero, the cost effectiveness value approaches infinity. The agency must consider cost for BSER determination. The content threshold used within the agency's cost effectiveness analysis is unclear. Either the agency used the traditional threshold content approach for estimating the potential regulated component inventory or it has overstated the cost effectiveness through the overstatement of emissions potential from components with very small methane and VOC contents.

In the preamble, the agency stated that industry had offered no empirical data to not establish an appropriate threshold. The agency has not demonstrated why a 1% methane and 10% VOC threshold are not appropriate, or how meaningful and cost-effective emission reductions are achieved at levels below those proposed by industry. This demonstration was not met by the agency in their definition of "potential to emit" and therefore the agency has not justified their decision. The recommendation to set the definition to include the VOC threshold at 10% and methane at 1% is an appropriate good faith effort by industry to reduce emissions.

EPA proposed that where a CVS is used to route emissions from an affected facility, the owner or operator would demonstrate there are no detectable emissions (NDE) from the covers and CVS through OGI or EPA Method 21 monitoring conducted during the fugitive emissions survey. Where emissions are detected, the emissions would be considered a violation of the NDE standard and thus a deviation. [FR 74804]

Comment: *The agency has a long history and regulatory precedents for pressure relief devices in both NSPS and NESHAP standards. These standards mandate that closed-vent systems are monitored annually with 5/15-day repair criteria. Routine AVO monitoring rounds by unit operators is also a standard work practice. CVS piping and components have been consistently found to have low leak percentages which makes sense when one considers that most of these components remained in a fixed configuration (i.e.., car-sealed open) and there is little to no operating changes of the FECs.*

The agency proposed action to make any emissions detection a violation is also a departure from historical leak detection and repair regulatory standards. EPA stated that their logic was that the NDE requirement was an emission standard and as such it has to be a violation even if repair provisions were allowed. This is an inappropriate regulatory approach since the NDE requirement should be considered a work practice standard rather than a numerical emissions standard. The CVS and control device requirements are sufficient to ensure that NDE operating conditions are the norm. The fact that the agency has prescribed monitoring survey requirements indicates the agency knows this paradigm to be true. The most important aspect of leak detection is routine surveillance of components and piping at appropriate intervals with prompt repair to stop the leak. The current 5-15 day repair timelines achieves this fundamental precept of LDAR, and making any leak detection a violation is an unnecessary addition to the requirements that does not expedite repairs or provide environmental benefits. Violations occur when repairs are not completed per requirements and/or routine monitoring is not conducted on-time or efficaciously.

In addition to this bimonthly OGI monitoring requirement, the EPA is also proposing to require OGI monitoring of each pressure relief device after each pressure release, as it is important to ensure the pressure relief device has reseated and is not allowing emissions to vent to the atmosphere. The EPA is soliciting comment on this change from a no detectable emissions standard to a bimonthly monitoring requirement. Where the EPA Method 21 option is used, we are proposing quarterly monitoring of the pressure relief device in addition of monitoring after each pressure relief. A leak is defined as an instrument reading of 500 ppm or greater when using EPA Method 21. [FR 74807]

Comment: *The agency has a long history and regulatory precedents for pressure relief devices in both NSPS and NESHAP standards. The most recent and stringent precedent for PRDs is found in the Part 63 Subpart CC which*

requires monitoring post-release to verify re-seating of PRD. The agency has consistently followed this approach in other RTR evaluations which makes this approach inconsistent with agency's technical analysis.

Not requiring routine monitoring of PRDs makes sense if one considers that if PRDs are properly seated then they are assumed to be in non-venting condition. Monitoring post-release is sufficient to ensure the emission standard is maintained.

EPA is proposing a requirement to monitor the CVS at the same frequency (i.e., bimonthly OGI in accordance with appendix K or quarterly EPA Method 21) as other equipment in the process unit and to repair any leaks identified during the routine monitoring. [FR 74808]

Comment: *In existing and recently revised NSPS and NESHAP standards for closed vent systems and control devices, the agency has prescribed initial inspection and on-going annual AVO inspections. The agency indicated there would be no cost to do these surveys, but that is incorrect. The monitoring survey routes would have to be expanded to include the CVS piping/ductwork sections which increases labor costs based on increased technician field survey time.*

Appendix K

EPA is proposing to revise the scope and applicability for appendix K to remove the sector applicability and to base the applicability on being able to image most of the compounds in the gaseous emissions from the process equipment. The EPA is retaining the requirement that appendix K does not on its own apply to anyone but must be referenced by a subpart before it would apply. [FR 74837] (App K VI.B.1)

1.3 Applicability. This protocol is applicable to facilities when specified in a referencing subpart. This protocol is intended to help determine the presence and location of leaks and is not currently applicable for use in direct emission rate measurements from sources

Comment: *This change in applicability is the correct approach. However, consistent with previously submitted comments on the proposed rulemaking, we recommend EPA proceed expeditiously to amend part 63 subpart CC (RMACT 1) to allow use of OGI technology and Appendix K as an alternative to Method 21 for refineries. In the recent Refinery Sector Rulemaking, EPA proposed allowing for use of OGI as an alternative to Method 21, but did not finalize that proposal because "we have not yet proposed appendix K."*[107] *Adding OGI as an alternative to RMACT 1 would significantly reduce the refinery and Agency resources associated with preparing and reviewing Alternative Method of Emission Limitation or Alternative Monitoring requests to allow OGI for those facilities and allow refineries to take advantage of the improvements inherent in Appendix K versus the currently available leak detection and repair (LDAR) Alternative Work Practice (AWP) in Part 60 Subpart A (§60.18(g), (h) and (i)). Moreover, it would be important for EPA to amend other Part 60 and 63 standards to make Appendix K an option for industry sectors beyond refineries.*

---

[107] 80 *Fed. Reg.* 75191 (December 1, 2015)

6.1.2 The OGI camera must be capable of detecting (or producing a detectable image of) methane emissions of 17 grams per hour (g/hr) and either butane emissions of 5.0 g/hr or propane emissions of 18 g/hr at a viewing distance of 2 meters and a delta-T of 5 °Celsius (C) in an environment of calm wind conditions around 1 meter per second (m/s) or less, unless the referencing subpart provides detection rates for a different compound(s) for that subpart.

Comment: *The response factor for butane and propane are almost identical, why has the agency selected lower mass rate criteria for butane? It seems inconsistent with the language in Section 1.2 which allows for the average response factor approach with respect to propane.*

9.3 The site must conduct monitoring surveys using a methodology that ensures that all the components regulated by the referencing subpart within the unit or area are monitored. This must be achieved using one of the following three approaches or a combination of these approaches. The approach(es) chosen and how the approach(es) will be implemented must be described in the monitoring plan

Comment: *The language provided in the Appendix K revisions for monitoring survey methodology provides additional flexibility consistent with industry comments. However, as written, the methodology is limited to just three options without any ability for a site to propose an alternative. Technology and survey approaches are always being improved with new creative ideas coming to forefront all the time. For example, use of GPS in surveys is only a recent capability in the past few years. The agency should add language which allows a site to use another methodology as long as it meets the intent and capabilities of the ones currently identified. A site could propose an alternative to their delegated authority prior to use*

9.4.1 For a complex scene of components, the operator must divide the scene into manageable subsections and dwell on each angle for a minimum of 2 seconds per component in the field of view (e.g., for a subsection with 5 components, the minimum dwell time would be 10 seconds). It may be necessary to reduce distance or change angles in order to reduce the number of components in the field of view

Comment: *See comments provided on "simple" and "complex" scene approaches.*

9.7.2 A full video of the monitoring survey must be recorded. The video must document the monitoring results for each piece of regulated equipment. Leaking components must be tagged for repair, and the date, time, location of each leak, and identification of the component associated with each leak must be recorded and stored with the OGI survey records.

Comment *– This language could be read to imply a full continuous video of the monitoring survey would be required which is inconsistent with the language of Section 9.7.1 where only video or still imagery of the leaks are required. This language should be deleted or clearly state that sites may elect as alternative to simply save the full continuous video versus leak imagery only.*

9.8 The monitoring plan must include a quality assurance (QA) verification video for each OGI operator at least once each monitoring day. The QA verification video must be a minimum of 5 minutes long and document the procedures the operator uses to survey (e.g., dwell times, angles, distances, backgrounds) and the camera configuration.

***Comment** – As mentioned in previous comments to Appendix K proposals, the daily QA verification video is unlikely to offer much value to a monitoring program. The most effective methodology to ensure technician monitoring efficacy is comparative monitoring via periodic performance audits. The daily quality assurance (QA) verification video requirement should be deleted.*

10.2.2.1 A minimum of 3 survey hours with OGI where trainees observe the techniques and methods of a senior OGI camera operator (see definition in Section 3.0) who reinforces the classroom training elements.

10.2.2.2 A minimum of 12 survey hours with OGI where the trainee performs the initial OGI survey with a senior OGI camera operator verifying the results by conducting a side-by-side comparative survey and providing instruction/correction where necessary.

10.2.2.3 A minimum of 15 survey hours with OGI where the trainee performs monitoring surveys independently with a senior OGI camera operator trainer present and the senior OGI camera operator providing oversight and instruction/correction to the trainee where necessary.

***Comment:** The specific hourly requirement for each survey training phase is too restrictive and does not reflect how individuals learn and master new skills. Some technicians may need more or less time in a particular phase or benefit more from side-by-side or direct observation. A more appropriate approach is to specify a total of 30 hours of field survey hours which includes direct observation, side-by-side, and independent surveys without such prescriptive hourly content. As long as the 30 hours of training surveys includes an appropriate number of components to be surveyed (e.g., 300) and a final monitoring survey test, then the proficiency will be attained and verified.*

Attachment B

Comments on the U.S. Environmental Protection Agency's Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances

Comments on the EPA's Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances

I. INTRODUCTION

As an addendum to our comments on the U.S. Environmental Protection Agency's ("EPA's" or "the Agency's") Supplemental Notice of Proposed Rulemaking on the revised "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review" ("Proposed NSPS Revision"),[108] the American Petroleum Institute ("API") respectfully submits these additional comments on EPA's "Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances" ("SC-GHG Report").[109]

API represents all segments of America's oil and natural gas industry. Our over 600 members produce, process, and distribute the majority of the nation's energy. The industry supports millions of U.S. jobs and is backed by a growing grassroots movement of millions of Americans. API was formed in 1919 as a standards-setting organization. In our first 100 years, API has developed more than 700 standards to enhance operational and environmental safety, efficiency, and sustainability. API and its members are committed to delivering solutions that reduce the risks of climate change while meeting society's growing energy needs. Addressing this dual challenge requires new approaches, new partners, new policies, and continuous innovation.

API believes that the pace of global action to reduce greenhouse gas ("GHG") emissions and effectively mitigate climate change will be determined by government policies and technology innovation. To that end, we have laid out a Climate Action Framework[110] that presents actions we are taking to accelerate technology and innovation, further mitigate GHG emissions from operations, advance cleaner fuels, drive comparable and reliable climate reporting, and, importantly, endorse a carbon price policy.

The natural gas and oil industry is essential to supporting a modern standard of living for all by ensuring that communities have access to affordable, reliable, and cleaner energy, and we are committed to working with local communities and policymakers to promote these principles across the energy sector. Our top priority remains public health and safety, and companies often have well-established policies in place for proactive community engagement and feedback aimed at fostering a culture of trust, inclusivity, and transparency. We believe that all people should be treated fairly, regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies.

API shares the Biden Administration's goal of reducing economy-wide GHG emissions. And while API further appreciates EPA's decision to accept comments specifically on the Agency's SC-GHG Report, we have a number of questions and concerns about EPA's unilateral development of SC-GHG estimates, the anticipated role of these new estimates in Agency rulemaking, and the SC-GHG Report's apparent inconsistency with the Biden Administration's stated intent to collaboratively and transparently develop and revise SC-GHG estimates through the Interagency Working Group ("IWG").

---

[108] 87 Fed. Reg. 74,702 (Dec. 6, 2022).
[109] Docket ID No. EPA-HQ-OAR-2021-0317 (Sept. 2022).
[110] https://www.api.org/climate.

Indeed, API has for many years attempted to constructively engage the IWG in its development of SC-GHG estimates, and has submitted detailed comments on multiple previous IWG technical support documents, including the IWG's most recent "Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990" ("Interim TSD").[111] Those comments provided the IWG constructive and actionable recommendations to improve the transparency, rationality, defensibility, and thus, durability of its estimates of the SC-GHG, and urged caution on the inherently limited utility of SC-GHG estimates. Those comments also specifically recommended that the IWG publish proposals for, and accept public comment on, the recommendations the IWG was required to provide by September 1, 2021 regarding potential applications for the SC-GHG,[112] the additional recommendations the IWG was required to provide by June 1, 2022 for revising the processes and methodologies for estimating the SC-GHG,[113] and final SC-GHG estimates the IWG was supposed to publish "no later than January 2022."[114]

Insofar as API is aware, after publishing the interim SC-GHG estimates in 2021, the IWG has not completed any of the actions required by E.O. 13990 or taken any action in response to comments and recommendations submitted by API and other parties. Moreover, notwithstanding that EPA is a key participant in the IWG, EPA's unilateral development of the revised SC-GHG estimates in the SC-GHG Report is not only inconsistent with the approach President Biden committed to in E.O. 13990, it does not appear to reflect any consideration of the comments API and others provided to the IWG.

In the detailed comments that follow, API explains how EPA's development of the SC-GHG Report appears inconsistent with the approach to which the Biden Administration committed in E.O. 13990 and other administrative directives, and why those inconsistencies call into question the rationality, defensibility, and durability of both EPA's agency-specific estimates as well as the administration-wide estimates developed by the IWG. We also describe how EPA's SC-GHG Report contains almost no discussion reflecting that EPA examined reasonable alternatives in scientific literature to its various technical choices, reflects no meaningful consideration of relevant analyses and recommendations previously submitted by API and others, and therefore appears to be based on a selective and incomplete application of important substantive and procedural recommendations, including the full suite of recommendations that the National Academies of Science, Engineering, and Medicine ("National Academies" or "NASEM") provided to the IWG.

Although API appreciates EPA's willingness to accept comments on the SC-GHG Report, consistent with the National Academies' recommendations, we believe EPA should have transparently engaged and collaborated with interested stakeholders throughout its process to revise and update each of the four modules on which the SC-GHG Report based its revised estimates, rather than postpone comment until each modules had been updated and the SC-GHG Report had been fully drafted. Given the extent of the changes encompassed in EPA's SC-GHG Report and the extensive new data and analyses on which the report purports to be based, API believes that the current 69-day comment period is insufficient for soliciting detailed feedback from informed stakeholders, particularly given that this comment period encompassed multiple holidays.

API is similarly concerned that EPA's docket for this rulemaking does not include all of the studies and data on which EPA purports to have based its SC-GHG Report, and therefore fails to provide interested parties sufficient information on which to base detailed comments. This is a particular concern in a rulemaking conducted pursuant

[112] *See* 86 Fed. Reg. at 24,670.

[113] *See* E.O. 13990 at Sec. (5)(b)(ii)(D) and (E).

[114] *See* E.O. 13990 at Sec. (5)(b)(ii)(B).

to the Clean Air Act ("CAA" or "the Act") because of the CAA's enhanced requirement that EPA justify rules based solely on the record it compiles and makes public at the time of the proposal.[115]

Notwithstanding the forgoing, in Section III.b. below, API raises a number of significant technical questions and concerns about EPA's data selection, framing decisions, and modeling assumptions. As noted therein, it is critical the SC-GHG Report completely and transparently explain the precise basis for each of its analytical framing decisions because the SC-GHG estimates that EPA developed using the process described in the SC-GHG Report are highly sensitive to even modest changes to one or a few model choices and judgements.

Finally, in Section III.c, API describes why, regardless of whether they are developed by the IWG or EPA alone, inherent limitations in estimates of the SC-GHG significantly constrain their utility in rulemaking. As EPA seemingly recognizes based on its apparent intent to use the SC-GHG Report in the Regulatory Impact Analysis but not as part of its assessment of the Best System of Emissions Reduction ("BSER") in the Proposed NSPS Revision itself, SC-GHG estimates may only have utility with respect to broad considerations of costs and benefits in analyses under E.O. 12866, and not in rules that require the SC-GHG to be expressed as a single value or with a narrow range of uncertainty.[116]

II. BACKGROUND

As noted in EPA's SC-GHG Report, the SC-GHG represents "the monetary value of future stream of net damages associated with adding one ton of that GHG to the atmosphere in a given year."[117] This metric, which originally attempted to estimate the social cost of only CO_2 emissions, "was explicitly designed for agency use pursuant to E.O. 12866. . ."[118] Since it was signed by President Clinton in 1993, E.O. 12866 has directed agencies to "propose or adopt a regulation only upon a reasoned determination that the benefits of the intended regulation justify its costs."[119] And when the proposed action is deemed a "significant federal action," E.O. 12866 required agencies to coordinate with OMB's Office of Information and Regulatory Affairs ("OIRA") in the development of a formal cost-benefit analysis called a Regulatory Impact Analysis ("RIA"). Thus, the SC-GHG Report characterizes the SC-GHG as "the theoretically appropriate value to use when conducting benefit-cost analyses of policies that affect GHG emissions,"[120] and consistent with that characterization, EPA purports to only rely on the SC-GHG Report in the RIA it issued in support of the Proposed NSPS Revisions.[121]

Initially, federal agencies' consideration of CO_2 emissions in RIAs was sporadic and varied significantly between agencies.[122] When agencies did consider CO_2 emissions, they utilized a variety of different methodologies that

[117] SC-GHG Report at 4.

[118] Palenik Z. (2020). The Social Cost of Carbon in the Courts: 2013-2019. New York University Environmental Law Journal, 28(3), 393-428. Per E.O. 12866 Sec. 1(a): "Federal agencies should promulgate only such regulations as are required by law, are necessary to interpret the law, or are made necessary by compelling public need, such as material failures of private markets to protect or improve the health and safety of the public, the environment, or the well-being of the American people. . . . Further, in choosing among alternative regulatory approaches, agencies should select those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity), unless a statute requires another regulatory approach."

[119] E.O. 12866 at Sec. 1(a). When the proposed action is deemed a "significant federal action," E.O. 12866 required agencies to coordinate with OMB's Office of Information and Regulatory Affairs ("OIRA") in the development of a formal cost-benefit analysis called a Regulatory Impact Analysis ("RIA"). (E.O. 12866 at Sec. 6(a)(3)(C)). A "Significant regulatory action" is "any regulatory action that is likely to result in a rule that may: (1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; (2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency; (3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or (4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in [E.O. 12866]" (Sec. 3(f)).

[120] SC-GHG Report at 4.

[121] *See* 87 Fed. Reg. at 74,713.

[122] Palenik Z. (2020). The Social Cost of Carbon in the Courts: 2013-2019. New York University Environmental Law Journal, 28(3), 393-428.

resulted in a wide range of estimates, each with different ranges of uncertainty.[123] The government was consistent, however, in limiting use of these early estimates to RIAs, and in providing separate values for "domestic" and "global" impacts.[124] The government's consideration of CO_2 emissions became more frequent and consistent, however, after a 2008 Ninth Circuit decision remanded a fuel economy rule for failing to consider the potential benefit of CO_2 emission reductions, stating that "while the record shows that there is a range of values, the value of carbon emissions reduction is certainly not zero."[125] Subsequent court decisions on the necessity and method of considering CO_2 emissions for federal agency actions have been mixed.

To help federal agencies comply with E.O. 12866, "harmonize a range of different SC-CO_2 values being used across multiple Federal agencies,"[126] and "ensure consistency in how benefits are evaluated across agencies," President Obama established the IWG in 2009.[127] The IWG was tasked with developing "a transparent and defensible method, specifically designed for the rulemaking process, to quantify avoided climate change damages from reduced CO_2 emissions."[128] As such, from the beginning, the IWG's SC-GHG estimates were intended to provide consistency across federal government agencies exclusively for the development of RIAs for "significant regulatory actions" involving GHG emissions. Notably, [t]his does not apply to many routine agency actions that will produce GHG emissions."[129]

The IWG's November 2013 TSD represented the first time the IWG (through OMB) accepted comment on the SC-CO_2 estimates.[130] Although the IWG and OMB had finally agreed to accept comments, they did not provide any materials other than the most recent TSDs. Thus, comments submitted by API and others urged the IWG to select its Integrated Assessment Model ("IAM") parameters through a highly transparent, collaborative, and data-driven process because modest changes to just a few model inputs drastically changes the output of the IAMs and therefore the SC-CO_2 estimate.[131]

The IWG broadly responded to the comments it received on the 2013 TSD in July 2015.[132] In that response, the IWG reiterated that the "purpose of [the IWG's] process was to ensure that agencies were using the best available information and to promote consistency in the way agencies quantify the benefits of reducing CO_2 emissions, or costs from increasing emissions, in regulatory impact analyses."[133]

The IWG updated its estimates of the SC-CO_2 again in August of 2016[134], and while API and others continued to have concerns with the transparency and rigor with which the IWG selected its model inputs, the TSD for the 2016 SC-CO_2 reflected some improvement to the characterization of uncertainty that was consistent with the NASEM Phase

[130] OMB's first-ever solicitation of public comment on the SC-CO_2 estimates was likely in response to a September 4, 2013 multi-association Petition for Correction filed under the Information Quality Act ("IQA") and numerous demands from Congress and other stakeholders for increasing the transparency of the SC-CO_2 estimation process.

[131] *See* multi-association comments filed February 26, 2014 (OMB-2013-0007-0140). OMB's July 2015 Response to Comments did not provide the key information sought by API and others, and resisted recommendations that the IWG select these parameters through a transparent process subject to peer review. (*See* July 2015 Response to Comments: Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866.) To its credit, however, OMB requested feedback from the NASEM on the IWG's process for updating the estimates of the SC-CO_2. (*See* NASEM 2017 at 1).

[134] 2016a TSD.

1 Report,[135] as well as API's prior comments. Notably, in an addendum to the 2016 TSD, the IWG adapted its SC-CO_2 methodology to estimate social costs for methane and nitrous oxide for the first time.[136] While the 2016 TSD represented the first time the IWG provided estimates of non-CO_2 GHG emissions, the IWG continued to represent that the purpose of the estimates was to allow agencies to consistently "incorporate the social benefits of reducing . . . emissions into cost-benefit analyses of regulatory actions."[137]

Months later, President Trump disbanded the IWG and instead directed each agency to develop their own SC-GHG estimates using the same IAMs and the IWG's same overall methodology for estimating the SC-GHGs.[138] As the U.S. Department of Justice explained in its June 4, 2021 brief in opposition to several states' motion to preliminarily enjoin Section 5 of E.O. 13990, and the interim SC-GHG values published under E.O. 13990:

> Although the Trump Administration's policy approach to climate issues differed in many ways from that of the preceding administration, it continued to use standardized estimates of the social costs of greenhouse gases. Pursuant to E.O. 13783, EPA developed interim SC-CO_2 estimates by making two (*and only two*) changes to the Working Group's 2016 estimates: First, it began reporting estimates that attempted to capture only the domestic impacts of climate change, and second, it applied 3% and 7% discount rates. . . . Accordingly, although the Working Group had been disbanded, and although the estimates of the social costs of greenhouse gas estimates were now lower (because of higher discount rates and an exclusive focus on U.S.-domestic damages), agencies continued to estimate the social costs of greenhouse gases in their cost-benefit analyses, as ordered by the President, just as they had done in prior administrations.[139]

While these two changes[140] were seemingly modest, their impact on the SC-GHG estimates, was anything but small. When the Obama Administration conducted its RIA for the Clean Power Plan ("CPP") in 2015, it estimated social costs of $12, $40, $60, and $120 per short ton of CO_2 emissions for the 5%, 3%, 2.5%, and 95th percentile of the 3% discount rates for the year 2020 in 2011 dollars.[141] When the Trump Administration conducted its RIA for the review of the CPP in 2017, it estimated the SC-CO_2 to be $6 per metric ton in 2020 (also in 2011 dollars) at the 3% discount rate, and $1 at the 7% rate.[142]

> Thus, in the span of just two years, the same government agency, utilizing the 'best available science' put forth estimates for the same metric that had changed by so many orders of magnitude

[140] These changes flowed from E.O. 13783 ("when monetizing the value of changes in greenhouse gas emissions resulting from regulations, including with respect to the consideration of domestic versus international impacts and the consideration of appropriate agencies shall ensure, to the extent permitted by law, that any such estimates are consistent with the guidance contained in OMB Circular A-4.")

[141] U.S. EPA, EPA-452/R-15-03 Regulatory Impact Analysis for the Clean Power Plan (2015) at 4-2. (The four SC-CO2 estimates differ based on use of discount rates of 5%, 3%, 2.5%, and the ninety-fifth percentile distribution at the 3% discount rate. (See 4-6, 4-7).

[142] U.S. EPA, Regulatory Impact Analysis for the Review of the Clean Power Plan: Proposal (2017) at 44. The conversion factor for metric ton to short ton is approximately 0.91, such that these estimates were actually about 9% lower when compared to the Obama-era estimates (2017 CPP RIA at 44).

> as to be farcical. This was the case even though the Trump and Obama analyses utilized the same underlying models.[143]

Just a few years later, the IWG has republished the prior 2016 SC-GHG values as the new Interim SC-GHG estimates, and as instructed by E.O. 13990, these estimates "tak[e] global damages into account" and utilize discount rates that the IWG believes "reflect the interests of future generations in avoiding threats posed by climate change."[144] As a result, the Trump Administration's estimated SC-CO_2 values of $1 and $6 per metric ton in 2020 (in 2011 dollars)[145] increased to $14, $51, $76, and $152 per metric ton of CO_2 emissions for the 5%, 3%, 2.5%, and 95th percentile of the 3% discount rates for the year 2020 (in 2020 dollars).[146]

This whipsawing of SC-GHG estimates is not based on any objective errors or omissions. Indeed, the IWG and Trump Administration can both point to academic scholarship and regulatory guidance in support of their selections of discount rates and geographic scales. Rather, these divergent estimates demonstrate the extent to which any given estimate of the SC-GHG differs based on one or two subjective judgements. The output of the models is dependent on subjective framing decisions that "reflect ideology as much as they reflect the actual, long-term externality cost of climate change."[147] And because many of the key analytical framing decisions that truly drove model output are subjective and not purely scientific determinations, robust and transparent stakeholder and public engagement is essential.

As API urged in its comments on the 2021 TSD and reiterates here, the sensitivity of SC-GHG modeling output to one or a few subjective inputs raises serious questions of the SC-GHG estimates' reliability and utility in rulemaking and policy analyses. It also illustrates the profound importance of adopting analytical framing decisions through a structured and predictable process that is open, transparent, and data-driven. While EPA may have valid reasons for unilaterally developing its own SC-GHG estimates, API is concerned that this unexplained deviation from the SC-GHG estimation and updating process that was historically consigned and recently re-entrusted to the IWG reflects another *ad hoc* estimation approach that lacks the necessary structure, consistency, and transparency.

Moreover, given that EPA's SC-GHG Report contains the most recent estimate of the SC-GHG provided by the federal government, API is concerned that other federal agencies may opt to rely on the estimates in the EPA's SC-GHG Report rather than the estimates in the IWG's 2021 Interim TSD. While this concern is somewhat mitigated by E.O. 13990's requirement that agencies use the IWG's values, the absence of any clear statement from EPA as to what the SC-GHG Report is or how its estimates are to be used perpetuates a serious concern that EPA's values may be misapplied in a variety of different regulatory and administrative contexts.

III. DETAILED COMMENTS

API is concerned about the procedures EPA employed when developing the SC-GHG Report and the revised estimates contained therein. We also have substantive technical questions and concerns about the methodology EPA employed in generating the revised SC-GHG estimates and the manner in which the Agency presented its

[147] Taylor, A. (2018). Why the Social Cost of Carbon is Red Herring. Tulane Environmental Law Journal, 31(2), 345-372, 370. [T]hose who would consider inclusion of IAM-generated estimates, particularly high-dollar ones, of the SCC to be an unmitigated success should nonetheless pay heed to the crow on the shoulder: a high degree of arbitrariness is currently baked into these estimates and it is quite difficult to know the degree to which they may be relied upon for accuracy or manipulated by agencies across different administrations.

estimates in the SC-GHG Report. Finally, API believes that EPA should more fully and explicitly explain why the inherent limits of the SC-GHG estimates render them unsuitable for agency rulemaking and decisions that require the SC-GHG to be expressed as a single value or within a reasonably narrow range of uncertainty. The subsections that follow discuss each of these three broad areas of concern in detail.

a. Procedural Concerns

As President Biden noted in Executive Order 13990 ("E.O. 13990") on his first day in office, "[a]n accurate social cost is essential for agencies to accurately determine the social benefits of reducing greenhouse gas emissions when conducting cost-benefit analyses . . ."[148] To that end, E.O. 13990 further instructed that, in undertaking actions such as developing SC-GHG estimates, "the Federal Government must be guided by the best science and be protected by processes that ensure the integrity of Federal decision-making.[149] Consistent with that mandate, President Biden also issued a Presidential Memorandum to all heads of executive departments and agencies reaffirming the Biden Administration's commitment to the principles outlined in President Clinton's Executive Order 12866 ("E.O. 12866")[150], which established the basic foundation for executive branch review of regulations, and President Obama's Executive Order 13563 ("E.O. 13563"),[151] which "took important steps toward modernizing the regulatory review process."[152]

Thus, through the Regulatory Review Memorandum, President Biden reaffirmed his administration's commitment to "allow for public participation and an open exchange of ideas;"[153] using "best available techniques to quantify anticipated present and future benefits and costs as accurately as possible;"[154] and ensuring "the objectivity of any scientific and technological information and processes used to support . . . regulatory actions."[155]

One week later, President Biden reiterated to his executive departments and agency heads that "[i]t is the policy of my Administration to make evidence-based decisions guided by the best available science and data."[156] According to the President Biden's Scientific Integrity Memorandum, "[w]hen scientific or technological information is considered in policy decisions, it should be subjected to well-established scientific processes, including peer review where feasible and appropriate. . ."[157]

API supports the principles President Biden outlined in these Executive Orders and presidential memoranda, and believes that certain aspects of EPA's development of SC-GHG estimates, such as taking public comment and committing to peer review, are broadly consistent with these principles. In other respects, however, EPA's development of the SC-GHG Report thus far appears to be the product of an insufficiently structured and transparent process.

Indeed, EPA's SC-GHG Report represents an unexplained departure from the more structured, transparent, and collaborative interagency process that the Biden Administration promised when it encouraged stakeholders

[157] Scientific Integrity Memorandum preamble.

interested in the SC-GHG development process to engage with the IWG. EPA's SC-GHG Report reflects no consideration of the comments API and others submitted to the IWG, and the limited data and time that EPA has provided at this stage does not appear consistent with a strong Agency interest in soliciting critical analysis. Furthermore, EPA's curious solicitation of comments on the SC-GHG Report within an NSPS rulemaking, which does not utilize the SC-GHG Report, does not particularly reflect an interest in transparency and collaboration. In fact, EPA's equivocal and fluctuating descriptions of the SC-GHG Report make it impossible for the public to even understand why EPA drafted the SC-GHG Report in the first place, or how the Agency intends to use it.

1. Lack of Clarity Regarding What the SC-GHG Report is and how it will be used

In both the preamble to the Proposed NSPS Revisions and the RIA in EPA's docket for the Proposed RIA Revisions ("Docketed RIA"), EPA concludes that the IWG's "interim SC-GHG estimates represent the most appropriate estimate of the SC-GHG until revised estimates have been developed reflecting the latest, peer-reviewed science."[158] Therefore, the Agency "estimated the climate benefits of methane emission reductions expected from this proposed rule using the social cost of methane (SC-CH_4) estimates presented in the [IWG's 2021 TSD]."[159]

Having disclaimed that the RIA estimated the climate benefits of the proposal's anticipated methane reductions using only the interim SC-GHG estimates from the IWG's 2021 TSD, EPA's preamble to the Proposed NSPS Revisions then describes the SC-GHG Report as "a sensitivity analysis of the monetized climate benefits using a set of SC-CH_4 estimates that incorporates recent research addressing recommendations of the National Academies of Sciences, Engineering, and Medicine."[160] According to EPA's preamble, the RIA presents the results of the SC-GHG Report's screening analysis in "Appendix B of the RIA."[161] However, the Docketed RIA does not include the sensitivity analysis EPA described in the preamble, nor does it contain any reference to, or even mention of, the SC-GHG Report.

Earlier versions of the RIA that were exchanged between and edited by EPA, OMB, and other agencies reflect that the RIA previously contained a substantial discussion of the SC-GHG Report and also included EPA's new estimates from the SC-GHG Report in a sensitivity analysis in a then-designated Appendix B.[162] These aspects of the draft RIA were deleted in their entirety without explanation shortly before publication of the Proposed NSPS Revisions. However, and particularly problematic from the perspective of transparency in public engagement as well as EPA's docket and rulemaking requirements under CAA Section 307, the version of the RIA that EPA posted on its website for public comment on November 11, 2022 contains the subsequently deleted discussion of the SC-GHG Report and Appendix B sensitivity analysis.[163] Thus, EPA is presently soliciting comments on two strikingly different versions of the Draft RIA. Indeed, while it is beyond the scope of this appendix's specific focus on EPA's SC-GHG Report, the Agency's publication of two divergent Draft RIAs raises significant questions about the sufficiency of the notice-and-comment opportunity on the required E.O. 12866 analysis as well as the Proposed NSPS Revisions.

While EPA's last minute revisions to the RIA remain unexplained, what is clear from the Docketed RIA is that EPA's SC-GHG Report is not a sensitivity analysis, and that the report's revised SC-GHG estimates are not amenable for use in sensitivity analyses. EPA's "Sensitivity and Uncertainty Analyses: Training Module" describes a "sensitivity analysis" as "a method to determine which variables, parameters, or other inputs have the most influence on the

[163] *See* https://www.epa.gov/environmental-economics/scghg.

model output."[164] Consistent with this description, EPA's Training Module explains that "[t]here can be two purposes for conducting a sensitivity analysis [1] comput[ing] the effect of changes in model inputs on the outputs; [2] to study how uncertainty in a model output can be systematically apportioned to different sources of uncertainty in the model input."[165]

EPA's SC-GHG Report and the SC-GHG estimates contained therein are in no way suited to these purposes. The estimates in EPA's SC-GHG Report were derived in a manner wholly different from the IWG's SC-GHG estimates. For each of the four modules of the SC-GHG estimation process - socioeconomics and emissions, climate, damages, and discounting – EPA's SC-GHG Report uses different models, methodologies, analytical framing decisions, and data than the IWG utilized. As detailed in the Executive Summary to the SC-GHG Report:

> The socioeconomic and emissions module relies on a new set of probabilistic projections for population, income, and GHG emissions developed under the Resources for the Future Social Cost of Carbon Initiative . . . The climate module relies on the Finite Amplitude Impulse Response (FaIR) model… The socioeconomic projections and outputs of the climate module are used as inputs to the damage module to estimate monetized future damages from temperature changes. Based on a review of available studies and approaches to damage function estimation, the report uses three separate damage functions to form the damage module. They are: 1. a subnational-scale, sectoral damage function… 2. a country-scale, sectoral damage function… and 3. a meta-analysis-based damage function… The discounting module . . . us[es] a set of dynamic discount rates that have been calibrated following the Newell et al. (2022) approach, as applied in Rennert et al. (2022a, 2022b). … Uncertainty in the starting rate is addressed by using three near-term target rates (1.5, 2.0, and 2.5 percent) based on multiple lines of evidence on observed market interest rates. … Finally, the value of aversion to risk associated with damages from GHG emissions is explicitly incorporated into the modeling framework following the economic literature. The estimation process generates nine separate distributions of estimates – the product of using three damage modules and three near-term target discount rates – of the social cost of each gas in each emissions year. To produce a range of estimates that reflects the uncertainty in the estimation exercise while providing a manageable number of estimates for policy analysis, in this report the multiple lines of evidence on damage modules are combined by averaging the results across the three damage module specifications.[166]

Every aspect of the above-described estimation process differs from the process employed by the IWG. And, because every aspect of EPA's SC-GHG estimation process differed from the IWG's process, it does not allow EPA "to determine which variables, parameters, or other inputs" in the IWG's estimation process "have the most influence on the model output." Examining two wholly different estimation processes does not provide any basis to discern how any of the IWG's inputs may impact the IWG's model output or apportion uncertainty to the IWG's various inputs.

"Sensitivity analyses" require the isolation and examination of one or a few model inputs while all other model parameters remain constant. For instance, in the 2021 TSD, the IWG advised that "agencies may consider

---

[164] *See* https://archive.epa.gov/epa/measurements-modeling/sensitivity-and-uncertainty-analyses-training-module.html#:~:text=Sensitivity%20analysis%20(SA)%20is%20the,)%20(EPA%2C%202003).

[165] *See* https://archive.epa.gov/epa/measurements-modeling/sensitivity-and-uncertainty-analyses-training-module.html#:~:text=Sensitivity%20analysis%20(SA)%20is%20the,)%20(EPA%2C%202003).

[166] SC-GHG Report at 1-2.

conducting additional sensitivity analysis using discount rates below 2.5 percent."[167] Consistent with EPA's Training Module and standard practices for conducting sensitivity analyses, the IWG instructed that agencies' sensitivity analyses should isolate a single input (the discount rate) in order to assess the impact of changes from that single input on the model output.

The estimates in EPA's SC-GHG Report are simply new estimates based on new methods and data, and they therefore plainly have no value in any scientifically relevant sensitivity analysis. Indeed, what EPA deemed a "Screening Analysis" in the since-deleted sections of the Docketed RIA was not a screening analysis at all, at least as defined by EPA's Training Module. EPA merely compared the values from the IWG's 2021 TSD to EPA's SC-GHG Report and found that the benefits estimated in EPA's SC-GHG Report were higher than the IWG's 2021 interim estimates. This is truly the full extent of EPA's use of the SC-GHG Report for a "sensitivity analysis," which perhaps explains the Agency's decision to strike those references from the Docketed RIA.

Recognizing that neither EPA's SC-GHG Report nor the estimates contained therein constitute, or can credibly be used in sensitivity analyses, one is compelled to recognize the SC-GHG Report's estimates for what they are – SC-GHG values that are wholly separate and distinct from the 2021 IWG interim SC-GHG estimates that the Biden Administration directed all agencies to use. In fact, the SC-GHG Report itself never suggests its estimates are intended or even suitable for sensitivity analyses. The SC-GHG Report accurately describes them as "new estimates of the SC-GHG."[168]

Indeed, the SC-GHG Report's estimates are "new estimates of the SC-GHG," but given EPA's deletion of the supposed "sensitivity analysis" and assertion that the SC-GHG Report's estimates were not used in the RIA or the "statutory [best system of emissions reduction] determinations" in the Proposed NSPS Revisions,[169] commenters are left with no explanation why EPA developed the SC-GHG Report, how EPA intends to use the report's estimates, or why EPA included the SC-GHG Report in the docket for the Proposed NSPS Revisions. A truly transparent and collaborative process demands much more than this. EPA should provide a full and complete explanation for the development and intended use of the SC-GHG Report before subjecting it to peer review or public comment. Absent any explanation of the SC-GHG Report's intended use, reviewers have little basis to opine on its suitability.

2. Inconsistency with the Biden Administration's Stated Approach to the SC-GHG

From the earliest days of his Administration and consistently thereafter, President Biden and other Administration officials publicly committed to developing and updating government-wide SC-GHG estimates through the IWG by prescribing a detailed and incremental process. Based on the Administration's representations, API and other stakeholders devoted significant time and resources attempting to engage the IWG, but the rigorous and transparent IWG process that the Biden Administration promised has not yet materialized in any meaningful way. Now, more than two years after the IWG released its first and only publication of the several it had been charged with developing, EPA appears to be charting its own course by developing its own agency-specific SC-GHG estimates in the SC-GHG Report.

As discussed in more detail below, EPA's independent development of SC-GHG estimates is incompatible with and, in fact, undermines the unified approach promised by the Biden Administration in E.O 13990. We also describe

---

[167] 2021 TSD at 4; *See also* 2021 TSD at 21 ("the IWG finds it appropriate as an interim recommendation that agencies may consider conducting additional sensitivity analysis using discount rates below 2.5%.").

[169] 87 Fed. Reg. at 74,843.

why EPA's unilateral SC-GHG estimates and any subsequent proliferation of agency-specific SC-GHG estimates contravene the Administration's stated interest in assessing the benefits and costs of proposed regulations consistently and cohesively across all federal agencies.

i. President Biden's Promised Approach for the Development and Agency use of SC-GHG Estimates

After the Trump Administration disbanded the IWG, President Biden on his first day in office issued E.O. 13990, which reestablished the IWG as the federal entity charged with developing and publishing the SC-GHG estimates that are to be used by all federal agencies.[170] The IWG's mission is fivefold:

> (A) publish an interim [SC-GHG] within 30 days of the date of this order, which agencies shall use when monetizing the value of changes in greenhouse gas emissions resulting from regulations and other relevant agency actions until final values are published;
>
> (B) publish a final [SC-GHG] by no later than January 2022;
>
> (C) provide recommendations to the President, by no later than September 1, 2021, regarding areas of decision-making, budgeting, and procurement by the Federal Government where the [SC-GHG] should be applied;
>
> (D) provide recommendations, by no later than June 1, 2022, regarding process for reviewing, and, as appropriate, updating, the [SC-GHG] to ensure that these costs are based on the best available economics and science; and
>
> (E) provide recommendations, to be published with the final [SC-GHG] under subparagraph (A) if feasible, and in any event by no later than June 1, 2022, to revise methodologies for calculating the [SC-GHG], to the extent that current methodologies do not adequately take account of climate risk, environmental justice, and intergenerational equity.[171]

Insofar as API is aware, the IWG has only completed the first of the five tasks prescribed by E.O. 13990.[172] Regarding these interim estimates, the E.O. mandates that "agencies ***shall*** use" them in promulgating their own "regulations and other relevant agency actions until final values are published."[173] Thus, although it is unclear why EPA developed the SC-GHG Report and how the Agency intends its SC-GHG estimates to be used, it bears mentioning that agencies deviating from these interim estimates do so in contravention with E.O. 13990.

The requirements of E.O. 13990 are also memorialized in the 2021 Interim TSD, which describes President Biden's directive that the reconstituted IWG "ensure that SC-GHG estimates used by the U.S. Government (USG) reflect the best available science and the recommendations of the National Academies (2017)…"[174] Consistent with the Executive Order, the IWG plainly recognized that the SC-GHG estimates it developed were to be used throughout the "U.S. Government," unless expressly precluded by statute.[175]

[170] E.O. 13990 at Sec. 5.

[171] E.O. 13990 at Sec. 5(b)(ii).

[172] 2021 TSD.

[173] E.O. 13990 at Sec. 5(b)(ii)(a) (emphasis added).

[174] 2021 TSD at 3.

[175] Social Cost of Greenhouse Gas Emissions: Frequently Asked Questions (FAQs), ("OIRA Guidance") at 2, June 3, 2021. Available at https://www.whitehouse.gov/wp-content/uploads/2021/06/Social-Cost-of-Greenhouse-Gas-Emissions.pdf.

The IWG's Interim TSD goes on to instruct that the Interim SC-GHG estimates "should be used by agencies until a comprehensive review and update is developed in line with the requirements in E.O. 13990."[176] The Interim TSD also "determined that it is appropriate for agencies to revert to the same set of four values drawn from the SC-GHG distributions based on three discount rates (2.5 percent, 3 percent, and 5 percent) as were used in regulatory analyses between 2010 and 2016 and subject to public comment."[177]

OMB, the entity responsible for coordinating the IWG efforts,[178] has likewise confirmed that President Biden's reconstitution of the IWG demonstrates that the President intended the IWG alone develop the SC-GHG estimates necessary "to ensur[e] that the estimates agencies consider . . . reflect the best available science and methodologies."[179] This directive is further confirmed in the June 2021 guidance document OIRA issued to agencies to assist in applying Section 5 of E.O. 13990.[180] The OIRA Guidance clarified that "[p]ursuant to E.O. 13990, when agencies prepare an assessment of the potential costs and benefits of regulatory action for purposes of compliance with E.O. 12866, they *must* use the 2021 interim estimates in monetizing increases or decreases in greenhouse gas emissions that result from regulations and other agency actions until updated values are released by the IWG."[181] Accordingly, E.O. 13990, the 2021 Interim TSD, OMB's solicitation of comments on the Interim TSD, and OIRA's guidance not only directed federal agencies to use the IWG's SC-GHG estimates, they apprised stakeholders interested in the federal government's SC-GHG estimates that the IWG was the sole entity with which to engage regarding the development of these important values.

In litigation surrounding E.O. 13990 and the 2021 Interim TSD, the U.S. Department of Justice ("DOJ") also describes the Biden Administration's stated approach to developing and using SC-GHG estimates, and opined on the degree to which E.O. 13990 compelled agencies to use the IWG's values:

> … the Executive Order requires agencies to use the Interim Estimates in some circumstances. *See* E.O. 13990 §§ 5(b)(ii)(A) (using the word "shall"); OIRA Guidance, at 1. But that directive is inoperative whenever the agency faces any conflicting statutory obligation . . .In other words, agencies will only ever rely on the Interim Estimates when they have discretion to do so…[182]

As DOJ stated elsewhere even more succinctly, "if an agency undertakes [SC-GHG] monetization, it shall use the Interim Estimates rather than another set of figures."[183]

ii. EPA's SC-GHG Report Contravenes the Approach President Biden Promised Stakeholders

Although it is not yet clear how EPA intends to use the estimates in its SC-GHG Report, the Agency's development and publication of these values appears to conflict with President Biden's explicit directive that the IWG develop the federal government's SC-GHG estimates and that federal agencies use those estimates. The Administration assigned this centralized role to the IWG "to ensur[e] that the estimates agencies consider . . . reflect the best available science and methodologies."[184] Even though EPA is a key member of the IWG and EPA's staff certainly

have a high level of expertise in climate science and economic analysis, E.O. 13990's reestablishment of the IWG seems to indicate that the Biden Administration believed that development of the highly important SC-GHG estimates called for a breadth of expertise and diversity of opinions unlikely to be found within a single agency.

While API has often disagreed with the IWG's lack of transparency and with various modeling decisions and methodologies that the IWG has employed in developing SC-GHG estimates, we believe that the multi-agency composition of the IWG provides at least an opportunity to develop future SC-GHG estimates using a greater diversity of viewpoints and expertise. Thus, when the Biden Administration once again consigned the federal government's SC-GHG estimation process to the IWG, API once again devoted significant time and resources developing comments reflecting our own viewpoints and considerable expertise. Unfortunately, the IWG's unexplained inaction on the tasks it was assigned in E.O. 13990 along with EPA's unilateral development of SC-GHG estimates in contravention with E.O. 13990 seem to indicate that API's efforts to engage the IWG may have been in vain and that the process laid out in E.O. 13990 has been inexplicably abandoned.

API and others with a deep interest in, and credible expertise relevant to, the development of SC-GHG estimates are effectively precluded from meaningfully engaging with the federal government on these estimates if the Administration changes without explanation the entities, planned actions, and procedures for developing SC-GHG estimates.

The other reason the Administration re-established the IWG and tasked it with developing the SC-GHG estimates was "to promote consistency in the way agencies quantify the benefits of reducing CO_2 emissions in regulatory impact analyses."[185] This accords with OMB Circular A-4, which emphasizes that "[i]n undertaking [benefit-cost analysis and cost-effectiveness analysis], it is important to keep in mind the larger objective of analytical consistency in estimating benefits and costs *across regulations and agencies*, subject to statutory limitations."[186]

While we recognize that the Administration has announced its intent to revise Circular A-4,[187] the mere prospect of these revisions provides no basis for contravening the guidelines and instructions currently provided by Circular A-4. Unless and until Circular A-4 is revised or replaced, it should continue to guide EPA and other agencies to develop clear, transparently supported, objective, and consistent RIAs. Indeed, far from justifying any departures from Circular A-4's guidelines, the Administration's announcement that Circular A-4 will be revised further illustrates that EPA's unilateral development of SC-GHG estimates is inconsistent with the overall RIA and SC-GHG development framework that the Biden Administration publicly announced.

Finally, the need for a single consistent process for developing the SC-GHG estimates used in RIAs is further reflected in a 2020 Government Accountability Office ("GAO") Report on the SC-GHG and specifically the manner in which the federal government should address the recommendations of the National Academies."[188] Recognizing that the National Academies' recommended procedural and technical improvements could not be feasibly implemented by a multitude of different agencies, the GAO urged OMB to "identify a federal entity or entities to be responsible for addressing the National Academies' recommendations…"[189] GAO considered the recommendation "implemented" when E.O. 13990 reinstated the IWG.[190]

---

[185] 2021 TSD at 10.

[186] OMB Circular A-4, Pages 9-10 (emphasis added).

[187] Joseph Biden Jr. 2021. Memorandum for the Heads of Executive Departments and Agencies; Modernizing Regulatory Review. The White House.

[188] GAO-20-254, Report to Congressional Requesters, SOCIAL COST OF CARBON: Identifying a Federal Entity to Address the National Academies' Recommendations Could Strengthen Regulatory Analysis ("GAO-20-254").

[189] GAO-20-254.

[190] GAO-20-254 Recommendation Status, https://www.gao.gov/products/gao-20-254#summary_recommend.

Thus, EPA's unexplained deviation from the SC-GHG development approach laid out in E.O. 13990 not only upends the process to which API and other have devoted time and resources, it undermines the federal government's longstanding objective of making RIAs more consistent across agencies and detracts from what the GAO and this Administration identified as necessary to improve the SC-GHG estimation process consistent with the National Academies' recommendations.

3. Failure to Respond to Comments

As a further consequence of the Agency's decision to unilaterally develop its own SC-GHG estimates, EPA's SC-GHG Report does not appear to be based on any meaningful consideration of the many significant and detailed comments submitted to the IWG, including most recently, the many comments in response to the 2021 Interim TSD. Based on the Biden Administration's representation that the IWG alone would develop the SC-GHG estimates that would be used by the many agencies of the federal government, "[t]he Office of Management and Budget (OMB), on behalf of the cochairs of the Interagency Working Group on the Social Cost of Greenhouse Gases, including the Council of Economic Advisors (CEA) and the Office of Science and Technology Policy (OSTP)," requested "public comment on the interim TSD as well as on how best to incorporate the latest peer-reviewed science and economics literature in order to develop an updated set of SC–GHG estimates."[191]

Notwithstanding that the IWG purported to solicit public comments "in order to facilitate early and robust interaction with the public on this key aspect of this Administration's climate policy,"[192] neither the IWG nor EPA, which is a key member of the IWG, ever responded to or meaningfully considered the public comments submitted by API and many others in 2021. This does not represent a valid and transparent effort to engage the public and solicit feedback to improve agency decision-making.

"For an agency's decisionmaking to be rational, it must respond to significant points raised during the public comment period."[193] EPA is not relieved of this obligation simply because the comments were solicited by OMB on behalf of the IWG. As a key member of the IWG, EPA "reviewed the comments submitted to the IWG,"[194] and therefore had an obligation to "engage the arguments raised before it."[195]

The issues on which the IWG solicited comment, including advances in science and economics, approaches for implementing the National Academies' recommendations, approaches for intergenerational equity, and the use of discount rates,[196] are directly relevant to the EPA's SC-GHG Report. So too are the significant comments and data submitted by API and others in response to the IWG's solicitation.

In particular, API submitted detailed and constructive questions and comments on issues regarding the selection of discount rates, the ability to reasonably forecast impacts on expansive time horizons, and the importance of providing domestic SC-GHG values alongside global values. The IWG never responded to these comments and questions, and given the existence of these same concerns in EPA's SC-GHG Report, EPA plainly ignored API's comments as well.

---

[191] 87 Fed. Reg. 24,669 (May 7, 2021).
[192] 87 Fed. Reg. at 24,670.
[193] *Allied Local & Reg'l Mfrs. Caucus v. EPA,* 215 F.3d 61, 68 (D.C. Cir. 2000).
[194] SC-GHG Report at 8.
[195] *Del. Dep't of Nat. Res. & Envtl. Control v. EPA*, 785 F.3d 1, 11 (D.C. Cir. 2015); *see Nat'l Shooting Sports Found., Inc. v. Jones*, 716 F.3d 200, 214 (D.C. Cir. 2013).
[196] 87 Fed. Reg. at 24,670.

It is not enough for EPA to suggest that it "has reviewed the comments submitted to the IWG in developing [the SC-GHG Report]."[197] EPA must respond in a reasoned manner to the comments received, [] explain how the agency resolved any significant problems raised by the comments, and [] show how that resolution led the agency to [its conclusion]."[198] "Consideration of comments as a matter of grace is not enough.' It must be made with a mind open to persuasion."[199]

It is also insufficient that EPA is now accepting comment on the SC-GHG Report. To begin, EPA's acceptance of comments on entirely new SC-GHG estimates in a wholly distinct SC-GHG Report in no way mitigates the absence of any record that EPA meaningfully engaged with or responded to any of the comments already submitted to the IWG.

Further, while it remains unclear what the SC-GHG Report is or how EPA intends to use it, nowhere does EPA represent that the report is in draft form or that the Agency will revise the SC-GHG Report based on comments and data received. On the contrary, EPA states that the "report presents new estimates of the SC-GHG" that EPA may rely upon "while [the IWG] process continues."[200] Therefore, if EPA intends to use and rely on the values in the SC-GHG Report as they are currently estimated, the Agency's solicitation of comments at this point does not truly "allow for public participation and an open exchange of ideas."[201] Nor is such an approach consistent with the National Academies' recommendation that draft revisions to the SC-GHG methods and estimates should be subject to public notice and comment, allowing input and review from a broader set of stakeholders, the scientific community, and the public.[202]

4. EPA has not Provided Interested Parties the Time or Information Necessary to Solicit Detailed and Constructive Feedback

In order for its public comment process to be reasonable and therefore lawful, EPA must provide commenters access to the data, studies, and other records on which the Agency relied as well as reasonably adequate time to review the data and draft comments analyzing EPA's conclusions and findings based on those records. EPA's present solicitation of comments on the SC-GHG Report does not satisfy either of these requirements.

The U.S. Court of Appeals for the District of Columbia Circuit ("D.C. Circuit") makes clear that when an agency relies on data that is critical to its decision-making process, that data must be disclosed in order to provide the public an opportunity to meaningfully comment on the agency's rulemaking rationale.[203] Indeed, the D.C. Circuit has consistently maintained that "[i]n order to allow for useful criticism it is especially important for the agency to identify and make available *technical studies and data* that it has employed in reaching the decisions to propose particular rules."[204]

[204] *Conn. Light & Power Co.,* 673 F.2d at 530 (emphasis added); *See also Am. Radio Relay League, Inc.,* 524 F.3d at 237 ("It would appear to be a fairly obvious proposition that studies upon which an agency relies in promulgating a rule must be made available during the rulemaking in order to afford interested persons meaningful notice and an opportunity for comment.").

Moreover, because of the "complex scientific issues involved in EPA rulemaking" Congress established more rigorous requirements under the CAA for making information available for public scrutiny.[205] Hence, the CAA mandates that "[a]ll data, information, and documents . . . on which the proposed rule relies *shall* be included in the docket on the date of publication of the proposed rule."[206] This critical requirement is particularly relevant here because EPA claims to have utilized, and is taking comment on, the SC-GHG Report as part of the Proposed NSPS Revisions, which is a rulemaking pursuant to the CAA.[207]

Therefore, if "documents of central importance upon which EPA intended to rely had been entered in the docket too late for any meaningful public comment prior to promulgation, then both the structure and spirit of section 307 would have been violated."[208] "The Congressional drafters, after all, intended to provide 'thorough and careful procedural safeguards . . . [to] insure an effective opportunity for public participation in the rulemaking process.'"[209]

Notwithstanding this requirement, EPA's docket omits several studies, records, and other materials that appear fundamental to the Agency's development of the SC-GHG Report. For instance, EPA claims to have based several aspects of the SC-GHG Report on "the public comments received on individual EPA proposed rulemakings and the IWG's February 2021 TSD,"[210] but only identifies two supportive comments of the 88 total comments submitted on the 2021 TSD.[211] EPA did not identify or provide any comments "it received on individual EPA proposed rulemakings." Therefore, the Agency's administrative record for the SC-GHG Report is either insufficiently comprehensive or EPA impermissibly "rel[ied] on some comments while ignoring comments advocating a different position."[212]

Similarly, the SC-GHG Report relies extensively on SC-GHG estimation and modeling approach developed by RFF,[213] but while EPA's administrative record includes the RFF paper itself, it does not include all the data and studies that RFF utilized in developing those projections and estimates that EPA incorporated into its SC-GHG Report. For instance, RFF augments their economic forecast and generates their emissions forecast based on expert opinion,[214][215] but EPA's administrative record does not appear to contain any details or documentation regarding the expert elicitation and forecasting that was a key part of RFF's modeling effort. Given the critical importance of these forecasts in modelling the SC-GHG and EPA's implicit adoption of the forecasts in the SC-GHG Report, EPA should provide the public with details regarding how and why these experts were selected. For example, EPA should submit for public comment in the docket for the Proposed NSPS Revisions RFF's documentation, which details RFF's survey methodologies, partial selection methodology, and results. EPA should also extend the time period for submission of public comments on EPA's SC-GHG Report. Additionally, EPA should foster transparency by clarifying how RFF selected their experts from RFF's nominee pool.

[213] Rennert, K., Prest, B.C., Pizer, W.A., Newell, R.G., Anthoff, D., Kingdon, C., Rennels, L., Cooke, R., Raftery, A.E., Ševčíková, H. and Errickson, F., 2022a. The social cost of carbon: Advances in long-term probabilistic projections of population, GDP, emissions, and discount rates. Brookings Papers on Economic Activity. Fall 2021, pp.223-305.

[214] Rennert et al.'s economic growth survey included the following participants: Daron Acemoglu, Erik Brynjolfsson, Jean Chateau, Melissa Dell, Robert Gordon, Mun Ho, Chad Jones, Pietro Peretto, Lant Pritchett, and Dominique van der Mensbrugghe.

[215] Rennert et al.'s future emissions survey included the following participants: Sally Benson, Geoff Blanford, Leon Clarke, Elmar Kriegler, Jennifer Faye Morris, Sergey Paltsev, Keywan Riahi, Susan Tierney, and Detlef van Vuuren.

More fundamentally, as discussed in Section III.a.1, EPA's administrative record does not even sufficiently apprise the public as to why EPA developed the SC-GHG Report or how the Agency intends to use it. However, even if EPA had timely provided all of the documents of central importance upon which it relied in drafting the SC-GHG Report, the public comment period EPA provided remains woefully insufficient. The SC-GHG Report provides a completely new set of SC-GHG estimates that were generated through a substantially revised modular approach using entirely different methodologies, models, studies, data, and analytical framing decisions than have been used by the IWG. And while EPA has not populated the administrative record with the full universe of the centrally important records on which it relied, there are hundreds of sources cited in the SC-GHG Report and the RFF Study that provided significant portions of the analysis used in the SC-GHG Report. As evidenced by the five years it took RFF to develop its SC-GHG estimates[216] and the fact that the IWG is more than a year overdue in developing the final SC-GHG estimates required by E.O. 13990, reviewing SC-GHG estimates and their underlying methodologies and data is incredibly labor-intensive and time-consuming.

As such, EPA's decision to provide the public only 69 days to review, develop, and submit comments on the SC-GHG Report is plainly unreasonable – particularly so, given that the comment period coincided with the holiday season. EPA's comment deadline for the SC-GHG Report is also unreasonable because it is the same comment period through which EPA is soliciting comments on the Proposed NSPS Revisions. The proposed revisions are complex rules that will apply to hundreds of thousands of facilities not previously subject to regulation under the CAA. Because of the wide variety of conditions faced by these facilities, and the novel nature of a first ever existing source rule, the current comment deadline is insufficient for even the Proposed NSPS Revisions alone.

In sum, EPA's current administrative record and comment deadline for the SC-GHG Report do not reasonably "allow for public participation and an open exchange of ideas."[217] API therefore respectfully requests that EPA supplement the administrative record with all of the centrally relevant information EPA utilized in developing the SC-GHG Report and provide a new and substantially longer comment period focused exclusively on the SC-GHG Report and the estimates contained therein.

b. Technical Issues with EPA's Methodology and Presentation of the SC-GHG Estimates

In addition to the procedural issues API described in the preceding subsection, our review of the SC-GHG Report raised several significant questions and concerns about EPA's data selection, framing decisions, and modeling assumptions. It is critical the SC-GHG Report completely and transparently explain the precise bases for each of its analytical framing decisions because the SC-GHG estimates that EPA developed using the process described in the SC-GHG Report are highly sensitive to even modest changes to one or a few model choices and judgements.

Moreover, given the enormous and continually growing body of data and academic literature relevant to estimating the SC-GHG, the process by which EPA selects the data and literature on which it relies must be rigorous, objective, and transparent. Thus, when describing the evidentiary bases for its SC-GHG estimates, the SC-GHG Report should not only identify the studies on which the Agency relied, it must reasonably explain and describe why EPA declined to utilize other credible academic literature and data.

[217] E.O. 13563 at Sec. 1(a).

The bullets below briefly describe a number of the questions and concerns that API and its members raised after reviewing the SC-GHG Report. Given the constrained timeframe for review and comment, these questions and concerns should by no means be considered exhaustive or complete. Rather, we urge EPA to view these questions and concerns as emblematic of API's broader concern with the manner in which the SC-GHG Report describes and supports EPA's model choices and SC-GHG estimation process.

- **Damage functions** – Two of the damage functions used in EPA's new SC-GHG model estimate damages at a subnational and/or sectoral level. However, there is no discussion about why EPA excluded other damage functions, particularly those produced by structural economy-wide models.[218] EPA should identify all the possible damage function approaches that could be incorporated and discuss the relative merits and shortcomings of each so stakeholders can understand EPA's rationale for their selected approach.

  Furthermore, given the relative importance of mortality-related impacts in the two sectoral damage functions, EPA should place more attention on how response functions could be adjusted for differences in age distributions across regions. Carleton *et al.* 2020 demonstrated that the temperature-mortality response function differs substantially by age, with a particularly strong relationship observed in the 65+ population. While age is included as a covariate in some of the studies included in Cromar *et al.* 2022, it is not uniformly considered across the literature assessed there. For example, the studies that do adjust for age do not present full mortality results by age. Cromar *et al.* did not consider heterogeneity by age group in their models estimating future mortality associated with temperature changes even though some of the individual studies included in Cromar *et al.* accounted for age. The ideal temperature-mortality model and subsequent monetization would account for age group heterogeneity at all stages of the analysis and calculations.

  Additionally, the temperature-mortality function for a given location and population will likely change through implementation of adaptation measures, a critical consideration in the SC-GHG estimation for mortality. However, adaptation is not consistently incorporated into these studies; and those studies that include adaptation vary in the way it is incorporated. In Carleton *et al.* 2020, administrative level 2 gross domestic product ("GDP") per capita and mean annual temperature for each location incorporates adaptation such that the location-specific exposure-response curve accounts for heterogeneity in adaptation response. Cromar *et al.* did not incorporate adaptation measures at a global or region-specific level, despite stating the importance of incorporating adaptation. As these measures will vary by many factors, including the regional climate and socioeconomic status, it is important that any future projections of the temperature-mortality function account for potential adaptation to temperature change, and the ideal study would account for adaptation at the local level.

- **Discount rate** – There are several choices regarding the discount rate that deserve more consideration and discussion. First, EPA should more fully justify its claim that long-term structural breaks in the interest rate imply lower interest rates in the future.[219] EPA should also explain how near-term interest rates from the last thirty years can fully inform the choice of an appropriate discount rate for the SC-GHG given the projection horizon of 300 years. Other work[220] has considered interest rates over long-time horizons and disputed the notion of structural breaks which calls into question some of EPA's discount rate assumptions. Furthermore, EPA should

In Climate Change 2022: Climate Impacts, Adaptation, and Vulnerability. Contribution of Working Group II to the Sixth Assessment Report of the IPCC, Chapter 16.

[219] *See* SC-GHG Report at 59.

[220] Rogoff et al. 2022. Long-Run Trends in Long-Maturity Real Rates 1311-2021. National Bureau of Economic Research.

explain their rationale for using a single discount rate for all regions, given that certain parameters used to estimate it, such as the economic growth rate, clearly vary across regions.

Second, since EPA estimates Ramsey parameters using assumptions about these near-term interest rates, EPA should consider whether the implied Ramsey parameters are reasonable and consistent with other available information. For example, the pure rate of time preference (ρ) that EPA estimates under the 2 percent near-term discount rate (0.2 percent) is significantly lower than those found in the Drupp *et al.*[221] survey cited in the SC-GHG Report.[222] Moreover, the value of ρ under the 1.5 percent near-term discount rate is near-zero, even though as EPA notes "it has been argued that very small values of ρ can lead to an unreasonable rate of optimal savings (Arrow et al. 1995), particularly with η around 1 (Dasgupta 2008, Weitzman 2007)."[223] Such results further call into question the choice of near-term discount rates and the reasons why parameters such as the Ramey parameters were forced to accommodate particular near-term discount rates, rather than the opposite.

Third, related to the calibration, EPA should state and explain how it calculates the near-term real growth rate of consumption per capita (g_t) as this is one of the few elements within the Ramsey discount rate that is observable in the market. To recover EPA's Ramsey parameters, a near-term consumption per capita growth rate of around 1.45 percent would seemingly be needed. Given that EPA appears to use the GDP per capita growth rate as a proxy for the consumption per capita growth rate, it is unclear why EPA derives its consumption per capita rate as the EPA notes "in the past decade average global per capita growth rates have been closer to 2%,"[224] and over the longer term global per capita growth rates have been higher. Once again, such results call into question why the growth rate was forced to accommodate other assumptions, rather than the opposite, given that the growth rate is the most observable of all the terms in the Ramsey equation.

Fourth, EPA should clarify how it estimates the near-term consumption growth rate "net of baseline climate change damages," and provide a practical example of how it calculated the consumption growth rate "net of baseline climate change damages" beyond what is offered in Appendix 3 of the SC-GHG Report. Moreover, EPA should discuss how climate damages affect the growth rate. If damages are assumed to impact investment (which would affect future economic output, and thus the growth rate), this seems to contradict EPA's assumption that damage functions are specified in consumption-equivalent units.[225]

Fifth, given the assumption of a constant savings rate, EPA should explain the basis for the specific savings rate and the methodology used. Similarly, EPA should discuss how the SC-GHG estimates would change if the savings rate varied at the national or regional given historical trends.

- **Geographic scope and reporting** – EPA lists several reasons for selecting a global SC-GHG—including the potential impacts on U.S. citizens living abroad, U.S. overseas military bases and investments, and regional destabilization caused by climate change. However, non-US impacts estimated by the damage functions used by EPA do not correspond to these impact categories. For example, total non-US mortality damages are not a reasonable estimate of the impacts on U.S. citizens living abroad. Therefore, EPA should consider and discuss reasonable alternatives for estimating potential impacts to U.S. interests that occur in other countries. In

---

[221] Drupp *et al.* 2018. Discounting Disentangled. American Economic Journal: Economic Policy, 10 (4): 109-34.

[222] For the 1.5 percent consumption discount rate, EPA sets ρ to 0.01 percent and η to 1.02. For the 2 percent consumption discount rate, EPA sets ρ to 0.20 percent and η to 1.24. For the 2.5 percent consumption discount rate, EPA sets ρ to 0.46 percent and η to 1.42. Drupp *et al.*'s survey found that respondents' answers suggest a mean ρ value of 1.1 percent with a standard deviation of 1.47 and a median value of 0.5 percent.

[223] Drupp *et al.* 2018 at 61.

[224] SC-GHG Report at 22.

[225] *See* SC-GHG Report at 53.

addition, while EPA holds that not all spillover costs are properly attributed in regional breakdowns, as discussed further in Section III.c.1. below, the public would still benefit from SC-GHG estimates reported regionally, consistent with Circular A-4. EPA's SC-GHG Report also assumes that U.S. GHG mitigation activities, such as emissions pledges and the use of the global SC-GHG, engender international reciprocity. However, if EPA justifies the use of the global SC-GHG based on these factors, then the Agency should explain why its global emissions projection does not reflect globally coordinated action. Reasonable alternatives that maintain consistency between the geographic scope and the emissions trajectories should be considered and discussed.

- **Incorporation into regulatory cost-benefit analysis** – Given EPA's selection of a 1.5, a 2, and a 2.5 percent near-term discount rate, EPA's proposed SC-GHG discount rates no longer correspond to the typical regulatory consumption discount rate of 3 percent. Additionally, EPA's Ramsey discount rate approach further diverges from the constant discount rate approach used throughout federal cost-benefit analyses. Given that the announced revisions to Circular A-4[226] have not been finalized, API believes that it is inappropriate to incorporate EPA's new SC-GHG estimate in regulatory analysis until Circular A-4 is updated, as it is difficult to understand how EPA's SC-GHG approach for estimating climate benefits could be reasonably combined with other estimated benefits and cost streams discounted at different rates following standard A-4 guidance. For example, were EPA or another agency to use the EPA's SC-GHG estimates to present new benefit estimates in an RIA without updating the cost side of the ledger using the same near-term consumption discount rate used in the SC-GHG Report, the inconsistency between the discount rates used for benefits and costs would bias the cost-benefit analysis and undercut the rationality of the RIA's conclusions.

  EPA discusses the shadow price of capital, the preferred approach by Circular A-4, in Appendix 2 of the SC-GHG Report; however, EPA does not discuss whether or how the Agency plans to use this method in future cost-benefit analyses. To apply this method consistently, both benefits and costs must be adjusted in a similar manner. Whether this overall approach, or the revised discount rates themselves will improve cost-benefit analyses depends on whether and how Circular A-4 is updated to ensure consistency in how costs and benefits are estimated and compared. To avoid exacerbating inconsistencies, EPA should acknowledge this dependency and avoid using revised estimates until OMB guidance is updated, and all reviews are completed.

- **Underestimation of the SC-GHG** - EPA states that "The modeling implemented in this report reflects conservative methodological choices, and, given both these choices and the numerous categories of damages that are not currently quantified and other model limitations, the resulting SC-GHG estimates likely underestimate the marginal damages from GHG pollution."[227] This claim is repeated throughout EPA's SC-GHG Report. However, EPA should provide additional support for this assertion by listing and explaining the range of possible options and how the specific approach ultimately adopted by the Agency represents a conservative methodological choice. Repeating these assertions throughout the SC-GHG Report prior to completion of the IWG's peer review process may hamper objective analysis and may bias the IWG's review.

- **Market rates vs. purchase power parity** – EPA's SC-GHG Report states that "the shift to PPP-based projections in the RFF-SPs . . . represents another advancement in the science underlying the SC-GHG framework presented in this report."[228] However, Bressler and Heal (2022) contend that using "purchasing-power parity is incompatible with a pure Kaldor-Hicks approach."[229] Specifically, Bressler and Heal provide an example in which

a regulation would generate net costs when analyzed in PPP-adjusted dollars but would generate net benefits when analyzed using market exchange rates. EPA should therefore explain how using PPP-adjusted dollars is compatible with the federal government's overall approach to cost-benefit analysis.

c. The SC-GHG Report Should Fully and Explicitly Discuss the Limited Utility of the SC-GHG Estimates

EPA's SC-GHG Report avers that the SC-GHG estimates allow "analysts to incorporate the net social benefits of reducing emissions of greenhouse gases (GHG), or the net social costs of increasing such emissions, in benefit-cost analysis and, when appropriate, in decision-making and other contexts."[230] API agrees that from its earliest development by the IWG, the SC-GHG "was explicitly designed for agency use pursuant to E.O. 12866."[231] That is why the titles of each of the six TSDs the IWG published prior to the 2021 TSD disclaimed that they were "for Regulatory Impact Analysis under Executive Order 12866."[232]

While API agrees with the SC-GHG Report's statement that SC-GHG estimates are used in benefit-cost analysis, we believe EPA should clarify and describe the "decision-making and other contexts" the Agency believes may appropriately be based on SC-GHG estimates.[233] API agrees with the need to take action on climate change and we agree that agencies generally should weigh costs and benefits when considering such actions, but given the significant uncertainty and recognized malleability of SC-GHG estimates through modest changes to one or a few inputs, we cannot support expanded use of the Agency's or the IWG's SC-GHG estimates beyond their originally intended application in cost-benefit analysis. Indeed, in addition to, and in fact because of, the ease with which they can be "manipulated to reflect preferences, philosophies, assumptions, and so on,"[234] the SC-GHG estimates reflect such a broad range of uncertainty that in some contexts they may not effectively assist agencies' broad weighing of costs and benefits, as envisioned in E.O. 12866.

The SC-CH_4 values in EPA's SC-GHG Report and the IWG's 2021 TSD illustrate how agencies can struggle to use the estimates to determine whether a particular course of action will deliver more benefits than costs or *vice versa*. In the SC-GHG Report, the "nine separate distributions of estimates"[235] for avoided SC-CH_4 damages in 2030 range from $1,100 per metric ton to $3,700 per metric ton.[236] The 2021 TSD's estimates for avoided SC-CH_4 damages in 2030 range even more widely from $940 per metric ton to $5,200 per metric ton.[237] From a policy and regulatory perspective, the difference between $940 and $5,200 per metric ton or even $1,100 and $3,700 per metric ton is immense. A regulatory action that is imminently justifiable to mitigate damages estimated at the higher end of these ranges may be preposterous if proposed to avoid damages estimated at the lower end of these ranges.

"Such a wide range of . . . SC-CO_2 estimates is little more than a mathematical affirmation of the federal court's judgment that 'the value of carbon emissions reductions is certainly not zero.'"[238] "However, for the purpose the .

. SC-CO_2 was developed— . . .RIAs[] for US federal regulations—such a wide range of SC-CO_2 is not necessarily a problem."[239]

The Electric Power Research Institute ("EPRI") examined 65 federal rules and 81 subrules between 2008 and 2016 that utilized the IWG's SC-CO_2 estimates in their regulatory analyses.[240] EPRI found that "the inclusion of benefits from policy-induced CO_2 emissions changes does not change the sign of net benefits. In other words, the net benefits are positive with and without consideration of CO_2 reduction benefits."[241]

Thus, while the broad range of uncertainty inherent in the IWG's SC-GHG estimates would appear to preclude their use in most cost-benefit analyses, in practice, the estimates have been used in analyses in which the difference between costs and benefits was larger than the SC-GHG estimates' range of uncertainty. This demonstrates that for those actions with non-climate benefits that are already estimated to exceed costs by a substantial margin, the IWG's SC-GHG estimates' range of uncertainty will not matter.

The extent of uncertainty and speculation that besets the SC-GHG estimates developed by the IWG and EPA alike precludes their reduction to a single value, be it a central value or otherwise. The IWG's SC-GHG estimates "were developed . . . with a methodology to fit the specific purpose of a benefits estimate to be added to a regulatory impact analysis . . ."[242] While EPA's SC-GHG Report adopts a modular approach in lieu of reliance on the IAMs used by the IWG, the reality of the SC-GHG estimation process is "that a high degree of uncertainty is baked in and cannot reasonably be estimated away."[243] At best, this enterprise is capable of producing "a very wide range of potential" SC-GHG estimates.[244]

> In aggregate, the SCC estimates developed by the interagency working group and others represent a strange marriage of conventional economic-financial logic, arbitrary economic-financial logic, massively expansive biophysical phenomena, preference, and uncertainty management utilized to create a digestible input – a dollar amount – for use in the dominant cost-benefit analysis . . . framework.[245]

Moreover, the subjective judgements that are necessary inputs into the SC-GHG estimation process make the product of those modeling exercises malleable. Indeed, SC-GHG estimates "reflect ideology as much as they reflect the actual, long-term externality cost of climate change."[246] Thus, "[f]or these assumptions, the tools of science, economics, or statistics are incapable of providing a 'best' or single value."[247]

> [P]roducing a wide range of SC-CO_2 estimates is simply the best we can do using this methodology, and it is the best we will ever be able to do. The . . . Central SC-CO_2 is not an optimal price of CO_2 emissions or a best estimate of the benefits of CO_2 reductions. It is a noncomprehensive estimate

> of the benefits of GHG reductions using one set of assumptions that is arguably defensible given the theoretical and methodological challenges associated with the approach.[248]

In addition to the methodological limitations precluding the use of the SC-GHG estimates in royalties, subsidies, fees, or applications that require a single value or narrow range of uncertainty, there are legal, statutory, and practical constraints on more expansive use of SC-GHG estimates as well. Indeed, courts have generally only upheld agencies' use of the SC-GHG estimates in the context of cost-benefit analyses.[249]

While some courts have held that agencies must estimate the costs of GHG emissions when assessing impacts of their proposed actions under the National Environmental Policy Act ("NEPA"), the agencies' impact assessments in those cases typically included cost-benefit analyses that are not required by NEPA.[250] In other words, because the agencies there estimated quantified benefits of certain actions, they also had to estimate quantified costs including of GHG emissions. In many other cases, courts have held that agencies have no obligation to use the SC-GHG estimates in analyzing impacts under NEPA.[251] Indeed, many of these courts took favorable views of agency determinations that SC-GHG estimates are ill-suited for NEPA analyses based on uncertainty ranges or otherwise.[252] Courts have generally taken a similar view to the Federal Energy Regulatory Commission's ("FERC's") prior position that the SC-GHG estimates' broad variability range makes them unsuited for public interest determinations[253] under the Natural Gas Act.[254] And in the context of collecting royalties and other financial obligations related to the leasing, production, and sale of minerals from federal and Indian lands, the federal government is affirmatively prohIbited from considering the SC-GHG estimates.[255]

Indeed, regardless of whether the Administration continues to rely on the IWG's estimates or those newly proffered by EPA in the SC-GHG Report, the SC-GHG estimates' broad range of variability and uncertainty render them inappropriate for use in any project-level or site-specific application. In addition, while analyses at these scales might be capable of monetizing some impacts (such as projected climate impacts), partial monetization is not advisable for several reasons. First, it could be interpreted as emphasizing or de-emphasizing the monetized impact, even though there is no basis on which to conclude that a monetized impact is more or less significant than a non-monetized impact. Second, monetized benefits and costs are only meaningful when they are compared to one another in aggregate.

These considerations illustrate the material distinction between formalized cost-benefit analysis in the regulatory context and other types of analysis. Whereas monetization is essential for regulatory analyses, it is potentially misleading outside this application for reasons discussed above. Notably, this material distinction is also embodied

in E.O. 12866, which distinguishes between "regulatory actions" and "significant regulatory actions" based in part of the projected scale of impact.[256] For each "significant" proposed action, the issuing agency is required to provide a cost-benefit analysis. Thus, existing regulatory guidance essentially equates significance with the need for cost-benefit analysis, which in turn, implies full monetization of costs and benefits. While (as discussed above), there are inherent limits to the usefulness of SC-GHG estimates in rulemaking, consideration of SC-GHG values is sensible in situations where all costs and benefits are monetized. Consideration of the SC-GHG estimates is not appropriate in instances where only a subset of impacts can be monetized; accordingly, restricting its use to significant regulatory actions ensures consistency with this principle.

d. The SC-GHG Report Needlessly Limits the Utility of EPA's SC-GHG Estimates by Failing to Present Domestic SC-GHG Estimates Alongside Global Estimates

In order to conduct a valid and legally-defensible cost-benefit analysis, agencies must ensure that they weigh costs and benefits of the same scale and of the same type. Therefore, consistent with API's repeated requests to the IWG, API recommends that EPA's SC-GHG Report present domestic SC-GHG estimates alongside global estimates. Indeed, we believe that, absent a clear congressional directive otherwise, agency cost-benefit analyses should be constructed to weigh domestic costs against domestic benefits. By doing so, agencies can better ensure that projected domestic impacts alone justify the costs to be imposed on domestic industries. When agencies have failed to do so and weighed domestic costs against global benefits, they have effectively put their thumb on the scale in favor of regulatory action. Such an analysis is not only inconsistent with basic economic principles it overlooks "the more prosaic commonsense notion that Congress generally legislates with domestic concerns in mind."[257]

Given that EPA claims to have utilized, and is taking comment on, the SC-GHG Report as part of the Proposed NSPS Revisions, the CAA provides a particularly relevant example of why the geographic scope of agencies' regulatory analyses should reflect the intended scope under which the regulation is proposed or promulgated.[258] In CAA Section 101(b)(1), Congress expressly stated that the statute's purpose is to "protect and enhance the quality of the *Nation's* air resources so as to promote the public health and welfare and the productive capacity of *its population*."[259] By focusing on "the Nation" and "its population," Congress clearly demonstrated that it enacted the CAA to affect domestic air quality.

This interpretation of the CAA is not new, nor does it fail to reflect the global nature of climate change. Indeed, EPA relied on this interpretation when it issued the highly important Endangerment Finding on which multiple federal climate change regulatory actions have been based.[260]

In addition to the clear inferences that can be drawn from Congress' statements of statutory intent, the text of specific provisions of the statute confirms that Congress intended to limit the reach of the Act to domestic effects, unless it expressly provided otherwise. In only two discrete instances, Congress explicitly addressed the foreign effects of domestic air emissions in the CAA.

[256] *See* E.O. 12866 at Sec. 3.

[257] *RJR Nabisco, Inc. v. Eur. Cmty.*, 136 S. Ct. 2090, 2100 (2016).

[258] 87 Fed. Reg. at 74,713.

[259] CAA § 101(b)(1) (emphasis added).

[260] *See* Final Rule, Endangerment and Cause or Contribute Findings for Greenhouse Gases under Section 202(a) of the CAA, 74 Fed. Reg. 66496, 66514 (Dec. 15, 2009) ("[T]he primary focus of the vulnerability, risk, and impact assessment is the United States").

First, in Title I of the Act, Congress authorized EPA to consider the foreign effects of domestic air emissions within the delineated framework of Section 115. There, Congress defined the process for EPA to evaluate and address reports of domestic air pollution possibly affecting public health or welfare in a foreign country.[261] Critically, this only applies when the Administrator finds there is "reciprocity" such that "the United States essentially [has] the same rights with respect to the prevention or control of air pollution occurring in that country as" Section 115 gives to the foreign country.[262]

Second, in Title VI of the CAA, Congress addressed the global impacts of domestic stratospheric ozone emissions by, among other actions, listing ozone-depleting chemicals of concern, establishing reporting requirements for manufacturers and other entities, and phasing out the production of certain chemicals.[263] Congress expressly enacted Title VI in 1990 in order to implement the Montreal Protocol on Substances that Deplete the Ozone Layer, an international treaty signed by the United States, which addresses stratospheric ozone.[264]

These two discrete provisions (Section 115 and Title VI) represent the full extent of EPA's authority to consider the international benefits of domestic regulation. Critically, these provisions demonstrate that, when Congress chose to allow the Agency to consider foreign impacts of domestic regulation, it said so expressly. These two provisions also reflect the very narrow purpose for which Congress allowed EPA to consider foreign impacts of domestic regulation. Both provisions deal with international agreements under which the United States and one or more foreign nations make reciprocal commitments to impose regulations within their borders that confer benefits outside their borders and/or to the other party.

In these two narrow circumstances, the United States is the beneficiary of EPA's action and also the foreign nation's reciprocal regulatory action. As such, while foreign impacts are considered, their consideration is solely intended to inform regulatory decisions seeking to maximize domestic benefits of reciprocal regulatory actions. The executive branch has ample authority to act for the benefit of foreign nations, but the CAA is generally not one of the statutes that confers that authority. With the exception of these two discrete provisions, the CAA arguably precludes EPA from weighing international benefits against domestic costs.[265]

In addition to the limitations that the CAA places on EPA specifically, OMB guidance applies these same principles government-wide. In support of limiting the use of international benefits for justifying regulation, OMB directs agencies developing regulatory analyses to focus on the "benefits and costs that accrue to citizens and residents of

[261] CAA § 115(a)-(b).

[262] CAA § 115(c).

[263] EPA, 1990 CAA Amendment Summary: Title VI (Jan. 4, 2017), https://www.epa.gov/clean-air-act-overview/1990-clean-air-act-amendment-summary-title-vi.

[264] 42 U.S.C. § 7671m(b) ("This subchapter as added by the CAA Amendments of 1990 shall be construed, interpreted, and applied as a supplement to the terms and conditions of the Montreal Protocol.").

[265] Settled principles of statutory interpretation further confirm that Congress did not intend to authorize EPA to rely on the foreign effects of U.S. emissions in promulgating regulations under the CAA. For one, statutes are construed to give effect to all provisions. *See, e.g., Hibbs v. Winn*, 542 U.S. 88, 101 (2004) ("A statute should be construed so that effect is given to all its provisions, so that no part will be inoperative or superfluous, void or insignificant….") (citations omitted). Section 115 would effectively be a nullity if EPA read the Act to provide the Agency with the authority to consider effects of domestic emissions on foreign countries without following the Section 115 process. Moreover, it is also a well-settled canon that if Congress addressed an issue in one provision, its failure to address that same issue elsewhere confirms its limited intent. *See, e.g., Russello v. United States*, 464 U.S. 16, 23 (1983) ("[W]here Congress includes particular language in one section of a statute but omits it in another section of the same Act, it is generally presumed that Congress acts intentionally and purposely in the disparate inclusion or exclusion.") (citations omitted).

the United States"[266] and directs agencies which "choose to evaluate a regulation that is likely to have effects beyond the borders of the United States" to report those impacts "separately."[267] OMB's guidance further states that an agency's cost-benefit analysis "should focus on benefits and costs that accrue to *citizens and residents of the United States*."[268]

Notwithstanding that OMB Circular A-4 mandates agency consideration of domestic costs and benefits while simply allowing for optional consideration of non-U.S. benefits, EPA's SC-GHG Report omits any calculation of domestic benefits. In lieu of this important, and arguably mandatory presentation of domestic benefits, the SC-GHG Report merely offers the EPA's justification for its absence.[269] While these justifications are perhaps sufficient to support the EPA's decision to present global benefits in the SC-GHG Report, none explain the Agency's refusal to also present an estimate of domestic benefits alongside the global value.

For instance, the IWG argues that analyzing the global benefits of U.S. regulatory actions can help generate reciprocal actions from other countries and "allows the U.S. to continue to actively encourage other nations . . . to take significant steps to reduce emissions."[270] Even assuming such effect occurs, the goal of the SC-GHG estimation process should not be the development of tools to aid in international negotiations or which help the U.S. "actively encourage" reciprocal actions on climate change; President Biden required use of the "best available economics and science"[271] to estimate as accurately as possible the societal costs of adding a small increment of GHG into the atmosphere in a given year. To the extent EPA is attempting to assume the IWG's assigned role of developing SC-GHG estimates, the Agency must also assume the obligation to dispassionately and objectively estimate the SC-GHGs using "best available economics and science."[272] And that obligation cannot be construed to encompass an advocacy role. Even if it were reasonable for EPA's interest in advocating for intergovernmental cooperation to shape how it estimates the SC-GHG, the EPA's SC-GHG Report provides no explanation why that advocacy role would be undermined by the presentation of domestic benefits *alongside global benefits*.

EPA also offers that:

> The global nature of GHG pollution and its impacts means that U.S. interests are affected by climate change impacts through a multitude of pathways and these need to be considered when evaluating the benefits of GHG mitigation to the U.S. population.[273]

Although the U.S. could be adversely impacted by potential climate change damages that could occur in other countries, it does not follow that the EPA must therefore include the potential *damages in those other countries* as part of the SC-GHG estimate. Rather, the Agency should include in the SC-GHG estimates the potential *domestic impact* of those reasonably projected extraterritorial climate damages. As explained by the NASEM:

> Correctly calculating the portion of the SC-CO_2 that directly affects the United States involves more than examining the direct impacts of climate that occur within the country's physical borders . . .

[272] E.O. 13990 at Sec. 5(b)(ii)(D). Notably, and as previously discussed, E.O. 13990 expressly assigned the SC-GHG estimation development process to the IWG and precluded agencies from developing and using their own values.
[273] SC-GHG Report at 11.

> Climate damages to the United States cannot be accurately characterized without accounting for consequences outside U.S. borders.[274]

In other words, regardless of whether climate change imposes costs on the U.S. directly or indirectly through potential damages in other countries, the costs EPA should be attempting to characterize are those anticipated to be borne by the U.S. and its citizens. Thus, the global nature of climate change is consistent with and supported by the presentation of domestic benefits in the SC-GHG estimates. And the global nature of this issue certainly does not explain why the domestic benefits should not at least be presented alongside projections of global benefits.

EPA's final rationale for declining to present domestic benefits alongside global values is that there are relatively few region- or country-specific SC-GHG estimates or models with sufficient resolution to estimate SC-GHG benefits on a country-specific basis.[275] At the same time, EPA has largely limited its own consideration of damage functions to those that can be specified at the national or sub-national level, suggesting that domestic impacts could be reasonably estimated in two of the three frameworks adopted.[276] Although we agree that there is a high level of uncertainty in the regional or country-specific SC-GHG estimates, we believe it is inconsistent for EPA to use this uncertainty to rationalize its decision to decline to provide any SC-GHG estimates other than global, particularly given EPA's decision to severely restrict consideration of damage functions to precisely those that provide such information. Uncertainty and speculation pervade every aspect of the SC-GHG estimates, and the Agency should explain why such uncertainty provides a valid basis to decline to render estimates in this instance, but presents no barrier in every other respect.

It is also increasingly inaccurate for EPA to cite the overall paucity of literature on regional and country-specific SC-GHG estimates. As noted by the NASEM in 2017:

> Estimation of the net damages per ton of CO_2 emissions to the United States alone, beyond the approximations done by the IWG, is feasible in principle; however, it is limited in practice by the existing SC-IAM methodologies . . .[277]

Indeed, EPA's SC-GHG Report identifies a number of new models and academic efforts that have enhanced our ability to model SC-GHG benefits with greater spatial resolution.[278] While these country-specific estimates remain highly uncertain and divergent, they all broadly agree that the SC-GHG in the U.S. is a small fraction of the SC-GHG Report's estimates of the global SC-GHG.

Although country-specific SC-GHG estimates remain quite imprecise, they are highly relevant because EPA and other agencies should not adopt rules which could impose massive costs on the U.S., but for which the claimed benefits primarily accrue overseas—certainly not without a clear and explicit directive from Congress. EPA's assertion that rule writers and policymakers use only the global SC-GHG estimates in cost-benefit analysis results in

[274] NASEM 2017 at 52-53.

[275] SC-GHG Report at 77-80.

[276] SC-GHG Report at 39 ("Based on a review of available studies using these approaches, the SC-GHG estimates presented in this report rely on three damage functions. They are: 1. a subnational-scale, sectoral damage function estimation (based on the Data-driven Spatial Climate Impact Model (DSCIM) developed by the Climate Impact Lab (CIL 2022, Carleton et al. 2022, Rode et al. 2021)), 2. a country-scale, sectoral damage function estimation (based on the Greenhouse Gas Impact Value Estimator (GIVE) model developed under RFF's Social Cost of Carbon Initiative (Rennert et al. 2022b)), and 3. a meta-analysis-based global damage function estimation (based on Howard and Sterner (2017)).").

[277] NASEM 2017 at 53.

[278] SC-GHG Report at 77-80.

a significant misalignment of costs and benefits, particularly for regulatory actions, like the Proposed NSPS Revisions, that are promulgated pursuant to the CAA.

As such, API's modest recommendation, which we have also previously voiced to the IWG, is not that the federal government abandon the global SC-GHG estimates, but that it simply present domestic SC-GHG estimates alongside global values. This approach would allow risk managers to more readily align the costs with the benefits. Consistent with OMB guidance, the costs of a rule for entities in the U.S. should be presented in comparison with the benefits occurring in the U.S.

IV. CONCLUSION

API appreciates the opportunity to provide these comments on EPA's SC-GHG Report. We hope this comment opportunity is the first step toward a more open and transparent process for developing SC-GHG estimates and the judgment and assumptions used to develop and portray those estimates.

API shares the Biden Administration's goal of reducing economy-wide GHG emissions. And while API appreciates EPA's decision to accept comments specifically on the Agency's SC-GHG Report, EPA's unilateral development of SC-GHG estimates raises a number of questions and concerns the anticipated role of these new estimates in Agency rulemaking, and the SC-GHG Report's apparent inconsistency with the Biden Administration's stated intent to collaboratively and transparently develop and revise SC-GHG estimates through the IWG.

President Biden's issuance of E.O. 13990 on his first day in office reflects the importance of the SC-GHG estimates to our nation's climate policies and regulations. Given the importance of these estimates, we believe EPA should have transparently engaged and collaborated with interested stakeholders throughout its process to revise and update each of the four modules on which the SC-GHG Report based its revised estimates, rather than postpone comment until each module had been updated and the SC-GHG Report had been fully drafted. Moreover, given the extent of the changes encompassed in EPA's SC-GHG Report and the extensive new data and analyses on which the report purports to be based, API believes that the current 69-day comment period is wholly insufficient for soliciting detailed feedback from informed stakeholders.

API is similarly concerned that EPA's docket for this rulemaking does not include all of the studies and data on which EPA purports to have based its SC-GHG Report, and therefore fails to provide interested parties sufficient information on which to base detailed comments. In fact, EPA has not even clearly explained why it developed the SC-GHG Report or how it intends the SC-GHG Report's estimates to be used. Nonetheless, where possible, API has tried to provide EPA relevant analysis and constructive recommendations for improving the reliability and utility of the SC-GHG Report and the estimates therein. We did so, not only with the intent of improving the SC-GHG estimates and the process through which they are developed, but with the hope that by providing credible analysis and constructive feedback, EPA would more fully recognize the benefit of engaging stakeholders in a more open, data-driven, and collaborative process.

API recognizes the need to confront the challenges of climate change. However, regardless of whether they are developed by the IWG or EPA alone, inherent limitations in estimates of the SC-GHG significantly constrain their utility in rulemaking. Indeed, SC-GHG estimates may only have utility with respect to broad considerations of costs and benefits in analyses under E.O. 12866, and not in rules that require the SC-GHG to be expressed as a single value or with a narrow range of uncertainty.

Thank you again for your consideration of these comments. If you have any questions or would like to discuss these comments, please feel free to contact Andrew Baxter at (202) 268-2800 or baxtera@api.org.

Sincerely,

Andrew Baxter

ANNEX D: API Barnett and Bakken Mantis Field Studies

PROVIDENCE
PHOTONICS

American Petroleum Institute Mantis™ Field Study

Final Report | Revision 1.0

September 2023

PROJECT 0040-001

API BARNETT

PREPARED BY
Providence Photonics, LLC | 1201 Main Street, Baton Rouge, LA 70802

Table of Contents

Introduction

Providence Photonics, LLC (Providence) has developed a method to remotely measure the performance of an industrial flare using Video Imaging Spectral Radiometry (VISR). The VISR method provides five flare performance metrics: combustion efficiency (CE), smoke index (SI), flame stability (FS), flame footprint (FF), and fractional heat release (FH). The VISR method is incorporated into Providence's Mantis™ flare monitoring product (Mantis).

Providence used the Mantis device to conduct a flare measurement in the Barnett regions for American Petroleum Institute (API) in September of 2023. The measurements were performed from September 11th, 2023 to September 16th, 2023. This report summarizes the Mantis data and associated findings from the study.

Background

The VISR method utilizes a multi-spectral mid-wave infrared imager to measure the radiance from both hydrocarbons being combusted and carbon dioxide (CO_2) as complete combustion product, and use that information to determine the combustion efficiency. The method was designed to be a continuous and autonomous remote flare monitor, but in this study it was deployed as a mobile technology for a short-term measurement. ***Figure 1*** below shows the Mantis device deployed at one of the sites during the Barnett study.

Figure 1: Mantis deployed during API field survey in Barnett region.

1. COMBUSTION EFFICIENCY (0 TO 100%): Combustion efficiency (CE) is a measure of the relative concentration of hydrocarbon vs. carbon dioxide in the post combustion gas plume. If there is no hydrocarbon present in the post combustion gas plume, then CE is 100%. CE should not be confused with Destruction and Removal Efficiency (DRE). The difference between these two metrics is discussed in **Appendix C**. While CE is directly measured by the VISR method, DRE is derived using correlations established through extractive sampling as discussed in **Appendix C**.
2. SMOKE INDEX (0 TO 10): Smoke index (SI) is a unit-less number which indicates the degree of visible emissions within the combustion envelope. A SI of 0 means no visible emissions are present while a SI of 10 means the flare has heavy black smoke. While SI only represents the degree of visible emissions within the combustion envelope, it is generally correlated to opacity and a SI above 3 generally indicates that some visible emissions are likely present outside of the combustion envelope.
3. FLAME FOOTPRINT (FT^2): Flame footprint (FF) is a measure of the flame size in square feet. It is not necessarily correlated to the visible flame size as the FF is determined by the radiance, not the visible flame. Note that the orientation of the flame will impact the FF as the depth of the flame will change with viewing angle.
4. FRACTIONAL HEAT RELEASE (BTU/HR): Fractional Heat Release (FH) is a measure of the heat released from flare combustion in the spectral bands monitored by the Mantis flare monitor. Although it is not a measure of the total heat release across the entire energy spectrum, FH is expected to be correlated to the total heat release.
5. FLAME STABILITY (0 TO 100%): Flame stability (FS) is a measure of the change in radiance measured by the Mantis flare monitor in a 1-second interval. A FS of 100% indicates a flame that has a constant radiance. A low FS value (generally lower than 80%) indicates a flame with significant radiance fluctuation within 1 second interval, suggesting a less stable flame. Variability on a longer time scale will not be described by the flame stability metric.

Data Quality Indicators

The VISR method has two important data quality indicators (DQI) to assess the quality of the measurement. The first is the number of pixels in the flame combustion envelope, the outer layer of the flame where the combustion process has ceased. The VISR method requires at least 30 pixels to accurately determine the performance metrics of the flame. The VISR device has a fixed focal length, so the number of pixels in the flame is determined by the size of the flame and the distance from the VISR imager to the flame. For this study, any measurements with less than 30 pixels were removed from the summary tables and **Appendix A**.

The second important DQI is the Smoke Index level. As the smoke index increases above 3.0 (this threshold may vary within a range of 1-2 depending on specific flares), visible emissions are generally present in the flame. When visible emissions become significant, the SI value will climb even higher to a maximum value of 10 for thick black smoke. Testing has shown that SI values above 3.0 may cause a small negative bias on the CE measurement by VISR (< 1%) and SI values above 5 may cause a significant negative bias to CE measured by VISR, as confirmed by testing with an extractive sampling method as a control (note that in the extractive sampling method, carbon soot is not included in the CE calculation). Any data points with a smoke index above 5 were removed from the summary tables and **Appendix A** as they are considered outside of method limits.

Observations

The following sections describe field observations and comparisons derived from the dataset.

Aggregate results

The flare measurements included sites from three companies ([redacted] In total, there were 39 individual flares measured. The distribution of the DRE measurements is represented in ***Figure 2*** below.

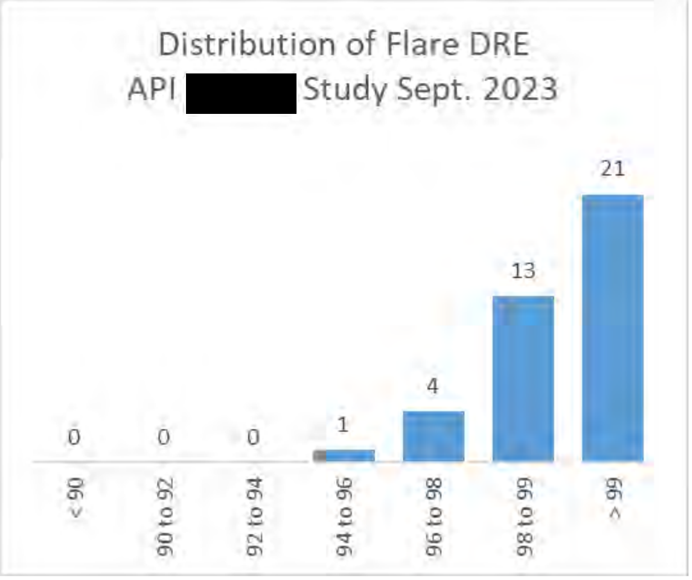

Figure 2: HP and LP flare tips on Green Canyon 254.

Summary

Providence conducted flare measurements on 39 flares in the Barnett region from September 11th, 2023 to September 16th, 2023. The measurement summaries are provided in ***Table 1*** and ***Appendix A*** with the distribution of the measurements provided in ***Figure 2***. Overall efficiencies across the study were high, with 87% of the flares demonstrating a DRE above 98%.

Appendix B: Validation of the VISR method

Precision and Accuracy of the VISR Method for Flare Monitoring

Extended Abstract: ME92
Presented at the conference:
Air Quality Measurement Methods and Technology
April 2-4, 2019
Durham, NC

Jon Morris, Yousheng Zeng, and Srikanth Mutyala
Providence Photonics, Baton Rouge, Louisiana

Introduction

Industrial flares represent a large category of air emission sources for Volatile Organic Compounds (VOC), air toxics, and greenhouse gases (GHG)[1-4]. Depending on their combustion efficiency (CE), the emissions of these air pollutants can be significantly different. Despite the large contribution of flares to air emission inventories, flares are the only source category for which no EPA test or monitoring methods can be applied to directly measure their efficiency or emission rates. As a result, flare emissions in air emission inventories may carry significant uncertainties.

A method based on Video Imaging Spectral Radiometry (VISR) has been developed for testing or continuously monitoring combustion efficiency (CE) of industrial flares[5]. To validate the VISR method, tests were conducted at flare test facilities of Zeeco, Inc. (Zeeco) and John Zink Hamworthy Combustion (John Zink), both located in Tulsa, Oklahoma, in September and October 2016, respectively. The test at Zeeco included both an air assisted flare and a steam assisted flare. Twenty-eight flare conditions were tested, 14 for the air flare and 14 for the steam flare. This test is referred to as the "Zeeco Test" in this paper.

The test at John Zink was part of a program sponsored and organized by the Petroleum Environmental Research Forum (PERF), an industry consortium. PERF project 2014-10 Direct Monitoring of Flare Combustion Efficiency was created and funded by participating PERF companies to provide a test platform for various developers/vendors of flare remote sensing technologies (Invitees) to participate in a blind test to evaluate the effectiveness of each technology. The blind test was administered by John Zink. Testing began on October 17th, 2016 and continued for 10 days, concluding on October 27th, 2016. The flare tip used was the John Zink model EEF-QSC-36, which was the same flare tip used during the 2010 TCEQ Flare Study[4]. A test protocol was developed which identified a series of test conditions to evaluate various factors that could affect flare CE measurement. Only limited logistical and environmental factors were shared with the Invitees (i.e., distance from the flare, view angle with respect to flame orientation due to wind, sun in/out of the field of view, daytime/nighttime testing). Information regarding flare operations such as the type of fuel gas used, firing rates, steam rates or any other flare operating parameters was concealed from Invitees. A total of 45 test points was evaluated over the 10 days of testing. Extractive sampling was performed on each test point as the control method for flare CE measurement. The results of the extractive sampling were not provided to Invitees until Invitees submitted their won results based on their respective measurement technology. This test is referred to as the "PERF Test" in this paper.

In this paper, the precision and accuracy of the VISR method are evaluated based on the test campaigns described above.

Methods and experimental setup

The VISR flare monitor is a remote monitoring device that can be positioned at any distance as long as the flare to be monitored is in the line of sight and there are a sufficient number of pixels of the flare flame image in the VISR monitor. The distances from flare to the VISR monitor in the experiments reported here were in the range of 174 feet to 650 feet. To evaluate the performance of the VISR method, an extractive sampling system was used as a reference method. A sample extraction apparatus was suspended by a crane over the flare plume to extract combustion product gases. The sample was transported through a heated sampling line to a sample manifold in a testing trailer. The sample manifold was connected to analyzers for oxygen (O_2), carbon dioxide (CO_2), carbon monoxide (CO), and hydrocarbon (HC). The methods for measuring O_2, CO_2, CO, and HC were EPA Method 3A, 3A, 10, and 25A, respectively. The level of O_2 was used to confirm that the sampling probe was in the flare plume. The concentrations of CO_2, CO, and HC were used to calculate flare CE per method used in the 2010 TCEQ flare study[3].

These test campaigns covered a wide range of process conditions: two steam flares and one air flare; multiple vent gas compositions (natural gas, propane, propylene, hydrogen, in pure form or mixed with nitrogen; vent gas flow range from 10 lb/hr to 10,000 lb/hr; various steam and air assist levels resulting in combustion zone net heating value (NHVcz) in a range of 120 to 1,250 Btu/scf for the steam flares and net heating value dilution parameter (NHVdil) in a range of 6.7 to 244 Btu/ft^2 for the air flare.

The test campaigns also covered a wide range of environmental conditions: distance ranging from 174 ft. to 650 ft.; different wind speed and direction (crosswind, wind oriented towards VISR device, and wind oriented away from VISR device); daytime vs. nighttime; various sky conditions (blue sky, cloudy, moving clouds); the Sun in or out of field of view; rain, and fog.

Results and Discussions

Precision

Precision is a measure of how the results of multiple measurements by the same method scatter while the target of the measurement holds steady. This is difficult to assess for flare measurements because even when the flare operating conditions are held steady (as they were in each test point of the PERF Test), the flare CE may change due to changes in environmental conditions. Analyte spiking or quadruplet sampling described in EPA Method 301 would help to isolate the measurement method precision from the fluctuation of the target itself[6]. However, these methods are not feasible for flare measurement. Nevertheless, the measurement precision can still be evaluated using the data from the PERF test. For each PERF test condition, 4 segments of measurement were made by the extractive method and 3 segments of measurement were made by VISR while the flare operating conditions were held constant (although flare CE did fluctuate due to changes in environmental conditions). The standard deviation (SD) and relative standard deviation (RSD) can be calculated based on these replicate measurements. **Table 1** is a summary of the SD and RSD for both the VISR method and the extractive method used in the PERF Test. As shown in **Table 1**, the RSD for the VISR method is in a range of 0.07% to 1.98% with an average of 0.62%. The variation of the VISR method appears to be slightly better than the extractive method from the perspective of both the average and the range of the RSD values, suggesting that the precision of VISR is at least as good as the extractive method. Note that in both cases, the variation due to changing environmental conditions is included in the RSD as there is no practical method to separate it. Despite the inclusion of environmental changes, the RSD is more than an order of magnitude smaller than 20% as required in EPA Method 301 (Section 9.0)[6]. If a more stringent criteria is used in which the 20% limit on RSD is applied to the most relevant range of 90-100 % CE measurement (i.e., in the span of 10 % CE measurement), the criteria would be SD < 2 % CE (20% of 10% = 2 % CE). As shown in **Table 1**, the highest SD is 1.84 measured as % CE, which is lower than the SD of 2 % CE measurement and therefore satisfies the more stringent criteria.

Table 1. Relative Standard Deviation (RSD) of VISR and extractive method per PERF Test

Method	CE Avg.	CE Range	SD Avg.	SD Range	RSD Avg.	RSD Range
VISR	96.47	80.61-99.91	0.59	0.07-1.84	0.62%	0.07-1.98%
Extractive	96.41	83.50-100.00	0.83	0.00-2.61	0.88%	0.00-2.72%

The Zeeco Test did not include multiple replicated measurements under each test condition. Therefore, a precision analysis is not performed on that data.

Accuracy

The accuracy of the VISR method is evaluated based on the Zeeco Test and PERF Test. In these two tests, the flare CE was measured by both the VISR method and the extractive method. The extractive method was used as the control (reference) method. Strictly speaking, what can be assessed is the agreement between the two methods, not the accuracy of either method because the true flare CE is unknown. The agreement between the two methods can be evaluated using a statistical method. One such method is to use t-test on the differences between the paired CE measurements by VISR and extractive methods. This method is the same as the method used in EPA Method 301 to determine if there is a difference caused by different sample storage time[6] (it should be noted that the methods for bias described in Method 301 are not directly applicable because they are specifically designed for analyte/isotopic spiking or quadruplet sampling systems, which are not feasible for flare measurement). The value of the t-statistic is calculated using the following equation.

$$t = \frac{|d_m|}{\frac{SD_d}{\sqrt{n}}}$$

Where d_m and SD_d are the mean and the standard deviation of the difference of the paired samples (VISR and extractive sample), and n is the total number of samples. The resulted t-statistic value is compared to the critical value of the t-statistic with a 95 percent confidence level and n-1 degree of freedom. If the resulted t-statistic value is less than the critical value, the difference between the VISR method and the extractive method is not statistically significant, i.e., the two methods are statistically the same. The results of the t-statistical analysis for both Zeeco and PERF tests are summarized in **Table 2**. The number of samples (tests) in **Table 2** is less than the number of tests actually conducted because some tests were designed for other purposes (e.g., smoke test) and they are not included in the evaluation of the agreement between VISR and extractive methods.

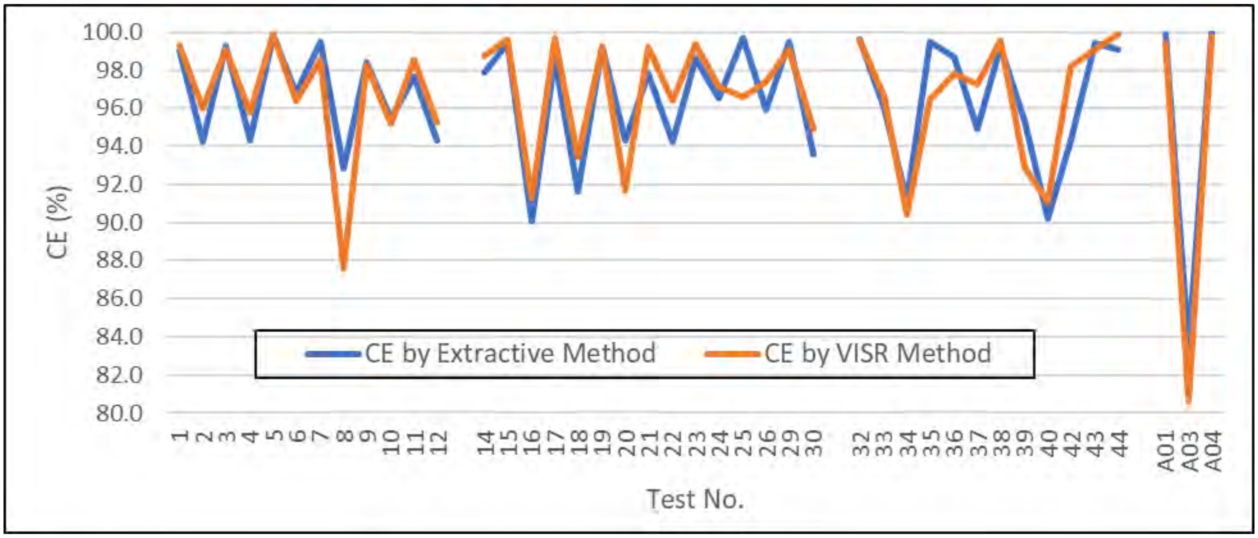
Table 2. t-Test to determine if the VISR method is different from the extractive method

	Zeeco Test (Steam Flare)	**Zeeco Test (Air Flare)**	**PERF Test**
No. of Samples, n	11	9	42
Mean Difference, d_m (% CE)	0.30	-0.21	0.07

Standard Deviation, SD_d (% CE)	1.32	0.65	1.69
t-Statistic Value	0.756	0.967	0.254
Degree of Freedom	10	8	41
t_95 Critical Value	2.228	2.306	2.020
Statistically Different?	No	No	No

As demonstrated in **Table 2**, statistically there is no difference between the flare CE measured by the VISR method and by the extractive method. The agreement between the two measurement methods can also be illustrated in **Figure 1** using the results from the PERF Test.

Figure 1. Flare CE measured by VISR method and extractive method – PERF Test results



Conclusion

Industrial flares can now be measured or continuously monitored by the VISR method for their performance, i.e., combustion efficiency (CE). The VISR method is a remote sensing method and can be deployed easily and practically. The VISR method transforms flare testing/monitoring from most difficult task (impossible in many cases) to a task that is easier than most conventional air emission testing methods. With the significant potential benefits that the VISR method can bring, it is important to characterize and understand the precision and accuracy of this method.

Through a large number of tests under various process and environmental conditions, a high precision and accuracy have been demonstrated for the VISR method. The relative standard deviation (RSD) is in the range of 0.07-1.98% with an average RSD of 0.62% for flare CE in the range from 80 to 100%. The average RSD of 0.62% is more than an order of magnitude smaller than the minimum precision target of 20% RSD set in EPA Method 301. The highest SD is only 1.84 measured as % CE.

The flare CE measured by the VISR method is in excellent agreement with the flare CE measured by the extractive method. The mean difference between the two methods is in the range of -0.21 to 0.30 measured in % CE. The t-statistic value in each of the three test groups are well below its corresponding t-test critical value, passing the t-test with a substantial margin. Keep in mind that the extractive method is suitable only in research. It is virtually impossible to deploy the extractive method to elevated flares at industrial production facilities. Having a method that can be easily deployed to industrial sites and produce highly time-resolved and accurate flare measurement results is a significant advancement.

Appendix C: Combustion Efficiency Versus Destruction Efficiency

With respect to emissions calculations or GHG reporting, it is important to consider the difference between combustion efficiency (CE) and destruction efficiency (DE). The VISR method measures CE, which is a measure of the efficiency of the flame to convert hydrocarbons into carbon dioxide and water. If the combustion efficiency is 100%, then all of the hydrocarbons have been oxidized all the way to carbon dioxide, leaving no hydrocarbons in the post combustion plume. CE will be reduced as the percentage of hydrocarbon in the post combustion plume increases. Destruction efficiency is a measure of the percentage of a compound that is destroyed (IE converted into another form), but not necessarily oxidized to the ultimate combustion product of carbon dioxide and water. In this case, it represents the percentage of hydrocarbons destroyed. The hydrocarbons could be converted to carbon dioxide, carbon monoxide, soot or another compound. As a result, DE is typically higher than CE. For emission inventory purposes, flares are generally deemed to have a DE of 98%, meaning 98% of the hydrocarbons sent to the flare are converted into another form. There is no quantitative method to convert the VISR CE data to DE, however we do have some points of reference. The US EPA Refinery Sector Rule (40 CFR 63.670 (r) equates a CE of 96.5% to a DE of 98%. The rule references the John Zink combustion handbook (Baukal, 2001).

In addition, there have been two major studies which have measured both CE and DE with extractive sampling: the 2010 TCEQ Study and the 2016 PERF Study. Both of these studies were conducted at John Zink's research facility in Tulsa, Oklahoma. Taken collectively, these studies provide 71 individual measurements of CE and DE. *Figure 8* below shows the relationship between CE and DE from these two studies.

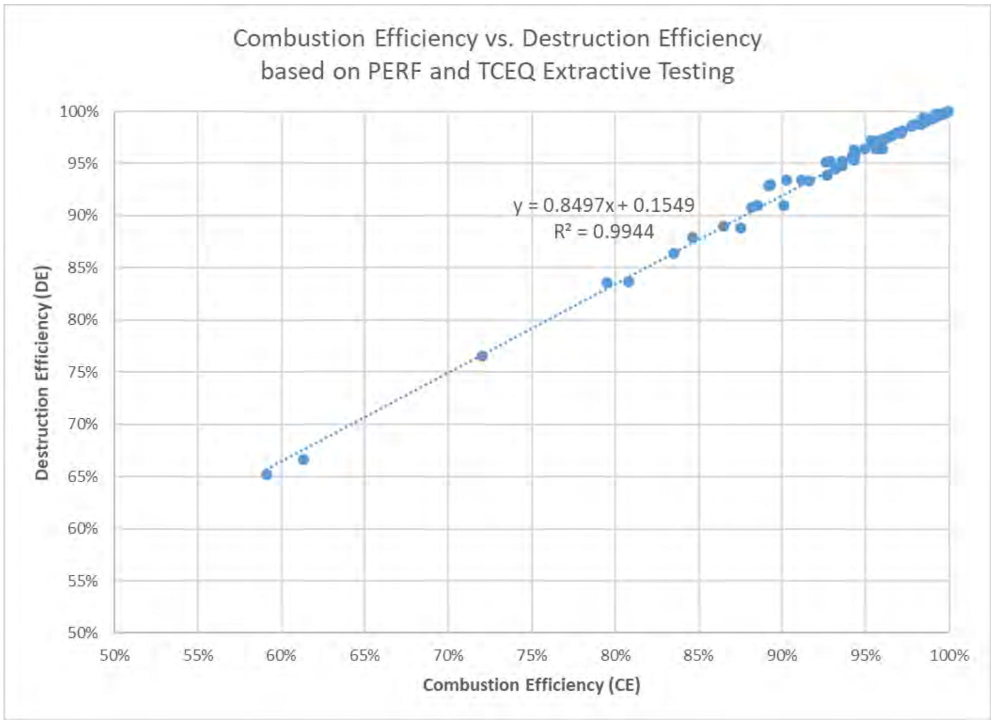

Figure 17. CE vs DE from extractive sampling during PERF and VISR studies.

As demonstrated by the chart, the relationship between DE and CE is quite linear. The fit equation to this data has an R^2 of 0.99. Equation 2 below can be used to convert CE to DE using this correlation:

$$DE\ (\%) = CE\ (\%) * 0.8497 + 0.1549$$

Equation 2

It should be noted that when SI is high and CE appears to be low, the destruction efficiency (DE) may still be high as the hydrocarbons are combusted into soot instead of oxidizing to the ultimate combustion products of water and CO_2. The CE-DE relationship shown in *Figure 8* is established under no smoke conditions. There has not been sufficient study on a similar CE-DE relationship when there is significant smoke in the flare. This equation will be valid for CE within a range of 60% to 99.4%. Above 99.4%, the DE will be capped at 100%. Below 60%, there is no extractive data available to extend the correlation.

Introduction

Providence Photonics, LLC (Providence) has developed a method to remotely measure the performance of an industrial flare using Video Imaging Spectral Radiometry (VISR). The VISR method provides five flare performance metrics: combustion efficiency (CE), smoke index (SI), flame stability (FS), flame footprint (FF), and fractional heat release (FH).

Providence conducted a field campaign using VISR at various [redacted] facilities in North Dakota from April 4th, 2022 to April 8th, 2022. A total of 92 individual flare measurements were performed. In addition to the VISR measurements, an mp4 video was captured for each flare using a FLIR GF320 optical gas imaging camera. This report summarizes the data and findings from the campaign.

Background

The VISR method utilizes a multi-spectral midwave infrared imager to measure relative concentrations of combustion gases. The method was designed to be a continuous and autonomous remote flare monitor, but in this study it was deployed as a mobile technology for a short-term measurement. ***Figure 1*** below shows the VISR device deployed at a [redacted] facility in North Dakota. The VISR device and related equipment was powered from the 12V battery system of the vehicle.

Figure 1: VISR device deployed at a [redacted] facility in North Dakota.

Results

The results from VISR measurements are tabulated in **Appendix A** and a summary is provided in *Table 1 below*.

Table 1: Summary VISR Results.

ID	Site Description	Flare Description	Distance (m)	Temp (°C)	RH (%)	Avg Wind Speed (mph)	FLIR Video	CE Avg (%)	DRE Avg (%)	SI Avg	FF Avg (m2)	FH Avg (MMBT	FS Avg (%)

Flare Performance Metrics

VISR provides five flare performance metrics at a 1-second data interval:

1. COMBUSTION EFFICIENCY (0 TO 100%): Combustion efficiency (CE) is a measure of the relative concentration of hydrocarbon vs. carbon dioxide in the post combustion gas plume. If there is no hydrocarbon present in the post combustion gas plume, then CE is 100%. CE should not be confused with Destruction and Removal Efficiency (DRE). The difference between these two metrics is discussed in **Appendix C**. While CE is directly measured by the VISR method, DRE is derived using correlations established through extractive sampling as discussed in **Appendix C**.
2. SMOKE INDEX (0 TO 10): Smoke index (SI) is a unit-less number which indicates the degree of visible emissions within the combustion envelope. A SI of 0 means no visible emissions are present while a SI of 10 means the flare has heavy black smoke. While SI only represents the degree of visible emissions within the combustion envelope, it is generally correlated to opacity and a SI above 2 indicates that some visible emissions are likely present outside of the combustion envelope.
3. FLAME FOOTPRINT (FT^2): Flame footprint (FF) is a measure of the flame size in square feet. It is not necessarily correlated to the visible flame size as the FF is determined by the radiance, not the visible flame. Note that the orientation of the flame will impact the FF as the depth of the flame will change with viewing angle.
4. FRACTIONAL HEAT RELEASE (BTU/HR): Fractional Heat Release (FH) is a measure of the heat released from flare combustion in the spectral bands monitored by the VISR imager. Although it is not a measure of the total heat release across the entire energy spectrum, FH is expected to be correlated to the total heat release.
5. FLAME STABILITY (0 TO 100%): Flame stability (FS) is a measure of the change in radiance measured by the VISR imager in a 1-second interval. A FS of 100% indicates a flame that has a constant radiance. A low FS value (generally lower than 80%) indicates a flame with significant radiance fluctuation within 1 second interval, suggesting a less stable flame. Variability on a longer time scale will not be described by the flame stability metric.

Data Quality Indicators

The VISR method has two important data quality indicators (DQI) to assess the quality of the measurement. The first is the number of pixels in the flame combustion envelope. The VISR method requires at least 30 pixels to accurately determine the performance metrics of the flame. The VISR device has a fixed focal length, so the number of pixels in the flame is determined by the size of the flame and the distance from the VISR imager to the flame. For this study the flame size was above the minimum number of pixels for all measurements performed.

The second important DQI is the Smoke Index level. As the smoke index increases above 2.0 (this threshold may vary within a range of 1-2 depending on specific flares), visible emissions are generally present in the flame. When visible emissions become significant, the SI value will climb even higher to a maximum value of 10 for thick black smoke. Extractive testing shows that SI values above 3.0 may cause a small negative bias on the CE measurement (< 1%) and SI values above 5 may cause a significant negative bias to CE, as confirmed by testing with an extractive sampling method as a control. Any data points with a smoke index above 3 were removed from the summary tables and **Appendix A** results.

Observations

The following sections describe observations and comparisons derived from the dataset.

Distribution of Flare DRE

The majority of flares measured (90%) had a DRE greater than 98%, and 84% had a DRE greater than 99%. ***Figure 2*** shows the distribution of flare DRE measurements across the entire dataset.

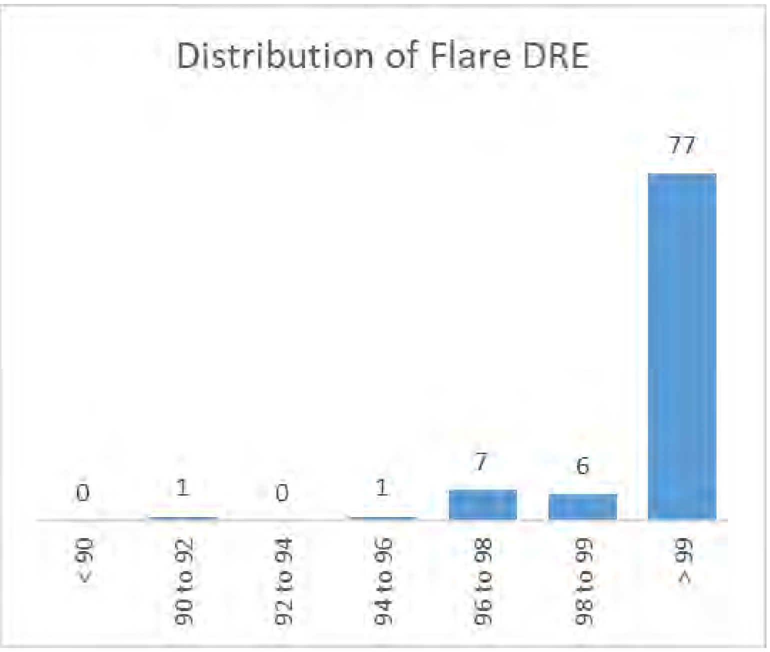

Figure 2: Distribution of Flare DRE measurements.

[redacted]

The lowest performing flare [redacted]
Figure 3 provides a time series plot of the Destruction Efficiency vs. Fractional Heat release (FH). The average DRE observed during this 15-minute measurement period was 90.82%.

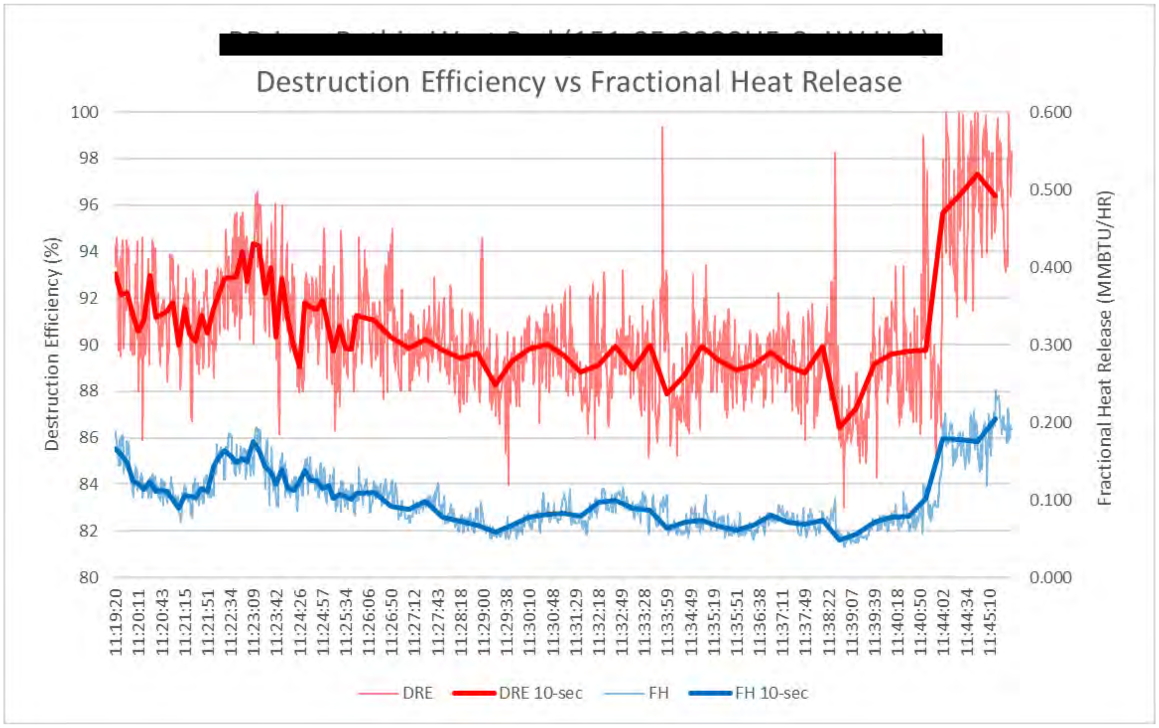

Figure 3: Destruction Efficiency vs. Fractional Heat Release for [redacted].

[redacted]

The flare with next lowest performance was the [redacted] [redacted]). ***Figure 4*** provides a time series plot of the Destruction Efficiency vs. Fractional Heat release (FH). The average DRE observed during this 15-minute period was 94.85%.

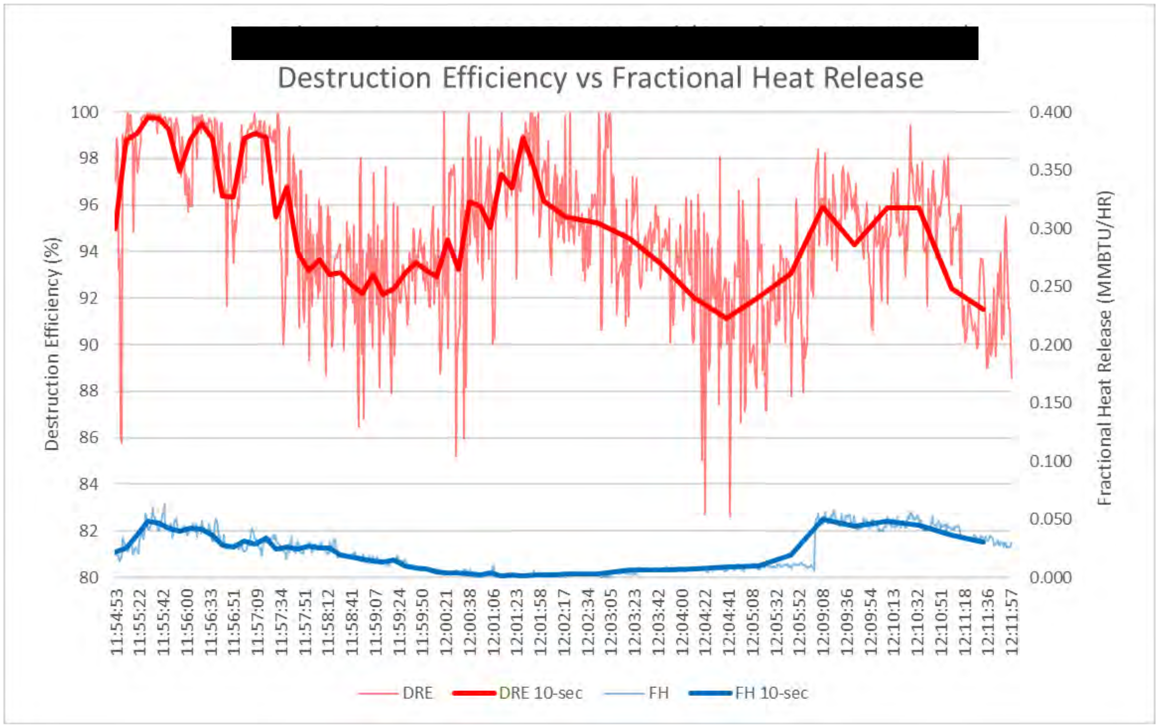

Figure 4: Destruction Efficiency vs. Fractional Heat Release for [redacted]

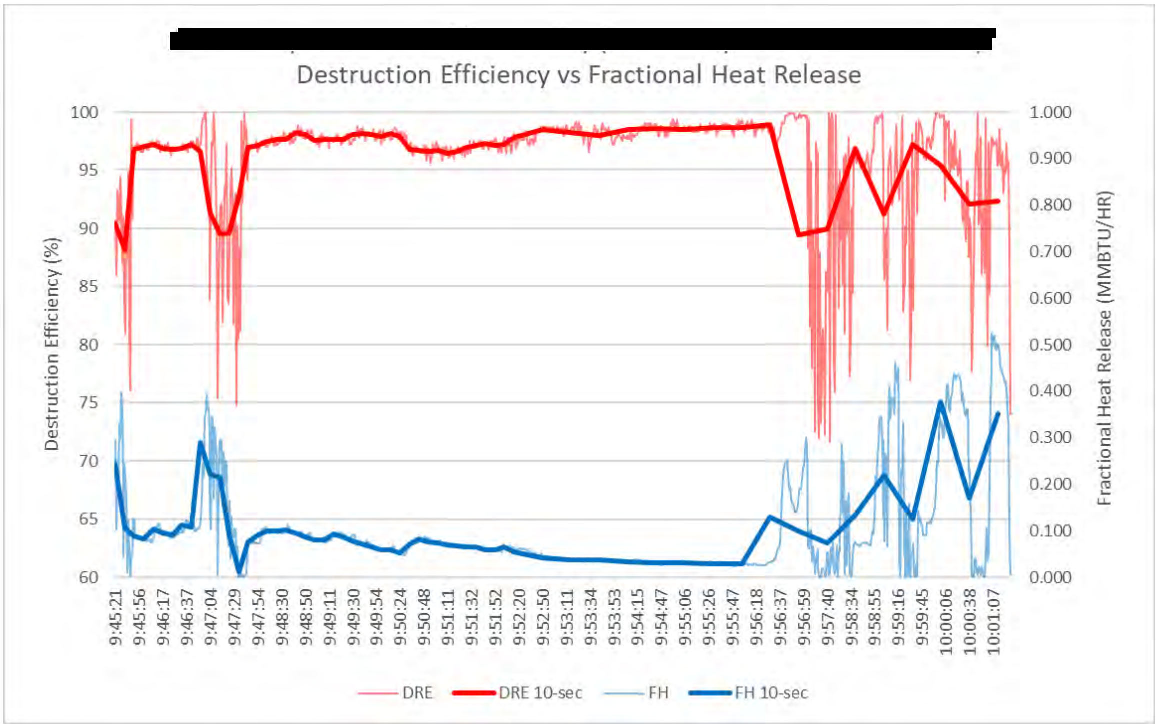
[redacted]

The flare with next lowest performance was the [redacted]-[redacted] ***Figure 5*** provides a time series plot of the Destruction Efficiency vs. Fractional Heat release (FH). The average DRE observed during this 15-minute period was 96.23%.



[redacted]

Figure 5: Destruction Efficiency vs. Fractional Heat Release and Smoke Index for [redacted]

Summary

In total, 92 flares across 67 sites were measured during the five-day study. The average DRE for all flares measured was 99.3%. Although there were a handful of flares with a DRE less than 98% (9 of 92), the majority of flares measured had a DRE which exceeded 99% (77 of 92). This data is consistent with prior studies in the area.

Appendix B: Validation of the VISR method

The VISR method has been extensively tested using extractive sampling as a control method. The largest blind test was conducted by the Petroleum Environmental Research Forum (PERF), a non-profit organization created to provide a stimulus to and a forum for the collection, exchange, and analysis of research information relating to the petroleum industry. PERF project 2014-10 (Test) was created by participating PERF companies to provide a test platform for various developers/vendors of flare remote sensing technologies (Invitees) to participate in a blind test to evaluate the effectiveness of each technology. The test was administered by John Zink at their test facility in Tulsa, Oklahoma, USA. [redacted] sponsoring PERF companies and Providence Photonics was one of the vendors participating in the PERF test. The results of the PERF test have now been released to the public.

The PERF test consisted of 43 individual test points. Each test point was measured with an extractive system suspended over the flame, as shown in *Figure 15*. With the exception of 3 test points provided as calibration data (per test protocol), the test was completely blind for the participants. The flare performance (Combustion Efficiency), flow rate and fuel composition were not shared with the participants until after their individual results were submitted.

The VISR method performed quite well in the PERF test. *Figure 16* below shows the VISR results compared to the control method (extractive results) across the 43 test points. Overall, the VISR result was within 1% of the extractive result and the accuracy was even better for the higher CE range (above 95%).

Figure 15. VISR method demonstrated as part of the PERF remote flare monitoring blind testing.

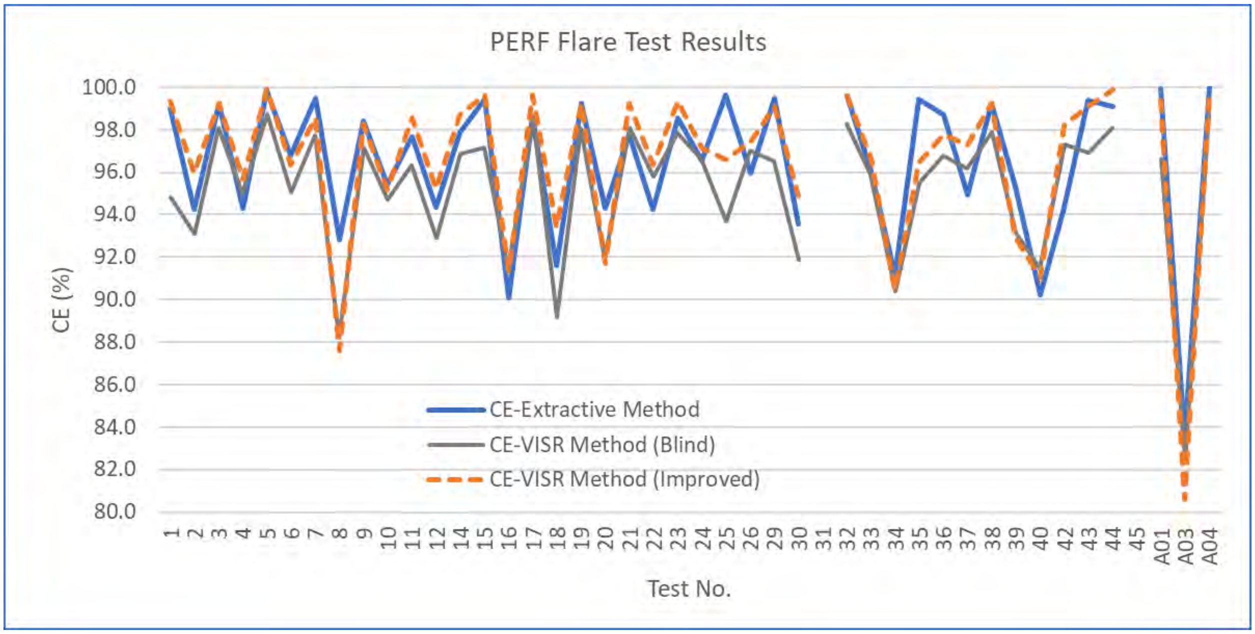

Figure 16. PERF test results, VISR (remote) vs. Extractive.

Note that the CE definition used by VISR was slightly different than what was used for the PERF extractive results. *Equation 1* below shows the calculation used to determine CE from the extractive results:

$$CE\ (\%) = \frac{CO_2(vol\%)}{CO_2(vol\%) + \frac{[CO(ppmvd) + 3\ \times THC(ppmvd)]}{10000}} \times 100$$

Equation 1

The VISR method uses the same equation but excludes the CO component. Extractive testing (including the PERF study) conducted by Providence Photonics, it was shown that the concentration of CO in the combustion plume (especially when CE is greater than 95%) is orders of magnitude lower than either CO2 or THC. Therefore, the effect of excluding CO from the CE equation is negligible.

Some definitions of CE also include soot (IE carbon) in the denominator, which means the presence of smoke will tend to lower CE. The VISR method does not measure carbon soot when determining CE, which is consistent with the definition of CE in a regulatory context.

A systematic negative bias of -0.8% was observed in the VISR results when compared to the extractive results from the PERF test. Providence Photonics has continued developing the CE algorithm since the PERF testing and believes that the systematic bias has been removed. This was confirmed by Providence Photonics by re-running the PERF data with the latest VISR algorithm. More information regarding the validation testing performed on the VISR method can be found in the PERF Report.

Another set of extractive testing was conducted at Zeeco's test facility in Tulsa, Oklahoma, USA and is discussed in a peer reviewed journal article[1].

Appendix C: Combustion Efficiency Versus Destruction Efficiency

With respect to emissions calculations or GHG reporting, it is important to consider the difference between combustion efficiency (CE) and destruction efficiency (DE). The VISR method measures CE, which is a measure of the efficiency of the flame to convert hydrocarbons into carbon dioxide and water. If the combustion efficiency is 100%, then all of the hydrocarbons have been oxidized all the way to carbon dioxide, leaving no hydrocarbons in the post combustion plume. CE will be reduced as the percentage of hydrocarbon in the post combustion plume increases. Destruction efficiency is a measure of the percentage of a compound that is destroyed (IE converted into another form), but not necessarily oxidized to the ultimate combustion product of carbon dioxide and water. In this case, it represents the percentage of hydrocarbons destroyed. The hydrocarbons could be converted to carbon dioxide, carbon monoxide, soot or another compound. As a result, DE is typically higher than CE. For emission inventory purposes, flares are generally deemed to have a DE of 98%, meaning 98% of the hydrocarbons sent to the flare are converted into another form. There is no quantitative method to convert the VISR CE data to DE, however we do have some points of reference. The US EPA Refinery Sector Rule (40 CFR 63.670 (r) equates a CE of 96.5% to a DE of 98%. The rule references the John Zink combustion handbook (Baukal, 2001).

In addition, there have been two major studies which have measured both CE and DE with extractive sampling: the 2010 TCEQ Study and the 2016 PERF Study. Both of these studies were conducted at John Zink's research facility in Tulsa, Oklahoma. Taken collectively, these studies provide 71 individual measurements of CE and DE. *Figure 8* below shows the relationship between CE and DE from these two studies.

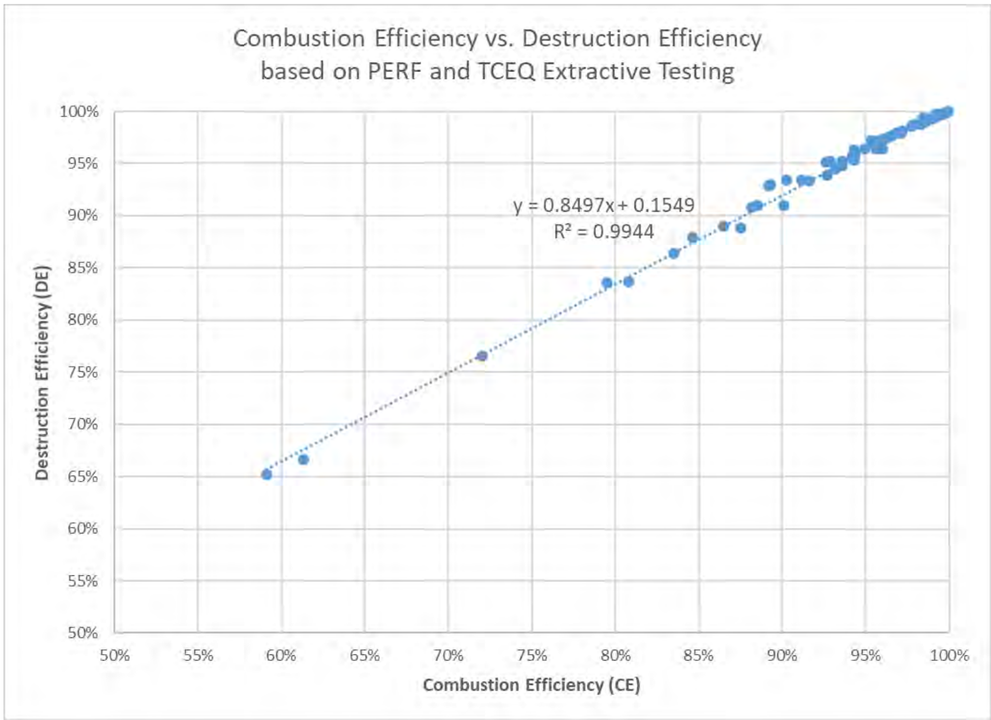

Figure 17. CE vs DE from extractive sampling during PERF and VISR studies.

As demonstrated by the chart, the relationship between DE and CE is quite linear. The fit equation to this data has an R^2 of 0.99. Equation 2 below can be used to convert CE to DE using this correlation:

$$DE\ (\%) = CE\ (\%) * 0.8497 + 0.1549$$

Equation 2

It should be noted that when SI is high and CE appears to be low, the destruction efficiency (DE) may still be high as the hydrocarbons are combusted into soot instead of oxidizing to the ultimate combustion products of water and CO_2. The CE-DE relationship shown in *Figure 8* is established under no smoke conditions. There has not been sufficient study on a similar CE-DE relationship when there is significant smoke in the flare. This equation will be valid for CE within a range of 60% to 99.4%. Above 99.4%, the DE will be capped at 100%. Below 60%, there is no extractive data available to extend the correlation.

PROVIDENCE PHOTONICS

Mantis Performance Report for [redacted] Flare Test

July 2022

Prepared for

[redacted]

PROVIDENCE PHOTONICS PROJECT NO. [redacted]

PREPARED BY
Providence Photonics, LLC | 1201 Main Street, Baton Rouge, LA 70802

Table of Contents

Introduction

[redacted]) retained Providence Photonics, LLC (Providence) to conduct performance measurements with the Mantis flare monitor. The test was funded in part by the DOE ARPA-E REMEDY program to improve the DRE of flares and reduce methane emissions from flares. The objective of the test was to provide a baseline for [redacted] DreamDuo flare.

The flare test was conducted at the [redacted] [redacted] [redacted] on July 26th, 2022. This report summarizes the performance results recorded by the Mantis flare monitor.

Background

The Mantis utilizes a multi-spectral midwave infrared imager to measure relative concentrations of combustion gases. The method was designed to be a continuous and autonomous remote flare monitor and can be integrated in the plant control system. In this instance, the Mantis data was recorded locally and retrieved later for reporting purposes.

Results

The results from Mantis measurements are tabulated in **Appendix A** and a summary is provided in *Table 1 below*.

Date	Start Time (Local)	End Time (Local)	Test Description	Distance (m)	Temp (°C)	RH (%)	CE Avg (%)	DRE Avg (%)	SI Avg	FF Avg (m2)	FH Avg (MMBTU/HR)	FS Avg (%)

Table 1: Summary Mantis Results.

Flare Performance Metrics

VISR provides five flare performance metrics at a 1-second data interval:

1. COMBUSTION EFFICIENCY (0 TO 100%): Combustion efficiency (CE) is a measure of the relative concentration of hydrocarbon vs. carbon dioxide in the post combustion gas plume. If there is no hydrocarbon present in the post combustion gas plume, then CE is 100%.
2. SMOKE INDEX (0 TO 10): Smoke index (SI) is a unit-less number which indicates the degree of visible emissions within the combustion envelope. A SI of 0 means no visible emissions are present while a SI of 10 means the flare has heavy black smoke. While SI only represents the degree of visible emissions within the combustion envelope, it is generally correlated to opacity and a SI above 2 indicates that some visible emissions are likely present outside of the combustion envelope.
3. FLAME FOOTPRINT (FT^2): Flame footprint (FF) is a measure of the flame size in square feet. It is not necessarily correlated to the visible flame size as the FF is determined by the radiance, not the visible flame. Note that the orientation of the flame will impact the FF as the depth of the flame will change with viewing angle.
4. FRACTIONAL HEAT RELEASE (BTU/HR): Fractional Heat Release (FH) is a measure of the heat released from flare combustion in the spectral bands monitored by the VISR imager. Although it is not a measure of the total heat release across the entire energy spectrum, FH is expected to be correlated to the total heat release.
5. FLAME STABILITY (0 TO 100%): Flame stability (FS) is a measure of the change in radiance measured by the VISR imager in a 1-second interval. A FS of 100% indicates a flame that has a constant radiance. A low FS value (generally lower than 80%) indicates a flame with significant radiance fluctuation within 1 second interval, suggesting a less stable flame. Variability on a longer time scale will not be described by the flame stability metric.

Data Quality Indicators

The VISR method has two important data quality indicators (DQI) to assess the quality of the measurement. The first is the number of pixels in the flame combustion envelope. The VISR method requires at least 30 pixels to accurately determine the performance metrics of the flame. The VISR device has a fixed focal length, so the number of pixels in the flame is determined by the size of the flame and the distance from the VISR imager to the flame. For this test the flame size was above the minimum number of pixels for all measurements performed.

The second important DQI is the Smoke Index level. As the smoke index increases above 2.0 (this threshold may vary within a range of 1-2 depending on specific flares), visible emissions are generally present in the flame. When visible emissions become significant, the SI value will climb even higher to a maximum value of 10 for thick black smoke. Extractive testing shows that SI values above 3.0 may cause a small negative bias on the CE measurement (< 1%) and SI values above 5 may cause a significant negative bias to CE, as confirmed by testing with an extractive sampling method as a control. Any data points with a smoke index above 3 were removed from the summary tables and **Appendix A** results.

Summary

A flare test was conducted at the [redacted] [redacted] [redacted] on July 26th, 2022. The test was funded in part by the DOE ARPA-E REMEDY program to improve the DRE of flares and reduce methane emissions from flares. The objective of the test was to provide a baseline for [redacted] DreamDuo flare. Raw 1-second data and summary data are provided along with this report.

Operator Survey of Supply Chain Delays for Equipment Needed for EPA Proposed NSPS OOOOb Methane Rule

API American Petroleum Institute

AXPC AMERICAN EXPLORATION & PRODUCTION COUNCIL

INGAA Interstate Natural Gas Association of America

IPAA INDEPENDENT PETROLEUM ASSOCIATION OF AMERICA

GPA MIDSTREAM ASSOCIATION

Operator Survey of Supply Chain Delays for Equipment Needed for EPA Proposed NSPS OOOOb Methane Rule

From June through September of 2023, the American Petroleum Institute (API), American Exploration and Production Council (AXPC), Interstate Natural Gas Association of America (INGAA), Independent Petroleum Association of America (IPAA), and GPA Midstream Association (the “Industry Trades”) conducted an operator survey of supply chain delays for components and equipment necessary to comply with the Environmental Protection Agency’s (EPA) proposed rule “Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review.” To comply with antitrust guidelines the survey was blinded, and data was gathered and complied by a third party consultant, John Beath Environmental.

The EPA’s OOOOb New Source Performance Standard (the “methane rule”) is a complex rule that will apply to many thousands of facilities in producing basins across the country. Because of the wide variety of conditions faced by these facilities, the challenges in acquiring equipment due to ongoing COVID-induced supply chain delays, and additional proposed rules which will apply to these sources such as EPA’s revisions to Subpart W of the Greenhouse Gas Reporting Program (GHGRP) that will also require equipment, **operators need a reasonable timeline based on a December 6, 2022 applicability date to come into compliance with the final methane rule.**

Operator Survey of Supply Chain Delays for Equipment Needed for EPA Proposed NSPS OOOOb Methane Rule

Responses to the survey included information from 11 basins; a majority of responses included information from the Permian Basin. The responses suggest that operators have the greatest supply chain concerns with pneumatics, control devices, storage vessels, associated gas, and fugitive emissions components.

The survey found that current backorder times for components range from 6+ to 24+ months. Implementation of the proposed methane rule is expected to increase current backorder times by an additional 6+ months. A November 15, 2021 applicability date is expected to substantially exacerbate the challenges of equipment acquisition over a December 6, 2022 applicability date.

The survey results indicate that reasonable compliance timelines, based on a December 6, 2022 applicability date, would need to allow a minimum of 12 to 26 months for operators to come into compliance with the final methane rule, as appropriate given supply chain backlogs for each affected facility.

Current and Anticipated Supply Chain Delays

- Current backorder is generally up to 12 months across affected facilities with additional lead time needed for specialized equipment.
- Finalization of NSPS OOOOb is expected to add a minimum of 6 months of additional backorder time across affected facilities.

Affected Facility	Current Procurement Lead Time ("Backorder") is Delayed	Anticipated Backorder upon NSPS OOOOb Finalization Compared to Existing Lead Time
Pneumatic Controllers and Pumps	• Up to 12 months across equipment options. • Electrical transformers and instrument air skids are experiencing variable delays with 24+ months indicated.	• Add 6 to 12 months
Control Device Provisions	• Up to 12 months for both control devices and other equipment (monitoring, etc.)	• Add 6 to 12 months for control devices and • Add 6+ months for other equipment.
Storage Vessels	• Up to 12 months for steel tanks, vent header control valves • Up to 24 months for VRUs and • Up to 30 months for PVRVs & thief hatches.	• Add 6+ months across equipment
Associated Gas	• Up to 18 months for VRUs, gas compressor skids	• Add 6 to 12 months
Fugitive Emissions Components	• Up to 12 months across monitoring options.	• Add up to 6 months
Other (miscellaneous equipment)	• Up to 18 months for VFDs	• Add 6 to 12 months for VFDs

Recommended OOOOb Compliance Timelines by Affected Facility

Affected Facility / Category	EPA Proposed Compliance Timeline	Anticipated Supply Chain Delay Upon Finalization *(Current lead time + additional anticipated lead time)*	Industry Trades Recommended Compliance Timeline
Pneumatic Controllers & Pumps	60 days	18 - 36 months	26 months
Control Devices and Closed Vent Systems	60 days	18-24 months	20 months
Associated Gas	60 days	30 months	24 months
Fugitive Emissions Components	60 days	18 months	12 months
Storage Vessels	30 - 60 days	18 - 36 months	26 months

API's February 13 comment letter[1] included anecdotal reports of members' supply chain constraints. This survey quantitatively expands on the supply chain issues raised to demonstrate the need for reasonable compliance timelines.

These recommended compliance timelines account only for supply chain delays and do not contemplate the additional time needed to install equipment. The recommendations reflect the realities of the supply chain, balanced with the urgency of aggressive industry action to achieve compliance with OOOOb and reduce emissions.

While this survey evaluated supply chain delays relative to OOOOb compliance and did not contemplate compliance with OOOOc, given the scope of the proposed rules and available data, similar supply chain constraints are anticipated to continue beyond the OOOOc implementation timeframe.

---

Equipment & Services Included by Affected Facility

☐ Survey responses included equipment and services for various compliance options for each affected facility (listed below).
☐ The survey included estimated equipment counts, supplier market, and supply chain delays.

Pneumatic Controllers & Pumps

- Electrical Transformers
- Solar Equipment
- Generator Skids
- Instrument Air Skids
- Electrical Valves/Controllers
- Replacement Pumps
- Replacement Controllers
- ECAT System
- Nitrogen Gas

Control Devices & Closed Vent Systems

- Flares
- Enclosed Combustion Devices
- Flow Meters
- Backpressure Valves
- Calorimeters
- Third-party Testing: Performance, Net Heating Value (NHV), Opacity
- Automatic Pilot Light
- Thermocouples
- Piping for Closed Vent System

Storage Vessels

- Steel Tanks
- Pressure-Vacuum Relief Valves (PVRVs) & Thief Hatches
- Vent Header Control Valve
- Vapor Recovery Units (VRUs)*

Associated Gas

- VRUs*
- Methane Pyrolysis Skids
- Gas Compressor Skids
- Gas to Liquids Skids
- Liquefied Natural Gas Production Skids

Fugitive Emissions Components

- Optical Gas Imaging (OGI) Cameras
- OGI Camera Technicians
- Third-party OGI Monitoring
- Third-party Alternative Screening Technology Monitoring
- Continuous Monitoring Systems
- Replacement Piping Components
- Handheld Methane Detectors

Other (Miscellaneous Equipment)

- Variable Frequency Drives (VFDs)
- Cabling (Electric/Communications)
- Engineering Analysis (Associated Gas, Pneumatic Pumps, etc.)
- Eductor Skid (for compressors)

---

*VRUs were considered separately for Storage Vessels and Associated Gas since size and design may differ.

Estimated Equipment Counts Needed for NSPS OOOOb Compliance

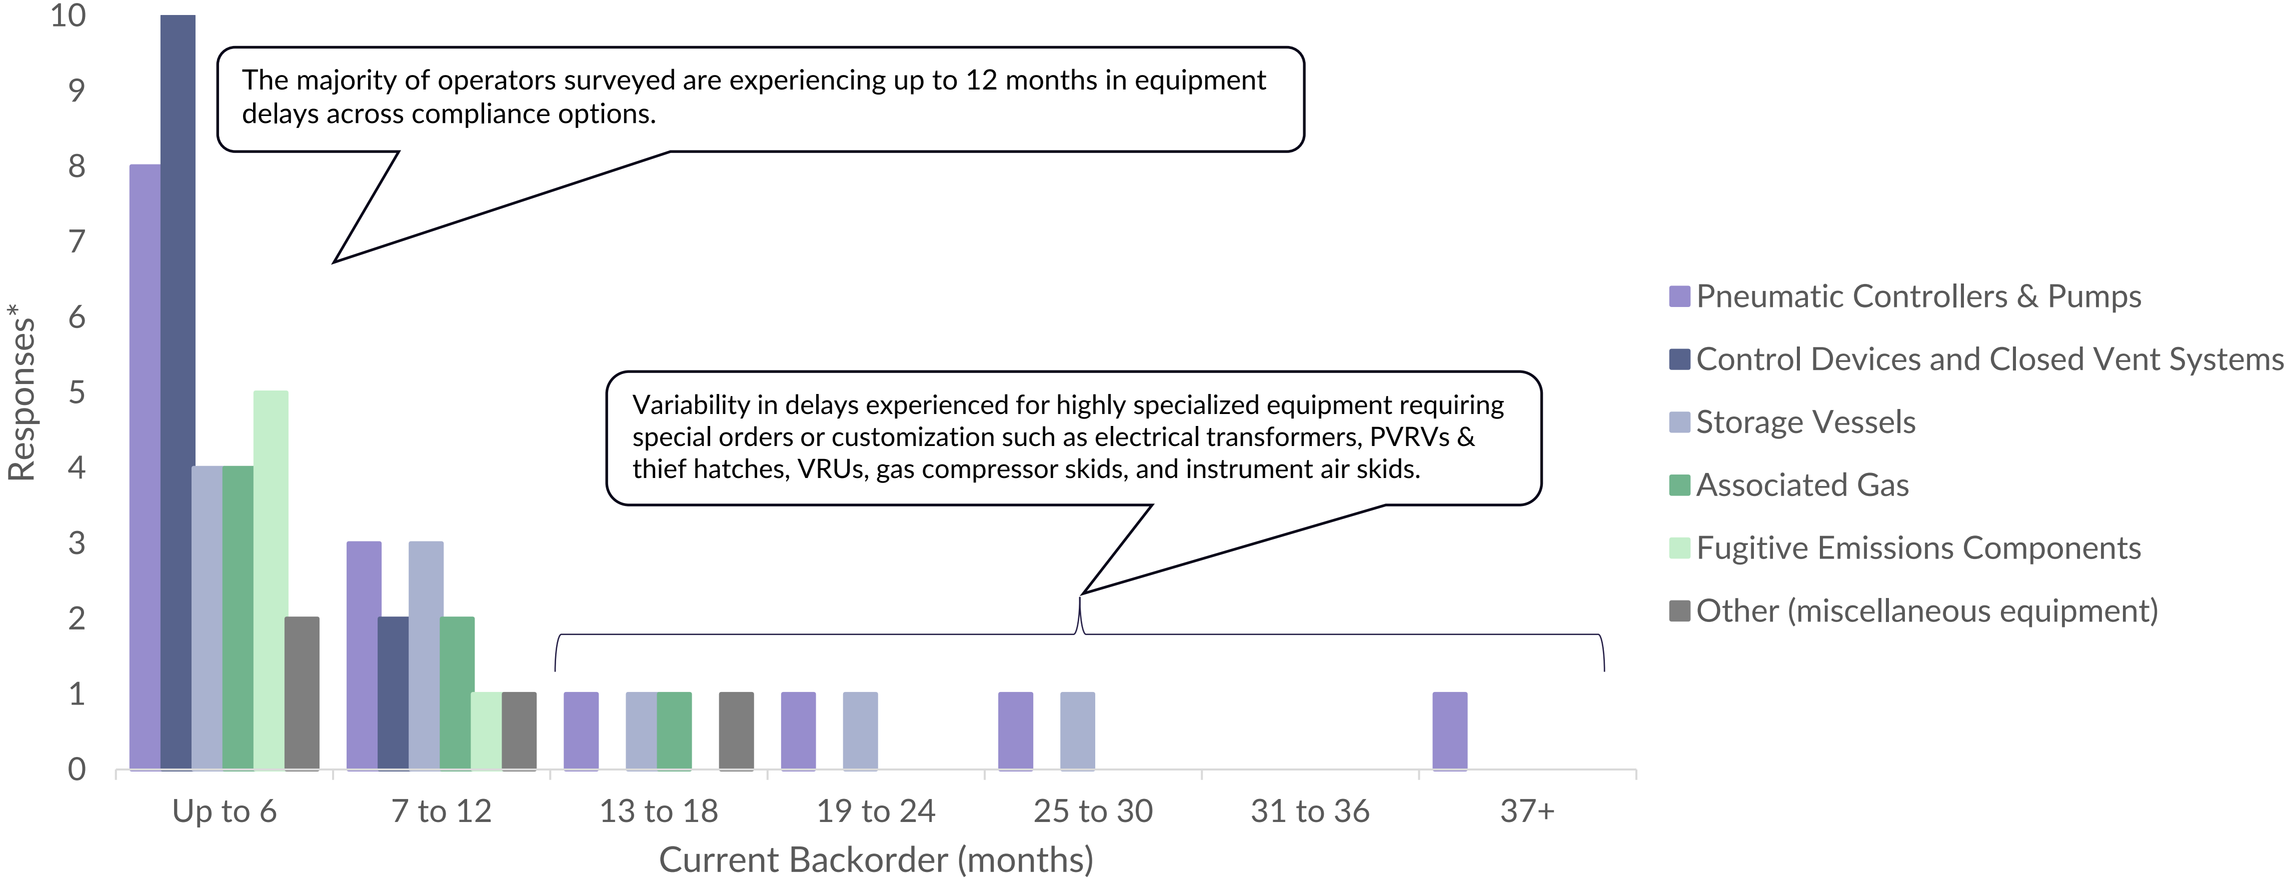
- **Pneumatic Controllers & Pumps**
  - Variety of responses highlight the need for multiple compliance options (i.e., no “one size fits all” solution).
  - 69% of responses indicated that instrument air skids would be needed.
  - Responses continue to indicate that a variety of power generation options will need to be used.
- **Control Devices & Closed Vent Systems**
  - 82% of responses indicated that flow meters would be needed.
  - 27% or more of responses indicated that third-party services (performance testing, NHV testing, or opacity monitoring) were being investigated for use.
- **Storage Vessels**
  - PVRVs & thief hatches were key equipment needed and were not considered in EPA’s cost analysis.
  - 29% of responses indicated that steel tanks would be needed, possibly as replacements for fiberglass tanks to facilitate a closed vent system. Replacement tanks were not considered in EPA’s cost analysis.
- **Associated Gas**
  - While operators support the concept of other types of beneficial use, responses indicated that operators were not planning to implement alternative technology options proposed by EPA (methane pyrolysis, gas to liquids, liquefied natural gas). The costs of alternative use options were not considered in EPA’s cost analysis.
- **Fugitive Emission Components**
  - Responses indicated that most operators were planning to implement their own OGI monitoring program (OGI cameras and technicians). A shortage of OGI technicians was also noted in the responses, and for gas processing operators, availability of qualified OGI camera technicians could be further limited based on the proposed certification and audit requirements in Appendix K. EPA’s cost analysis assumed that operators would use a third-party service.

Survey Results Compared to Previous API Comments

- Since the February 13, 2023 comment deadline, equipment backorder has generally remained the same or worsened.
- A reasonable compliance timeline of 12 to 26 months is needed based on a December 6, 2022 applicability date. Additional time would be needed if EPA maintains the November 15, 2021 applicability date.

Supply Chain Item	Survey Results (August 2023)	Previous API Comments (February 2023)	Summary of Comparison
Control Device Backorder	Up to 6 months: 75% 7 to 12 months: 25%	3 to 4 months	Backorder has increased by up to 8 months.
Flow Meter Backorder	Up to 6 months: 83% 7 to 12 months: 17%	6 to 8 months	Backorder remains approximately 6 to 8 months.
Flow Meter Installation Timeline (Hot Tap)	Up to 2 weeks: 50% 3 to 4 weeks: 33% 12+ weeks: 17%	Up to 4 months	Survey results may not reflect hot tap installations.
Instrument Air Skids Backorder	Up to 6 months: 58% 7 to 12 months: 25% 19+ months: 17%	8 to 12 months	Backorder has increased by up to 7 months.
Solar Panels Backorder	Up to 6 months: 80% 7 to 12 months: 20%	18 to 24 months	Backorder has decreased by 6 to 12 months.

Current Procurement Lead Time

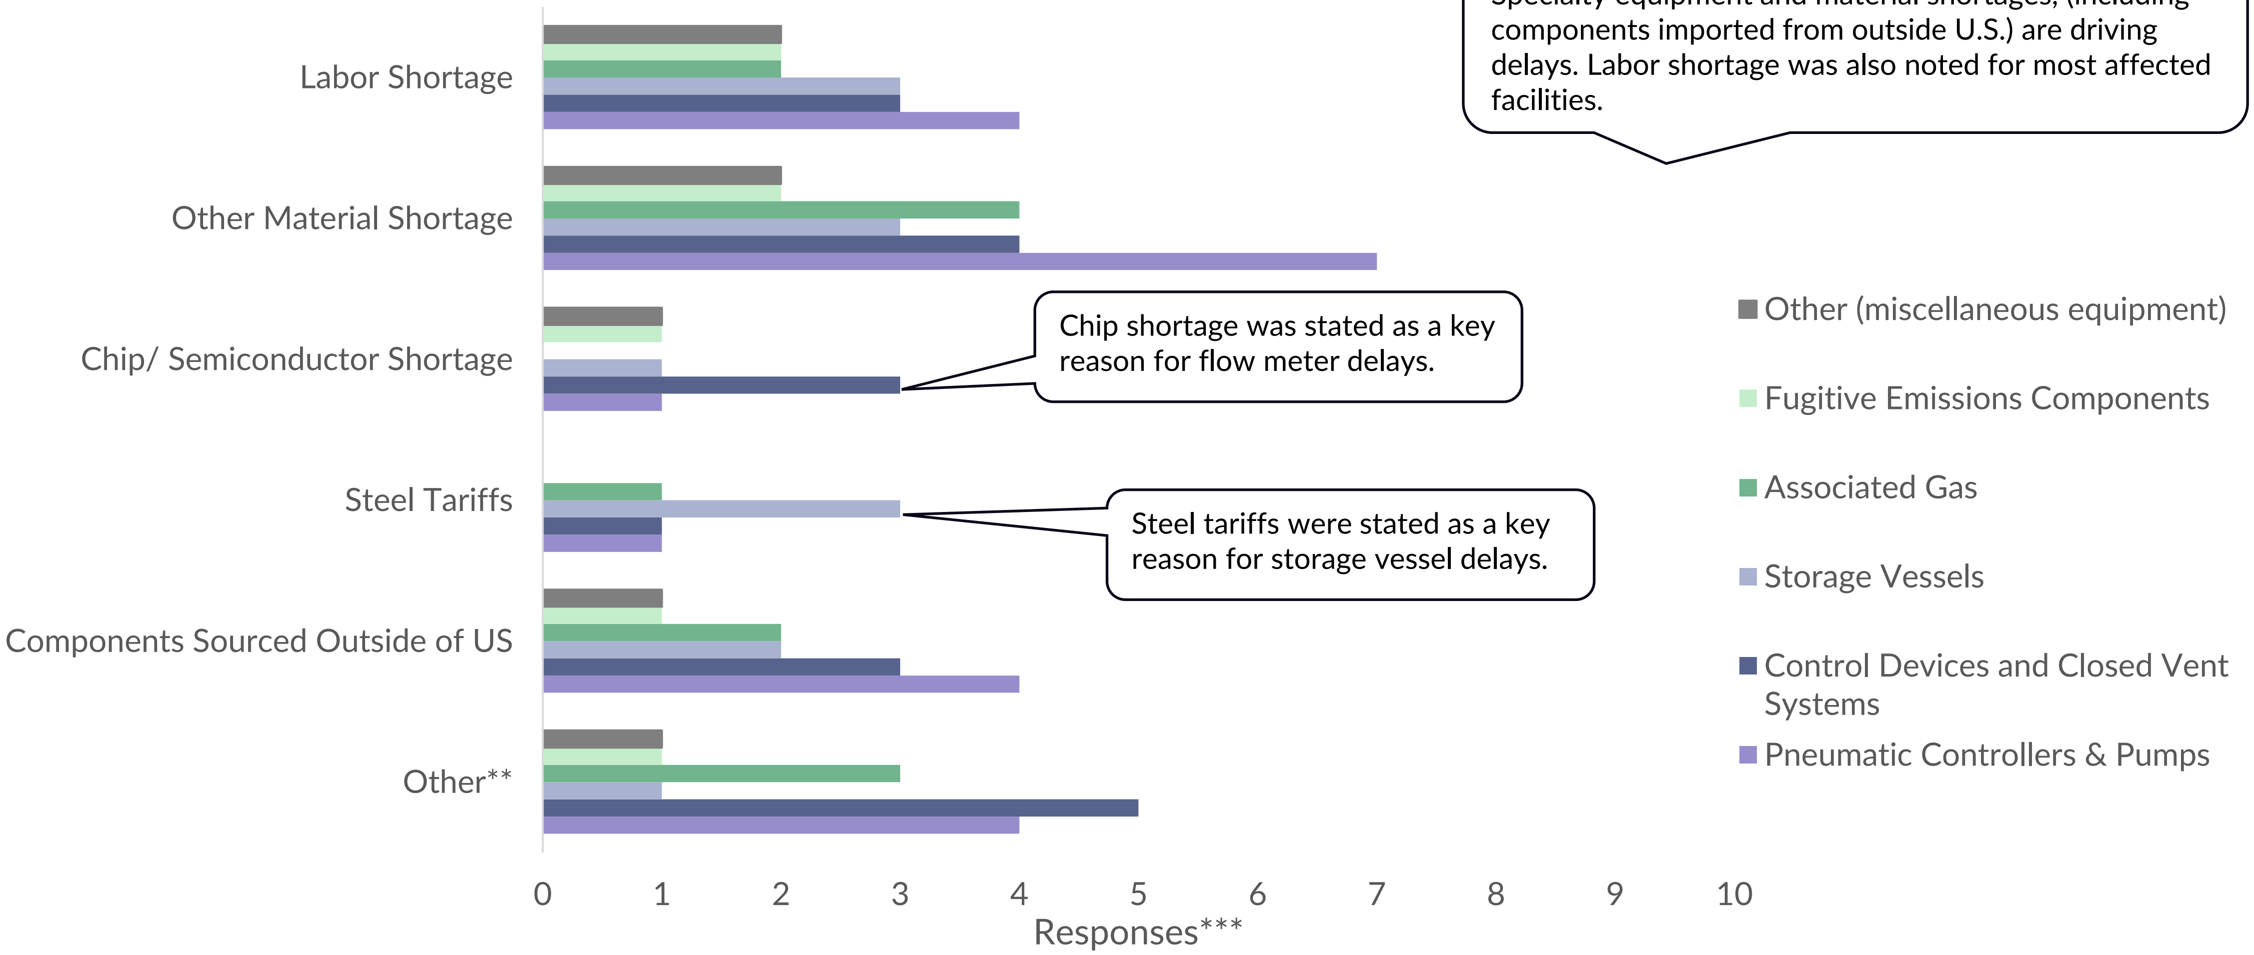


The majority of operators surveyed are experiencing up to 12 months in equipment delays across compliance options.

Variability in delays experienced for highly specialized equipment requiring special orders or customization such as electrical transformers, PVRVs & thief hatches, VRUs, gas compressor skids, and instrument air skids.

*Responses by affected facility based on maximum count for each backorder timeframe.

Supplier-Stated Reason(s) for Backorder*



Specialty equipment and material shortages, (including components imported from outside U.S.) are driving delays. Labor shortage was also noted for most affected facilities.

Chip shortage was stated as a key reason for flow meter delays.

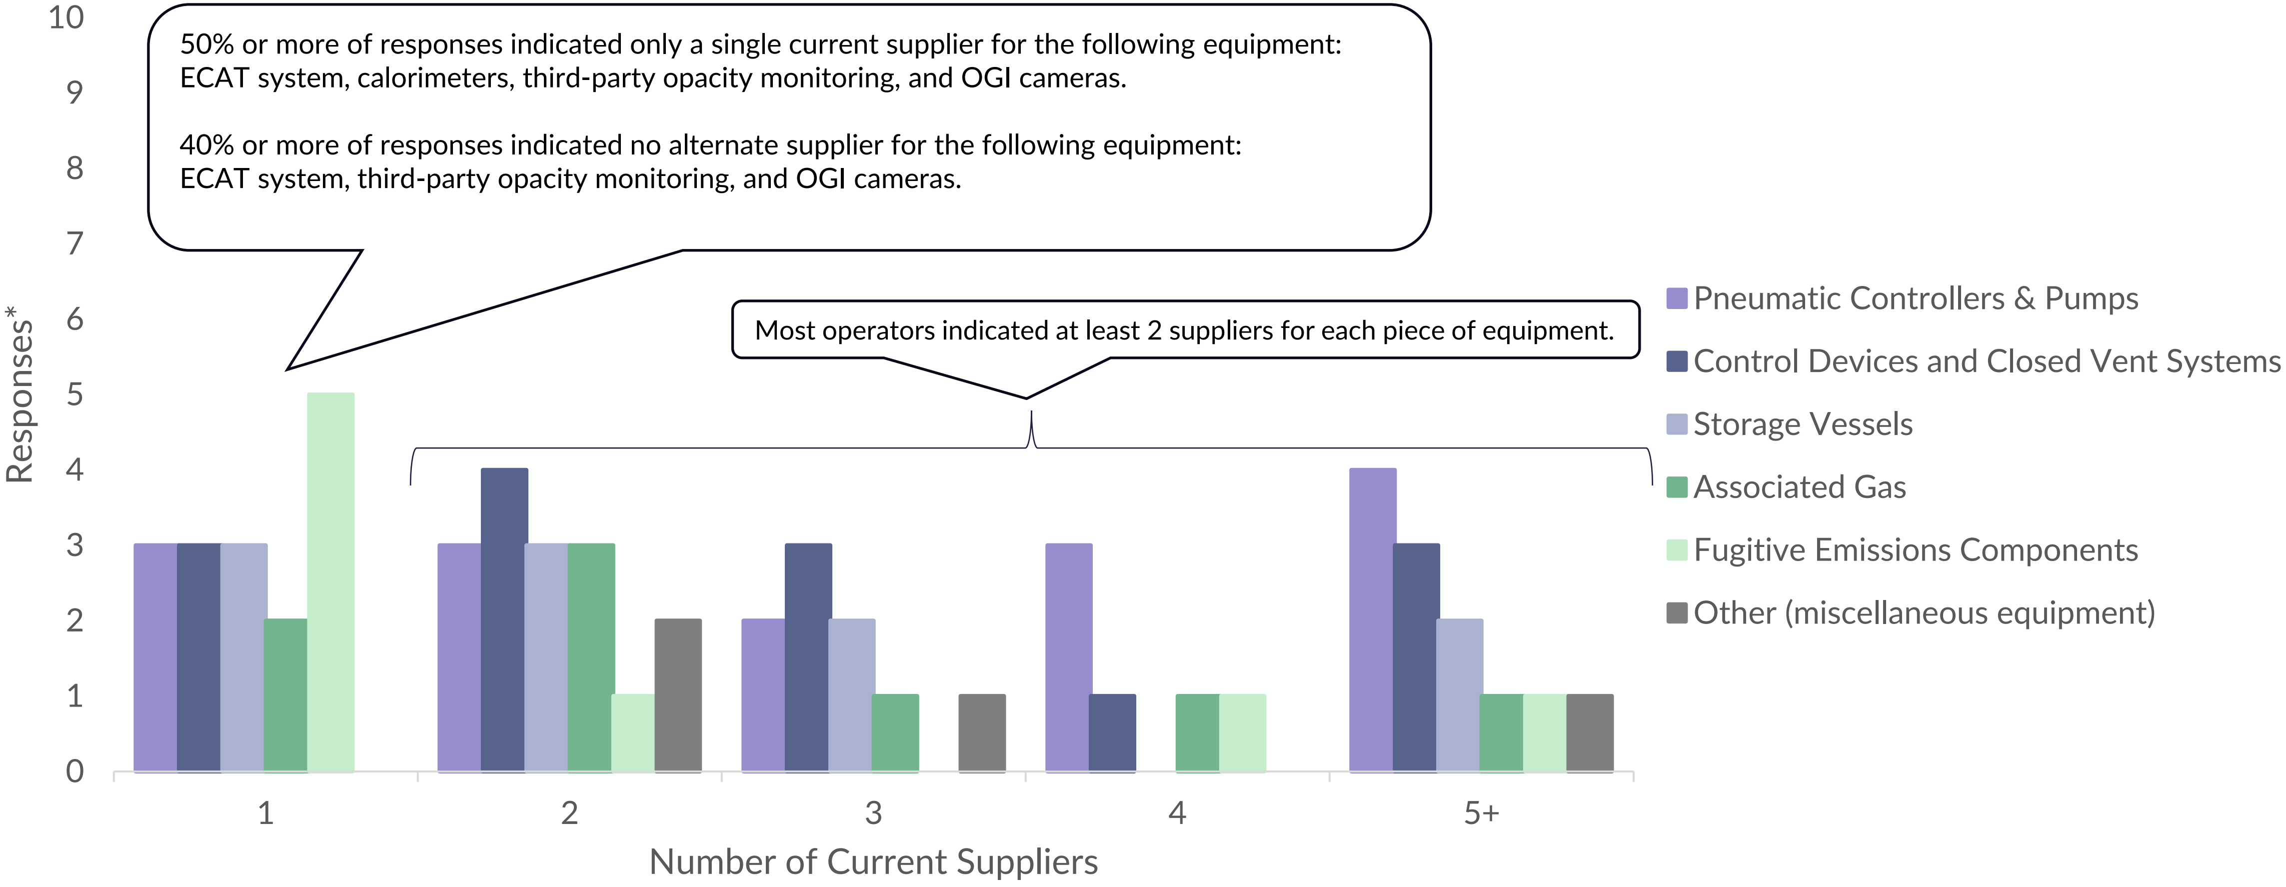
Steel tariffs were stated as a key reason for storage vessel delays.

* Responses could indicate more than one reason for backorder delays

** Other reasons vary by control option but include: “Fabricator backlog”; “Standard lead time”; “Limited inventory as order is customized”; “Engineering design required for proper equipment function”.

*** Responses based on maximum count for each reason.

Supplier Market



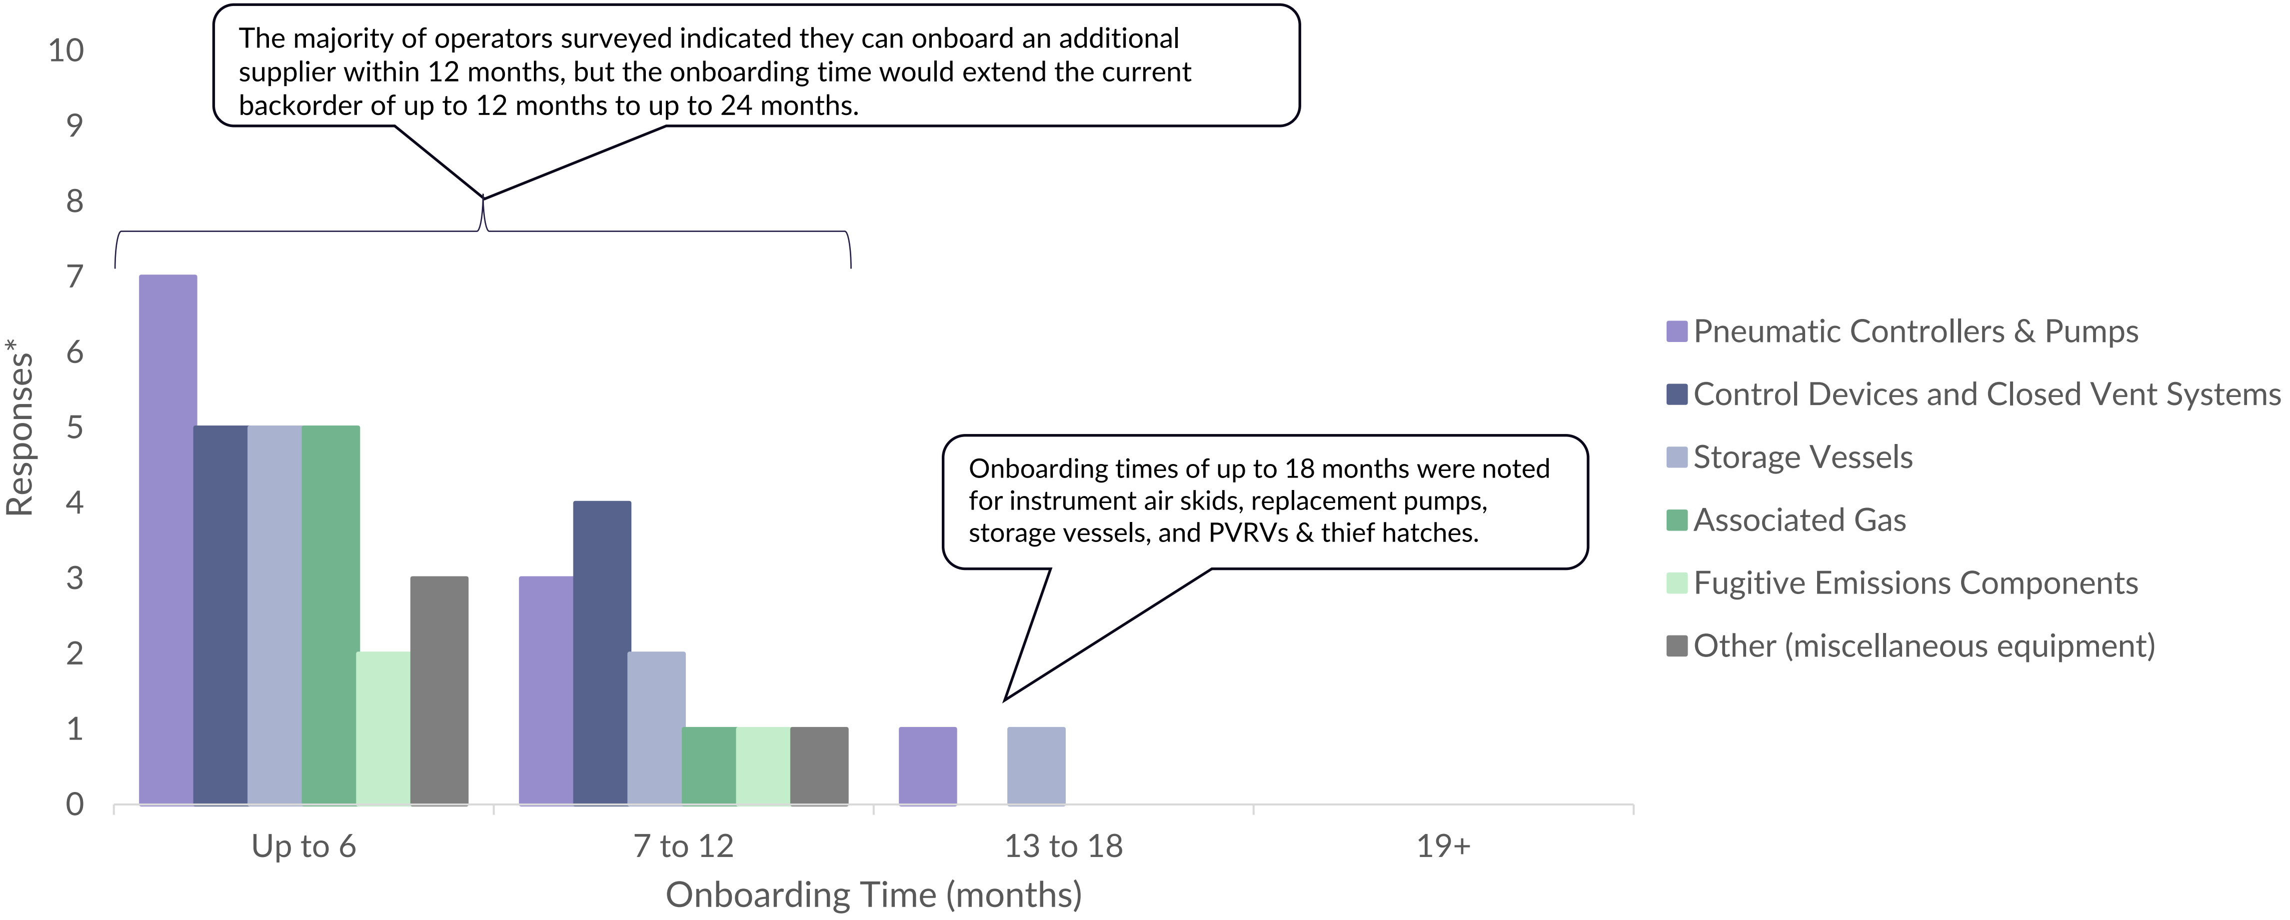
50% or more of responses indicated only a single current supplier for the following equipment: ECAT system, calorimeters, third-party opacity monitoring, and OGI cameras.

40% or more of responses indicated no alternate supplier for the following equipment: ECAT system, third-party opacity monitoring, and OGI cameras.

Most operators indicated at least 2 suppliers for each piece of equipment.

*Responses by affected facility based on maximum count for each number of current suppliers.

Onboarding Time for an Additional Supplier

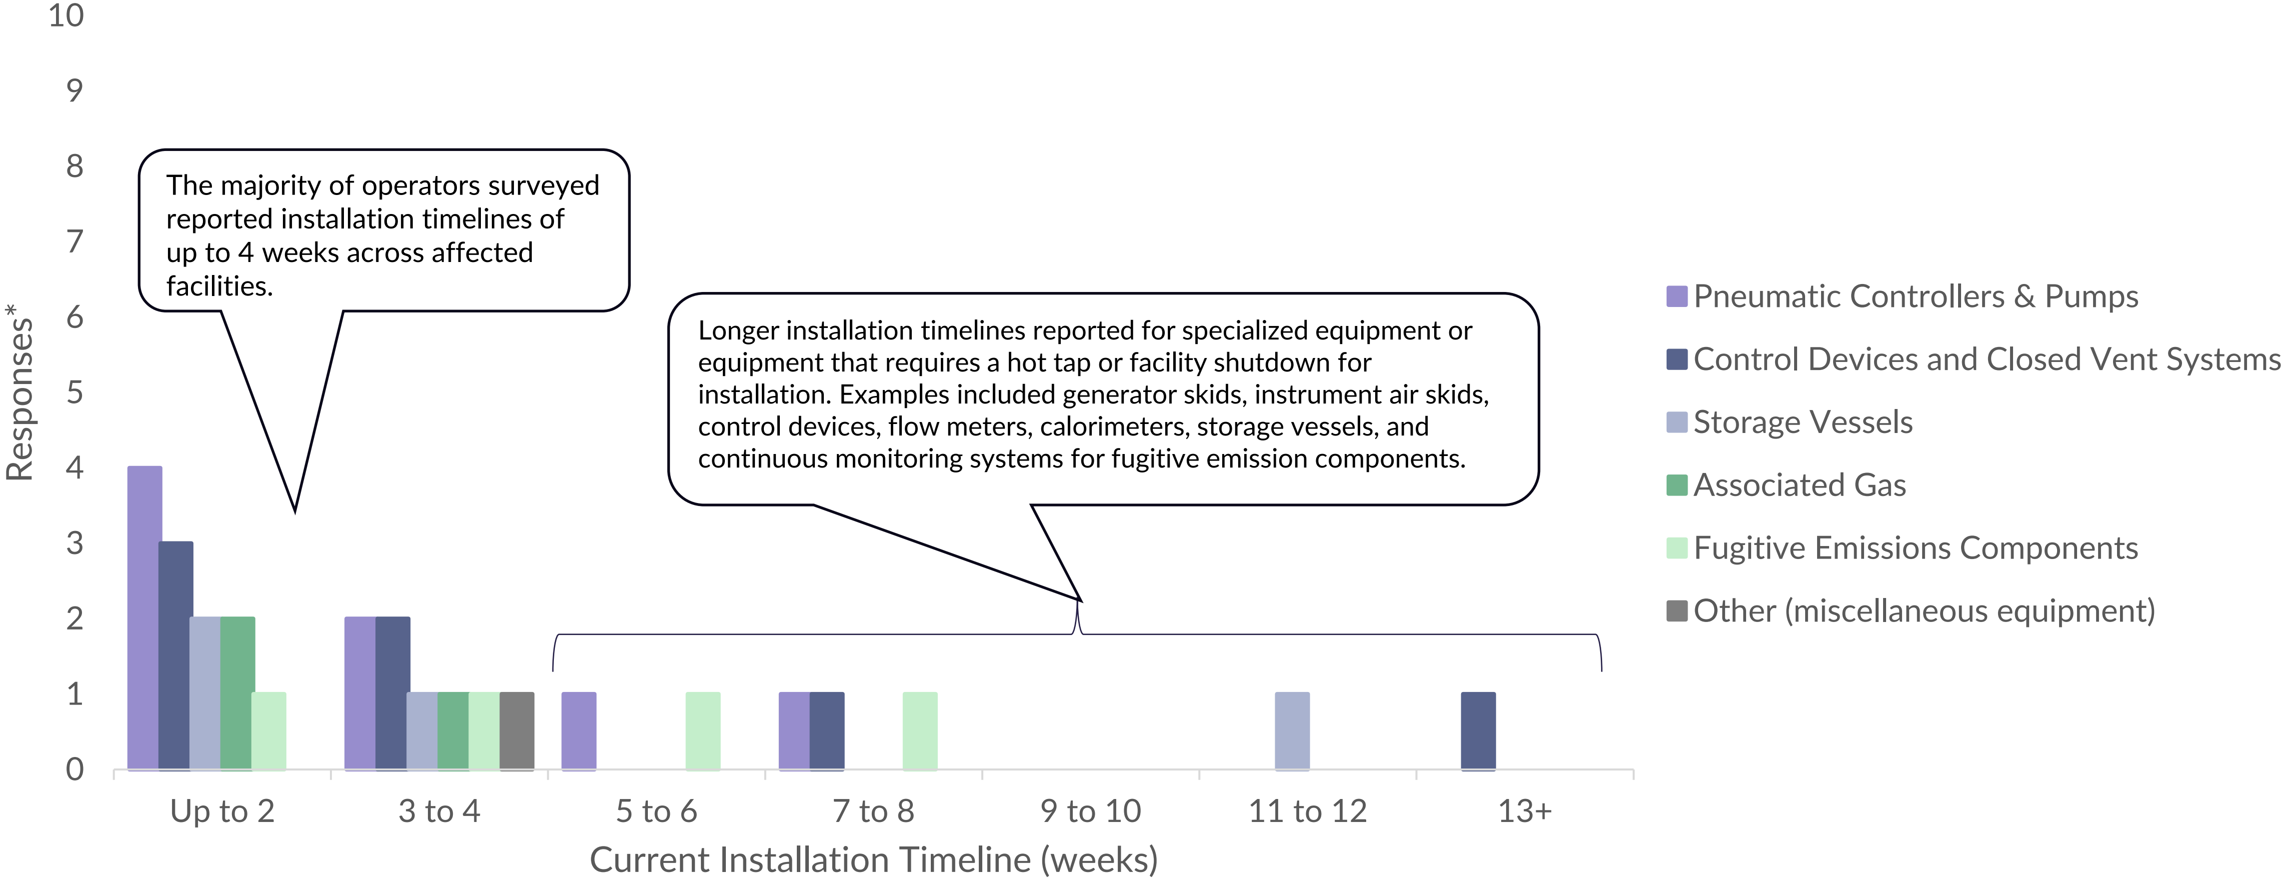


The majority of operators surveyed indicated they can onboard an additional supplier within 12 months, but the onboarding time would extend the current backorder of up to 12 months to up to 24 months.

Onboarding times of up to 18 months were noted for instrument air skids, replacement pumps, storage vessels, and PVRVs & thief hatches.

*Responses by affected facility based on maximum count for each onboarding timeframe.

Current Installation Timelines

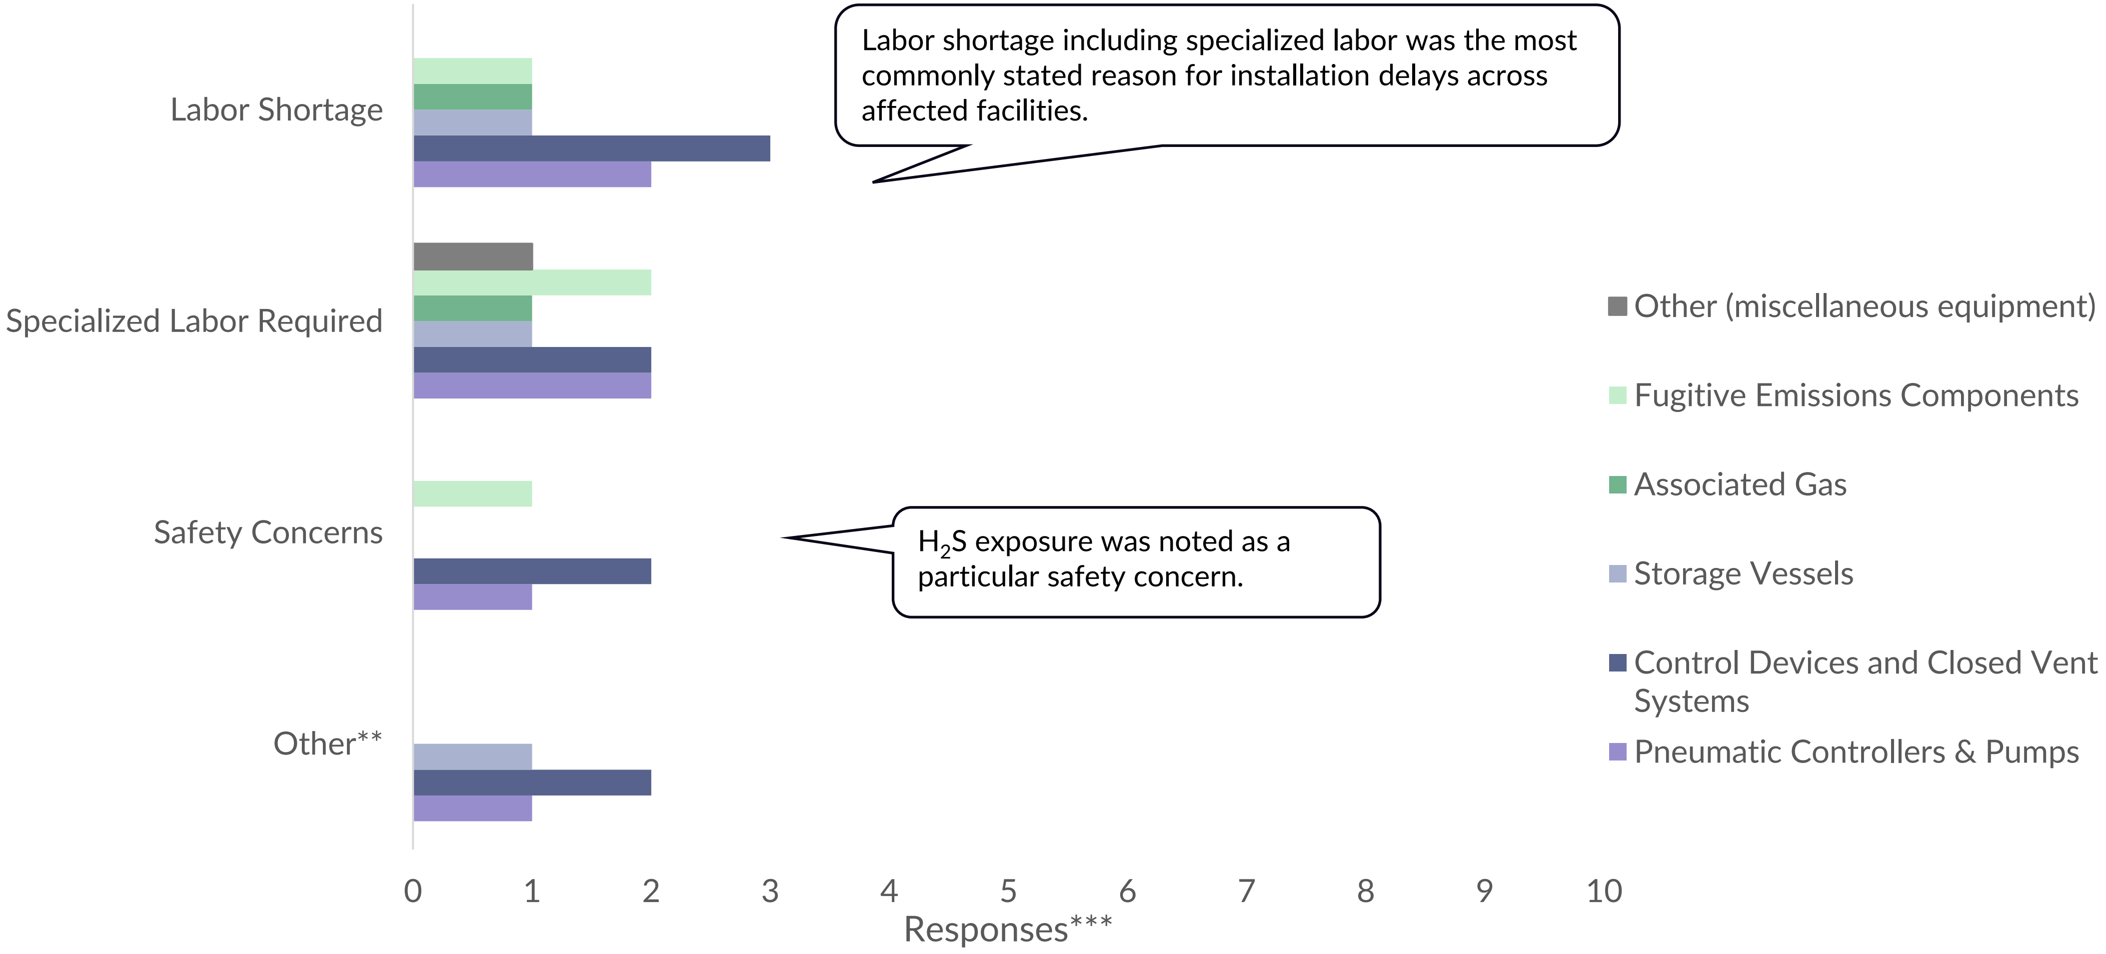


The majority of operators surveyed reported installation timelines of up to 4 weeks across affected facilities.

Longer installation timelines reported for specialized equipment or equipment that requires a hot tap or facility shutdown for installation. Examples included generator skids, instrument air skids, control devices, flow meters, calorimeters, storage vessels, and continuous monitoring systems for fugitive emission components.

*Responses by affected facility based on maximum count for each installation timeline.

Reason(s) for Installation Timelines



Labor shortage including specialized labor was the most commonly stated reason for installation delays across affected facilities.

H_2S exposure was noted as a particular safety concern.

* Responses could indicate more than one reason for backorder delays
** Other reasons vary by control option but include: “Engineering evaluation needed”; “Normal construction timeline”; “Weather, road conditions”.
*** Responses based on maximum count for each reason.

Docket ID No. EPA-HQ-OAR-2023-0234
October 2, 2023

ANNEX F: API Assessment of Properly Functioning and Malfunctioning Intermittent Bleed Pneumatic Controllers

Note: Data for this analysis is included separately within this docket in pdf format

ANNEX F

Analysis to Support Amendment to Calculation 3 for Intermittent Bleed Devices Monitoring

EPA should amend Equation W-1C to more accurately reflect available empirical data on emissions from properly functioning pneumatic controllers. This proposed amendment is consistent with data contained in Annex A, the API study "Pneumatic Controller Inventory and Measurement at 67 Oil and Gas Sites in the Western United States," and data from the University of Texas,[1] both indicating that malfunctioning intermittent controllers are the primary source of measured emissions; the API pneumatic controller study data indicates it is approximately 85%.

Methods

The UT data[2,3] (304 controllers) and the API data (265 controllers) on natural gas driven intermittent bleed pneumatic controllers were reanalyzed to simulate the use of an IR camera to segregate equipment into malfunctioning and properly functioning controller categories and an average emission calculated for each category after segregation.

Controllers were separated into three groups based on time series behavior, where the detection threshold of the OGI camera was assumed to be 0.9 scfh (~17 g/hr). A sensitivity analysis was conducted to assess the impact of the assumed OGI detection threshold on the results.

Controller categories:[4]

- **Not Malfunctioning**:
    - **Low:** average value of the time series was less than the assumed detection threshold of the camera
    - **Proper:** Either
        - **Return to zero/baseline**: average value was at or above the detection threshold and the last value of the time series was below the threshold, or
        - **Baseline prior to actuation, but measurement terminated during actuation**: average value was at or above the detection threshold and at least half of the data points are less than the threshold.
- Otherwise **Malfunctioning**

The low category represents the equipment that would be viewed as "properly operating" irrespective of time series behavior because emissions would be undetected. The proper category represents equipment that would be viewed as having an actuation associated with emissions, but the actuation would terminate. The "not malfunctioning" category is the combined groups of low and proper. These should be indistinguishable through inspection, since OGI inspection results would be ambiguous as to whether a controller is emitting constantly below the detection limit of the camera or functioning

---

[1] http://dept.ceer.utexas.edu/methane/study/datasets3.cfm Data downloaded September 2023.

[2] Ibid.

[3] All pneumatics in UT study were included as intermittent, though there were observations of both low and high continuous bleed devices intermingled. The result of this aggregation increases the properly operating emission factor through the inclusion of low-bleed continuous results that are below the assumed OGI detection threshold.

[4] Files attached dividing those time traces into low, proper, and malfunctioning categories for each the UT and the API data set provides visual inspection to assess implications of these criteria on the time series disaggregation.

properly. The malfunctioning category are the set of observations that are neither categorized as low nor proper. Both studies indicated that malfunctioning intermittent controllers were the majority of measured emissions, including ~85% in the API pneumatic controller study data.[5]

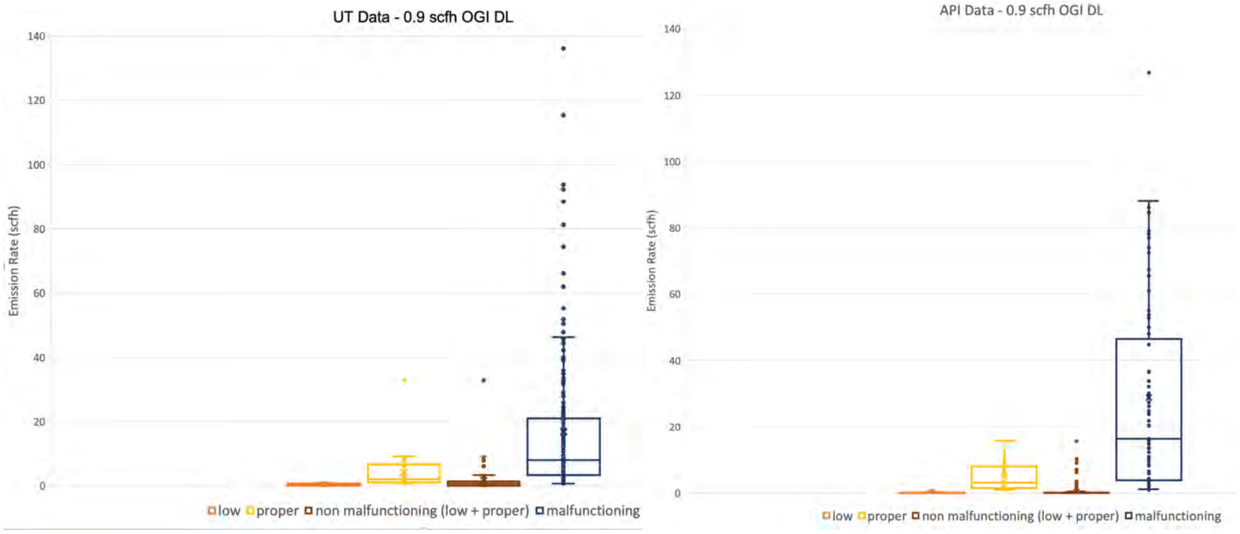
Results

The categorization with OGI camera assumed detection threshold of 0.9 scfh results in a revised set of properly functioning and malfunctioning emission factors of 0.9 and 20.0 scfh, respectively, which would result in a revised equation W-1C as below.

$$E_i = GHG_i \times \left[\sum_{z=1}^{x}\{20.0 \times T_{mal,z} + 0.9 \times (T_{t,z} - T_{mal,z})\} + (0.9 \times Count \times T_{avg})\right] \quad (Rev.Eq.W-1C)$$

The box and whisker plots in Figure 1 show the low, proper, non-malfunctioning, and the malfunctioning average measurements for the UT, API, and combined UT/API data and Table 1 provides the average and median values from each. As expected, each series is skewed.

Figure 1: Top Left – UT data; Top Right – API Data; Bottom – Combined UT + API data



---

[5] API Study "Pneumatic Controller Inventory and Measurement at 67 Oil and Gas Sites in the Western United States."

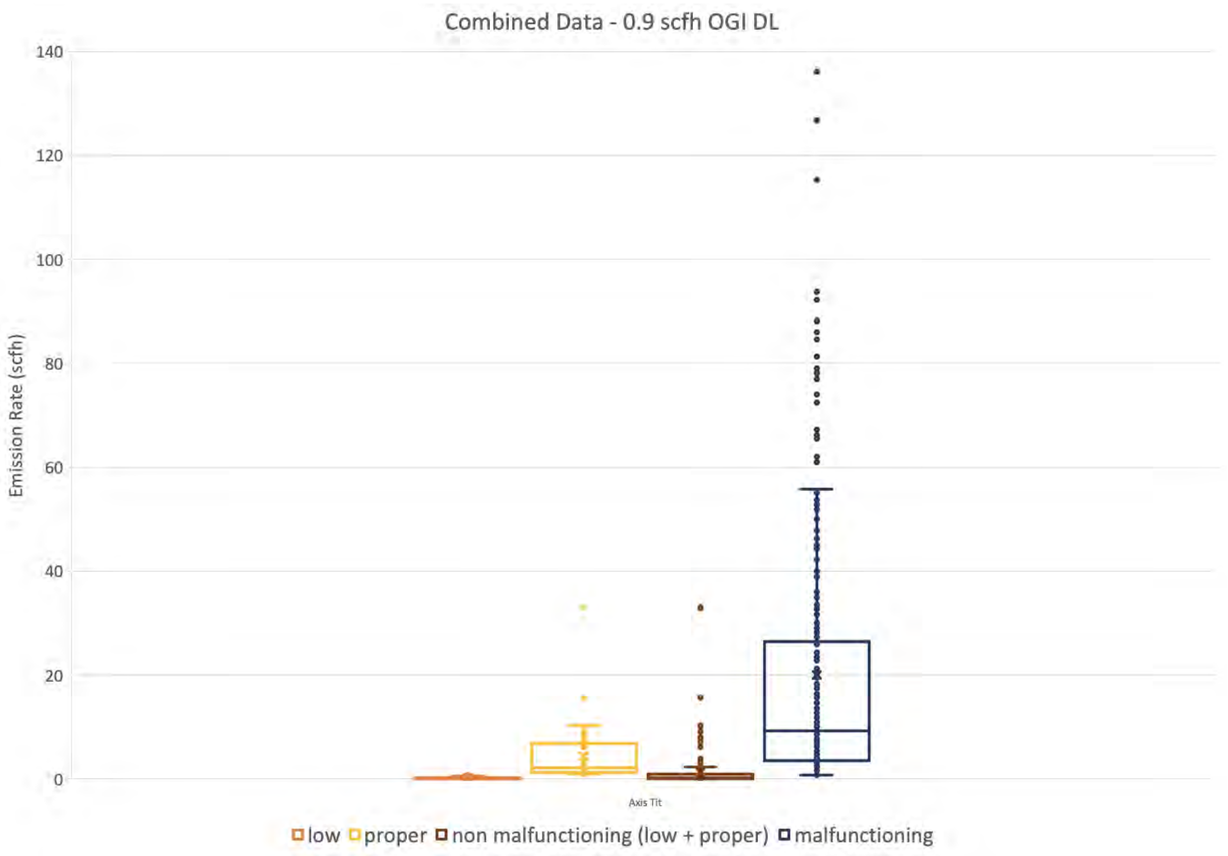


Table 1: Average and median emission rates (scfh) for the low, proper, non-malfunctioning and malfunctioning groups for each the UT, API and combined data sets along with equipment counts in each category.

	Low (scfh) [count]	Proper (scfh) [count]	Non-Malfunctioning (scfh) [count]	Malfunctioning (scfh) [count]
UT – Avg	0.3 [62]	4.3 [36]	1.8 [98]	16.5 [206]
API – Avg	0.1 [171]	5.0 [13]	0.5 [184]	28.8 [81]
Combined – Avg	0.2 [233]	4.4 [49]	**0.9 [282]**	**20.0 [287]**
UT – Median	0.3	2.0	0.7	8.0
API - Median	0.0	2.5	0.0	16.4
Combined - Median	0.0	2.2	0.0	9.3

The non-malfunctioning average emission rate in this segregation of equipment is 0.9 SCFH (68% lower than the proposed factor). The average emission rate of the designated malfunctioning equipment is 20.0 (24% higher than the proposed factor). This results in an overall emission per controller of 10.5 SCFH.

Overall, these results are quite consistent with those from the API pneumatic controller study, insofar as most of the emissions are attributable to the malfunctioning equipment. However, the method of segregating functioning from malfunctioning is different, resulting in a higher properly operating emission factor than the factor proposed in that study analysis shown in Table 2 below. The revised factor of 0.9 SCFH, though larger than the previously proposed factor from the API pneumatic controller study is still significantly lower than the proposed factor in the GHGRP Subpart W proposal.

Table 2: Comparison of the data analyses (former and this work) to proposed emission factors.

	API Study Report Average Emission Rate (SCFH)	API Reanalysis Average Emission Rate (SCFH)	Subpart W Proposed Factors (SCFH)	All data Reanalysis Average Emission Rate (SCFH)
Properly Functioning	0.28	0.5	2.82	**0.9**
Malfunctioning	24.1	28.8	16.1	**20.0**
Average of all equipment	9.25	9.1	-	10.5

One important limitation of the analysis on the UT data is that the time series are much shorter (~2 minutes in duration on average). However, the proposed rule requires an inspection period of 2 minutes.[6]

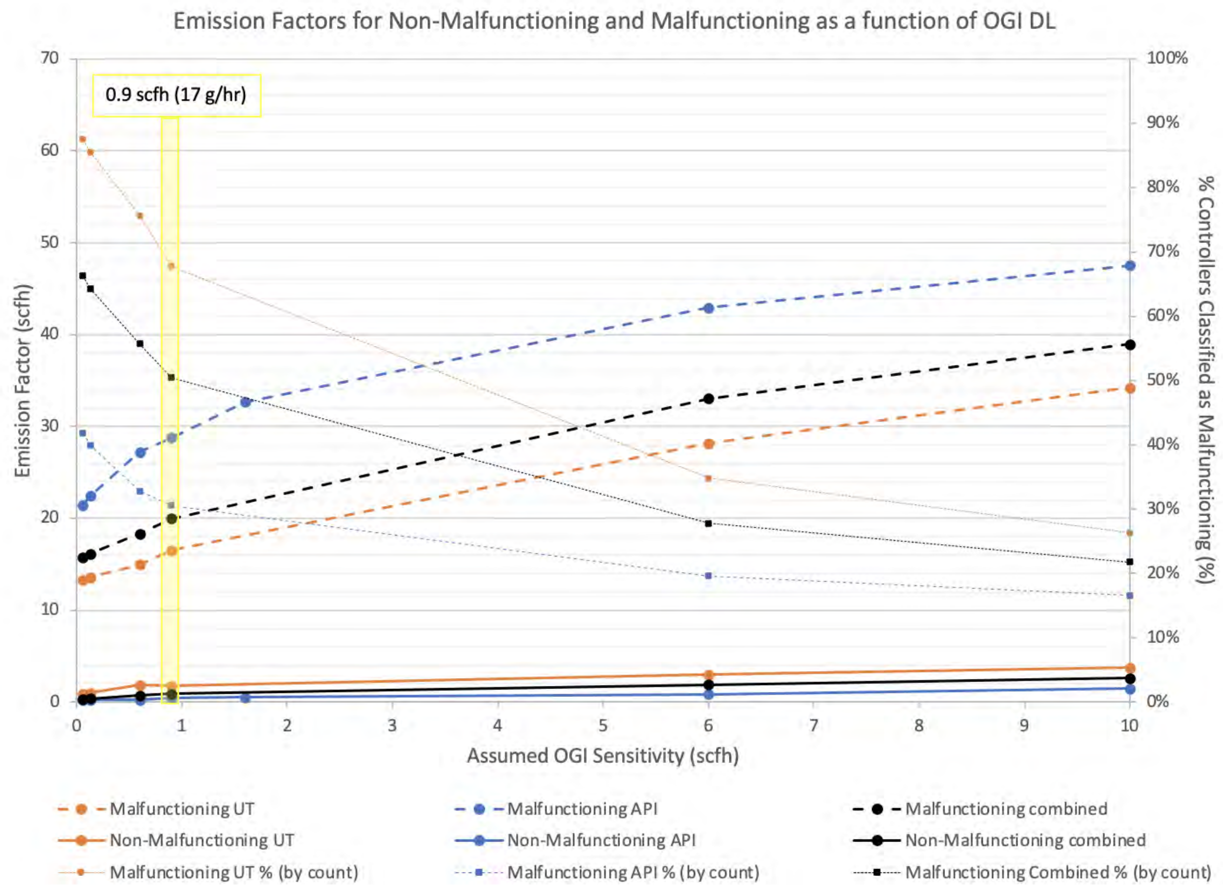
Sensitivity Analysis

A sensitivity analysis was performed to assess the impact of selecting a theoretical OGI detection limit of 0.6 SCFH. The results are shown in the figure below.

Figure 2: Data categorized as described in methods, with varying assumed detection threshold of OGI from 0.13 scfh to 10 scfh. Dashed lines show the variation of the malfunctioning pneumatic controller average (left axis), solid lines show the variation of the non-malfunctioning (properly operating) pneumatic controller average (left axis), and the dotted lines show the % of controllers that would be classified as malfunctioning under the different detection threshold scenarios (right axis). UT data are shown in orange, API data in blue, and the combined data are shown in black.

---

[6] "You must use one of the monitoring methods specified in § 98.234(a)(1) through (3) except that the monitoring dwell time for each device vent must be at least 2 minutes or until a malfunction is identified, whichever is shorter. A device is considered malfunctioning if any leak is observed when the device is not actuating or if a leak is observed for more than 5 seconds during a device actuation. If you cannot tell when a device is actuating, any observed leak from the device indicates a malfunctioning device."



The assumed detection threshold exceeds 10 scfh before the non-malfunctioning (properly operating) average emission reaches 2.82 scfh (proposed factor).

Similarly, a sensitivity analysis was performed to assess the impact of including instrument reported "zeroes" as zeroes. Data substitution was performed to replace all instances of zero with 0.13 scfh to represent the minimum detection limit of the high flowsampler employed in both studies. As shown in Figure 3, there are minor impacts to average emissions for detection thresholds for OGI below ~0.6 scfh, but there is no impact on the proposed range of emission factors.

Figure 3: Data categorized as described in methods, with varying assumed detection threshold of OGI from 0.13 scfh to 1 scfh under two scenarios: 1) data are used as reported and 2) zeroes are substituted with the instrument MDL of 0.13 scfh. Dashed lines show the variation of the malfunctioning pneumatic controller average (left axis) and solid lines show the variation of the non-malfunctioning (properly operating) pneumatic controller average (left axis). UT data are shown in dark orange with the revised data in light orange, API data in dark blue with the revised data in light blue, and the combined data are shown in black with the revised data shown in grey.

Subject: **Waste Emissions Charge for Petroleum and Natural Gas Systems**
Docket ID No. EPA–HQ–OAR–2023–0434

Dear Madam or Sir:

The American Exploration and Production Council (AXPC) appreciates the opportunity to provide input responsive to the Environmental Protection Agency's (EPA) Proposed Rule "Waste Emissions Charge for Petroleum and Natural Gas Systems" (89 FR 5318, January 26, 2024) ("WEC").

AXPC is a national trade association representing 34 leading independent oil and natural gas exploration and production companies in the United States. AXPC companies are among leaders across the world in the cleanest and safest onshore production of oil and natural gas, while supporting millions of Americans in high-paying jobs and investing a wealth of resources in our communities. Dedicated to safety, science, and technological advancement, our members strive to deliver affordable, reliable energy while positively impacting the economy and the communities in which we live and operate.

As part of this mission, AXPC members understand the importance of ensuring positive environmental and public-welfare outcomes and responsible stewardship of the nation's natural resources. The United States is a world leader in oil and natural gas production, achieving that status while at the same time substantially reducing emissions. The historic reductions in US greenhouse gas (GHG) emissions over the last decade have been driven by the emergence of US natural gas production as a low-cost source of reliable energy. It is important that regulatory policy enables us to build on that success.

AXPC companies are focused on reducing methane emissions from their operations and support effective and reasonable regulation of methane that balances the essential value of US oil and natural gas production with the global challenge of addressing climate change. AXPC companies believe collaboration amongst policy makers and industry partners is needed to find solutions that will meaningfully drive down emissions, while allowing US independent producers to meet the global demand for affordable and reliable oil and natural gas. It is in the spirit of this aim that we offer these comments to EPA proposed rule.

As established in the Inflation Reduction Act (IRA), the implementation of the WEC should be done in a manner that is equitable to operators of varying sizes and portfolios. AXPC is concerned that EPA's proposal offers a simplified calculation of methane intensity that does not take into account the products that the upstream *oil* and gas industry produces and in doing so unduly punishes operators who produce large amounts of energy in the form of oil or NGLs over other production profiles. In our detailed comments attached, we recommend that EPA amend the Facility Methane Intensity calculation to define the numerator as waste emissions relative to the amount of *natural gas sold*. In other words, defining WEC Facility Methane Emissions, as the portion of the emissions attributable to the natural gas sent to sales or facility throughput. Such an approach conforms to the plain reading of the statute and congressional intent; and it is consistent with life cycle assessment practices, and would help avoid unintended negative outcomes that might otherwise result from the inequitable program proposed.

Additionally, in order to stay true to Congress's directive, it is critical that EPA develop an approach to the Regulatory Compliance Exemption that ensures its availability and utility as Congress clearly intended. Under the terms of the proposal, the Regulatory Compliance Exemption would not be available for at least three years, and once available, will be virtually impossible to achieve. If EPA were to finalize such an approach, it would amount to giving no meaningful effect to Congress's intent to provide a Regulatory Compliance Exemption, standing in conflict with established legal precedent for such matters.

Finally, AXPC requests clarification from EPA on the netting provisions of "WEC applicable facilities." As explained further in AXPC's detailed comments, as currently proposed, the inability to net assets that have achieved regulatory compliance or whose emissions are below the WEC threshold may not incentivize deeper emission reductions. Similarly, inability to net assets at the parent company level may also hold back the incentives for operators to make the most impactful emission reductions in their portfolio of assets. We believe these outcomes to be contrary to both EPA and Congress's intent for this program.

With these priority topics in mind, we respectfully submit the below detailed comments on the (EPA's Proposed Rule to implement the "Waste Emissions Charge for Petroleum and Natural Gas Systems." We have identified a number of issues of significant concern and other minor items for which we request additional clarity in the regulatory text consistent with our understanding of EPA's stated intention in the preamble and where appropriate offer potential recommended solutions.

Please do not hesitate to contact me, Wendy Kirchoff (281-386-7324), or Rebecca Denney (972-989-3912), if you have questions or need additional information on any of these items. We look forward to continued collaboration.

Sincerely,

Wendy Kirchoff

Detailed Comments on

Environmental Protection Agency’s (EPA’s)
“Waste Emissions Charge for Petroleum and Natural Gas Systems”
at 89 Fed. Reg. 5318 (January 26, 2024)

Docket ID No. EPA–HQ–OAR–2023–0434

March 26, 2024

I. EPA should amend the Facility Methane Emissions calculation to define the WEC Facility Methane Emissions as the portion of the emissions attributable to the natural gas sent to sales or facility throughput.

Clean Air Act (CAA) section 136(c) instructs the Administrator to "impose and collect a charge *on methane emissions that exceed an applicable waste emissions threshold* [emphasis added] under subsection (f) from an owner or operator of an applicable facility that reports more than 25,000 metric tons of carbon dioxide equivalent of greenhouse gases emitted per year pursuant to Subpart W of part 98 of title 40, Code of Federal Regulations, regardless of the reporting threshold under that subpart." Subsection (f) defines such a threshold as a "charge on the *reported metric tons of methane emissions from such facility that exceed (A) 0.20 percent of the natural gas sent to sale from such facility; or (B) 10 metric tons of methane per million barrels of oil sent to sale from such facility* [emphasis added], if such facility sent no natural gas to sale" or, similarly for nonproduction petroleum and natural gas systems, a "*charge on the reported metric tons of methane emissions that exceed 0.05 percent of the natural gas sent to sale from or through such facility* [emphasis added]."

A plain reading of CAA sections 136(c) and (f) clearly indicates that the methane emissions subject to evaluation against the Waste Emission Threshold for a given segment are those emissions attributable to the specifically listed product (e.g., natural gas sent to sale from a natural gas production facility, oil from an oil producing facility, natural gas sent to sale through a nonproduction petroleum and natural gas system). But EPA went beyond the statutory text, fundamentally changing its meaning with its addition of the word "all" when it proposed "to interpret 'reported metric tons of methane emissions' to mean *all reported methane emissions from a facility*, as reported under Subpart W." 89 Fed. Reg. at 5327/2 (emphasis added).

This is not an appropriate implementation of the statutory text. Rather, the WEC Facility Methane Emissions should be those reported pursuant to Subpart W that are attributable to the relevant product in the segment Waste Emissions Threshold. This is the correct way to give force to all provisions of Section 136 because read together: Subsection (c) directs EPA to "impose and collect a charge on methane emissions that exceed an applicable waste emissions threshold under subsection (f)," and subsection (f) in turn tells EPA what to do when "to imposing and collecting the charge under subsection (c)." EPA should "impose and collect the charge on the reported metric tons of methane emissions from such facility that exceed—

a) 0.20 percent of the natural gas sent to sale from such facility; or
b) 10 metric tons of methane per million barrels of oil sent to sale from such facility, if such facility sent no natural gas to sale."

EPA does not identify its authority to impose and collect a charge on emissions other than those specifically referenced in (f)(A) and (B), nor does the text of Section 136 provide any.

Therefore, wherever there is natural gas sent to sale from the facility, the quantity of methane emissions in the numerator should reflect the total methane emissions attributable to the quantity of natural gas sent for sale represented in the denominator. This is managed in the commonly adopted

Natural Gas Sustainability Initiative (NGSI) protocol[1] on an energy allocation basis by multiplying the methane emissions by a gas ratio, which is defined as the energy content of the produced gas divided by the energy content of total produced hydrocarbons (values already reported through Subpart W filings) as shown below in equation 1.

$$Intensity\ IRA = \frac{CH_4\ emissions * Gas\ ratio}{sales\ natural\ gas}, \text{ where} \tag{1}$$

Gas ratio = energy content of produced gas / energy content of total hydrocarbons

Such an approach conforms to the plain reading of the statute and is consistent with practices in the life cycle assessment (LCA) community as illustrated in the implementation of the California Low Carbon Fuel Standard (LCFS)[2] or renewable fuel standard for transportation fuels.

Allen et al.[3] illustrated the importance of including emissions allocation on an energy basis, even within a single basin. In that work, the Eagle Ford Shale is analyzed across 12 subregions, ranging from primarily oil production to primarily dry gas production. When energy allocation is considered, similar methane intensities are observed across all subregions, but when all emissions are attributed solely to the natural gas portion of production (as is inherent in a metric lacking product allocation), the oil producing regions were significantly disadvantaged by as much as an order of magnitude with an unallocated methane intensity metric. This is because without energy allocation, the assessment is inherently biased: the methane associated with the total fluids production is included in the numerator (methane associated with oil AND gas production) but only the gas portion of the total sold is used in the denominator.

This bias is illustrated in Figure 1 below, where assets reported into the GHGRP for reporting year 2022 are plotted on a methane per energy intensity basis, as a function of production energy. Each dot in the figure represents a single reported facility (production and gathering and boosting facilities have been aggregated to single facilities when reported separately by the same reporting entity within a single region). Where methane emissions exceed the WEC threshold (0.2% of reported gas to sales for production and 0.05% of gas throughput for boosting and gathering), the dot is colored blue. Where methane emissions are less than the WEC threshold, the dot is colored green. The WEC threshold for production is overlaid as a red line, where 0.2% of a purely gas producing asset corresponds to 38.4 MT methane/btu.

[3] Allen, David T.; Chen, Qining; Dunn, Jennifer B. “Consistent Metrics Needed for Quantifying Methane Emissions from Upstream Oil and Gas Operations.” Environ. Sci. Technol. Lett., 2021, 8, 4, 345-349.

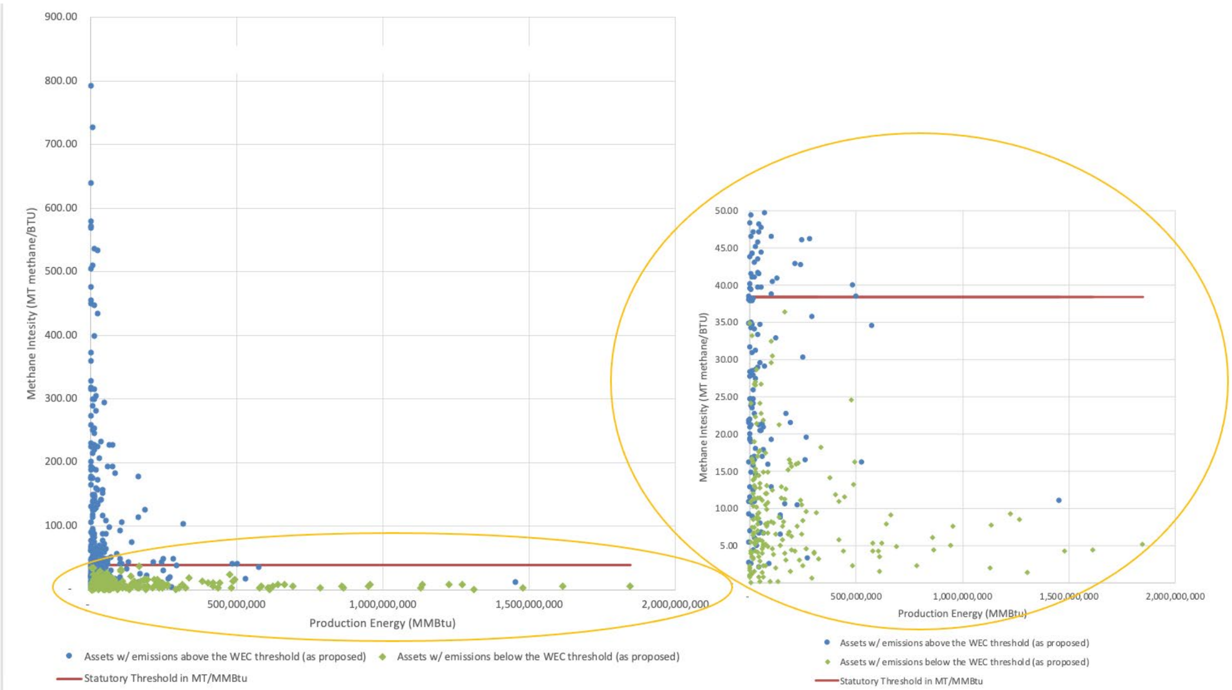

Figure 1 – *Emissions intensity as a function of production energy for the 2022 reporting year pursuant to Subpart W disaggregated by assets below and above the WEC threshold calculated as proposed, attributing all Subpart W emissions to gas only (except where no gas is sent to sale).*

In all cases, assets with high methane intensity on an energy basis exceed the WEC threshold. Most instances of low methane intensity on an energy basis fall below the WEC threshold. There are a handful of cases where assets with *low* methane intensity on an energy basis *exceed* the WEC threshold. In all of these cases, the operator largely produces energy in the form of oil and/or NGLs. In fact, as Table 1 shows, the average percent of energy sold derived from gas for the subset of assets that are low methane intensity on an energy basis but also above the asset WEC threshold is 30% compared to 67% of energy sold derived from gas for all assets and 73% for the assets that are low methane intensity and below the WEC threshold.

Intensity	WEC Threshold	% of Energy Produced as Natural Gas
Low[1]	Under	73%
Low[1]	Above	30%
All	All	67%

Notes:

1. *Low is considered to be less than 38.4 MT methane/btu which is equal to 0.2% when converted.*
2. *All data sourced from EPA Facility Level GHG Emission Data*

Table 1: *Analysis of intensities, the WEC threshold, and energy production from natural gas.*

Additionally, the language of CAA Section 136 focuses on minimizing waste. *See* Sec. 136(a)(3)(B), (C) (providing funding for “improving and deploying industrial equipment and processes that reduce methane and other greenhouse gas emissions *and waste*; ... supporting innovation in reducing methane and other greenhouse gas emissions *and waste* from petroleum and natural gas systems") (emphases added); 136(c) (titling the program that the proposal implements the "Waste emissions charge"); 136(f) ("Waste emissions threshold"); 136(h) (directing EPA to revise Subpart W to ensure that reports thereunder "accurately reflect the total methane emissions *and waste emissions* from the applicable facilities") (emphasis added).

This last passage is an especially strong signal that EPA, as explained above, is not to impose and collect WEC charges on *all* methane emissions, but rather on the *waste* emissions that exceed the waste emissions threshold for the specific segments identified in Subsection (f), since this last passage reveals that Congress identifies "waste emissions" (on which the "Waste Emissions Charge" is to be imposed and collected) as a discrete subset of "total methane emissions."

If an operator were required to apply a purely natural-gas-based waste emissions threshold to all emissions associated with a liquids production facility, that operator would be perversely incentivized to waste (not sell) any associated gas, likely via flaring, simply to avoid the waste emissions charge from methane emissions incorrectly associated with a comparatively small volume of "gas sent to sales".

Moreover, the assignment of all methane emissions to the natural gas portion of production and processing suggests that US oil and natural gas liquids (NGLs) have a methane intensity of zero. In fact, there are facilities that emit methane and are exclusively dedicated to liquids production or processing. Congress clearly understood this and designated a specific waste emissions threshold for production facilities with no marketed natural gas. Another scenario was identified in EPA's preamble discussing gathering and boosting and processing facilities with zero reported throughput of gas. EPA correctly identified that there are a small number of gathering and boosting and natural gas processing facilities that emit methane and report under Subpart W, but do not send gas to sales. Under the current proposed implementation of the statute, these facilities, which in general exclusively, or almost exclusively, handle NGLs or oil, with no reported throughput of natural gas to sales, are incorrectly considered in excess of the waste emissions threshold for any and all reported emissions.

Applying an energy allocation basis would resolve this issue by allocating emissions based on energy of products received by the facility, where these volumes are already reported to the GHGRP through Subpart W.

EPA indicates it is aware of other approaches for calculating "methane intensity" using energy allocation methods, but suggests that its proposal is more practical since the proposed approach "can be implemented with data currently reported under Subpart W" and other methods would increase operator burden. Setting aside the aforementioned disproportionate financial burden looming over operators producing or handling liquids rich assets relative to those producing or handling principally dry gas under the current proposal, the necessary information to apply an energy allocation to the facility emissions tabulation are also already currently reported under Subpart W.

Data reported under Subpart W for production facilities include:

- Quantity of gas produced in the calendar year from wells (thousand standard cubic feet) [98.236(aa)(1)(i)(A)]
- Quantity of gas produced in the calendar year for sales (thousand standard cubic feet) [98.236(aa)(1)(i)(B)]

- Quantity of crude oil and condensate produced in the calendar year for sales (barrels) [98.236(aa)(1)(i)(C)]

Data reported under Subpart W for boosting and gathering facilities include:

- Quantity of gas received by the gathering and boosting facility in the calendar year (thousand standard cubic feet) [98.236(aa)(10)(i)]
- Quantity of gas transported to a natural gas processing facility, a natural gas transmission pipeline, a natural gas distribution pipeline, or another gathering and boosting facility in the calendar year (thousand standard cubic feet) [98.236(aa)(10)(ii)]
- Quantity of all hydrocarbon liquids received by the gathering and boosting facility in the calendar year (barrels) [98.236(aa)(10)(iii)]
- Quantity of all hydrocarbon liquids transported to a natural gas processing facility, a natural gas transmission pipeline, a natural gas distribution pipeline, or another gathering and boosting facility in the calendar year (barrels) [98.236(aa)(10)(iv)]

EPA says that operators would need to collect and report additional detailed information on all of the constituents of the natural gas and other hydrocarbons in order to apply an energy allocation approach. However, just as EPA proposed to consistently apply the density of methane to the natural gas quantity irrespective of small variations in sales gas composition, EPA could also include standard, representative energy conversion factors to apply to the reported quantities of gas and liquid products. Such an approach would allow uniform, representative allocation of emissions by product using widely accepted standard values. AXPC recommends energy conversion factors of 5.7 million BTU (MMBtu)/barrel for liquids and 1.0 million BTU (MMBtu)/thousand SCF (Mcf) of gas.[4]

II. EPA should clarify that a parent company may function as a common WEC obligated party for the WEC applicable facilities of its subsidiaries and may choose to include facilities that fall under the 25,000 tons CO_2e applicability threshold.

EPA proposes that netting may occur only across entities that have the same owner or operator. However, in many of the segments (for example, onshore and gathering and boosting), the term ‘operator’ is very specifically defined and reflects one, very specific operator. Often this is an entity that is established for operation in a particular region or in a particular industry segment. Thus, many times, the name of the entity operating the onshore production assets will be different (although under the same parent and company umbrella) as the entity operating gathering and boosting assets. In other cases, an entity operating the onshore production assets in one basin will be different than the operator of onshore production assets in another basin. Thus, limiting netting to the same operator will likely have the effect of significantly reducing or eliminating the ability for operators to use the intended netting provision.

Additionally, companies often retain the name of a legacy operating company even after acquiring assets, even though the new “parent company” ultimately makes capital allocation decisions, consolidates for tax purposes, etc. – leaving the subsidiary to manage daily operations. In some cases,

---

[4] https://www.eia.gov/energyexplained/units-and-calculators/ with cited source Data source: *Monthly Energy Review*, May 2023; preliminary data. Prices are nominal prices (not adjusted for changes in the value of the U.S. dollar). https://www.eia.gov/totalenergy/data/monthly/pdf/sec12_3.pdf

there may be a corporate structure that acquires a company or asset to be a wholly or partially owned subsidiary. In these instances, there may be multiple operators of WEC applicability facilities that are owned by the same parent company – the company that ultimately has control over operations of the WEC applicable facility. A company should be able to net across assets over which it has control of the operations. Precluding such netting across assets provides no incentive for companies to find reductions anywhere they can in order to reduce overall methane emissions. For example, certain operations, areas, or regions may have better access to electricity. Assets in those areas or regions are better positioned to reduce methane emissions through electrification. Operators should be encouraged to find those reductions in areas where they can, even in areas where the WEC applicable facility is already below the WEC threshold. Allowing netting across subsidiaries within parent companies will allow for this. Similarly, where operators have both onshore and gathering and boosting operations, the ability to net where owned by the same parent can encourage creative and thoughtful planning and design to reduce emissions along the natural gas value chain where most available and in places that can achieve the greatest reductions. Restricting netting is inadvertently setting a “floor” for emissions reduction by disincentivizing reduction below the legislatively established thresholds established in the IRA which was not the intent of Congress.

This is consistent with EPA’s goal of aligning reporting requirements under Subpart W, both in terms of timing and responsibility. AXPC’s proposal would maintain a reporting structure where facilities, as reported under Subpart W, remain intact as WEC obligated facilities. And each reported facility should have an individual owner or operator responsible for reporting and filing the WEC. However, such entities should be able to net with any sister companies. Circumstances described above, such as discrepancies in naming conventions or for a legacy corporate name that may persist in Subpart W designated representative representations, should not limit aggregation of WEC applicable facilities into a single WEC filing by a single WEC obligated party. Furthermore, to the extent that a company voluntarily reports facilities that fall under the 25,000 tons CO_2e applicability threshold, those facilities should also be included as a WEC applicable facility. AXPC recommends that EPA clarify that a parent company may function as the WEC obligated party for the WEC applicable facilities of its subsidiaries.

III. EPA’s proposed reporting deadlines associated with the WEC are unreasonable and should be revised in two important ways: 1) The WEC filing and payment deadline should be 30 days after EPA concludes its Subpart W data verification activities or November 1 of each year, whichever comes later, and 2) the proposed deadline to disallow part 99 resubmissions after November 1 of the year following the reporting year should apply to EPA requests for revisions in addition to operators’ voluntary resubmission.

Under 40 CFR 98 Subpart W, GHG emissions and data are due to the EPA on March 31 of the following year. Historically, EPA continues to review and require changes to Subpart W submissions months and even years after the submittal deadline. In this regard, we note that Congress has not given EPA direction with respect to when it should require obligated parties to submit their WEC payments. Subsection 136(g) provides only that “[t]he charge under subsection (c) shall be imposed and collected beginning with respect to emissions reported for calendar year 2024 and for each year thereafter.” In stark contrast, subsection (h) *does* provide a date certain by which EPA is to finalize its revisions to Subpart W. This contrast shows that Congress wished EPA to have timing flexibility on when WEC charges are to be imposed and collected.

But EPA's proposed rule does not acknowledge Congress's silence in this respect, nor does it give any explanation for proposing to align WEC payment dates with Subpart W filing dates, *see* 89 Fed. Reg. at 5350. Requiring companies to submit the WEC filing and remit applicable WEC obligation on the same day will result in numerous instances of refiling and confusion - particularly as implementation of revised Subpart W requirements and provisions occurs.

Companies should submit their WEC filings and EPA should complete any verifications and/or audits before companies are required to submit their WEC obligation payments. EPA has stated that companies must submit any revisions to their WEC filings by November 1st of the year after the reporting year (i.e., approximately 7 months after the WEC filing). EPA has indicated that changes to the WEC filings (with limited exceptions for submitting exemption report information) cannot be made by the operator after that date. If this deadline is imposed on operators as a deadline after which revisions may not occur, that same deadline should apply to EPA. Thus, if EPA does not request corrections before November 1, the GHG reported emissions are final.[5]

EPA in its final rule should provide that WEC obligation payments are due within 30 days of that November 1st date. This approach will avoid creating unnecessary burden on both the agency and reporters to track, modify, and in some cases reimburse payments in response to EPA or an operator's identified need for revisions to a submitted report, as commonly occurs in the program including for many accepted and compliant reasons. This staggered WEC filing and WEC obligation timeline (with a half year to complete any revisions – whether by EPA or the operator) will also eliminate potential complications with the three types of financial sanctions (i.e., two different potential interest payments and administrative penalties) that could result from a timely but inaccurate WEC obligation payment at the time of the WEC filing. While AXPC understands EPA's desire to incentivize accurate reporting, the reports that are required under Subpart W and form the basis of the WEC filing are among the most extensive in the country. These could require – for a particular WEC applicable facility – thousands to tens of thousands of calculations. AXPC is aware of no other reporting scheme with that level of detail. Operators work diligently to file accurate statements, but there is an inherent risk of minimal and generally inconsequential mistakes based upon the shear extent and scope of reporting. Such dynamics are often further complicated by other dynamics such as mergers and acquisitions of companies and/or assets. Penalties should not be assessed due to good faith but erroneous efforts. Delaying the obligation to pay the WEC fee until after WEC filings are deemed complete and finalized will eliminate such outcomes and avoid the needless confusion and dedication of resources from agency and operator alike that will otherwise incur should the timing of WEC obligations be finalized as proposed.

IV. EPA should allow operators to provide empirical data as part of the WEC filing, consistent with Congressional intent.

AXPC urges EPA to allow operators, upon their election, to utilize a mechanism by which to provide empirical data as part of the WEC filing that demonstrates that an emission factor or factor for a particular piece of equipment overestimates emissions and that empirical data appropriately reflects a

---

[5] AXPC believes that any audits should be completed by this November 1st date. If EPA does not adopt the proposal to complete audits by November 1st, there must be a date certain by which EPA can no longer conduct an audit, EPA must have a basis to believe there are significant errors before requiring an audit, and EPA should not impose any penalties for revised WEC obligations or should provide opportunities and bases for waiving any penalties.

lower waste emission charge obligation. Providing such an opportunity is consistent with Congress's directive to EPA to update Subpart W to reflect empirical data.

V. EPA should develop an approach that ensures the availability and utility of the intended exemption for regulatory compliance

Under the Inflation Reduction Act (IRA), Congress exhibited a clear intent to require that EPA provide an exemption from the WEC for applicable facilities that are subject to and in compliance with certain CAA 111(b) and (d) regulations (herein the "Regulatory Compliance Exemption"). Specifically, Congress provided that:

> Charges shall not be imposed pursuant to subsection (c) on an applicable facility that is subject to and in compliance with methane emissions requirements pursuant to subsections (b) and (d) of section 7411 of this title upon a determination by the Administrator that—
>
> > (i) methane emissions standards and plans pursuant to subsections (b) and (d) of section 7411 of this title have been approved and are in effect in all States with respect to the applicable facilities; and
> >
> > (ii) compliance with the requirements described in clause (i) will result in equivalent or greater emissions reductions as would be achieved by the proposed rule of the Administrator entitled "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review" (86 Fed. Reg. 63110 (November 15, 2021)), if such rule had been finalized and implemented.
>
> 42 U.S.C. § 7436(f)(6).

Congress could not have intended for the exemption to be essentially unattainable. However, as proposed, EPA's implementing rule will eviscerate the Regulatory Compliance Exemption. Under the terms of the proposal, the Regulatory Compliance Exemption would not be available for *at least* three years (because, in the final methane rule, this is how long EPA has allowed for states to submit their 111(d) plans and for EPA to review and approve or disapprove them) and once available, will be virtually impossible to achieve (particularly for the onshore and gathering and boosting sectors) – thus, giving no meaningful effect to Congress's intent to provide a Regulatory Compliance Exemption. In other words, EPA has effectively interpreted the Regulatory Compliance Exemption out of the statute. *Zadvydas v. Davis*, 533 U.S. 678, 696 (2001) (if Congress made its intent clear in the statute, courts "must give effect to that intent"); *cf. Kosak v. United States*, 465 U.S. 848, 854 (1984) (a court should not interpret a statute to "nullif[y]" a portion of the statute "through judicial interpretation").

EPA must revise the final rule and preamble to, among other things:

(1) Accurately reflect Congressional intent with respect to the regulatory compliance exemption;
(2) Remove unsupported assumptions regarding whether facilities subject to methane regulations will be above or below the WEC thresholds;
(3) Limit noncompliance to emissions limits and work practice standards;

(4) Limit noncompliance to those circumstances where enforcement actions result in penalties and a determination that the WEC Regulatory Compliance Exemption is unavailable;
(5) Ensure that EPA can determine availability of the Regulatory Compliance Exemption upon adoption of each state or federal OOOOc plan; and
(6) Ensure that EPA makes equivalency determinations (particularly with respect to NSPS OOOOb) immediately.

a) EPA misinterprets Congress's intent with respect to the regulatory compliance exemption

EPA states that it believes the Congressional intent of the Regulatory Compliance Exemption was two-fold: (1) to be implemented such that the WEC acts as a bridge to full implementation of the NSPS OOOOb and EG OOOOc by encouraging methane reductions in the near term while state plans are being developed; and (2) encouraging timely implementation of requirements in state and federal plans. EPA then uses this interpretation of Congressional intent as the basis for additional erroneous conclusions – namely, (1) that no operator may avail themselves of the Regulatory Compliance Exemption until all states (and the federal government, as necessary) have had OOOOc plans approved by EPA (for state plans) or promulgated federal plans (herein "state and federal OOOOc plans") and (2) that EPA must wait until all state and federal OOOOc plans are approved or promulgated to determine whether those NSPS OOOOb and EG OOOOc plans will affect equivalent emissions reductions as the proposal from November 2021 would have done.

EPA provides no explanation for how the plain reading of the statutory text supports its conclusion. The statute, on its face, provides no indication of such an intent, and states no such reasons for the basis of the exemption. However, exemptions from the fee were clearly intended to reward and incentivize compliance with the regulations – regulations that were themselves designed to reduce emissions.

Further, EPA cites no legislative history to support its position, and the legislative history that exists does not support EPA's interpretation of Congress's intent. Rather, the legislative history provides that the WEC is intended to reduce methane emissions, create a clean energy technology bank, and fund wildlife resiliency efforts and clean energy infrastructure. 168 Cong. Rec. H7577-02 (2022). In contrast, EPA's reading suggests that the primary intent of the Inflation Reduction Act in implementing the WEC was to address gaps in timing of finalization of NSPS OOOOb and state and federal OOOOc plans. Nothing in the legislative history supports such an interpretation. A more realistic interpretation is that the Regulatory Compliance Exemption was intended to provide an exemption for entities that were otherwise incurring the costs associated with complying with extensive methane emissions reduction requirements. If the intent had been for the WEC to function as a bridge until finalization of NSPS OOOOb and state and federal OOOOc plan, then Congress would have eliminated the WEC upon such occurrence. However, Congress did not propose such elimination and thus, there is no evidence that the WEC was intended to act as a bridge to anything.

Even if EPA were correct that Congress intended to incentivize quicker implementation of state and federal OOOOc plans, EPA's interpretation of the Regulatory Compliance Exemption works directly against any such intent. If *no* states' WEC Applicable Facilities may enjoy the benefit of the Regulatory Compliance Exemption until *all* state and federal OOOOc plans have been adopted, there is simply no incentive for states to adopt and obtain approval of their plans more quickly. This is particularly true given that different states will have different resources available, differing levels of experience with rulemaking, and other factors that may make development of a OOOOc plan more or less difficult.

And as we explain in more detail below in Section V(f) and (g), EPA's reading of the statutory text in this regard is not plausible. Instead, the proper reading of the text requires that a WEC Applicable Facility should be eligible for the Regulatory Compliance Exemption once all states within which the WEC Applicable Facility has affected or designated facilities have a state or federal OOOOc plan in effect.

b) EPA provides no basis for its conclusion that facilities compliant with NSPS OOOOb and EG OOOOc will likely be below the WEC thresholds

EPA states that:

> WEC applicable facilities containing CAA section 111(b) and (d) facilities that are in compliance with the applicable standards are likely to have emissions below the thresholds specified in section II.B of this preamble due to mitigation resulting from meeting the methane emissions requirements of NSPS OOOOb or EG OOOOc-implementing state and Federal plans and therefore would not be expected to incur charges under the WEC program.

89 Fed. Reg. at 5323. EPA provides no basis for its conclusion on such a technical issue. The WEC will be based on emissions intensity factors that are set forth in the statute. NSPS OOOOb/EG OOOOc do not contain emissions intensity requirements. Rather, they contain command and control regulations that mandate emissions standards and work practice standards designed to target reductions from specific units or equipment. EPA has provided no nexus or correlation between the emissions reductions expected from NSPS OOOOb/EG OOOOc and the emission intensity thresholds established in the IRA that support or justify its conclusions. Whether EPA's conclusion proves accurate in some instances (or even many) is irrelevant. EPA should not make such broad statements or conclusions (which may then be used to set expectations regarding emissions from NSPS OOOOb/EG OOOOc subject facilities).

AXPC does not believe that Congress had any understanding as to whether compliance with NSPS OOOOb/EG OOOOc would result in most facilities being below the waste emissions charge threshold. In fact, the existence of the Regulatory Compliance Exemption suggests that Congress expected otherwise. While EPA acknowledges that there will be some applicable facilities that are complying with NSPS OOOOb and EG OOOOc that are above the waste emissions thresholds, EPA appears to suggest that these would be limited exceptions. And EPA's apparent expectation that these will be limited exceptions then appears to support its creation of a rigorous, unattainable Regulatory Compliance Exemption. In short, EPA ignores the consequences that may result from implementing the Regulatory Compliance Exemption such that it is unachievable and likely underestimates the number of applicable facilities that are substantially and materially in compliance with NSPS OOOOb/EG OOOOc yet will still owe substantial fees under the WEC.

EPA cannot conclude that facilities compliant with NSPS OOOOb and EG OOOOc will not be subject to the WEC based on whims. It must provide specific evidence to support a technical conclusion and should not establish inaccurate and erroneous expectations regarding whether and how NSPS OOOOb and EG OOOOc will specifically relate to the waste emissions thresholds. Here, there is no reason that EPA needs to arrive at this conclusion and AXPC requests that EPA withdraws its unfounded statements.

AXPC provides several reasons that it believes EPA's conclusion is not only unsupported but ignores recent changes that EPA itself has proposed to Subpart W and the potential consequences for WEC

Applicable Facilities. To the extent that EPA relied upon any data in arriving at its conclusion, it appears likely (given that recent proposed changes to Subpart W have not yet been finalized) that EPA was basing any conclusions on existing Subpart W reporting and emissions factors in existing Subpart W. See Regulatory Impact Analysis of the Proposed Waste Emission Charge at 2-4. However, as noted in AXPC and other industry stakeholder comments on the proposed revisions to Subpart W, EPA has proposed to substantially increase certain emissions factors for certain equipment – including equipment that either will be difficult to mitigate or that is not equipment addressed by NSPS OOOOb/EG OOOOc (see e.g., use of pilot flame monitoring data, flowback estimates, among others). As noted in comments from AXPC and other industry stakeholders on Subpart W, EPA's proposed revisions to Subpart W will likely now result in the overestimation of emissions in certain categories – and these overestimated emissions may well result in many operators being above the WEC threshold – even for WEC Applicable Facilities that are materially compliant with NSPS OOOOb/EG OOOOc.

These considerations are one of the key reasons that AXPC and other industry stakeholders have been requesting that EPA take a more thoughtful and coordinated approach with respect to Subpart W revisions and the WEC rule. These issues are inherently tied together, and Congress specifically directed EPA to undertake the difficult work of coordinating the two – in part to ensure that an accurate inventory is being submitted. Specifically, Congress required that:

> [n]ot later than 2 years after August 16, 2022, the Administrator shall revise the requirements of Subpart W of part 98 of title 40, Code of Federal Regulations, to ensure the reporting under such subpart, and calculation of charges under subsections (e) and (f) of this section, are based on empirical data, including data collected pursuant to subsection (a)(4), accurately reflect the total methane emissions and waste emissions from the applicable facilities, and allow owners and operators of applicable facilities to submit empirical emissions data, in a manner to be prescribed by the Administrator, to demonstrate the extent to which a charge under subsection (c) is owed.
>
> 42 U.S.C. § 7435(h).

AXPC does not believe that many of the proposed revisions to Subpart W appropriately reflect emissions and will in fact overstate emissions. For example, Subpart W proposes to allow operators to only account for combustion efficiencies of either 92 or 95 percent for flares and enclosed combustion devices depending on whether the combustion devices must comply with NSPS OOOOb/EG OOOOc control device requirements. Both values are too low in light of the rigorous control device requirements in NSPS OOOOb/EG OOOOc and recent studies. At a minimum, these revisions and increased factors have not likely been considered by EPA in its unsupported statements regarding the relationship between NSPS OOOOb/EG OOOOc and an emissions intensity threshold. EPA must take a step back and ensure that its efforts regarding amendments to Subpart W and its finalization of the Proposed Rule are coordinated, thoughtful, and consistent.

AXPC also incorporates by reference its comments filed on the proposed revisions to Subpart W in this regard, *see* EPA-HQ-OAR-2023-0234-0295 at page 28, and reproduces them here due to concern that EPA may take the position that incorporation by reference is not a sufficient means of placing them before EPA in this rulemaking docket. EPA obviously did not heed these comments, but neither has it given any explanation in the instant proposal why it can disregard them and continue to treat the Subpart W and WEC rulemakings as separate rulemakings in violation of the statute and the fundamental obligation to conduct its rulemakings in a rational manner.

We particularly reiterate from our Subpart W comments the following observations: As a threshold matter, EPA cannot legally or rationally treat the Subpart W rulemaking as separate and independent from its forthcoming proposed implementation of the MERP's "waste emissions charge program." ... Congress did not intend EPA to proceed this way. To the contrary, it directed EPA to make revisions to Subpart W so that both reporting under Subpart W and the calculation of WEC meet certain criteria. When submitting Subpart W comments, regulated companies were in the dark as to how EPA would interpret and implement the WEC program. And now, operators remain in the dark regarding how EPA will finalize amendments to Subpart W. This deprives them of the substance of their right to provide informed comment on the significance of the current Proposed Rule with regard to how the changes EPA plans for Subpart W will interact with EPA's implementation of the WEC.

c) EPA's implementation of the regulatory compliance exemption should evaluate compliance only with the emissions limits and work practice standards in NSPS OOOOb and EG OOOOc (and state and federal plans thereunder)

EPA acknowledges that CAA 136(f)(6)(A) does not specify the definition of compliance for the purposes of the exemption, and notes that many different types of compliance deviations or violations can occur. EPA proposes that under the Regulatory Compliance Exemption, a WEC applicable facility must be in full compliance with the methane emissions requirements of the applicable NSPS (OOOOa and OOOOb) and state and federal OOOOc plans at all affected and designated facilities contained within that WEC applicable facility. 89 Fed. Reg. at 5344-45. EPA interprets full compliance as no deviations or violations from the requirements, including quantitative emissions limits, work practice standards, monitoring, recordkeeping, and reporting. EPA bases its interpretation on the lack of "mitigating language" and its interpretation that Congress intended the reference to compliance with requirements to mean all requirements. However, EPA does not provide reasoning or support for why the variation in types of requirements means that they all must be considered in relation to the regulatory exemption for the methane emissions charge. EPA cannot merely point to the absence of definitional language, without considering the purpose of the statute; properly considering statutory purpose suggests that Congress did not intend that the regulatory compliance exemption required compliance with *all* requirements listed in the NSPS.

EPA's finalization of this proposal should provide that the Regulatory Compliance Exemption will be assessed only against NSPS OOOOb and EG OOOOc, not against NSPS OOOOa or any future potential NSPS or EG methane regulations on this sector under CAA section 111. EPA only mentions its proposal to assess compliance status for purposes of the regulatory compliance exemption with respect to NSPS OOOOa once, 89 Fed. Reg. at 5344, and EPA does not offer any statutory construction or other substantive discussion of why it proposes to include NSPS OOOOa in its regulatory-compliance assessments. The proper reading of the statute is that Congress did not intend EPA to do so.

While it is true that the introductory clause of CAA 136(f)(6)(A), viewed in isolation, speaks generally of "methane emissions requirements pursuant to subsections (b) and (d) of section 7411," these words must be read in context. The sub-provision at CAA 136(f)(6)(A)(ii) refers specifically to the November 2021 proposal of what has recently been finalized as NSPS OOOOb and the accompanying EG OOOOc, and *these* are the requirements to which Congress refers in the root text of CAA 136(f)(6)(A). Furthermore, while we disagree with EPA that Congress intended the Regulatory Compliance Exemption to incentivize quicker adoption of requirements under state or federal OOOOc plans, we observe that this construction of the statute proceeds from the same assumption as our reading does here: that Congress in the Regulatory Compliance Exemption contemplated assessing eligibility for that exemption against the rulemaking initiated with the November 2021 proposal, and not for other standards.

Proceeding as EPA proposes and assessing compliance against NSPS OOOOa in addition to the regulations Congress intended will create confusion. State plans should address the relationship between facilities that are NSPS OOOOa and those that are subject to the state OOOOc plan. State plans will provide implementation timeframes for facilities to come into compliance with the OOOOc plans, and EPA has appropriately concluded that those requirements only need be in place, not implemented, to qualify for the Regulatory Compliance Exemption. However, to the extent that an NSPS OOOOa affected facility remains as such until actual implementation of the OOOOc requirements, there could be a period of time where OOOOa continues to apply after EPA has signed off on the Regulatory Compliance Exemption. NSPS OOOOa compliance should not be part of the analysis in determining whether the Regulatory Compliance Exemption is available during that period.

While it is clear why requirements such as monitoring, reporting, and recordkeeping are part of sections 111(b) and 111(d), they need not be applied to determine compliance for purposes of this exemption. Considerations such as monitoring, recordkeeping, and reporting, while required by CAA section 111, should not be included in determinations of compliance for the Regulatory Compliance Exemption because they do not directly impact emissions or the amount of emission reductions.

The plain language of the statute, and Congress's intent, clearly demonstrate that the purpose of the emission charge and the regulatory compliance exception is to incentivize facilities to reduce actual methane emissions. Since the focus is on the actual levels of emissions, and less on the process requirements such as recordkeeping, reporting, and monitoring, compliance should be established where an operator has met all quantitative limits and work practice standards. This is in line with the calculation process for the charge which determines the charge based on the metric tons of methane emissions above the threshold requirement. A deviation in monitoring, recordkeeping or reporting will not impact this calculation, and thus should not impact whether an operator is in compliance for the exception.

This is evidenced by EPA's discussion of the demonstration that it will make to meet Clause (ii) (as described below). Specifically, EPA notes that Congress directs EPA to compare the emissions that would have been achieved if the NSPS OOOOb/EG OOOOc 2021 Proposal were finalized against the finalized NSPS OOOOb/EG OOOOc. This evidences that Congress was focused on the *emissions reductions* that the NSPS OOOOb/EG OOOOc would achieve (through emissions standards or work practice standards), not on requirements related to monitoring, recordkeeping, and reporting. Thus, only those provisions of NSPS OOOOb and state or federal OOOOc plan that constitute an emission limits or the non-recordkeeping and reporting provisions of a work practice standard should be considered in determining eligibility for the Regulatory Compliance Exemption.

d) EPA must revise the reporting requirements for the regulatory compliance exemption and must not base availability of the regulatory compliance exemption on self-reported deviations

EPA's Proposed Rule indicates that in order to obtain the Regulatory Compliance Exemption a facility must have no deviations or violations of the methane emissions requirements (including monitoring, recordkeeping, and reporting) promulgated pursuant to NSPS OOOOb or state or federal OOOOc plans. EPA proposes that operators represent this status and appears to require reliance on operators' annual reporting requirements under the NSPS to require operators to self-report whether there are deviations or violations of the methane emissions requirements. AXPC strongly disagrees with numerous aspects of this proposal by EPA.

First, operators should not be required to report unless they are seeking a Regulatory Compliance Exemption. If an operator knows that it cannot obtain the Regulatory Compliance Exemption (either because its emissions are below the WEC thresholds or because an operator has itself concluded that it cannot meet the Regulatory Compliance Exemption), then that operator should be able to elect not to report and acknowledge that it does not seek the Regulatory Compliance Exemption. EPA should not mandate reporting by individuals that are not seeking the Regulatory Compliance Exemption – either because they are not eligible or because they cannot obtain it. An exemption is precisely that: an exemption. If an operator does not want an exemption (whether the Regulatory Compliance Exemption, the permitting delay exemption or the plugged well exemption), then EPA should not require an operator to submit any materials regarding that exemption.

Second, deviation reporting may not always reflect a violation appropriate for pursuit of enforcement or may often not reflect noncompliance that should result in ineligibility for the Regulatory Compliance Exemption. Rather, a determination of noncompliance should be based only on those circumstances where an operator has an enforcement action that has resulted in penalties for noncompliance with emission limits and work practice standards under NSPS OOOOb or state or federal OOOOc plans **and** where EPA has determined that such enforcement action precludes eligibility for the Regulatory Compliance Exemption. By limiting noncompliance to those circumstances where an operator and relevant authority have entered into a settlement agreement requiring the payment of penalties or an adjudication resulting in payment of penalties, EPA would ensure proper and fair due process under the law. Further, requiring either the settlement agreement or the adjudication to include a finding regarding the availability of the Regulatory Compliance Exemption would allow EPA to utilize its discretion to acknowledge when deviations or violations are not substantively or materially impacting emissions such that an operator should retain eligibility for the Regulatory Compliance Exemption.

Establishing such a basis for determining eligibility for the Regulatory Compliance Exemption is needed to ensure that EPA does not inadvertently disincentivize self-audits or self-investigation or unduly punish operators who embrace a rigorous deviation reporting program. EPA invested significant time over the last 5 to 10 years to develop programs and incentives for operators in the oil and gas sector to complete self-audits on their existing assets or on newly acquired assets. EPA's interpretation of the Regulatory Compliance Exemption – i.e., that all deviations or violations identified by the operator itself will preclude eligibility – will strongly disincentivize self-audits.

The statutory text leaves room for EPA to determine the extent and meaning of the term "in compliance." Here, EPA has elected in its proposed rule to interpret the term in such a manner that it makes the exemption fundamentally unavailable. This is particularly true for the onshore and gathering and boosting sectors where each WEC applicable facility has dozens to thousands of affected and/or designated facilities/sites within its boundaries. It is unclear whether Congress understood in adopting the WEC provisions of the IRA that onshore and gathering and boosting applicable facilities can contain dozens to thousands of affected and/or designated facilities. It makes no logical sense that Congress would intend that a deviation at one affected facility (e.g., one storage tank) would then make ineligible for the Regulatory Compliance Exemption the remaining thousands of storage tanks that are in compliance within that same basin. Certainly Congress intended that the Regulatory Compliance Exemption be available to all operators subject to the 111(b) and (d) requirements. EPA's current approach does not give effect to the statutory intent or requirement, and is therefore not a reasonable interpretation and application of the statutory text. AXPC's proposal would provide EPA and operators the ability to discuss and determine when noncompliance should preclude use of the Regulatory Compliance Exemption.

In addition, or in the alternative, EPA should develop a threshold or percentage of compliance (again only with respect to emissions limits and work practice standards) that a WEC applicable facility must achieve. EPA must provide meaningful opportunity for operators to obtain the Regulatory Compliance Exemption and flawless compliance should not be mandated in order to obtain the Regulatory Compliance Exemption. This is particularly true given that certain interpretations and requirements that EPA has established in NSPS OOOOb and EG OOOOc make strict and flawless compliance even with emissions standards and work practice standards virtually impossible. For example, EPA has proposed that any emission from a cover or closed vent system constitutes a deviation/violation of the standard. As AXPC and other parties noted in their comments on NSPS OOOOb/EG OOOOc, emissions cannot be precluded from covers or closed vent systems (even with complete and compliant design and operation). Unfortunately, as these interdependent rulemaking timelines overlap, commenters do not yet have a full understanding of whether, if and how these (and other) issues will be addressed by EPA or the courts in response to any reconsideration or review petitions (each of which would be filed after the close of this comment period). EPA must look for a path forward that does not mandate flawless compliance that is not practically achievable, in the same way this rule must not incorporate such a flawed expectation in order to obtain the Regulatory Compliance Exemption. AXPC has proposed one path here – i.e., limit the provisions to which the compliance demonstration applies and limit non-compliance to those that have completed the full enforcement process. In addition, or in the alternative, EPA should consider and adopt some other alternative that would give meaning and availability to the Regulatory Compliance Exemption.

e) EPA's discussion regarding netting of WEC applicable facilities creates significant confusion

EPA determines in the Proposed Rule that "if a facility's emissions are not subject to the WEC, either because the facility is not a WEC applicable facility, or because a WEC applicable facility receives the Regulatory Compliance Exemption,[6] that facility's emissions do not factor into the netting of emissions for a WEC obligated party." 89 Fed. Reg. at 5329. In other words, "only WEC applicable facilities may net, and only WEC applicable emissions may be netted." *Id*. Based on a related analysis, EPA further

---

[6] AXPC notes that this discussion assumes the final adoption of a Regulatory Compliance Exemption that can be attained. As currently proposed, AXPC believes that no (or virtually no) WEC Applicable Facilities will be able to receive the Regulatory Compliance Exemption and this erroneous interpretation for facilities receiving the exemption will be irrelevant.

concludes that WEC Applicable Facilities with emissions below the waste emissions threshold are not eligible to receive the Regulatory Compliance Exemption. Thus, EPA apparently concludes that: (1) WEC Applicable Facilities with waste emissions above the threshold may receive the Regulatory Compliance Exemption but may not net; and (2) WEC Applicable Facilities with waste emissions below the threshold may not receive the Regulatory Compliance Exemption but may net. While this result appears to be a reasonably practical outcome with respect to netting and the Regulatory Compliance Exemption, EPA's position and its logic are confusing. Instead, EPA should encourage all WEC Applicable Facilities to both: (1) achieve emissions below the waste emissions threshold; and (2) to maintain compliance such that the WEC Applicable Facility is eligible for the Regulatory Compliance Exemption. EPA's stated interpretations do not on their face appear to support these goals. Instead, EPA should simply conclude that a WEC Applicable Facility that receives the Regulatory Compliance Exemption remains eligible to net (at the operator's election). In fact, AXPC believes that netting should always be at the option and discretion of the operator. There should be no forced netting. Rather, operators should be able to elect when to net (and as discussed above, should be able to net through parent companies). And, as noted above, operators should be able to voluntarily report Subpart W emissions for facilities that do not exceed the threshold and use those emissions for netting purposes.

AXPC agrees with EPA that nothing should require an operator of a WEC Applicable Facility that does not seek the benefits of the Regulatory Compliance Exemption to have to undertake the necessary resources to demonstrate compliance with the Regulatory Compliance Exemption. However, an operator should be able to make the demonstration that it meets the Regulatory Compliance Exemption even if it has emissions below the WEC threshold. This is important in the event that an operator submits emissions calculations below the WEC threshold but where subsequent calculations (either the operators or through the verification process at EPA) evidence emissions above the WEC threshold. In that case, an operator who was below the WEC threshold initially may need to subsequently rely upon the Regulatory Compliance Exemption.

f) Clause (i) of the regulatory exemption should be met for a WEC applicable facility once all state (or federal) plans covering that WEC applicable facility are approved (or promulgated)

As noted above, Congress identified two prongs that must be met in order for the Regulatory Exemption to be available for an operator of a WEC Applicable Facility. In the first prong (set forth in 42 U.S.C. § 136(f)(6)(A)(i)(herein "Clause (i)"), Congress indicated that Clause (i) requirements have been satisfied when "methane emissions standards and plans …. have been approved and ***are in effect in all States with respect to the applicable facilities***." (Emphasis added.) EPA proposes to interpret the words "are in effect[7] in all States with respect to the applicable facilities" as follows:

> The EPA further proposes to interpret ''all states'' in CAA section 136(f)(6)(A)(i) to mean that every state with an applicable facility (i.e., all states with Subpart W facilities containing CAA section 111(b) or (d) facilities) must have an approved plan (state or Federal) before the determination can be made.
>
> 89 Fed. Reg. at 5337/3.

---

[7] EPA interprets "in effect" as when an Administrator determination regarding a federal or state OOOOc plan has been made, not when the applicable requirements in the state and federal plans are fully implemented. As noted in Section V(g) below, AXPC agrees with this part of EPA's interpretation.

EPA claims that this approach is aligned with a plain reading of the statutory text. But this is not a reasonable interpretation of this statutory phrase, either on its own terms, in context, or when considering Congress's underlying purpose in enacting the Regulatory Compliance Exemption provision. First, as noted above, it directly contradicts what EPA itself says is a major purpose for the exemption: incentivizing timely implementation of state-plan requirements. While AXPC does not agree with EPA that the Inflation Reduction Act was intended to incentivize timely implementation of state-plan requirements, EPA's internal inconsistencies evidence the problems with its interpretations of the statutory language.

EPA's interpretation ignores a critical part of the provision – the modifier – "with respect to the applicable facilities." Statutes must be read as a whole, and the "cardinal principle of interpretation [is] that courts must give effect, if possible, to every clause and word of a statute." *Parker Drilling Mgmt. Servs., Ltd. v. Newton*, 139 S. Ct. 1881, 1890 (2019). The term "the applicable facilities" refers not to *all facilities* nationwide, but to the *specific* facilities whose eligibility for the Regulatory Compliance Exemption is in question. Giving meaning to all terms of the statute results in the conclusion that a facility is not eligible for the Regulatory Compliance Exemption until all states in which the applicable facility is located have a state or federal OOOOc plan in effect. As for the words "in all states," they refer not to *all* states that have any existing sources (as EPA proposes to read them), but rather to all states in which the WEC obligated party has equipment in a given facility. EPA itself in the proposal repeatedly notes that there are facilities which extend across state lines. *See, e.g.*, 89 Fed. Reg. at 5399. All that these words provide is that no facility is eligible for the Regulatory Compliance Exemption for existing sources until all states in which that facility is located have a state or federal existing-source plan in effect.

EPA states that its "proposed approach for implementing the Regulatory Compliance Exemption is based on a *plain reading* of the statutory text in CAA section 136(f)(6)," 89 Fed. Reg. at 5336/2 (emphasis added). However, this is patently not the case. First, EPA itself admits that it departs from a literal reading of this section when it proposes to interpret the phrase "'plans pursuant to subsection. . . (d) of section 111'" as "includ[ing] the promulgation of a Federal plan where the EPA determines that one or more states have failed to submit an approvable state plan, as that is the only way a plan pursuant to CAA section 111(d) would take effect in those states." 89 Fed. Reg. at 5337/3 (ellipsis in original). While AXPC agrees with EPA with respect to this interpretation, such interpretation is simply not a "plain reading" of the statutory text. Rather, it requires interpretation based on the structure and function of CAA Section 111, knowledge of which should be imputed to Congress as part of the background understanding of the text that it enacted here.

The entire statutory phrase at issue in Clause (i) reads:

> methane emissions standards *and plans* pursuant to subsections (b) *and* (d) of section 7411 of this title have been *approved* and are in effect in all States with respect to the applicable facilities
>
> CAA Sec. 136(f)(6)(A)(i) (emphases added).

Like EPA's interpretation that Clause (i) includes adoption of federal plans (as applicable), this provision demonstrates the need to consider the context of Clean Air Act Section 111 in interpreting these provisions. EPA does not "approve" its own federal existing-source plans, it *promulgates* them. And once the Agency has made this departure from the text's literal meaning, it loses any remaining justification for its claim that a plain reading of "in all states" requires it to wait until *all* states with *any* applicable facilities in them *anywhere* in the country have a plan in effect before affording the regulatory-compliance exemption to any facility. As with its reading of the "plans pursuant" provision, the correct interpretive approach here is to look for reasonable Congressional intent in light of the other statutory section referenced here and the nature of the regulatory problem and sector at issue.

Second, the phrase "pursuant to subsections (b) and (d) of section 7411" likewise requires a reasonable interpretation in context rather than a literal one—and here, unlike with its interpretation to include its own federal plans within the meaning of plans "approved" under Subsection (d), EPA's interpretation is not correct.

Here is EPA's interpretation:

> The EPA proposes to interpret the language in CAA section 136(f)(6)(A)(i) to mean that this temporal requirement is only met when *both* (1) emission standards for new sources under CAA section 111(b) are promulgated and in effect and (2) all state plans for existing sources pursuant to an EG issued under CAA section 111(d) have been approved by the EPA and are in effect.

89 Fed. Reg. at 5337/2. This is not the correct interpretation of the statutory text. The new-source and existing-source authority under Section 111(b) and (d), respectively, are mutually exclusive, *see Section* 111(a)(6) ("The term 'existing source' means any stationary source other than a new source."). Again, Congress was speaking at a high level in Section 136(f)(6), and again, EPA's interpretation of the Congressional intent should be informed by the text and structure of Section 111, which (f)(6) explicitly references. Because new-source regulation under 111(b) will be in effect once the recently finalized NSPS OOOOb is in effect, *i.e.*, May 7, 2024, *see* 89 Fed. Reg. at 16820/1, there is no reason for EPA to wait any longer past that date, and in particular no reason for it to wait until *any* state plan is in effect, let alone *all* state plans are in effect, before determining that new-source methane regulations are "in effect" with respect to all new sources in all states.

EPA instead should adopt the

> alternative [that] would involve a determination for methane emissions standards after the promulgation of final emissions standards for CAA section 111(b) facilities and then determinations on a state-by-state basis as each state plan containing emissions standards for CAA section 111(d) facilities were submitted and approved by the EPA (or a Federal plan was promulgated where a state did not submit an approvable plan).

89 Fed. Reg. at 5338/1. The only reason EPA gives for not adopting this approach is its belief that the statute requires "that emissions standards and plans must be approved and in effect in *all* states" before it can make the predicate determinations for the regulatory compliance exemption, but as explained above, that is not the correct reading of the statute.

g) EPA need not and should not wait until all state or federal OOOOc plans are approved or promulgated to make equivalency determinations under clause (ii)

Clause (ii) of the Regulatory Compliance Exemption requires that EPA make a demonstration that compliance with the requirements described in Clause (i) "will result in equivalent or greater emissions reductions as would be achieved by the proposed rule of the Administrator entitled "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review" (86 Fed. Reg. 63110 (November 15, 2021)), if such rule had been finalized and implemented." EPA proposes to conduct the analysis for purposes of this equivalency determination at a national level, comparing the national-level emissions reductions that would have been achieved under the NSPS OOOOb/EG OOOOc 2021 Proposal (if finalized as proposed) against those that will be achieved upon implementation of the final NSPS OOOOb/EG OOOOc. Further, EPA proposes that the two determinations (1) federal regulation equivalency and (2) state plan equivalency be made together, at one time, for NSPS OOOOb and all state and federal OOOOc plans.

EPA's proposal that it make both determinations at once is based on their interpretation that the language of the statute calls for "one single determination." However, as discussed throughout, this interpretation is not in line with principles of statutory construction, or the purpose of the statute. The full sentence reads that plans are "approved and are in effect in all States with respect to the applicable facilities" and as discussed elsewhere, should not be read to refer to all applicable facilities nationwide. Additionally, EPA states that the determination cannot be made until standards and plans are in place in all states because the equivalency determination must be made on a nationwide scale.

We do not agree that EPA must make this determination after all plans are approved and in effect. EPA's focus on "a" determination is very unpersuasive. Furthermore, the singular use of "a" within the phrase "upon a determination by the Administrator" is countered by the singular word "an" within the phrase "[c]harges shall not be imposed pursuant to subsection (c) on an applicable facility that is subject to and in compliance with methane emissions requirements." This phrase clearly contemplates that the Regulatory Compliance Exemption is being made for particular applicable facilities, and *that* is the correct frame through which the subsequent phrase "a determination" should be made.

EPA's interpretation would put operators in States with timely plans at the mercy of other States. This would essentially eliminate the exemption for the first several years. A two-step analysis, that first determines equivalency of NSPS OOOOb, and then determines equivalency of NSPS OOOOc and state plans, will eliminate wasted time and resources because if NSPS OOOOb does not meet the equivalency determination, then neither will NSPS OOOOc.

EPA in fact has all the information it needs to make the equivalency determination *now*, and that determination is ripe for the making now (or at latest when the March 2024 final rule takes effect in May 2024). In the November 2021 proposal, EPA made certain projections as to the emissions reductions it projected would result from implementation of the proposal, and in the March 2024 final rule, EPA issued updated versions of the projections. Its March 2024 projections *exceed* the November 2021 projections (even adjusting for the longer time frame for which the final rule makes these projections), *compare* 86 Fed. Reg. at 63257/3 (Nov. 2021 proposal) *with* 89 Fed. Reg. at 17017/2-3 (Mar. 2024 final rule), demonstrating that compliance with the final rule will meet the standard articulated at CAA Sec. 136(f)(6)(A)(ii).

EPA therefore can and should make the equivalency determination now. However, even if EPA rejects this approach, at the very least, a state-by-state approach is more aligned with Congress's intent than EPA's proposed approach, because it will ensure efficiency in the process and ensure more operators are eligible for the exemption. The state determination can be done in parallel with the evaluation and approval of each state's plan (or in parallel with EPA's promulgation of a federal plan for a state's existing sources). Under this approach, once a state plan is approved (or a federal plan is promulgated), the EPA can also make a determination of equivalency. Further, the approach is simplified if EPA has already determined that NSPS OOOOb is equivalent, because then the state plan's approval means it meets the requirements of 111b and 111d, and thus it is equivalent.

CAA Sec. 136(f)(6)(A)(ii) provides that the Regulatory Compliance Exemption requires a determination by the Administrator that the regulatory requirements referenced in (A)(i) "will result in equivalent or greater emissions reductions as would be achieved by the [November 2021 proposal], if such rule had been finalized *and implemented*." (Emphasis added.) The "implementat[ion]" of existing-source regulation pursuant to both Section 111(d)(1) (state plans) and (d)(2) (federal plans) entails the states' prerogative (under (d)(1) to "take into consideration, among other factors, the remaining useful life of the existing source to which such standard applies," and EPA's own *obligation* (under (d)(2)) to "take into consideration, among other factors, remaining useful lives of the sources in the category of sources to which such standard applies." (This language is what EPA refers to by the acronym RULOF, for "remaining useful life and other factors.").

In other words, RULOF considerations *are part of* existing-source rule implementation, as the text and structure of Section 111(d) clearly demonstrate, and Congress was aware of this fact when it enacted the Regulatory Compliance Exemption provision at Section 136(f)(6). EPA is therefore wrong to suggest, *see* 89 Fed. Reg. at 5342, that the statutory RULOF authority somehow prevents it from making an equivalency determination with respect to existing-source plans until those plans are approved (for state plans) or promulgated (for federal plans). RULOF considerations would have been available to states (and mandatory for EPA) under Section 111(d) "if [the November 2021 proposal had been finalized and implemented" in the same manner as those considerations are available to states (and mandatory for EPA) now that the March 2024 final rule has been finalized and will be implemented. Congress's contemplation of the finalization and implementation of the November 2021 proposal necessarily entails exercise of the statutorily available RULOF authority. Therefore, questions of RULOF are no barrier to EPA making its equivalency determination now.

h) AXPC agrees with EPA on certain conclusions

AXPC agrees with EPA's interpretation that the Regulatory Compliance Exemption should be available when state or federal plans are in effect (see elsewhere for disagreement that all state or federal plans need to be adopted) even if full implementation of those requirements is not required until a future date.

AXPC further agrees with EPA's interpretation that operators are eligible for the exemption for the entire calendar year during which the requisite determinations that the regulatory exemption is available occur (for example, if June 2027, then the whole of 2027). This should not be for a portion of the reporting year or for the next reporting year. It should be noted that the typical calendar-year cadence described in the proposed rules for Subpart W/WEC filings may be out of step with OOOOb as the first compliance reporting is currently expected to be in July or August.

VI. Definitions should reference 40 CFR 98 Subpart W

EPA had defined some terms the same and some terms differently from 40 CFR 98 Subpart W. To avoid conflicting definitions and having to update definitions in two places, EPA should instead simply reference the definitions in 40 CFR 98 Subpart W.

VII. EPA should not require the operator to pay for audits

EPA should not require the operator to pay for a third-party audit of the WEC. EPA should conduct the audit or pay for the auditors. EPA's proposal in this regard presents the daunting prospect of unknown costs on operators.

VIII. EPA should exclude stationary fuel combustion emissions reported under Subpart W that could otherwise be reported under Subpart C

The proposed WEC rule arbitrarily treats stationary fuel combustion emissions differently depending on whether those emissions occur at a facility reporting under Subpart W or at a facility in an industrial segment such as gas processing or transmission that reports the same type of combustion emissions under Subpart C. This inconsistency arises not from any technical difference or legal reason but merely from how EPA has defined "WEC applicable facility" to include all emissions reported under Subpart W, without accounting for the arbitrariness of including stationary fuel combustion emissions that must be reported under Subpart W due to the type of oil and gas facility. Inclusion of fuel combustion emissions in the WEC facility emissions is inappropriate because methane emissions from fuel combustion are not waste. Emissions from fuel combustion (e.g., engines) occur through routing of natural gas to fuel combustion equipment (such as engines) for beneficial use. To correct these concerns, EPA should exclude stationary fuel combustion unit emissions that are reported under § 98.232 pursuant to § 98.232(k) (these could be defined as those that could otherwise be reported under Subpart C), from counting towards the waste emission charge.

The intent of the WEC is to encourage the reduction of methane emissions and this was effectuated in part by tying the WEC to compliance with OOOOb and OOOOc requirements.[8] EPA acknowledges this in the proposal, saying "The EPA expects that, as oil and gas operations implement the requirements of final NSPS OOOOb and the plans issued and approved pursuant to EG OOOOc (and undertake other methane mitigation voluntarily or due to other Federal or state regulations), total reported Subpart W facility methane emissions would decline."[9] It follows that Congress did not intend to subject an upstream operator to WEC obligations resulting from stationary fuel combustion emissions, when these emissions are separate and unrelated from the issue of whether a facility's methane emissions associated have been reduced as much as practicable pursuant to NSPS OOOOb or OOOOc requirements. Further, as noted above, these emissions are not waste emissions. Excluding upstream operators' stationary fuel combustion emissions that could otherwise be reported under Subpart C from the WEC facility emissions calculation is congruent with the intent of the WEC to incentivize the reduction of methane emissions in accordance with NSPS OOOOb and OOOOc.

Therefore, in the final rule, EPA should exclude stationary fuel combustion emissions reported under Subpart W that could otherwise be reported under Subpart C from the calculation of whether the facility owes a WEC obligation.

Washington, DC 20460.

Docket Number: EPA–HQ–OAR–2023–0434
Waste Emissions Charge for Petroleum and Natural Gas Systems

The Independent Petroleum Association of America (IPAA) submits these comments regarding the Environmental Protection Agency (EPA) proposal to implement a Waste Emissions Charge for Petroleum and Natural Gas Systems (WEC) under the Inflation Reduction Act Methane Emissions Reduction Program (Methane Tax).

IPAA represents the thousands of independent oil and natural gas explorers and producers, as well as the service and supply industries that support their efforts, that will be significantly affected by the actions resulting from this regulatory proposal. Independent producers drill about 91 percent of American oil and natural gas wells, produce 83 percent of American oil and produce 90 percent of American natural gas.

In addition to the comments filed here, unless there are specific comments presented herein, IPAA endorses the comments filed by the American Petroleum Institute (API).

The Methane Tax process includes multiple features. However, a key factor in conjunction with this WEC proposal is the application of information from Subpart W. IPAA previously filed comments on the EPA proposal to modify Subpart W (EPA-HQ-OAR-2023-0234-0265). These comments are included in this submission as Appendix A.

Because the emissions calculations under Subpart W are the building blocks for calculation of the WEC, these comments will reiterate and expand on those prior comments. Then, it will address key issues in the WEC proposal.

A. Subpart W

There are several key issues within EPA's Subpart W proposal that remain unresolved and yet essential to the consideration of the WEC proposal because they define the emissions amounts that will ultimately be taxed. One of these is a fundamental issue related to the definition of a facility under the Methane Tax as it relies on Subpart W. A second issue relates to EPA's failure to properly assess emissions factors that become the emissions basis. These will be addressed below.

1. *EPA fails to properly develop a facility definition for the Methane Tax that is consistent with the Clean Air Act.*

The issue of the Subpart W facility definition is not a new one, but it has returned to focus because of EPA's choice to use it without addressing whether it is appropriate for the Methane Tax. The underlying structure of the Subpart W facility definition has been contentious since it was first proposed and adopted for the Greenhouse Gas Reporting Program (GHGRP). The principal issue continues to be that the definition fails to reflect the realities of oil and natural gas production operations. It fails to track other definitions of oil and natural gas production facilities in the Clean Air Act (CAA). EPA's default to the use of the Subpart W definition in the GHGRP context is inappropriate and not required by the Methane Tax.

IPAA has consistently recommended that EPA more properly define Subpart W facilities in the context of the general understanding of facilities within the CAA and the industry. In 2010 comments filed when the facility definition was first developed, IPAA stated the following:

> Most notably, we believe that use of the CAA denies EPA the authority to create a definition of a facility that differs from that in the CAA. EPA proposes the following definition:
>
> > Onshore petroleum and natural gas production facility means all petroleum or natural gas equipment associated with all petroleum or natural gas production wells under common ownership or common control by an onshore petroleum and natural gas production owner or operator located in a single hydrocarbon basin as defined by the American Association of Petroleum Geologists which is assigned a three digit Geologic Province Code. Where an operating entity holds more than one permit in a basin, then all onshore petroleum and natural gas production equipment relating to all permits in their name in the basin is one onshore petroleum and natural gas production facility.
>
> Under this definition, for example, all wells under common ownership along the Gulf Coast of Texas and Louisiana and deeply into the mainland of those states would be considered as one facility. This would be analogous to proposing that every McDonalds restaurant in the State of Texas should be considered as one facility because they have the same name and are franchised from a common source.
>
> Nothing in the CAA suggests that EPA can define an onshore petroleum and natural gas production facility as broadly as it proposes. In reality, the only guidance provided to EPA in the CAA resides in Section 112(n)(4)(A) where it states:
>
> > … in the case of any oil or gas exploration or production well (with its associated equipment), such emissions shall not be aggregated for any purpose ….
>
> EPA proposes its basin approach and solicits comment on the option of using a similar approach involving "field-level reporting". In doing so, the Agency discounts the obvious choice – the well pad. Clearly, the well pad looks like a facility under the definition in the CAA and is the typical permitting unit under CAA regulations. EPA considered a well pad approach and "EPA analyzed the average emissions associated with each of the four well pad facility cases and determined that average emissions at these operations were low (from about 370 metric tons of CO2e per year to slightly less than 5,000 metric tons of CO2e per

year).” Recognizing that individual sources were small, EPA chose to create its novel basin approach.

We identified this issue in our comments to EPA’s proposal in 2009 when we stated:

> We believe that including onshore petroleum and natural gas production facilities in the reporting requirements runs counter to EPA’s focus in this proposal. EPA structured the proposal by selecting its 25,000 tons/year facility reporting threshold in part based on a cost effectiveness test to capture most of the GHG emissions while limiting excessive costs. Despite this effort, under the current proposal 43 percent of the first year capital costs to comply with the rule will be borne by the petroleum and natural gas industry to report an estimated 3 percent of the nation’s GHG emissions. Expanding the reporting requirements to onshore facilities will dramatically increase these costs unnecessarily.
>
> American petroleum and natural gas production comes from approximately 933,000 wells – roughly 500,000 oil wells and 433,000 natural gas wells. These facilities are spread across 33 states. Offshore facilities would be within the scope of the reporting requirements. EPA estimates that 50 offshore facilities would be covered under the 25,000 tons/year threshold. If EPA were to expand the reporting requirements to onshore facilities, it is highly unlikely that any production well facility would meet the reporting threshold. For example, approximately 85 percent of oil wells and 74 percent of natural gas wells are marginal wells producing less than 15 barrels/day of oil and 90 mcf/day of natural gas, respectively. Most of these operations are owned by small businesses. None of them would exceed the reporting threshold individually.
>
> EPA largely seems to recognize this reality when it states:
>
> > …this segment is not proposed for inclusion primarily due to the unique difficulty in defining a ‘‘facility’’ in this sector and correspondingly determining who would be responsible for reporting.
>
> EPA has requested comments on how to define a facility for onshore petroleum and natural gas production and whether to require reporting on a basin level. We believe that the appropriate facility definition tracks the nature of the operation – essentially a well pad which may contain one or several wells and the attendant separation and storage facilities. As we discussed above, these operations will fall well below the reporting threshold. To approach the reporting on a basin level would result in compelling this industry to use a reporting threshold far below the 25,000

> tons/year threshold required for other industries. In essence, all production operations would have to determine emissions levels by whatever estimation or monitoring requirements would apply. This would impose dramatically different costs. To put all of this in some perspective, EPA's INVENTORY OF U.S. GREENHOUSE GAS EMISSIONS AND SINKS: 1990- 2007 (Released on April 15, 2009) would suggest that the GHG emissions from natural gas systems and petroleum systems account for roughly 2.3 percent of U.S. GHG emissions. EPA suggests that about 27 percent of these emissions come from onshore petroleum and natural gas production operations – or roughly 0.6 percent of U.S. GHG emissions.
>
> There is no compelling rationale to justify imposing on this segment of American industry a far costlier reporting requirement, capturing hundreds of thousands of wells many owned by small businesses, solely for the purpose of minimally improving the U.S. GHG emission inventory.

This circumstance has not changed appreciably. EPA argues that it has underestimated the amount of GHG emissions from onshore petroleum and natural gas production systems. The 2008 U.S. Inventory of Greenhouse Gases reported 131 MMTCO2e from petroleum and natural gas systems. EPA believes the emissions are 351 MMTCO2e. To put this in the same perspective as our 2009 comments, these systems would account for slightly more than 6 percent of U.S. GHG emissions and the onshore petroleum and natural gas production systems would be approximately 3.9 percent. EPA must recognize the burden it will impose on the small businesses that operate the majority of these systems.

Small Business Implications

EPA cavalierly asserts that this proposal "…will not have a significant economic impact on a substantial number of small entities." But, can this be true? Comparing numbers of wells that must report against the number of wells operated by small businesses shows a different result.

In creating its basin-level reporting approach, EPA indicates that it will capture 81 percent of the onshore petroleum and natural gas production GHG emissions. It also states – in rejecting the logical well pad facility definition – that individual well pad emissions were low. Consequently, we must conclude that EPA's definition must capture something close to 80 percent of the operating wells.

In 2008, there were 960,303 operating wells in the U.S. (525,287 oil wells and 435,016 natural gas wells, with about 7,000 of these in the federal offshore). The Energy Information Administration reports that 85 percent of these oil wells and 73.3 percent of these natural gas wells are marginal wells. Assuming a proportional distribution across wells, the following results would be produced:

	Wells Reported Under Rule	Marginal Wells Reported Under Rule
Oil Wells	417,300	354,815
Natural Gas Wells	345,213	253,041
Total	762,513	607,856

> Clearly, there will be a pervasive burden borne by America's marginal well producers. EPA is well aware that the companies operating marginal wells are dominated by small businesses. To suggest that the proposed rule will not have a significant impact on small businesses is simply incorrect.

EPA rejected these arguments with the following rationale in its publication of the GHGRP Subpart W regulations:

> We are also including two distinctive definitions of facility for onshore petroleum and natural gas production and for natural gas distribution. Defining a facility in these cases is not as straightforward as other industry segments covered under subpart W. For some segments of the industry (e.g., onshore natural gas processing, onshore natural gas transmission compression, and offshore petroleum and natural gas production), identifying the facility is clear since there are physical boundaries and ownership structures that lend themselves to identifying the scope of reporting and responsible reporting entities. However, in onshore petroleum and natural gas production and natural gas distribution such distinctions are more challenging. As explained in the April 2010 proposal, EPA evaluated existing definitions used under current regulations and determined that it was necessary to provide a unique definition of facility for each of these two segments in order to ensure that the reporting delineation is clear, avoid double counting, and ensure appropriate emissions coverage. For more information please see the preamble for the April 2010 proposal (75 FR 18608) and the Greenhouse Gas Emissions from Petroleum and Natural Gas Industry: Background Technical Support Document (EPA–HQ–OAR–2009–0923).
>
> These definitions are intended only for purposes of subpart W and are not intended to affect to definition of a facility as it might be applied in any other context of the Clean Air Act.

This commitment will no longer be true if EPA applies the Subpart W facility definition in the Methane Tax.

There is nothing in the CAA nor in the Methane Tax that justifies EPA transferring the facility definition component of Subpart W to the Methane Tax. Rather, it is more pertinent to look to other agency actions addressing the definition of oil and natural gas production facilities.

The general concept of a "facility" under the CAA revolves around a typical plant site composed of a single operation or multiple interlocking operations like a refinery or chemical plant or steel mill. Certainly, the dispersed historical nature of oil and natural gas production facilities has made defining those facilities more difficult. However, the only place in the CAA where Congress has spoken is under Section 112 where the language states:

> ...emissions from any oil or gas exploration or production well (with associated equipment) and emissions from any pipeline compressor or pump station shall not be aggregated with emissions from other similar units, whether or not such units are in a contiguous area or under common control, to determine whether such units or stations are major sources, and in the case of any oil or gas exploration or production well (with its associated equipment), such emissions shall not be aggregated for any purpose under this section.

Where EPA is so frequently referring to the plain reading of the language of the Methane Tax in this proposal, this Congressional directive should bear strongly on EPA's interpretation.

Supporting the concept of using a tightly drawn definition of a facility is EPA's actions in defining a "major source" under its federal operating permit requirements as follows:

> *Major source* means any stationary source (or any group of stationary sources that are located on one or more contiguous or adjacent properties, and are under common control of the same person (or persons under common control)), belonging to a single major industrial grouping and that are described in paragraph (1), (2), or (3) of this definition. For the purposes of defining "major source," a stationary source or group of stationary sources shall be considered part of a single industrial grouping if all of the pollutant emitting activities at such source or group of sources on contiguous or adjacent properties belong to the same Major Group (*i.e.,* all have the same two-digit code) as described in the Standard Industrial Classification Manual, 1987. For onshore activities belonging to Standard Industrial Classification (SIC) Major Group 13: Oil and Gas Extraction, pollutant emitting activities shall be considered adjacent if they are located on the same surface site; or if they are located on surface sites that are located within 1/4 mile of one another (measured from the center of the equipment on the surface site) and they share equipment. Shared equipment includes, but is not limited to, produced fluids storage tanks, phase separators, natural gas dehydrators or emissions control devices.

This interpretation was developed through an extensive rulemaking and did not come quickly. Yet, it, too, provides evidence that EPA can come to a rational decision on defining an oil and natural gas production facility. Significantly, this action occurred in 2016, well after the Subpart W facility definition was created.

EPA now faces a different more compelling situation than it did in 2010 when it drafted Subpart W. Congress not only created the Methane Tax, it also intended that the tax should not apply to small well producers. As Senator Manchin stated in his June 2023 letter to EPA:

> - The statute clearly intends to exempt marginal wells and smaller producers from the fee.[3] EPA must make it clearly understood that those entities not subject to the current Subpart W Greenhouse Gas Reporting Program are not subject to EPA fees under MERP.
> - ...
> - EPA should draw reasonable boundaries around the definition of individual "facilities" (such as pad site, compressor site, or reporting field) for emissions intensity calculations so that aggregations of large amounts of disparate wells

and gathering lines does not lead to charging a fee on marginal facilities that Congress intended to exempt or on facilities that have minimal actual emissions.

EPA's use of the facility definition from Subpart W thwarts both these mandates. EPA's sweeping scope of a facility using the American Association of Petroleum Geologists (AAPG) basins to define a facility compels small producers to aggregate all their small producing wells over huge areas, like the entire state for West Virginia or Michigan.

To give some perspective to the potential impact of the use of the sweeping facility definition under Subpart W, a few facts can provide some insight. First, it's important to understand that small business oil and natural gas producers typically need to operate hundreds of small wells across an AAPG basin to be economic. Second, looking at the most recent GHGI (providing data on 2022 emissions), it shows that the distribution of CO_2eq emissions for natural gas production wells is approximately 9 percent CO_2 and 91 percent methane (as CO_2eq). For petroleum (oil) wells the distribution is approximately 33 percent CO_2 and 67 percent methane (as CO_2eq). Third, the following table shows how these distributions result in emissions to make up the 25,000 tonnes/year threshold in the Methane Tax.

Emissions Producing 25,000 tonnes/year				
CO_2 Emissions	Methane Emissions (CO_2eq)	Methane Emissions (21 GWP)	Methane Emissions (25 GWP)	Methane Emissions (28 GWP)
Natural Gas Production (tonnes/year)				
2187	22813	1086	913	815
Oil Production (tonnes/year)				
8188	16812	801	672	600

This table shows the mass of methane emissions based on three methane Global Warming Potentials (GWP) -- 21 (2010 GWP), 25 (the current GWP) and 28 (EPA's proposed revision to the GWP). In this discussion, it is assumed that EPA will finalize its proposed GWP revision and change the methane GWP to 28. Fourth, when EPA proposed its Subpart OOOOb and OOOOc regulations in 2021, it set a threshold for its Leak Detection and Repair (LDAR) program of 3 tons/year (2.722 tonnes/year) from a well site. This can be considered as a proxy for a marginal well.

Using this information, a small business well producer with operations across an AAPG basis would be subject to the Methane Tax threshold with as few as 220 oil wells or 300 natural gas wells. These totals are well within the operations of a typical small producer. Clearly, this application violates the Congressional intent to exclude small businesses and marginal wells from the scope of the Methane Tax.

2. *EPA's proposed approach to a WEC applicable facility egregiously worsens the impact on small producers that own Gathering and Boosting operations*

As adverse as the Subpart W facility definition is for small producers, EPA would make it extraordinarily harsher if the producer operates Gathering and Boosting. First, the Gathering and Boosting (G&B) Emissions Factors (EF) under Subpart W for methane emissions are based on mileage of pipe, not on actual emissions. Second, the WEC emissions threshold for G&B is one quarter of the threshold for natural gas production. Third, EPA is proposing that production (oil and natural gas) and G&B be treated as one applicable facility under the Methane Tax. Under this approach, which will be discussed in more detail below, using the EF in EPA's proposed Subpart W revisions, a small producer with as little as 560 miles of unprotected pipe in an AAPG region would equate to the 300 marginal natural gas wells described above and thereby pull that producer into the Methane Tax.

3. *EPA fails to properly address the accuracy of the emissions factors it was mandated to improve under the Methane Tax.*

As stated above, IPAA has previously addressed its concerns about EPA's actions to fulfill its mandate under the Methane Tax to revise Subpart W. While those comments present a more extensive view, a key aspect is restated here:

> EPA actions to revise component emissions factors raise serious questions about both the approach and the proposal. As discussed above, the Inflation Reduction Act mandate to revise Subpart W requires EPA to conduct thorough analyses of the numerous emissions factors and either independently validate them or develop its own valid factors. It failed to do either.
>
> Instead, it turned to three reports as the basis for new emissions factors. These reports are generally referenced as Zimmerle[1], Pacsi[2] and Rutherford[3].
>
> However, EPA's use of these materials demonstrates a callous disregard for the mandate EPA must meet in revising Subpart W. The Zimmerle report addresses emissions from gathering compressor stations; the Pacsi report addresses emissions from oil and natural gas production equipment leaks. Each of these studies conclude that the current emissions factor calculation process under Subpart W overstates emissions that they studied. The Zimmerle report states:
>
>> Combining study emission data with 2017 GHGRP activity data, the study indicated statistically lower national emissions of … 66% … of current GHGI estimates, despite estimating 17% … more stations than the 2017 GHGI ….
>
> The Pacsi report states:
>
>> The most common EPA estimation method for greenhouse gas emission reporting for equipment leaks, which is based on major site equipment counts and population-average component emission factors, would have overestimated equipment leak emissions by 22% to 36% for the sites surveyed in this study as compared to direct measurements of leaking components because of a lower frequency of leaking components in this work than during the field

> surveys conducted more than 20 years ago to develop the current EPA factors.

To show the EPA lack of regard for its mandate, EPA ignores these conclusions and cherry picks elements of the reports to increase the component emissions factors in Subpart W. The Rutherford study takes a different approach. It makes the assumption that component based emissions estimates understate actual emissions because it believes that ambient monitoring presents more accurate results. Consequently, it surveys a variety of component based emissions studies to create emissions factors higher than those in the current Subpart W and adopts them as more accurate.

Critically, EPA embraces all these various changes that increase the Subpart W emissions factors, but it never attempts to independently validate them. The effect of this action is increases in virtually every component emissions factor, some of which would yield emissions estimates 5 times or more than the current Subpart W calculations. Not only is this approach a clear dereliction of EPA's responsibilities, but it also has the effect (along with changing the GWP for methane) of de facto lowering the 25,000 mt/year threshold and raising the emissions subject to methane tax. Enverus Intelligence Research, a subsidiary of the energy-focused Software as a Service firm Enverus, has found the proposed regulations would more than double 2021 reported methane and increase overall carbon dioxide-equivalent emissions by 41%. If EPA is intentionally revising the Congressionally enacted methane tax through its rulemaking actions, it should be held to a standard that requires it prove that its revisions are valid.

B. Waste Emissions Charge

Because the Methane Tax contains no legislative history and frequently fails to truly define its terms, EPA must interpret the legislative text. In its proposal EPA frequently refers to terms like "a plain reading" of the statute. However, EPA manipulates its reading of the text by only partially reading the text or ignoring key terms. As a result, it creates inappropriate conclusions and therefore inappropriate regulatory proposals.

Definition of Applicable Facility

As described previously, EPA fails to address the inappropriate use of the GHGRP Subpart W facility definition in the Methane Tax – a definition that EPA characterized by describing as follows:

> These definitions are intended only for purposes of subpart W and are not intended to affect to definition of a facility as it might be applied in any other context of the Clean Air Act.

But, in the definition of "applicable facility", EPA proposes a definition that compounds this misuse outrageously. EPA proposes that:

> In cases where a subpart W facility reports under two or more of the industry segments listed in the previous paragraph, the EPA proposes that the 25,000 mt CO2e threshold would be evaluated based on the total facility GHG emissions

reported to subpart W across all of the industry segments (i.e., the facility's total subpart W GHGs).

This proposal appears to create a structure that would compel operators to sum emissions of their operations in an AAPG basin to include, for example, their oil and natural gas production operations and their G&B operations such that if both were below 25,000 mt/year but the sum were above 25,000 mt/year, their operations would then become subject to the WEC. This proposal extends an already inappropriate approach to a facility definition to arbitrarily capture even more operations for what is solely intended to make them subject to the Methane Tax. It should be summarily rejected.

Calculations of WEC Emissions Thresholds

1. *EPA fails to use natural gas when the term is in the text of the statute.*

A key and clear failure in EPA's interpretation of the legislative text is its failure to use natural gas as the basis of WEC thresholds when the term is in the text. This failure results in EPA effectively raising the WEC emissions threshold by about 30 percent. Most of the WEC emissions thresholds are based on natural gas sales or throughput. This discussion will focus on the emissions threshold for the onshore petroleum and natural gas production industry segment that sends natural gas to sales. EPA presents this calculation as follows:

$$TH_{is,Prod} = 0.002 \times \rho_{CH4} \times Q_{ng,Prod} \qquad \text{(Eq. B-1)}$$

Where:

$TH_{is,Prod}$ = The methane waste emissions threshold for the industry segment at a WEC applicable facility for the reporting year in the production sector that has natural gas sent to sale, metric tons (mt) CH_4.

0.002 = Industry segment-specific methane intensity threshold, as specified in CAA section 136(f), for methane emissions for applicable facilities with natural gas sales in the production sector, thousand standard cubic feet (Mscf) CH_4 per Mscf of natural gas sent to sale.

ρ_{CH4} = Density of methane = 0.0192 kilograms per standard cubic foot (kg/scf) = 0.0192 metric tons per thousand standard cubic feet (mt/Mscf).

$Q_{ng,Prod}$ = The total quantity of natural gas that is sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to part 98, subpart W of this chapter. For onshore petroleum and natural gas production, you must use the quantity reported pursuant to proposed § 98.236(aa)(1)(i)(B) of this chapter, in Mscf. For offshore petroleum and natural gas production, you must use the quantity reported pursuant to proposed § 98.236(aa)(2)(i) of this chapter, in Mscf.

The two key factors in this equation are the use of natural gas sales as the basis of the emissions threshold and the use of methane density to convert volume to mass. Methane is not natural gas.

Natural gas is denser than methane. By using methane density instead of natural gas density, EPA lowers the emissions threshold and effectively raises the Methane Tax payment.

Then, in one of its more disingenuous statements, EPA argues that its use of methane density instead of natural gas density is actually intended to decrease the reporting burden on industry.

> With the exception of production facilities that only produce oil, the statutory text clearly lists natural gas as the throughput value. Further, the proposed approach can be implemented with data currently reported under subpart W, while alternative methane intensity methodologies would require reporting of additional data and increase the burden on the oil and gas industry. ... An approach that calculates methane intensity as the mass of methane emissions divided by the mass of natural gas would require facilities to collect and report detailed information on all of the constituents of natural gas throughput. ... The EPA therefore believes that the proposed approaches not only follow a plain reading of CAA section 136(f) but are also the best and most reasonable approaches.

If EPA really believes in plainly reading the statute, it will clearly conclude that the statute uses natural gas as the basis for the WEC and the emissions threshold. Consequently, its task is to present options to use natural gas density in its calculations.

Certainly, one option should be for operators to provide natural gas density information based on their operations and EPA needs to provide a framework for the submission of such data.

However, other approaches are also available. For example, since 2011, EPA has used a memorandum, "Composition of Natural Gas for use in the Oil and Natural Gas Sector Rulemaking" (included as Appendix B in this document) to provide natural gas composition data for its regulations. Using this document, a natural gas density of approximately 0.0535 lb/scf can be calculated. This demonstrates the significance of using a natural gas density rather than the methane density of 0.0416 lb/scf. It is nearly 30 percent higher. Given that EPA has been using this document for its rulemaking for over a decade, it can certainly be used as a default value if no other information is available.

Another approach that EPA could take would be to work with organizations like the Energy Information Administration or the Gas Technology Institute or Enverus that may have databases with AAPG basin average natural gas densities. If such databases do not exist, EPA could initiate an effort by one of these organizations to obtain such information. These densities could then be used as AAPG basin default values when no other information is available.

Any approach to define default natural gas densities and to provide for operator supplied natural gas densities are clearly plausible approaches to address the issue of needing a natural gas density to calculate the emissions threshold.

But what is clear is that EPA's approach of using a methane density is not a valid plain reading of the statute and must be altered.

2. *The current approach is unfair to oil dominated production and must be changed.*

Some of the emissions thresholds in the Methane Tax seem to be derived from various voluntary emissions intensity programs related to natural gas production. At least this appears to be the case for the onshore production emissions threshold for operators with natural gas sales. This emissions intensity target was developed by companies operating production that is dominated by natural gas sales. While it may be a rational target for such operations, it is inappropriate for production that is primarily petroleum with minimal or limited natural gas sales. Similarly, the emissions threshold for petroleum production with no natural gas sales is wholly inconsistent with the threshold for natural gas production facilities and generates a likely impossible target to meet.

The following are some examples of the implications of the emissions thresholds for different operations. For illustrative purposes, they will be based on petroleum production of one million barrels/year. One million barrels per year can be converted to natural gas production based on energy equivalency which is 6 mcf of natural gas is equivalent to one barrel of oil. Therefore, one million barrels of oil is equivalent to 6 million mcf of natural gas.

For petroleum production with no gas sales, the Methane Tax emissions threshold is 10 metric tons per one million barrels. If this production was natural gas where the emissions threshold is 0.2 percent of natural gas sales, then for 6 million mcf of production (using natural gas density in the calculation), the threshold would be 292 metric tons. This multiple of 29 is wholly inappropriate.

A similar issue exists for a petroleum producer with limited natural gas sales. Assume that the same petroleum producer had an additional one percent of its oil production as natural gas – 60,000 mcf. This would produce a natural gas emissions threshold of about 2.9 mt. Again, a threshold that is wholly inconsistent with a comparable natural gas energy producer.

3. *The G&B emissions threshold has no identifiable basis and is inequitable*

There is nothing in the Methane Tax that explains why the emissions threshold for G&B was selected. It is well below the emissions threshold for other segments of the industry. This low threshold is complicated by the egregious use of the Subpart W EF for G&B. As noted above, the G&B EF are based on miles of pipe and do not reflect control measures or emissions data that could show dramatically different emissions profiles. EPA needs to justify the G&B emissions threshold and generate valid EF for this sector.

Compliance Date for the Submission of Methane Tax Payments

EPA's proposed approach for the payments of the Methane Tax is unjustified and flies in the face of historic filing issues with the GHGRP. For the many years that the GHGRP has been in operation, the filing date has been March 31 of the year following the year of emissions reporting (e.g., March 2024 for 2023 data). However, given the short time frame to develop the data, verification of data has extended into November in many instances.

Now, EPA is proposing that the WEC filing and payment must be submitted on March 31. It allows modifications to the WEC filing to be made until November 1. However, while any reductions in emissions would allow for a rebate, increases would have penalties applied to them. This approach is unnecessary. Given the history of the GHGRP, EPA knows there will likely be modifications needed for many filings. Consequently, a fair approach would delay the payment date until November 1, after the revisions and verifications have been completed.

Regulatory Compliance Exemption

IPAA has doubted that the Regulatory Compliance Exemption (Exemption) would be realistically available; it has always appeared a false promise. Consistent with this perception, EPA's proposal demonstrates that it will use every measure possible to prevent the application of the Exemption.

1. *The Exemption Proposal is Inconsistent with the Plain Reading of the Statute*

To begin with, EPA shows its bias by choosing to cleverly try to parse the language of the statute and make it as unworkable as it can. Its first act is to misread the following language:

> ...methane emissions standards and plans pursuant to subsections (b) and (d) of section 111 have been approved and are in effect in all States with respect to the applicable facilities.

EPA chooses to focus on the term "all States" in isolation from the reference to "applicable facilities". A clear plain reading of the statute would reflect Congress' already punitive limitation on companies that would prevent them from using the Exemption as soon as a state in which they operate has plans in place by requiring that all the states where they had applicable facilities have approved section 111(b) and section 111(d) plans in place. That is, if a company had applicable facilities in Texas and West Virginia, it could not benefit from the Exemption in Texas if West Virginia's plans had not been approved. Both Texas and West Virginia must have approved plans.

EPA drives the issue to an absurd conclusion by interpreting the language to mean that if a company had operations in Texas and West Virginia and both had approved plans, the company could not utilize the Exemption if, say, South Dakota did not have approved plans – a state where it had no applicable facilities.

EPA's rationale for this interpretation can have no purpose other than to prevent the Exemption from being used and compel higher taxes on companies when they are, if fact, acting as the statute would envision – reducing their methane emissions and complying with the regulations.

2. *The Equivalency Proposal is Unfair and Designed to Prevent Use of the Exemption*

The second major task for EPA involving the Exemption relates to determining whether the promulgated Subpart OOOOb regulations and the forthcoming Subpart OOOOc state regulations "will result in equivalent or greater emissions reductions as would be achieved by the [2021] proposed rule…". EPA's course of action here is to punt. EPA merely states it will address this action in a future rulemaking after all the state plans have been approved.

This deferral of action by EPA leaves the entire process in an unacceptable limbo. This decision has always been fraught with confusion and EPA does nothing to create a framework for industry or states as it avoids any action – even when some actions are possible.

At issue here is that not only will this determination affect the Methane Tax, it can influence the state planning process if EPA were to conclude that the Subpart OOOOb regulations failed to meet the equivalency test. If so, it would mean that state plans would have to fill the gap perhaps compelling existing source regulations that are more extreme than those in the EG – or Subpart OOOOb.

Confounding the decision-making process is the fundamental challenge inherent in interpreting the 2021 Subparts OOOOb and OOOOc proposals. The 2021 proposal was largely devoid of true regulatory language, raising the issue of how EPA will evaluate this amorphous proposal. Numerous questions arise. For example:

a. How will EPA interpret the 2021 Subpart OOOOb proposal against the final 2024 Subpart OOOOb regulations? This comparison can be made now since the Subpart OOOOb regulations are final.
b. How will EPA address the 2021 Subpart OOOOc proposal given that the EG process allows states to develop comparable regulations and that the Remaining Useful Life and Other Factors (RULOF) provisions of Section 111(d) can be applied and applied differently in each state? Understanding this framework could potentially significantly affect EPA's conclusion.

EPA's failure to suggest how it will grapple with these complex decisions leaves the regulated community and states in a position of trying to make key regulatory and investment decisions in a void. Also, EPA's failure to address these decisions allows it to prevent applicable facilities from accessing the Exemption by not taking any action. Under the deferral approach, all state plans could be approved, but EPA could just defer the Exemption by making no decision.

There is nothing in the statute that prevents EPA from making segmented determinations on the equivalency of regulatory programs relative to the 2021 proposal. For example, as suggested above, EPA could determine if the final Subpart OOOOb regulations are equivalent to the 2021 Subpart OOOOb proposal. If they are not, it largely closes out the availability of the Exemption. Similarly, state-by-state determinations regarding Subpart OOOOc are feasible with the larger question being how EPA will assess how the 2021 Subpart OOOOc EG would have been implemented when there is virtually no regulatory language available. At least under a state-by-state approach, the potential for the Exemption to be available in a timely manner would be far higher, particularly if EPA junks the current proposal that all states must have approved plans before any applicable facility can utilize the Exemption and returns to a more logical plain reading of the statute that is described above.

EPA's approach in comparing the 2021 proposal to the 2024 final Subpart OOOOc EG would be inappropriate and unfair to the most vulnerable of existing sources. EPA asserts that it would assume that the 2021 EG would be implemented as proposed (although the proposal was not regulatory language). However, it would compare that assessment with the approved state plan that includes RULOF facilities. Such an approach is inequitable. First, there is no reason to assume that the RULOF facilities under the 2024 EG would not have been RULOF facilities under the 2021 proposal since they are clearly facilities where the regulations pose such a severe burden that they qualify as RULOF facilities. Second, penalizing all applicable facilities in a state because it has RULOF facilities is completely unwarranted and inequitable. Third, if the impact of the approach is to deny facilities that deserve RULOF treatment its application in order to obtain the Exemption for the remaining facilities in a state is an egregiously harsh punishment for those uneconomic facilities that are likely mature operations and probably small businesses. Therefore, a more equitable approach would compare whatever EPA concludes in the efficacy of the 2021 EG proposal with the basic regulatory structure in an approved state plan under the 2024 EG.

3. *Actual Noncompliance Needs to be the Basis for Denying an Exemption*

The third key ingredient to obtaining the Exemption is compliance with the Subpart OOOO family of regulations and state plans implementing the EG. Here, again, EPA proposes an approach intended to preclude the use of the Exemption. As EPA describes:

> CAA section 136(f)(6)(A) states that the WEC shall not be imposed "on an applicable facility that is subject to and in compliance with methane emissions requirements pursuant to subsections (b) and (d) of section 111." For the purpose of determining WEC facility eligibility for the regulatory compliance exemption, the EPA proposes that the compliance status of CAA section 111(b) and (d) facilities contained within a WEC applicable facility would be assessed based on compliance with the applicable methane emissions requirements for the Oil & Natural Gas Source Category (40 CFR part 60, subparts OOOOa, OOOOb, and OOOOc).

The statutory language gives EPA wide latitude to determine what constitutes compliance with the federal and state regulations. There is nothing in this language that prohibits EPA from using a test such as substantive compliance which would be appropriate, despite EPA's assertion otherwise.

In fact, to create a fair compliance test, there are several key components that should be included. First, the compliance test should be substantive compliance, not some shallow failure to adhere to some trivial detail. Second, the noncomplying events should be identified as a result of regulatory actions by the appropriate governing regulator. Third, the events should be adjudicated to assure that they are actual noncompliance with fines, penalties or specific performance actions assessed. Fourth, only the applicable facility where the noncompliance occurred should be denied the Exemption; other applicable facilities should not be affected.

Auditing, Compliance and Enforcement

EPA devotes two paragraphs of largely boilerplate material describing its auditing, compliance and enforcement policies. Nothing in them suggests that EPA has any intent not to use these authorities in the harassing fashion that has been the history of its actions related to the American oil and natural gas production industry.

The creation of the Methane Tax gives pervasive and largely unfettered opportunities to use auditing and enforcement actions to adversely affect oil and natural gas producers. EPA can audit any producer, challenging every calculation that is made, or challenging whether a small producer should have filed Subpart W and Methane Tax information. It can threaten large and crippling fines without any standards regarding the development of the information.

IPAA has raised this issue previously because of past experiences with the Office of Enforcement and Compliance Assurance (OECA). OECA's actions to target small businesses with crippling fines generates a harsh adverse dynamic. Since EPA seems intent on using the

Methane Tax to capture small businesses and marginal wells in its scope, EPA needs to determine how it will use these enforcement tools and make those policies public. It has not.

Conclusion

IPAA opposed the Methane Tax when it was being developed. It is clearly a punitive tax, cast as a backstop to the Subpart OOOO family of regulations. It presents itself as necessary to deal with an urgent need to reduce American methane emissions in the context of a global climate challenge; however, it only addresses the thirty percent of American methane emissions from the oil and natural gas industry, leaving the other seventy percent untaxed. That seventy percent is also largely unregulated; certainly, it is not regulated to the extent of oil and natural gas. The Methane Tax exemplifies the worst in legislation – no hearings, no committee reports, no conference report, no statements during floor debate. Now, EPA is using its regulatory authority to interpret the statute to consistently increase the taxable entities, to increase emissions calculations and to increase waste emissions thresholds while limiting the availability of the Exemption. IPAA urges EPA to reverse this course, withdraw this proposal and the Subpart W proposal, and limit the adverse effects of the Methane Tax.

If IPAA can provide further information, please contact Dan Naatz at dnaatz@ipaa.org.

Sincerely,

Dan Naatz

Re: Greenhouse Gas Reporting Rule: Revisions and Confidentiality Determinations for Petroleum and Natural Gas Systems

These comments are filed on behalf of the Independent Petroleum Association of America (IPAA). IPAA represents the thousands of independent oil and natural gas explorers and producers, as well as the service and supply industries that support their efforts, that will be significantly affected by the actions resulting from this regulatory proposal. Independent producers drill about 91 percent of American oil and natural gas wells, produce 83 percent of American oil and produce 90 percent of American natural gas.

In addition to the specific comments made herein, IPAA has joined comments submitted separately by the American Petroleum Institute (API).

These comments address proposals by the Environmental Protection Agency (EPA) to revise reporting requirements for Petroleum and Natural Gas Systems for the Greenhouse Gas Reporting Program (GHGRP) under Subpart W.

Subpart W Mandate

Initial efforts to revise Subpart W were included in 2022 as a part of a similarly titled proposal – Revisions and Confidentiality Determinations for Data Elements under the Greenhouse Gas Reporting Rule; Docket No. EPA-HQ-OAR-2019-0424. However, enactment of the Inflation Reduction Act (IRA) mandated that EPA revise Subpart W because of its use as the emissions basis for inclusion in and the calculation of the Methane Emissions Reduction Program (MERP) methane tax. In fact, no action taken now to revise Subpart W cannot be evaluated without considering and understanding its implications under the methane tax.

The mandate to revise Subpart W is no small task. The history of Subpart W demonstrates that its accuracy was never intended to be the basis for use as a taxing mechanism. Generally, its emissions factors were developed from limited emissions studies that were never structured to develop precise emissions estimates. The Inflation Reduction Act mandate requires EPA to:

> Not later than 2 years after August 16, 2022, the Administrator shall revise the requirements of subpart W of part 98 of title 40, Code of Federal Regulations, to ensure the reporting under such subpart, and calculation of charges under

> subsections (e)[1] and (f)[2] of this section, are based on empirical data, including data collected pursuant to subsection (a)(4)[3], accurately reflect the total methane emissions and waste emissions from the applicable facilities, and allow owners and operators of applicable facilities to submit empirical emissions data, in a manner to be prescribed by the Administrator, to demonstrate the extent to which a charge under subsection (c)[4] is owed.

The current proposal fails to remotely meet this mandate regarding either time or substance.

One obvious element of the MERP is that its timelines for action are completely inconsistent with reality. It initiates the methane tax in 2025 based on 2024 emissions reporting while falsely promising that compliance with federal Subpart OOOO, OOOOa, OOOOb, and OOOOc regulations and emissions guidelines will void the tax when these regulations will not be fully implemented until at least 2028. Regarding the Subpart W revisions, it requires EPA to finish its revisions by August 2024. The scope of actions that must be undertaken for the full revision of Subpart W, as described in the Inflation Reduction Act, cannot be completed in a two-year window. However, rather than execute its mandated task, EPA proposes a thinly disguised cosmetic rework of the same material that has existed for years with little or no validation by EPA – and, even then, EPA does not apply its changes for a year after its mandated deadline.

If Congress intends to impose millions of dollars of taxes on methane emissions from the petroleum and natural gas industries, potentially crippling the production of millions of barrels and cubic feet of these American products, its mandate to EPA to revise the appallingly inaccurate emissions tools of Subpart W must be read as a serious and thorough methodological effort.

Such an effort would have several key elements. First, it must recognize the nature of emissions particularly from petroleum and natural gas production and production related emissions. Second, it must recognize that some emissions can be measured and others will continue to need emissions estimates from factors; these decisions will be particularly influenced by the economic status of the facility operator. Third, it must recognize that EPA will need to validate these measurement tools and the emissions factors.

Emissions from petroleum and natural gas systems are characterized by leaks from pieces of equipment that cannot be readily or continuously measured. They differ by an array of numerous factors – crude oil versus natural gas, associated gas or low volatility crude, wet or dry gas wells. All wells decline as they produce, changing the volume and composition of their production. Studies have shown that low production wells differ from high volume wells. The economics of production differs between high and low production wells, frequently an indication of the capitalization of the operations. The amount of active equipment at a facility changes with production. Some facilities have gathering and compression equipment on site; others do not. Many low production wells do not operate daily. Many small natural gas wells have booster compressors to suck natural gas from the well bore. Emissions analyses show that 90 percent of

---

[1] Emissions charge amount

[2] Waste emissions threshold

[3] Direct and indirect costs required to administer this section, prepare inventories, gather empirical data, and track emissions

[4] Waste emissions charge

emissions come from about 10 percent of facilities, with storage tanks and some pneumatic controllers accounting for the predominant percentage of these emissions.

Because so many of the potential emissions sources from petroleum and natural gas production facilities are diverse components like valves, flanges, storage tanks, connectors, and controllers that are individually small, there are not straightforward methods to routinely monitor these emissions. Studies that have been conducted have used methods like bagging equipment to collect emissions for a short period of time. This technique is infeasible for routine operations. Newer facilities with higher volumes of production and more equipment at a site have been able to collect emissions from equipment like pneumatic controllers and pneumatic pumps and route them to vapor capture or combustion. However, such technology is limited if not impossible for older, low production facilities. Consequently, while EPA has been directed to expand the use of actual facility-based emissions data to quantify emissions, there will continue to be a certain need for emissions factors for emissions that are too difficult to measure or too expensive to collect for low production operations.

Perhaps most importantly for EPA and where EPA has failed most clearly in this proposal is the need to produce validated emissions calculations and validated emissions factors for Subpart W. Subpart W presents a long history of relying on limited studies from the 1990s appended using questionable analyses by environmental lobbyists to produce reports on petroleum and natural gas production facilities. Many of these same analyses have been used for the development of EPA methane regulations in Subpart OOOO, OOOOa, OOOOb and OOOOc. Missing from all these EPA actions is careful, thorough validation of the analyses by EPA and replication of these analyses. Many of these studies have been based on a small number of facilities, based on drive-by analysis with no information on facilities' operation, based on recalibrating data in different ways without any new information, based on applying statistical manipulation to produce headline grabbing allegations. Congress' mandate to EPA is connected to very real methane tax consequences. EPA cannot meet this mandate without collecting and analyzing its own data to develop sound, robust emissions calculation methods and emissions factors. This proposal fails completely to meet this essential test.

These challenges for EPA to meet its Subpart W mandate demonstrate clearly that it cannot be done properly in the two-year window of the MERP timeline. For EPA to do it job right, it needs to get changes made to the Inflation Reduction Act to make its timelines for both Subpart W and the completion and implementation of the Subpart OOOOb regulations and OOOOc emissions guidelines to complete these actions before collecting methane taxes from American producers.

New Implications of Subpart W

When Subpart W was solely related to filing under the GHGRP, determining whether a facility needed to file and the accuracy of submitted information carried limited further scrutiny. However, because the MERP imposes a methane tax, all filing decisions now become auditable and subject to penalties under the enforcement provisions of the Clean Air Act (CAA). These new burdens compel EPA to address them in Subpart W, but it does not.

Both the MERP and Subpart W establish a filing threshold of 25,000 mt/year of CO_2eq. This threshold was set initially by EPA when it initiated Subpart W reporting to limit the burden on small businesses while maintaining reporting by the preponderance of emissions sources. It was specifically retained in the MERP legislation. At issue then is the challenge to small producers to determine whether they are subject to the Subpart W filing requirements without compelling them to complete a costly full-blown inventory that is unnecessary. EPA provides no simple estimating procedure to determine whether small producers are near the 25,000 mt/year threshold. Both EPA and Congress have shown that small producers are not the target of the methane tax; however, EPA must now provide a mechanism to easily exclude them without the threat of audit and enforcement by the Office of Enforcement and Compliance Assurance (OECA).

A different, but similar, issue arises for all reporting entities. With Subpart W becoming the basis for the methane tax, any and all information submitted become the subject of audit and enforcement under the CAA. This creates the potential for frivolous and harassing actions by OECA. The history of OECA interaction with American petroleum and natural gas producers has been characterized by OECA actions to target smaller producers with fine threats that would bankrupt them. These actions have included interpretations of regulations by OECA that differed from the interpretation and guidance from the regulatory authors within EPA. Filing under Subpart W creates hundreds of thousands of opportunities to challenge any submitted information. Since EPA has proposed numerous different approaches to submitting information and creates the opportunity for reporters to submit facility specific information, EPA must now assure that good faith actions by reporters are not windows of opportunity for OECA to pursue harassing actions. However, EPA has not provided clear and straightforward guidance in this Subpart W proposal. Nor has it shown that OECA will use such guidance.

Property Transfer

When property transfers, the reporting of emissions takes on a different context because of the introduction of the methane tax. Previously, these issues have been largely related to assuring that there was a source responsible for assuring emissions were reported. The methane tax changes the process because substantial amounts of money are involved and there are equities that need addressed. Essentially, no new owner should be responsible for the methane taxes generated by the prior owner. This EPA proposal regarding the transfer of property fails to set forth clear delineations to create the equity that is essential.

Facility Definition

When EPA set its facility definition for the GHGRP, it was based on the 25,000 mt/year on information indicating that it would exclude small wells and producers. However, experience is showing that the current structure of the definition is capturing facilities comprised of low production wells and gathering and boosting facilities (that were not part of the original threshold selection). EPA is now proposing that emissions calculations be made at the well pad level. It should also revise the facility definition to exclude low production wells and to alter the gathering and boosting calculation to limit the use of arbitrary emissions estimates based on pipeline mileage.

Specific Proposals

EPA actions to revise component emissions factors raise serious questions about both the approach and the proposal. As discussed above, the Inflation Reduction Act mandate to revise Subpart W requires EPA to conduct thorough analyses of the numerous emissions factors and either independently validate them or develop its own valid factors. It failed to do either.

Instead, it turned to three reports as the basis for new emissions factors. These reports are generally referenced as Zimmerle[5], Pacsi[6] and Rutherford[7].

However, EPA's use of these materials demonstrates a callous disregard for the mandate EPA must meet in revising Subpart W. The Zimmerle report addresses emissions from gathering compressor stations; the Pacsi report addresses emissions from oil and natural gas production equipment leaks. Each of these studies conclude that the current emissions factor calculation process under Subpart W overstates emissions that they studied. The Zimmerle report states:

> Combining study emission data with 2017 GHGRP activity data, the study indicated statistically lower national emissions of … 66% … of current GHGI estimates, despite estimating 17% … more stations than the 2017 GHGI ….

The Pacsi report states:

> The most common EPA estimation method for greenhouse gas emission reporting for equipment leaks, which is based on major site equipment counts and population-average component emission factors, would have overestimated equipment leak emissions by 22% to 36% for the sites surveyed in this study as compared to direct measurements of leaking components because of a lower frequency of leaking components in this work than during the field surveys conducted more than 20 years ago to develop the current EPA factors.

To show the EPA lack of regard for its mandate, EPA ignores these conclusions and cherry picks elements of the reports to increase the component emissions factors in Subpart W. The Rutherford study takes a different approach. It makes the assumption that component based emissions estimates understate actual emissions because it believes that ambient monitoring presents more accurate results. Consequently, it surveys a variety of component based emissions studies to create emissions factors higher than those in the current Subpart W and adopts them as more accurate.

Critically, EPA embraces all these various changes that increase the Subpart W emissions factors, but it never attempts to independently validate them. The effect of this action is increases in virtually every component emissions factor, some of which would yield emissions estimates 5 times or more than the current Subpart W calculations. Not only is this approach a clear dereliction of EPA's responsibilities, but it also has the effect (along with changing the GWP for methane) of de facto lowering the 25,000 mt/year threshold and raising the emissions subject to methane tax. Enverus Intelligence Research, a subsidiary of the energy-focused Software as a Service firm Enverus, has found the proposed regulations would more than double 2021 reported methane and increase overall carbon dioxide-equivalent emissions by 41%. If EPA is intentionally revising the Congressionally enacted methane tax through its rulemaking actions, it should be held to a standard that requires it prove that its revisions are valid.

Intermittent Pneumatic Controllers

EPA is proposing a series of different emissions calculations for intermittent pneumatic controllers – one of the largest emissions sources at production facilities based on the current EF. While using more accurate analysis is highly desirable, these proposals have not been independently verified by EPA. Additionally, this approach requires much higher data acquisition for each controller which could be burdensome for smaller companies. At the same time EPA eliminates the EF for intermittent pneumatic controller rather than modify what has clearly been a flawed EF.

Each EF carries with it a history of its development and evolution. Intermittent pneumatic controllers used in oil and natural gas production have been an example of the challenge of developing accurate information. Intermittent pneumatic controllers operate only when they activate. Correspondingly, they emit when they activate unless they are failing for some reason. Intermittent pneumatic controllers are one of the most pervasive pieces of equipment at oil and natural gas production facilities. Consequently, they are one of the largest emissions sources for these operations. At issue is the validity of the EF and the proposed revisions for this equipment.

To illustrate the issue, EPA need look no farther than its own proposed GHGRP revisions for calculating emissions associated with intermittent-bleed pneumatic devices, both those from the 2022 proposed rule (Docket ID No. EPA-HQ-OAR-2019-0424) and those from the 2023 proposed rule that is the focus of these comments (Docket ID No. EPA–HQ–OAR–2023–0234; FRL–10246–01–OAR). The first obvious observation is that the EPA cannot itself decide how to accurately calculate emissions from pneumatic devices, as evidenced by the widely varying proposed revisions.

The current GHGRP - Subpart W rules require reporters to calculate emissions from intermittent-bleed pneumatic devices by:

Utilizing Equation “W-1”, where

- EF_t = 13.5 scf/hr/component for intermittent-bleed pneumatic device vents (from Table W-1A), and
- T_t = Average estimated number of hours in the operating year the devices, of each type “t”, were operational using engineering estimates based on best available data. Default is 8,760 hours. (every hour of every day in a year)

In the 2022 Proposed GHGRP – Subpart W revisions for calculating emissions from intermittent-bleed pneumatic devices, the EPA proposal allowed one of two calculation methods:

- Utilize Equation “W-1A”, where
- EFt = 8.8 scf/hr/component for intermittent-bleed pneumatic device vents (from Table W-1A), and
- Tt = Average estimated number of hours in the operating year the devices, of each type “t”, were in service (i.e., supplied with natural gas) using engineering estimates based on best available data. Default is 8,760 hours (every hour of every day in a year). **This represents a nearly 35% reduction compared to the current emissions factor**,

OR

- Utilize Equation "W-1B", which contemplates an entirely new proposed alternative calculation methodology allowing reporters that perform approved leak surveys (i.e. LDAR surveys with OGI cameras) to identify properly operating v. malfunctioning intermittent-bleed pneumatic devices, and
- Proposes an EF of 24.1 scf/hr/component for malfunctioning/leaking devices and specifies the method for determining the amount of time a device was assumed to be leaking, and
- Proposes an EF of 0.30 scf/hr/component for properly operating devices and specifies the method for determining the amount of time a device was assumed to be leaking. **This represents a nearly 98% reduction from the current required EF for intermittent-bleed pneumatic devices.**

And, now in its latest proposed GHGRP – Subpart W revisions for calculating emissions from intermittent-bleed pneumatic devices, the EPA proposal allows one of three calculation methods. Proposed "Calculation Method 3" is most analogous to the alternative method from the 2022 Proposed Rule and allows for the following:

- Utilize Equation "W-1C", which, similar to the method described above, allows reporters that perform approved leak surveys (i.e., LDAR surveys with OGI cameras) to identify properly operating v. malfunctioning intermittent-bleed pneumatic devices, and
- Proposes an EF of 16.1 scf/hr/component for malfunctioning/leaking devices and specifies the method for determining the amount of time a device was assumed to be leaking, and
- Proposes an EF of 2.82 scf/hr/component for properly operating devices and specifies the method for determining the amount of time a device was assumed to be leaking. **This represents a nearly 80% reduction from the current required EF for intermittent-bleed pneumatic devices.**

Although many Subpart W reporters currently perform OOOOa compliant LDAR surveys utilizing OGI cameras, in-line with the proposed GHGRP revisions, and are able to identify properly operating devices versus malfunctioning devices, the current rules do not allow the data to be used. And, as such, significantly overstates GHG emissions from intermittent-bleed pneumatic devices.

To demonstrate how GHG emissions from intermittent-bleed pneumatic devices are significantly overstated by the current GHGRP Subpart W rules versus EPA's proposed revisions from both 2022 and 2023, see the hypothetical scenario below:

Comparison of Methane Emissions Associated with Intermittent-Bleed Pneumatic Devices as Determined by Current GHGRP "Eq. W-1" v. 2022 Proposed GHGRP "Eq. W-1A" AND "Eq. W-1B" v. 2023 Proposed GHGRP "Eq. W-1C" (aka "Calculation Method 3")

Assumptions:
- One Subpart W Reporter
- 100 Intermittent-bleed Pneumatic Devices @ 20 Locations
- Performs compliant OGI leak surveys at all 20 locations one-time per annum
- Identifies 10 malfunctioning (i.e. leaking) Devices (10% leak rate)
- Remaining 90 Devices, verified to be operating normally
- Uses default of 8760 hours for device "operating" (current rule) and "In-service" (proposed rule) times
- Produces dry gas with a 98% CH4 Fraction

Current – "Eq. W-1"	$E_{s,i} = \sum_{t=1}^{3} Count_t * EF_t * GHG_i * T_t$ (Eq. W-1) **100 devices x 13.5 scf/hr/device x 0.98 CH4 % x 8760 hours = 11,589,480 scf CH4 emissions**
2022 Proposed – "Eq. W-1A"	$E_{s,i} = \sum_{t=1}^{3} Count_t * EF_t * GHG_i * T_t$ (Eq. W-1A) **100 devices x 8.8 scf/hr/device x 0.98 CH4 % x 8760 hours = 7,554,624 scf CH4 emissions**
2022 Proposed – "Eq. W-1B"	$E_i = GHG_i * \left[\left(24.1 * \sum_{z=1}^{x} T_z\right) + \left(0.3 * Count * T_{avg}\right)\right]$ (Eq. W-1B) **0.98 CH4 % x [(24.1 scf/hr/device x 10 leaking devices x 8760 hours) + (0.3 scf/hr/device x 90 non-leaking devices x 8760 hours)] = 2,300,726 scf CH4 emissions**
2023 Proposed – "Eq. W-1C"	$E_i = GHG_i \times \left[\sum_{z=1}^{x}\{16.1 \times T_{mal,z} + 2.82 \times (T_{t,z} - T_{mal,z})\} + (2.82 \times Count \times T_{avg})\right]$ (Eq. W-1C) **0.98 CH4 % x [10 leaking devices ((16.1 scf/hr/device x 8760 hours) + (2.82 scf/hr/device (8760 hours – 8760 hours)) + (2.82 scf/hr/device x 90 non-leaking devices x 8760 hours)] = 3,560,975 scf CH4 emissions**

Summary – In the scenario above, current GHGRP requirements ("Eq. W-1") overstate methane emissions associated with intermittent-bleed pneumatic devices by approx. 35% compared to 2022 proposed GHGRP alternative 1 ("Eq. W-1A"), by approx. 80% compared to 2022 proposed GHGRP alternative 2 ("Eq. W-1B") and by approx. 69% compared to 2023 proposed GHGRP Calculation Method 3 ("Eq. W-1C").

This example demonstrates that the agency is well aware that current GHGRP rules and associated mandated calculation methodologies significantly overstate emissions for intermittent-bleed pneumatic devices.

IPAA generally supports EPA's proposal to allow multiple calculation methods for determining emissions from natural gas driven intermittent-bleed pneumatic devices. However, there are concerns with each proposed method as described below:

Calculation Method 1 – Direct measurement with flow monitoring device

This calculation method as an alternative for reporters that have or can cost-effectively install flow monitoring devices to directly measure fuel gas supplied to intermittent-bleed pneumatic devices. For many, if not most, reporters that do not already have flow monitoring devices installed, it will be cost prohibitive to install these devices and currently this is the only proposed method that fully allows the use of "empirical data" as mandated by the IRA. Consequently, EPA should amend calculation Methods 2 & 3 as described below.

> Calculation Method 2 – Direct measurement of device vent rates and use of "In-service" times

This proposed calculation method allows reporters to use empirical data in the form of direct measurement to determine vent rates from intermittent-bleed pneumatic devices. Unfortunately, this method, as proposed, is only a half-solution, in-terms of allowing empirical data, because it still requires reporters to use the non-empirical factor of "in-service (i.e., supplied with natural gas)" hours to calculate emissions.

Under proposed Calculation Method 2, reporters are required to determine emissions using the actual "number of hours the pneumatic device was in-service (i.e., supplied with natural gas) in the calendar year" for devices where vent rates were measured AND to use proposed "Eq. W-1B" for devices that did not have vent rates directly measured during the calendar year. Variable "T_t" in proposed Eq. W-1B, requires reporters to determine the "Average estimated number of hours in the operating year the devices of each type "t", were in-service (i.e., supplied with natural gas) using engineering estimates based on best available data. Default is 8,760 hours." In both instances the requirement to determine emissions based on the concept of "in-service" hours completely contradicts the IRA mandate to allow the use of "empirical data."

Interestingly, EPA proposes that, absent any measured volume during a 5-minute or 15-minute sampling period, as applicable, reporters can use "company records or engineering estimates" to estimate per actuation emissions and actuation cycle counts to estimate emissions. See the proposed rule excerpt below:

> For intermittent bleed devices, the lack of any emissions during a 5-minute or 15-minute period, as applicable, would indicate that the device did not actuate and that the device is seating correctly when not actuating. As such, we are proposing that engineering calculations would be made to estimate emissions per activation and that company records or engineering estimates would be used to assess the number of actuations per year to calculate the emissions from that device for the reporting year." (FR p. 50311)

This approach represents "empirical data" consistent with the IRA mandate and would yield more accurate emissions estimates for intermittent-bleed pneumatic devices. As such, EPA should amend the Calculation Methods 2 & 3 to allow the use of this approach more broadly, in lieu of the "In-service" hours concept and not only when there is a lack of emissions measured during a sampling period, but in all cases.

Under proposed Calculation Method 2, EPA proposes to require the vent rate for every pneumatic device to be directly measured every 5 years. This measurement frequency is overly burdensome and unnecessary to determine a statistically representative average vent rate for devices of the same type (i.e., intermittent bleed). EPA should amend the proposed rule to only require 10% of devices to be surveyed each year.

Further, under proposed Calculation Method 2, EPA proposes to require a 15-minute vent rate sampling period for each pneumatic device, except isolation valve actuators, which would only be required to be sampled for a minimum of 5 minutes. See excerpt below:

> We are proposing a reduced monitoring duration for isolation valve actuators specifically because these devices actuate very infrequently, and the monitoring is targeted to confirm the valve actuators are not malfunctioning (i.e., emitting when not actuating) rather than to develop an average emission rate considering some limited number of actuations." (FR p. 50311)

A reduced monitoring frequency of only 5 minutes is adequate to confirm a pneumatic device is not malfunctioning. It is not only true for isolation valve actuators, but for all intermittent bleed pneumatic devices. Accordingly, EPA should amend the proposed rule to only require a 5-minute sampling period for all devices. The currently proposed 15-minute sampling period is overly burdensome and unnecessary to accurately estimate emissions.

Calculation Method 3 – Intermittent-bleed Pneumatic Device Surveys

As EPA acknowledges in its proposed revisions to the GHGRP rule, it is possible to identify and distinguish malfunctioning or "leaking" intermittent-bleed pneumatic devices from properly operating intermittent-bleed pneumatic devices via leak surveys (see below).

> As part of our review to characterize pneumatic device emissions, we found a significant difference in the emissions from intermittent bleed pneumatic devices that appeared to be functioning as intended (short, small releases during device actuation) and those that appeared to be malfunctioning (continuously emitting or exhibiting large or prolonged releases upon actuation). For natural gas intermittent bleed pneumatic devices, it is possible to identify malfunctioning devices through routine monitoring using optical gas imaging (OGI) or other technologies.
> (FR 50312)

This alternative method for calculating emissions from intermittent bleed pneumatic devices should be included for reporters that are unable to justify the costs associated with proposed calculation Methods 1 & 2, even though it does not allow the use of empirical data.

However, proposed calculation Method 3, in its current form, like the current Subpart W rules, will still likely overstate emissions from intermittent bleed pneumatic devices significantly, because it continues to rely upon the use of one-size fits all leaker emissions factors and a determination of "in-service" hours based on a default of 8760 hours (every hour of every day in a reporting year). This approach, even though properly operating devices are confirmed via approved leak surveys, requires reporters to assume properly operating intermittent bleed pneumatic devices are leaking continuously or nearly continuously.

Properly operating intermittent bleed pneumatic devices, as acknowledged by the agency, do not vent continuously. By design and definition, intermittent-bleed pneumatic devices only vent ("process emissions") when they actuate. Therefore, EPA should amend Calculation Methods 3 to allow reporters to use "company records or engineering estimates" to determine actuation cycle counts, when the data is available, in lieu of the "In-service" hours concept. This approach would allow the use of "empirical data" and yield more accurate emissions estimates.

The currently proposed EFs for Calculation Method 3 vary significantly from the 2022 proposed rule, see table below, without sufficient basis. From available information, it appears that EPA used the Zimmerle study to develop its 2023 proposal. However, these values are based on controllers under very different operating conditions than those in the oil and natural gas production component of the industry. Experts who have evaluated the 2023 proposal conclude that the 2022 factors are more appropriate. EPA should amend the proposed leaker factors to align with the 2022 proposed rule, which was consistent with the "API Field Measurement Study: Pneumatic Controllers" (Tupper 2019)

	Whole Gas EF – Properly Operating Intermittent Bleed Pneumatic Device	Whole Gas EF – Malfunctioning Intermittent Bleed Pneumatic Device
2022 Proposed Rule	0.03 scf/hr/device	24.1 scf/hr/device
2023 Proposed Rule	2.82 scf/hr/device	16.1 scf/hr/device

Retain a Calculation Method Similar to the Current Subpart W Regulations

EPA should allow a fourth calculation method similar to the method in the current Subpart W rules and that which was included in the 2022 proposed rule, that allows small operators to use a single whole gas emissions factor-based approach for calculating emissions from intermittent-bleed pneumatic devices. EPA suggests that such an alternative is unnecessary because of the Subpart OOOOb and OOOOc proposals. However, neither of those are finalized and alternative approaches to managing emissions have been proposed. In particular, the Subpart OOOOc Emissions Guidelines are not binding on states and state regulations may continue to allow natural gas driven pneumatic controllers.

The current EF for intermittent pneumatic controllers is 13.5 scf/hour/component. This EF was developed in the mid-1990s based on data collected from 19 controllers. It is hardly an example of robust data acquisition. Since then, the validity of this EF has been consistently questioned. It has become a higher profile issue as various environmental lobbying groups have produced reports based on the GHGI that is largely developed using the GHGRP.

Over the years other studies have been done to address this EF. However, the quality of EPA's 2022 analysis of this EF that has been such a target is wanting. In general, EPA discusses six studies that have been done with information on intermittent pneumatic controllers for production operations (GRI/EPA 1996, Allen, Thoma, Prasino, OIPA and API 2019). Additionally, EPA assessed a Department of Energy study on Gathering and Boosting operations (DOE G&B). In each case EPA discusses the limitations of the studies – short sampling times with assumptions about the activation period for intermittent controllers, emissions that are calculated rather than measured, and classification issues. Then, EPA eliminates two studies (Thoma, OIPA) apparently because of their use calculated emissions (which were far lower than some of the other studies). Subsequently, it produced the following summary table:

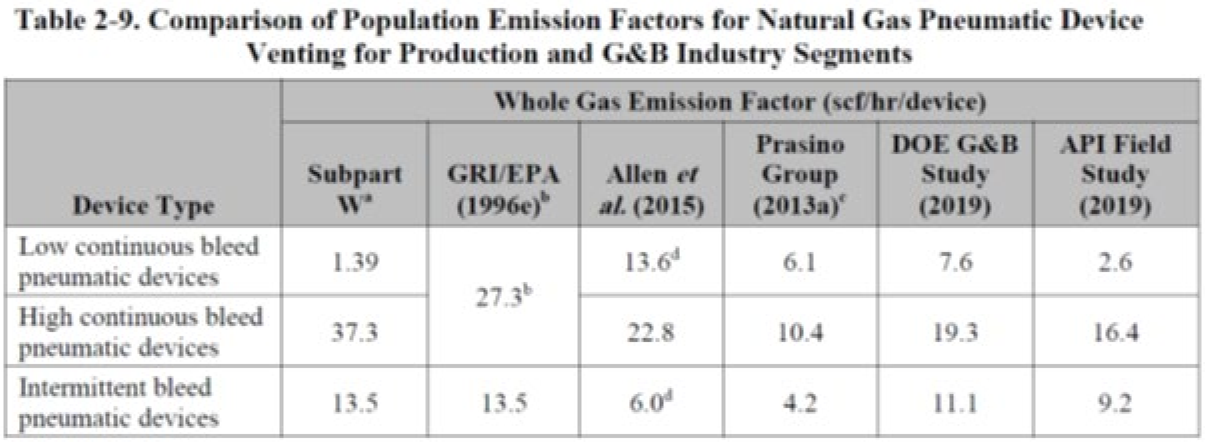

Table 2-9. Comparison of Population Emission Factors for Natural Gas Pneumatic Device Venting for Production and G&B Industry Segments

Device Type	Subpart W[a]	GRI/EPA (1996e)[b]	Allen *et al.* (2015)	Prasino Group (2013a)[c]	DOE G&B Study (2019)	API Field Study (2019)
	Whole Gas Emission Factor (scf/hr/device)					
Low continuous bleed pneumatic devices	1.39	27.3[b]	13.6[d]	6.1	7.6	2.6
High continuous bleed pneumatic devices	37.3		22.8	10.4	19.3	16.4
Intermittent bleed pneumatic devices	13.5	13.5	6.0[d]	4.2	11.1	9.2

Next, EPA averaged the intermittent factors for these studies to produce a new EF of 8.8 scf/hr. However, this appears to include the EF from the DOE G&B study; if it had not, the EF would appear to be 8.2 scf/hr. If EPA had included the Thoma and OIPA studies instead of the DOE G&B study, the EF would be 6.8 scf/hr. None of these calculations appear to be weighted based on the number of controllers tested. Consequently, for example, the 19 controllers in the GRI/EPA 1996 study are treated equally with the 128 controllers in the Prasino report. If EPA had weighted the data and used the Thoma and the OIPA studies, the EF would be closer to 3.7 scf/hr/device.

EPA should include a fourth calculation option that provides a single EF and that EF should be 3.7 scf/hr/device.

Gathering and Boosting/Centralized Production Facilities

The Gathering and Boosting category in the methane tax has an inordinately low threshold for its tax basis without any apparent justification. EPA needs to explain the source of the excess emissions fee threshold for gathering and boosting facilities and why it is appropriate. Clearly though only truly separate gathering and boosting operations should be included in it. The current Subpart W proposal creates a critical issue in this regard. The types of equipment used for gathering and boosting of natural gas can be used independently to move natural gas from production facilities to natural gas processing facilities, but it can also be used at oil and natural gas production operations as an integral part of those operations. The proposed Subpart W creates a designation of upstream operators' centralized tank batteries. "Centralized oil production sites" are defined as sites collecting oil from multiple well pads without compressors "that are part of the onshore petroleum and natural gas gathering and boosting facility that gathers hydrocarbon liquids from multiple well pads". In the proposed rule, EPA has classified centralized oil production sites under the Gathering and Boosting segment. Subpart W needs to be clarified to assure that those centralized oil production operations are included within the reporting for the production facility.

Centralized Oil Production Facility Issues

EPA has recognized centralized production sites as a facility type in the proposed rule and required its emissions to be reported at the site-level, rather than per well ID, which streamlines the reporting for tank batteries. However, there are challenges with including "centralized oil production sites" in the Gathering and Boosting segment.

First, EPA included "production" clearly in the name and it is nonsensical that centralized production sites would be considered part of the Gathering and Boosting segment.

Second, these sites are considered by many operators as part of the upstream production process as these tank batteries are likened to "production supportive facilities." Facility design efficiency gains over the years have led to centralization of production surface equipment. The centralization of surface equipment generally results in emissions reductions relative to dispersed facilities (separation and tanks installed at each well pad) because the total equipment counts are significantly reduced (fewer emission points), there is a reduction of tank batteries/spill risk, increased operational efficiencies, and better ability to site major facilities away from sensitive areas/populations. This segment classification is contradictory to previous interpretations and may have unintended consequences such as companies electing not to centralize such operations (even though consolidation serves to minimize environmental footprint) due to the more burdensome methane fee implications. Facilities comprised of centralized surface equipment are owned and operated by producers, supportive of production, and may or may not include a well head or pump jack collocated on a single pad.

However, because EPA re-defined the production segment in 2016 as "associated with a single well pad", this has created reporting confusion and centralized tank batteries have been categorized differently both by individual owners/operators, as well as other federal rules (NSPS OOOOb). For example, under the proposed OOOOb regulations, the "centralized oil production facilities" (referred to in NSPS OOOOb as "centralized production facility") are grouped under the production segment by definition rather than as Gathering and Boosting as explained below.

Currently Subpart W calls and defines the subject facility as:

> "**Centralized oil production site** means any permanent combination of one or more hydrocarbon liquids storage tanks located on one or more contiguous or adjacent properties that does not also contain a permanent combination of one or more compressors that are part of the onshore petroleum and natural gas gathering and boosting facility that gathers hydrocarbon liquids from multiple well-pads. A centralized oil production site is a type of gathering and boosting site for purposes of reporting under §98.236."

Meanwhile NSPS OOOOb/OOOOc calls and defines it as:

> "**Centralized production facility** means one or more storage vessels and all equipment at a single surface site used to gather, for the purpose of sale or processing to sell, crude oil, condensate, produced water, or intermediate hydrocarbon liquid from one or more offsite natural gas or oil production wells. This equipment includes, but is not limited to, equipment used for storage, separation, treating, dehydration, artificial lift, combustion, compression, pumping, metering, monitoring, and flowline. Process vessels and process tanks are not considered storage vessels or storage tanks. A centralized production facility is located upstream of the natural gas processing plant or the crude oil pipeline breakout station and is a part of producing operations."

In addition, in the Pipeline and Hazardous Material Safety Administration's ('PHMSA") proposed Gas Pipeline Leak Detection and Repair rule, PHMSA does not define or regulate *any* production facilities as "gathering and boosting". Specifically, as defined in API's

Recommended Practice-80 and incorporated in 49 CFR 192: “The production function, in most cases, extends well downstream of the wellhead and may include several processes required to prepare the gas for transportation. In this context:

> ‘Production Operation’ means piping and equipment used for production and preparation for transportation or delivery of hydrocarbon gas and/or liquids and includes the following processes: (a) extraction and recovery, lifting, stabilization, treatment, separation, production processing, storage, and measurement of hydrocarbon gas and/or liquids; and (b) associated production compression, gas lift, gas injection, or fuel gas supply.”

Both the NSPS OOOOb/OOOOc and PHMSA’s name and definition of what are essentially tank batteries are much more consistent with how these facilities operate and are managed in the field. In an effort to mitigate confusion and create more rule alignment, EPA should align the name and definition of the subject facility type between Subpart W and NSPS OOOOb/OOOOc.

In this proposal, EPA claims to be striving for consistency when EPA states, on page 50288 of the proposal, “as in the 2016 rule, the proposed amendments would also allow facilities to use a consistent method to demonstrate compliance with multiple EPA programs.” Also, even though EPA uses the word “gather” in the definition in OOOOb/OOOOc, these sites are still properly defined as “part of the producing operations.”

Further, the fact that EPA has proposed the definition of “centralized production sites” as sites that do <u>not</u> include compressors that are part of the Gathering and Boosting segment is puzzling. If these sites are part of the Gathering and Boosting segment as EPA has proposed, why would these sites not be allowed to have compressors that are part of the Gathering and Boosting segment on them? This demonstrates that EPA <u>*does*</u> understand the distinction between gathering and boosting compressors that should appropriately be included in the Gathering and Boosting segment and centralized tank batteries that clearly should not.

As such, EPA should change both the name and definition of “centralized oil production site” in the Subpart W rule to match NSPS OOOOb/OOOOc, to align with other federal programs for consistency, and to reflect how the industry owns and operates these facilities. EPA should delete “associated with a single well pad” from the Onshore Petroleum and Natural Gas Production definition in Subpart W in order to clear up the confusion and properly have centralized production sites in the production segment where they belong.

Further, and most importantly, EPA’s proposed definitions are contrary to the MERP waste emissions thresholds, where gathering and boosting sites are considered “non-production”. In this language on the Waste Emission Threshold, Congress created two categories for applicability of the threshold: “Production” and “Non-Production”. The Gathering and Boosting segment (segment #8) is listed under “Non-Production”. Clearly, Congress did not intend for sites associated with production, such as “centralized **production** sites” to be considered gathering and boosting. EPA may have been able to impose reporting obligations for emissions from centralized tank batteries under the Gathering and Boosting segment in the past but for application of the tax, these sites should be considered production. Doing otherwise would result in an inequitable application of the tax that would most likely not be applied uniformly by all upstream operators. If EPA does not wish to clear up the confusion and include centralized production sites in the Production segment, EPA should carve out these sites for threshold determination and make these sites subject to the 0.2% threshold as Congress has clearly mandated in the law.

In addition, the categorization of a centralized production site into Gathering and Boosting could result in a backslide from the progress industry has made in minimizing its overall footprint and emission sources. Due to the higher methane taxes that may accompany categorizing production sites as Gathering and Boosting (subjecting these facilities to the 0.05% threshold instead of the 0.2% threshold) operators may be economically incentivized to migrate back to individual well pad installations, dramatically increasing the amount of equipment in the field and increasing GHG emissions.

Gathering and Boosting Emissions Factor Issues

A consistent criticism of the current emissions estimation process for gathering and boosting operations relates to its use of emissions factors based on the mileage of pipelines. These factors cannot be altered based on any operational actions other than changing the nature of the pipeline material or structure. These factors from 1996 are unchanged in this proposal despite studies showing that pipeline emissions are overestimated. The consequence of this failure will be to impose the harshest excess emissions tax on this essential component of the natural gas value chain without providing any plausible recourse to alter the emissions calculations. This inaction by EPA flies in the face of its mandate to make the Subpart W emissions estimate more accurate, more reflective of actual operations.

Pipelines are inspected routinely, leaks are fixed, and emissions are eliminated. Only actual emissions should be reported under Subpart W and used for any excess emissions tax calculation; not simply based upon miles of pipeline for which the vast majority are not leaking. There should be an option to demonstrate that emissions are being managed, to show that there are no leaks, or, where leaks are identified, the emissions be based on the leaks found

Pipeline leaks are easily detected through regular inspection using airborne overflights, easement riding and operator inspections. Arguably, these have lower detection limits based on the type of technology used. Larger leaks can easily and quickly be determined by sudden drops in production. The pipeline can be isolated, and the volume of gas lost can easily be determined with great accuracy. Following are some options to determine pipeline factors and credit for inspection:

> Pipeline flyovers have a lower detection limit but do detect methane. If no leaks are found, then no emissions factor should be used for that segment and there should be no excess emissions tax or emissions calculated.
>
> Similarly, when laser-based and acoustic based technology is employed while riding the pipeline easement, leaks are detected. If no leak is detected, then no excess emissions tax or emission factor should be used. If a leak is found, then the actual leak can be measured or an emission factor should be developed. This is currently allowed in the detection of fugitives and a comparable approach for pipelines can be developed.

Use of Advanced Monitoring and Measurement Technologies

For many source categories under Subpart W, EPA has included several options for operators to be able to provide empirical data, such as measurement with metering or using updated emissions factors based on recent field measurement studies. However, under this proposed rule, EPA has not included a pathway for using the results of advanced methane detection and measurement surveys as a source of empirical data for key source categories, like tanks, flares, and compressors.

Methane detection and measurement technologies have advanced in the last few years due to early-phase research efforts, including from the Department of Energy, to develop technologies that have now become commercially available. Some operators have included these technologies in their voluntary methane management programs. Including a pathway for utilization of these technologies for emissions reporting would improve the quality of data submitted under Subpart W while supporting a growing methane detection and measurement industry. A final rule for changes to Subpart W should include a pathway for utilizing survey results from technologies, particularly those approved for use under NSPS OOOOb and OOOOc, for emissions reporting.

Large emissions events

The comments filed by API extensively address the complexity and flaws in the EPA Subpart W proposal on large emissions events. IPAA commends these comments, which it joined in submitting, as a detailed assessment of the issues that need to be resolved.

Flares

The comments filed by API extensively address the complexity and flaws in the EPA Subpart W proposal on emissions issues related to oil and natural gas production flaring. IPAA commends these comments, which it joined in submitting, as a detailed assessment of the issues that need to be resolved.

Environmentalists' Recommendations Inappropriate and Unworkable

As a component of its efforts to suppress American oil and natural gas production, professional environmental lobbying organizations have orchestrated initiatives to press for additions to the Subpart W reporting regulations that are either inappropriate or unworkable. This effort was evident during the August 2023 EPA public hearing on its current Subpart W proposal where about 40 testifiers used exactly the same terms to demand changes to the Subpart W proposal. These demands reflect comments made by the Environmental Defense Fund in several forums regarding Subpart W and the methane tax.

Following is a list of the key demands:

- Integrating top-down, basin-level data alongside site- and equipment-level measurement data. Top-down, basin-level data provides a full picture of total emissions in a region, while site-level, population-based measurement data can provide insights of emissions at a finer resolution, all of which strengthen the accuracy of reported emissions.
- Building in appropriate statistical analysis of measurement data to provide a representative assessment of pollution at the facility and basin levels. Measurement data requires statistical analysis to account for intermittent emission events that may be missed by individual, one-time measurements.
- Defining guardrails and requiring independent verification for self-reported measurements from companies to ensure any company reported data accurately represents operations and is not limited to unrepresentative sites or equipment known to have lower emissions.

One of the key issues here is the relationship between these recommendations and Subpart W. Everyone would like to have the relationship between top-down basin-level data and site- and equipment-level measurement data better understood to resolve the recurring contentious debates regarding these issues. However, such an analysis is well outside the scope of facility reporting under Subpart W. Subpart W is predicated on individual companies reporting emissions estimates based on artificially contrived facilities, e.g., all their operations in an APGA basin. Even if EPA alters the reporting structure to require reporting by well pad, the reporting remains a company-based report. Conversely, basin level data is just that – basin level. It contains information that reflects emissions from numerous well pads, owned and operated by different companies. Moreover, Subpart W information reports annual emissions; top-down basin-level data is temporal in nature perhaps hours, perhaps days, perhaps minutes. No analysis that compares the top-down data and equipment-level measurement data can realistically use Subpart W reporting. These analyses must have a coordinated effort to assess data from both components simultaneously.

Similarly, while statistical analysis can be valuable, it is not in the purview of Subpart W reporting. If EPA wants to conduct appropriate statistical analysis, it must design a more rigorous direct sampling or estimating strategy. Such an effort could be valuable if developed by and validated by EPA. To date, the analyses that have been generated have been thinly veiled advocacy efforts designed to press for regulations so quickly that EPA has never developed a full and accurate understand of the emissions profiles of oil and natural gas production operations.

The final recommendation reflects the environmental lobbying position that only it can be trusted; everyone else must be put to a higher level of scrutiny. The American oil and natural gas production industry is committed to managing its emissions, including methane emissions. It has invested millions of dollars in meeting its requirements and will continue to make necessary investments. While differences may exist regarding the best, most cost-effective actions that should be taken, producers will continue their commitment to protect the environment. Certainly, the idea of having independent verification of self-reported emissions data is appealing. Presently, many of the Subpart W reports are prepared by independent consultants because of the complexity of the current requirements, particularly for smaller producers. The larger issue may well be whether the restructuring of Subpart W reporting in the context of the methane tax will adversely affect access to independent consultants. This issue has arisen in previous EPA NSPS regulations where EPA required professional engineers (PE) to certify information. Two issues arose. First, there were not enough PEs with expertise to undertake the tasks. Second, the license risks for the PE in undertaking the task were too great to bring more into the arena. A similar dynamic may occur in the methane tax context. Because OECA can challenge any reported information and because OECA has a history of using its enforcement power in this industry to target smaller producers, independent contractors may conclude that the risks to their businesses to too high to participate given the magnitude of penalties under the CAA.

Taken as a whole, these environmental lobbying organizations' recommendations are either inappropriate in the context of Subpart W or unworkable or both.

Conclusion

The task mandated to EPA by Congress requires the agency to comprehensively review, revise and validate its Subpart W regulations to make them accurate and reliable because of the role their implementation will play in the MERP, defining exposure and calculating its methane tax. Congress' deadline of EPA's action failed to reflect the reality of the task. EPA, faced with the choice of meeting a deadline or meeting its mandate to comprehensively revise Subpart W, chose the deadline and produced a wholly inadequate compendium of emissions calculations. At its best, the Subpart W proposal collects revisions to the current calculation process that EPA failed to validate as either accurate or appropriate. At its worst, the Subpart W proposal is a thinly disguised effort to raise the MERP methane tax rates through careful selection of higher emissions factors and unworkable calculation procedures. EPA should withdraw the current Subpart W proposal and execute its mandate to make it accurate, including taking the necessary steps to validate the emissions factors or emissions calculation procedures that it ultimately puts in place.

If there are questions or if EPA needs additional information on these comments, please contact Dan Naatz at 202-857-4722 or dnaatz@ipaa.org.

and Executive Vice President

APPENDIX B

Memorandum to Bruce Moore: Composition of Natural Gas for use in the Oil and Natural Gas Sector Rulemaking

June 2011

E ^{C}/R Incorporated *Providing Environmental Technical Support Since 1989*

MEMORANDUM

DATE: July 28, 2011

SUBJECT: Composition of Natural Gas for use in the Oil and Natural Gas Sector Rulemaking

FROM: Heather P. Brown, P.E.

TO: Bruce Moore, EPA/OAQPS/SPPD

The purpose of this memorandum is to document the development of a representative natural gas composition for use in the oil and natural gas sector rulemaking. This composition will be used to determine hazardous air pollutant (HAP) and volatile organic compound (VOC) emissions from several segments of the oil and natural gas sector.

Gas composition data was compiled from several sources across the industry. The following is a list of the sources of data used for this analysis:

- CENRAP database. "Recommendations for Improvements to the CENRAP States' Oil and Gas Emissions Inventory", November 13, 2008. Covers the following States: Texas, Louisiana, Arkansas, Oklahoma, Kansas, Nebraska, Missouri, Iowa, and Minnesota
- GTI Database. "GTI's Gas Resource Database, Second Edition – August 2001"
- TX Barnett Shale. "Emissions from Natural Gas Production in the Barnett Shale Area and Opportunities for Cost-Effective Improvements", January 26, 2009
- INGAA/API Compendium. "Greenhouse Gas Emission Estimation Guidelines for Natural Gas Transmission and Storage Volume 1 – GHG Emission Estimation Methodologies and Procedures" September 28, 2005
- GOADS Offshore. "Year 2005 Gulfwide Emission Inventory Study" December 2007
- NREL LCA. "Life Cycle Assessment of a Natural Gas Combined-Cycle Power Generation System" September 2000
- Union Gas. Chemical Composition of Natural Gas found online at http://www.uniongas.com/aboutus/aboutng/composition.asp
- Marcellus. "Supplemental Generic Environmental Impact Statement On The Oil, Gas and Solution Mining Regulatory Program - Well Permit Issuance for Horizontal Drilling And High-Volume Hydraulic Fracturing to Develop the Marcellus Shale and Other Low-Permeability Gas Reservoirs" September 2009
- Wyoming DEQ. Speciation of Natural Gas and Condensate. Courtesy of Cynthia Madison, Wyoming DEQ

Tables 1 and 2 present a summary of the methane, VOC, and HAP contents provided in the above data sources for the production and transmission sectors, respectively, along with an identification of the basins/areas of the country covered by the gas composition.

In addition to the above, gas composition data were collected from the industry in 1995 during the development of the original maximum achievable control technology (MACT) standards for this sector. These data are presented in Tables 3 and 4 for production and transmission, respectively.[1] This 1995 GRI data represents gas samples from across the United States.

Gas Composition for Pneumatics, Equipment Leaks, and Compressors

Tables 1 and 2 also present a comparison of the 1995 GRI data to the other data sources. For production, the 1995 GRI data is well within the ranges of the other data sources which range from 1.19 to 11.6 percent for VOC by volume. The 1995 GRI data is also within the 95 percent confidence interval of the production data which range from 2.81 to 7.82 percent volume for VOC. Of the data sources that provide data on HAP emissions, the GRI data represent gas compositions across the United States, while the CENRAP, TX Barnett, and Marcellus data are specific to the regions specified in Tables 1 and 2. In addition, it can be expected that the gas composition for pneumatic controllers, equipment leaks, and compressors associated with these emissions units are associated with gas from oil wells and gas wells making the range of VOC composition widely varied. Therefore, it was determined that the 1995 GRI data was appropriate to use to develop a representative gas composition for pneumatic controllers, equipment leaks, and compressors.

For the transmission sector, the average 1995 GRI VOC concentration of 0.89 percent volume was compared to other data sources and was found to be in the range of the VOC composition, which ranged from 0.29 to 6.84 percent VOC by volume. It was determined that the 1995 GRI gas composition would be used to represent the average composition of natural gas in the transmission sector, because the other data sources represented natural gas compositions outside the U.S.[i]

The gas compositions from the 1995 GRI data were then converted to weight percents. First, because the average volume percent was not equal to 100, the volume percents were normalized for each component. Then the weight of each component present in the gas was calculated using the molecular weight (MW) for each component in pounds per pound mole (lb/lbmol) and an assumed gas volume of 385 cubic feet (ft^3), which represents one pound mole of gas. Finally, relative weight percents for each component were calculated. These weight percents are presented in Table 5.

---

[i] It should be noted that the GRI data contains a statement that the BTEX data are "skewed toward high BTEX and VOC content gases…." However, the 1995 GRI data are within the ranges of the other data and very close to the average of other data identified. Therefore, these data were determined to be appropriate to use to develop a representative gas composition for pneumatics, equipment leaks and compressors.

Table 1. Gas Composition (volume %) for Production Sector

Data Source[a]	Source of Natural Gas	Area Covered	Volume %		
			Methane	**VOC**	**HAP**
CENRAP [b]	Conventional Gas Wells	11 Basins: Louisiana Mississippi Salt, Southern Oklahoma, Nemaha Uplift, Arkoma, Cambridge Arch Central Kansas Uplift, Fort Worth, Cherokee Platform, Permian, East TExas, Western Gulf, and Anadarko	87.8	3.50	0.019

a- Isooctane = 2,2,4, Trimethylpentane

b- Average of all gas compositions presented in Tables 1 and 2 for production and transmission, respectively.

Once the weight percents were calculated for each natural gas component, relative ratios were calculated for methane:total organic compounds (TOC), VOC:TOC, HAP:TOC, VOC:Methane, HAP:Methane, BTEX:Methane, HAP:VOC, and BTEX:VOC. These relative ratios are presented in Table 6.

Natural Gas Composition for Completions and Recompletions

The gas composition for completions and recompletions from gas wells were determined by performing a sensitivity analysis on the compositions of the gas well data using a larger sample size which included data from hydraulically fractured wells. The results of this analysis are shown in Table 7. A mean of 3.63 percent VOC with a 95 percent confidence interval that ranges from 3.30 to 3.96 percent VOC by volume was determined. Based on the summary statistics, these data appear to be reasonable for use in developing an average natural gas composition to use for completions and recompletions of gas wells.

Once it was determined that this data was appropriate, the average gas composition was calculated and then normalized so that the total volume percent equaled 100. This average gas composition is presented in Table 8. The gas composition data was then converted to weight percent by normalizing the volume percent for each component, then calculating the weight of each component using the MW for each component in lb/lbmol and a standard gas volume of 385 ft^3. Finally, relative weight percents for each component were calculated. Once the weight percents were calculated for each natural gas component, relative ratios were calculated for methane:total organic compounds (TOC), VOC:TOC, HAP:TOC, VOC:Methane, HAP:Methane, BTEX:Methane, HAP:VOC, and BTEX:VOC. These relative ratios are presented in Table 9.

A similar analysis was performed for completions and recompletions from oil wells. The results of this analysis are presented in Table 10. The average VOC composition was 11.62 percent by volume, with a 95 percent confidence interval that ranges from 6.73 to 16.5 percent VOC by volume. As was done for gas wells, the average composition was normalized. The gas composition used for completions and recompletions for oil wells is presented in Table 8. The gas composition data was converted to weight percent using the same approach detailed for gas wells and are presented in Table 9.

NORTH DAKOTA
OIL AND GAS DIVISION

March 26, 2024

Submitted Electronically via Regulations.gov

Michael S. Regan
Administrator, Environmental Protection Agency
1200 Pennsylvania Ave NW, Suite 1101A
Washington, DC 20460

Re: State of North Dakota Comments on the Proposed Rulemaking Titled "Waste Emissions Charge for Petroleum and Natural Gas Systems" (Docket ID No. EPA-HQ-OAR-2023-0434; FLR-10246.1-01-OAR)

Dear Administrator Regan:

The State of North Dakota, acting by and through its Industrial Commission (NDIC) and Department of Environmental Quality (NDDEQ), respectfully submits the following comments[1] on the U.S. Environmental Protection Agency's (EPA) proposed rulemaking titled "Waste Emissions Charge for Petroleum and Natural Gas Systems," published in the Federal Register on January 26, 2024 (89 Fed. Reg. 5318) (Docket ID No. EPA-HQ-OAR-2023-0434; FLR-10246.1-01-OAR) (hereinafter the "Proposed Rule").

The Proposed Rule is intended to implement Section 136 of the Clean Air Act (CAA), which was enacted as part of the Inflation Reduction Act of 2022 (IRA). Unlike most other sections of the CAA, § 136 does not directly regulate emissions. Instead, CAA § 136 requires EPA to impose a methane emissions fee – or waste emissions charge (WEC) – on certain oil and gas sources and sets out the basic formula for calculating these fees.

However, in the Proposed Rule, EPA interprets CAA § 136 to give it authority to directly regulate methane emissions from oil and gas sources, contrary to Congressional intent and the principle of cooperative federalism that is the basis for the CAA. In addition to this fundamental flaw, the Proposed Rule has several other technical and legal defects, resulting in a proposal that fails to meet the Administrative Procedure Act's (APA) reasonableness requirement. 5 U.S.C. § 706(2)(A). Of particular concern to North Dakota are the destructive impacts that such

---

[1] North Dakota also supports the comments submitted by the State of West Virginia et al. on the Proposed Rule.

unreasonable requirements have on low-producing or marginal wells. North Dakota urges EPA to withdraw the Proposed Rule and work with its state partners to develop a new proposal implementing CAA § 136's methane fee provisions in a way that complies with the IRA, CAA, and APA.

I. North Dakota's Significant Interests in the Proposed Rule.

North Dakota is ranked 3rd in the United States among all states in the production of oil and gas. North Dakota produces over 400,000,000 barrels of oil per year and over 1.1 trillion cubic feet of natural gas per year. Oil and gas production are central to North Dakota's economy and the welfare of its citizens, responsible for 54% of the value of North Dakota's economy, generating approximately 76% of tax revenue, and creating approximately 66,000 good-paying jobs. The Proposed Rule, which would force many marginal wells to be prematurely shut-in or plugged and abandoned, would have harmful impacts to North Dakota's economy by destroying the tax revenue and jobs associated with these wells.

In addition to its economic interests, North Dakota's regulatory interests would be harmed by the Proposed Rule. As a major oil-producing state, North Dakota has taken the lead role in regulating emissions from oil and gas sources for decades. NDDEQ, which is the primary delegated implementation and enforcement authority for the CAA in North Dakota, regulates emissions of methane and other greenhouse gases from oil and gas sources under its Air Pollution Control Rules, N.D. Admin. Code ch. 33.1-15. *See* N.D.C.C. § 23.1-06-04(1) (authorizing NDDEQ to implement federal CAA programs). NDIC also has rules and requirements to reduce emissions from oil and gas sources, including its Gas Capture Policy, which has significantly reduced emissions associated with flaring. Over the last decade, North Dakota's oil and gas industry has worked diligently to attain the Gas Capture Policy's goals even while production has significantly increased.[2]

II. The Proposed Rule is Premature.

As a threshold matter, the Proposed Rule is premature and should be withdrawn. There is significant uncertainty regarding related EPA rules that form the foundation of the Proposed Rule, impacting North Dakota's ability to provide meaningful comment. EPA should wait to propose a rule to implement CAA § 136 until the related rules are final and have gone through judicial review.

First, as required by CAA § 136(h), the Proposed Rule relies on data reported under subpart W, part 98 of title 40, Code of Federal Regulations ("Subpart W"). Under the statute, EPA must adopt revisions to Subpart W to address this reporting by August 16, 2024. EPA has proposed revisions

---

[2] In October 2014, when the Gas Capture Policy first went into effect, gas capture for Bakken facilities was at 78% and gas capture statewide was at 77%. In October 2014, North Dakota produced 44,543,371 mcf of gas. In October 2023, gas capture for Bakken facilities was at 95% and gas capture statewide was at 94%. In October 2023, North Dakota produced 105,437,132 mcf of gas.

to Subpart W, but they have not been finalized. 88 Fed. Reg. 50,282 (Aug. 1, 2023) (to be codified at 40 C.F.R. pt. 98, subpt. W). EPA brushes past the fact that Subpart W is currently being revised by assuming the final revisions will be identical to the August 1, 2023 proposal and citing to Subpart W as if it had already been revised in that way. 89 Fed. Reg. at 5322. This approach prejudices those who submit comments on the Proposed Rule because the Proposed Rule relies exclusively on Subpart W to report the data used to calculate methane fees and commenters lack information regarding whether and how EPA will revise the reporting requirements.

Second, a central feature of the Proposed Rule, the Regulatory Compliance Exemption, is intrinsically intertwined with EPA's recently adopted OOOOb and OOOOc methane emissions requirements. *See* 89 Fed. Reg. 16,820 (March 8, 2024). Although the OOOOb and OOOOc rules are final, they are subject to litigation[3] and their fate is, therefore, uncertain. The scope of these rules may change because of judicial review. As a result, the full impact of OOOOb and OOOOc on the Regulatory Compliance Exemption is currently unknown.

III. The Proposed Rule's Regulatory Compliance Exemption is Unlawful and Unworkable.

CAA § 136(f)(6) contains an "exemption for regulatory compliance," which EPA refers to the in the Proposed Rule as the "Regulatory Compliance Exemption." Under CAA § 136(f)(6), an applicable facility that is subject to methane emissions requirements under CAA § 111(b) and (d) is exempt from methane fees if it is in compliance with those requirements. The exemption only goes into effect after EPA makes two determinations. First, EPA must determine that methane emissions standards and plans under CAA § 111(b) and (d) "have been approved and are in effect in all States with respect to the applicable facilities." CAA § 136(f)(6)(A)(i). Second, EPA must determine that the methane emissions requirements under CAA § 111(b) and (d) "will result in equivalent or greater emissions reductions as would be achieved by [EPA's proposed November 15, 2021, rule] if such rule had been finalized and implemented." CAA § 136(f)(6)(A)(ii).

EPA recently adopted methane emissions requirements for new sources under CAA § 111(b), the OOOOb rules, and existing sources under § 111(d), the OOOOc rules. EPA is proposing that the CAA § 136(f)(6) exemption is not available until the OOOOb and OOOOc rules are both in effect nationwide. 89 Fed. Reg. at 5336. As a result, the Regulatory Compliance Exemption would not be available until every state has an approved CAA § 111(d) plan implementing OOOOc. *Id.* at 5337.

Further, EPA proposes to apply a "no deviations" policy when determining a facility's eligibility for the CAA § 136(f)(6) Regulatory Compliance Exemption. 89 Fed. Reg. at 5344. This means EPA would deny the exemption to any facility – which it interprets as all assets in a basin[4] – that has *any* deviation from OOOOb rules or a state's OOOOc plan. So, an operator would be ineligible for the Regulation Compliance Exemption for all of its assets in a basin if any one of its assets in

---

[3] North Dakota and other parties have filed petitions to review the rule in the D.C. Circuit Court of Appeals. *Oklahoma v. EPA*, No. 24-1059 (D.C. Cir. filed Mar. 12, 2024).

[4] As discussed in Section IV, North Dakota disagrees with the basin-wide approach.

that basin has a single wisp of unauthorized methane or if an operator makes an inconsequential error in reporting or recordkeeping.

The Regulatory Compliance Exemption as set forth in the Proposed Rule is contrary to the CAA and IRA. It exceeds EPA's authority and infringes on the role of states as the primary enforcers of the CAA. And several aspects of it are unreasonable, resulting in an exemption that is meaningless. EPA must, therefore, withdraw the Proposed Rule and work with its state partners to develop a legal and workable solution.

a. CAA § 136(f)(6) does not authorize EPA to directly regulate methane emissions.

The meaning of CAA § 136(f)(6)'s condition that a facility be "in compliance with methane emissions requirements" must be considered in the context of the OOOOb and OOOOc rules and the CAA's cooperative federalism framework. Compliance with OOOOb and OOOOc rules should be determined by the appropriate enforcement authority. Typically, this would be the states through their enforcement programs. Or, if a state has not adopted OOOOb, EPA would determine compliance as the primary enforcement authority. Only if, after the requisite due process, an appropriate enforcement authority determines in an enforcement action that a facility is not in compliance with OOOOb or a state plan implementing OOOOc, should a facility be considered noncompliant and, therefore, ineligible for the exemption.

EPA's "no deviations" policy goes beyond this plain reading of CAA § 136(f)(6). It appears to be an attempt to directly regulate methane emissions. EPA acknowledges that it intends to use the methane charge to achieve emissions reductions by stating "[t]he WEC has important interactions and is designed to work hand-in-hand with the NSPS and EG for the Oil and Natural Gas Sector[5] by accelerating the adoption of cost-effective methane mitigation technologies . . . ." 89 Fed. Reg. at 5360. EPA further claims that "this action will result in cumulative emissions reductions . . . ." *Id.* CAA § 136(f)(6) cannot be interpreted to give EPA this authority, because the IRA, as a reconciliation bill, was only for the purpose of imposing fees and not for direct regulation of emissions. *See* 2 U.S.C. § 644 (provisions in reconciliation bills that are unrelated to budgetary matters may be stricken). Bypassing state enforcement authorities would conflict with the important role of the states under the CAA. *See* 42 U.S.C. § 7401(a)(3) ("air pollution prevention . . . and air pollution control at its source *is the primary responsibility of States and local governments*") (emphasis added); and 42 U.S.C. § 7407(a) ("Each State shall have the primary responsibility for assuring air quality within the entire geographic area comprising such State . . . ."). Courts have rejected similar attempts by agencies to directly regulate emissions from oil and gas sources without statutory authority. *See, e.g., Wyoming v. United States DOI*, No. 2:16-CV-0285-SWS, 2017 U.S. Dist. LEXIS 5736, at *28 (D. Wyo. Jan. 16, 2017).

b. EPA's "no deviations" policy is unreasonable.

Not only is EPA's "no deviations" policy unlawful, but it is also unreasonable. Reading CAA § 136(f)(6)'s "in compliance" condition as applying to any minor deviation would lead to absurd

---

[5] The "NSPS and EG for the Oil and Natural Gas Sector" are the OOOOb and OOOOc rules.

results. Requiring that a noncompliance determination be based on an enforcement authority's finding that a violation occurred using the appropriate process would help put some necessary limits on EPA's ability to exclude facilities from the exemption. Rejecting EPA's basin-wide approach for defining "facility," as discussed in Section IV, would also help avoid absurd results because methane fees would not be applied to all of an operator's assets in an entire basin based on an isolated "deviation" at one well site.

c. The exemption must be applied on a state-by-state basis.

EPA misreads CAA § 136(f)(6) by interpreting it to require that OOOOb and OOOOc state plans both be in effect nationwide for the exemption to be available. EPA's interpretation ignores the phrase "with respect to the applicable facilities." The plain meaning of CAA § 136(f)(6) is that OOOOb and a OOOOc state plan must be in effect in all states in which an applicable facility[6] is located. As soon as OOOOb is in effect, facilities subject to it should be able to claim the exemption. And once a state has an approved 111(d) plan implementing OOOOc, the exemption should be in effect for all facilities in that state that are subject to the plan. This state-by-state interpretation is consistent with CAA § 111(d), which requires state-specific implementation plans.

The Proposed Rule's implementation of EPA's Regulatory Compliance Exemption on a nationwide basis must be rejected because it renders CAA § 136(f)(6) essentially meaningless. It will take years for all states to have approved OOOOc state plans in place.[7] Delays in EPA's review and approval of state plans are often due to resource issues at the federal level or litigation relating to such plans. The Proposed Rule, and the related OOOOb and OOOOc rules, should address these concerns so that states and regulated entities are not punished by being denied the exemption due to delays beyond their control. Although it would not completely solve the problem, EPA would be better able to address such concerns by applying the exemption on a state-by-state basis.

The onshore petroleum and natural gas production data reported under Subpart W is sufficiently detailed to apply the exemption on a state-by-state basis. Owners and operators initially group data at the basin level, as defined by the American Association of Petroleum Geologists (AAPG) Geologic Note: AAPG–CSD Geologic Provinces Code Map. *See* 40 C.F.R. § 98.238 (definition of basin). But the Subpart W reports are further differentiated by the county and state where the sub-basin is located, as well as by formation type (oil, high permeability gas, shale gas, coal seam, or other tight reservoir rock). 40 C.F.R. § 98.236(aa)(1)(ii)(A-C) (onshore petroleum and natural gas production). For example, while the Williston Basin, AAPG-CSD code 395, covers all of North Dakota and parts of Montana and South Dakota, the Subpart W reporting form collects additional county-specific data.

Furthermore, applying the exemption on a state-by-state basis is consistent with the Congressional intent to encourage early compliance with methane emissions requirements. *See* 89 Fed. Reg. at

---

[6] As discussed in Section IV, the best interpretation of "facility" is centralized production facility or, if the asset is not tied into a centralized production facility, an individual well.

[7] For example, there are states – including North Dakota – that do not yet have fully approved Round One Regional Haze Plans. These state plans were first required to be submitted in 2007.

5336. States would be rewarded by adopting early and compliant OOOOc plans. If the exemption were applied nationwide, there would be no incentive for states to act early.

d. EPA must attempt to construe CAA § 136(f)(6) to avoid non-delegation concerns.

The Constitution imposes limits on the delegation of legislative power to administrative agencies. *West Virginia v. EPA*, 597 U.S. 697, 750 (2022). At a minimum, Congress must provide "an intelligible principle to guide [the agency's] use of discretion." *Gundy v. United States*, 139 S. Ct. 2116, 2123 (2019) (cleaned up); *see also id.* at 2139-40 (Gorsuch, J., dissenting) (questioning whether even a few "intelligible principles" are enough to save an overbroad delegation of legislative power). This "requires construing the challenged statute to figure out what task it delegates and what instructions it provides." *Id.* at 2123.

While other aspects of the IRA and EPA's interpretation of it raise non-delegation concerns, CAA § 136(f)(6) is especially problematic. CAA § 136(f)(6)(ii) requires EPA to determine that compliance with the methane emissions requirements adopted in OOOOb and state plans implementing OOOOc "will result in equivalent or greater emissions reductions as would be achieved" by EPA's November 2021 proposed rule "if such rule had been finalized and implemented." The central flaw is that the November 2021 proposed rule contained no regulatory text and so there is no intelligible principle to guide EPA's application of the statute. Moreover, regarding OOOOc, these requirements are implemented via state plans which can take various factors into account, such as remaining useful life of the source, so it is impossible to know what emissions reductions would have been achieved by these hypothetical state plans.[8]

Although it may not be possible, EPA must attempt to construe CAA § 136(f)(6) to avoid non-delegation concerns. One acceptable reading could be that EPA should look to the final requirements in its recently adopted OOOOb and OOOOc rules, as these are the eventual outcome of its November 2021 proposed rule. In doing so, EPA must take into consideration any revisions required because of judicial review. This reading would clarify and simplify the application of the Regulatory Compliance Exemption.

IV. The Proposed Rule's Interpretation of "Facility" is Unreasonable and Inconsistent with CAA § 136.

Under CAA § 136(c), EPA is to impose a methane fee on emissions exceeding the waste emissions threshold "from an owner or operator of an applicable facility that reports more than 25,000 metric tons of carbon dioxide equivalent of greenhouse gases emitter per year" under Subpart W. CAA § 136(d) defines "applicable facility" as a facility within one of nine listed Subpart W industry segments, including "[o]nshore petroleum and natural gas production." CAA § 136 does not define the term "facility."

---

[8] As the Proposed Rule acknowledges, "because state plans were never developed pursuant to the NSPS OOOOb/EG OOOOc 2021 Proposal, there is no means of reasonably estimating the requirements that may have been included in those state plans and what emissions reductions they would have achieved." 89 Fed. Reg. at 5342.

In the Proposed Rule, EPA takes the position that a "facility" for purposes of CAA § 136 is a "facility" as defined in Subpart W. 89 Fed. Reg. at 5343. Currently, Subpart W defines "facility" for onshore petroleum and natural gas production as:

> all petroleum or natural gas equipment on a single well-pad or associated with a single well-pad and CO[2] EOR[9] operations that are under common ownership or common control including leased, rented, or contracted activities by an onshore petroleum and natural gas production owner or operator and that are located in a single hydrocarbon basin as defined in § 98.238. Where a person or entity owns or operates more than one well in a basin, then all onshore petroleum and natural gas production equipment associated with all wells that the person or entity owns or operates in the basin would be considered one facility.

40 C.F.R. § 98.238. In other words, under Subpart W, a "facility" includes all of an operator's assets in a basin.

Nothing in CAA § 136 requires "facility" to be defined on a basin-wide basis. The statute directs that "[f]or purposes of this section, the term 'applicable facility' means a facility within the following industry segments, as defined in Subpart W of part 98 of title 40, Code of Federal Regulations." CAA § 136(d). In this sentence the phrase "as defined in subpart W" immediately follows the term "industry segments" and thus refers to "industry segments" instead of the term "applicable facility."

EPA's belief that CAA § 136 requires the agency to impose methane fees on Subpart W "applicable facilities" misreads the statute and results in an overly broad interpretation that would have severe negative consequences for North Dakota and for owners and operators of marginal wells. Defining "applicable facilities" to include all of an owner or operator's assets in a basin causes more owners and operators to exceed the 25,000 metric ton threshold by combining the emissions from multiple stationary sources. While combining emissions from all of an owner or operator's assets may be reasonable for reporting purposes because it results in a more complete inventory, it does not follow that emissions should be combined in the same manner for purposes of assessing fees. The 25,000 metric ton threshold established by Congress should be used to protect small operators and marginal wells. EPA can accomplish this by defining facilities more reasonably. Conversely, the Proposed Rule as drafted would result in more than 2,200 of marginal wells in North Dakota being subject to methane fees. As a result, these marginal wells could be shut-in and plugged and abandoned prematurely, resulting in wasted resources. Prematurely plugging and abandoning these marginal wells would cause economic harm to North Dakota in the form of lost tax revenue and lost jobs.

For purposes of onshore petroleum and natural gas production, "facility" should instead be defined as a centralized production facility or, if the asset is not tied into a centralized production facility, a single well-pad. This would reduce confusion surrounding reporting in this segment and be more

---

[9] The phrase "CO[2] EOR" means carbon dioxide enhanced oil recovery.

consistent with OOOOb and OOOOc. It would also be more consistent with the common understanding of the word "facility." And, operators already report data by centralized production facility to state regulators, such as NDIC, so this should help streamline reporting. At a minimum, EPA should use the data it already receives to allocate onshore petroleum and natural gas production emissions to sub-basins at the county level.

Using the centralized production facility approach is consistent with CAA § 136 and is how emissions are currently reported for OOOO. For example, as discussed in Section III, the Regulatory Compliance Exemption must be considered on a state-by-state basis. To properly implement this exemption, it is necessary to identify facilities within each state rather than basin-wide, as basins cross state borders.

And using the centralized production facility approach would also ensure owners and operators are treated consistently across basins. The Williston Basin lies partially within Canada. There are North Dakota owners and operators who have assets on both sides of the border. If "facility" were to be defined basin-wide, methane fees would have to be assessed differently for these owners and operators because the assessment of their methane fees could not take into consideration all of their basin-wide assets. This could mean a higher or lower fee – depending on the company's assets – than the owner or operator would have if all of the Williston Basin was within the United States.

V. The Proposed Rule's Permitting Delay Exemption is Unreasonably Narrow.

CAA § 136(f)(5) contains an exemption from fees for emissions caused by delays in environmental permitting for gathering and transmission infrastructure, which EPA refers to the in the Proposed Rule as the "Permitting Delay Exemption." But the Proposed Rule's provisions implementing this exemption are so unreasonably narrow that it is rendered meaningless. This is yet another reason why EPA should withdraw the Proposed Rule and develop a new proposal that is consistent with the IRA, CAA, and APA. For example, under EPA's proposal the exemption would not be available until the permitting authority has delayed the permit for "somewhere between 30 and 42 months." 89 Fed. Reg. at 5333. This means that operators would have to pay years of burdensome fees for circumstances beyond their control. In North Dakota, where it can already be difficult to permit infrastructure needed to tie oil and gas facilities to pipelines, these unreasonable restrictions on qualifying for the exemption would be especially harmful.

In addition, the meaning of "environmental permits" is not clear. North Dakota agrees with EPA that this should include permits issued by federal, state, or local agencies, but EPA should further clarify the types of permits that would be eligible for the exemption. Permits relating to siting and zoning of pipelines, compressor facilities, gas processing facilities, and other infrastructure should be included, as these relate to environmental impacts.

V. Conclusion

For the reasons stated herein, the NDIC and NDDEQ respectfully urge EPA to withdraw the Proposed Rule and work with its state partners to develop a new proposal implementing CAA § 136's methane fee provisions in a way that complies with the IRA, CAA, and APA.

Sincerely,

Lynn D Helms

Subject:	YOU"RE INVITED! - ND Petroleum Council March Board Events
Date:	Monday, February 12, 2024 5:16:27 PM
Attachments:	image001.png image002.png UND EERC Luncheon and Tour Flyer.pdf
Importance:	High

Good afternoon, North Dakota leaders:

The North Dakota Petroleum Council Board of Directors and guests are eagerly awaiting our February 29-March 1 visit to Grand Forks and the University of North Dakota!

In advance of our two-day visit, we wanted to share the invitation below from the Energy & Environmental Research Center (EERC):

> You are cordially invited to a luncheon at the University of North Dakota (UND) Energy & Environmental Research Center (EERC) on Friday, March 1, 2024, at noon. Attendees include state and local leaders and North Dakota Petroleum Council members.
>
> Following the luncheon, you have an opportunity to tour the EERC or the College of Engineering & Mines (CEM). You can join the EERC for a journey through the EERC's expanding array of projects, deeply meaningful for our state, and the entire region.
>
> - Option 1: At the EERC, the tour will include, but not be limited to, research on Bakken, salt caverns, rare-earth elements, CO_2 capture and storage, development of new materials, and the latest update to our expanding hydrogen program. During the tour, you will hear from our professional research staff who bring a wealth of expertise to these impactful areas. The EERC team is looking forward to answering any questions you may have and the opportunity to connect with leadership from North Dakota and our entire region.
> - Option 2: Dean Brian Tande will lead a tour of the College of Engineering & Mines National Security Corridor and the Collaborative Energy Center. CEM research has grown by more than 40% in the past several years, with over $9M in areas such as energy, rare-earth elements, UAS, and national security.
>
> Please RSVP by February 15, 2024, for both the luncheon and the tour at this link: use this link.

Capping off the events on Friday, NDPC will host a social at the CanadInn's Playmakers Lounge from 4:30 to 6:00 p.m. and then host guests at the Ralph as UND takes on Western Michigan in some good old North Dakota hockey. Hockey tickets are sponsored by our great friends at AE2S, Construction Engineers, and the UND Alumni Association & Foundation. We have a hockey ticket for you. However, if you have access to other tickets, please use those and find us on the suite level (Suites 201 and 204; Alumni Association suite is 225).

In order to best prepare for meals and other logistics, we ask that you RSVP by February 15th at each of the links below.

Friday, March 1 - EERC Lunch & Tour Invite
Friday, March 1 - NDPC Social & Hockey Night

Thank you all for your continued support and please contact me with any questions. We look forward to seeing each of you.

Best regards,
Brady

Subject: Waste Emissions Charge for Petroleum and Natural Gas Systems PROPOSED RULE
Date: Friday, January 26, 2024 10:51:34 AM
Attachments: 2024-00938.pdf

Hi all,

I saw this morning the Waste Emissions Charge for Petroleum and Natural Gas Systems rule proposed by EPA made it into the Federal Register. Comment Deadline is March 11th. I did flag for Dave G. and Lynn H. but I wanted to ensure it was on everyone's radar.

"This program requires the EPA to impose and collect an annual charge on methane emissions that exceed specified waste emissions thresholds from an owner or operator of an applicable facility that reports more than 25,000 metric tons of carbon dioxide equivalent of greenhouse gases emitted per year pursuant to the petroleum and natural gas systems source category requirements of the Greenhouse Gas Reporting Rule. The proposal would implement calculation procedures, flexibilities, and exemptions related to the waste emissions charge and proposes to establish confidentiality determinations for data elements included in waste emissions charge filings."

https://www.federalregister.gov/d/2024-00938

Dave G. did say there would probably be a high likelihood DEQ would comment. Does DMR believe it needs to comment as well? Do we need external resources to assist in the comment letter?

Thank you for your input and attention to this. The battle rages on…

Happy Friday?

John Reiten

RIN 2060-AW02

Waste Emissions Charge for Petroleum and Natural Gas Systems

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing a regulation to implement the requirements of the Clean Air Act (CAA) as specified in the Methane Emissions Reduction Program of the Inflation Reduction Act. This program requires the EPA to impose and collect an annual charge on methane emissions that exceed specified waste emissions thresholds from an owner or operator of an applicable facility that reports more than 25,000 metric tons of carbon dioxide equivalent of greenhouse gases emitted per year pursuant to the petroleum and natural gas systems source category requirements of the Greenhouse Gas Reporting Rule. The proposal would implement calculation procedures, flexibilities, and exemptions related to the waste emissions charge and proposes to establish confidentiality determinations for data elements included in waste emissions charge filings.

DATES: *Comments*. Comments must be received on or before **[INSERT DATE 45 DAYS AFTER DATE OF PUBLICATION IN THE *FEDERAL REGISTER*]**. Under the Paperwork Reduction Act (PRA), comments on the information collection provisions are best assured of consideration if the Office of Management and Budget (OMB) receives a copy of your comments on or before **[INSERT DATE 30 DAYS AFTER DATE OF PUBLICATION IN THE *FEDERAL REGISTER*]**.

Public hearing. The EPA will conduct a virtual public hearing on **[INSERT DATE 15 DAYS AFTER DATE OF PUBLICATION IN THE *FEDERAL REGISTER*]**. See **SUPPLEMENTARY INFORMATION** for information on registering for a public hearing.

ADDRESSES: *Comments*. You may submit comments, identified by Docket ID No. EPA-HQ-OAR-2023-0434, by any of the following methods:

Federal eRulemaking Portal. *https://www.regulations.gov* (our preferred method). Follow the online instructions for submitting comments.

Mail: U.S. Environmental Protection Agency, EPA Docket Center, Air and Radiation Docket, Mail Code 28221T, 1200 Pennsylvania Avenue NW, Washington, DC 20460.

Hand Delivery or Courier (by scheduled appointment only): EPA Docket Center, WJC West Building, Room 3334, 1301 Constitution Avenue NW, Washington, DC 20004. The Docket Center's hours of operations are 8:30 a.m.-4:30 p.m., Monday-Friday (except Federal holidays).

Instructions: All submissions received must include the Docket ID No. for this proposed rulemaking. Comments received may be posted without change to *https://www.regulations.gov*, including any personal information provided. For detailed instructions on sending comments and additional information on the rulemaking process, see the "Public Participation" heading of the **SUPPLEMENTARY INFORMATION** section of this document.

The virtual hearing will be held using an online meeting platform, and the EPA has provided information on its website (*https://www.epa.gov/inflation-reduction-act/methane-emissions-reduction-program-merp*) regarding how to register and access the hearing. Refer to the **SUPPLEMENTARY INFORMATION** section for additional information.

FOR FURTHER INFORMATION CONTACT: For questions about this proposed action, contact Mr. Shaun Ragnauth, Climate Change Division, Office of Atmospheric Programs (MC-6207A), Environmental Protection Agency, 1200 Pennsylvania Ave., NW, Washington, DC 20460; telephone number: (202) 343-9142; e-mail address: *merp@epa.gov*.

World wide web (WWW). In addition to being available in the docket, an electronic copy of this proposal will also be available through the WWW. Following the Administrator's signature, a copy of this proposed rule will be posted on the EPA's Inflation Reduction Act

Methane Emissions Reduction Program website at *https://www.epa.gov/inflation-reduction-act/methane-emissions-reduction-program*.

SUPPLEMENTARY INFORMATION:

Written comments. Submit your comments, identified by Docket ID No. EPA-HQ-OAR-2023-0434, at *https://www.regulations.gov* (our preferred method), or the other methods identified in the **ADDRESSES** section. Once submitted, comments cannot be edited or removed from the docket. The EPA may publish any comment received to its public docket. Do not submit to the EPA's docket at *https://www.regulations.gov* any information you consider to be confidential business information (CBI), proprietary business information (PBI), or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). Commenters who would like the EPA to further consider in this rulemaking comments relevant to this rulemaking that they previously provided on any other rulemaking or request for information (*e.g.*, the Greenhouse Gas Reporting Rule: Revisions and Confidentiality Determinations for Petroleum and Natural Gas Systems, Docket ID No. EPA-HQ-OAR-2023-0234, the Methane Emissions Reduction Program Request for Information, Docket ID No. EPA-HQ-OAR-2022-0875, and the Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review, Docket ID No. EPA-HQ-OAR-2021-0317) must submit those comments to the EPA during this proposal's comment period. Please visit *https://www.epa.gov/dockets/commenting-epa-dockets* for additional submission methods; the full EPA public comment policy; information about CBI, PBI, or multimedia submissions, and general guidance on making effective comments.

Participation in virtual public hearing. The EPA will begin pre-registering speakers for the hearing no later than one business day after publication in the *Federal Register*. To register to speak at the virtual hearing, please use the online registration form available at *https://www.epa.gov/inflation-reduction-act/methane-emissions-reduction-program* or contact us by email at merp@epa.gov. The last day to pre-register to speak at the hearing will be **[INSERT DATE 12 DAYS AFTER DATE OF PUBLICATION IN THE *FEDERAL REGISTER*]**. On **[INSERT DATE 14 DAYS AFTER DATE OF PUBLICATION IN THE *FEDERAL REGISTER*]**, the EPA will post a general agenda that will list pre-registered speakers in approximate order at *https://www.epa.gov/inflation-reduction-act/methane-emissions-reduction-program*.

The EPA will make reasonable efforts to follow the schedule as closely as practicable on the day of the hearing; however, please plan for the hearings to run either ahead of schedule or behind schedule.

Each commenter will have 4 minutes to provide oral testimony. The EPA encourages commenters to provide the EPA with a copy of their oral testimony electronically (via email) by emailing it to *merp@epa.gov*. The EPA also recommends submitting the text of your oral testimony as written comments to the rulemaking docket.

The EPA may ask clarifying questions during the oral presentations but will not respond to the presentations at that time. Written statements and supporting information submitted during the comment period will be considered with the same weight as oral testimony and supporting information presented at the public hearing.

Please note that any updates made to any aspect of the hearing will be posted online at *https://www.epa.gov/inflation-reduction-act/methane-emissions-reduction-program*. While the EPA expects the hearing to go forward as set forth above, please monitor our website or contact us by email at *merp@epa.gov* to determine if there are any updates. The EPA does not intend to publish a document in the *Federal Register* announcing updates.

If you require the services of an interpreter or special accommodation such as audio description, please pre-register for the hearing with the public hearing team and describe your needs by **[INSERT DATE 7 DAYS AFTER DATE OF PUBLICATION IN THE *FEDERAL REGISTER*]**. The EPA may not be able to arrange accommodations without advanced notice.

Regulated entities. This is a proposed regulation. If finalized, the regulation would affect certain owners or operators of facilities in certain segments of the petroleum and natural gas systems industry that report more than 25,000 metric tons (mt) of carbon dioxide equivalent (CO_2e) pursuant to the requirements codified at 40 CFR part 98, subpart W (Petroleum and Natural Gas Systems) (hereafter referred to as “part 98, subpart W”). Per the requirements of CAA section 136(d), the industry segments to which the waste emissions charge may apply are offshore petroleum and natural gas production, onshore petroleum and natural gas production, onshore natural gas processing, onshore gas transmission compression, underground natural gas storage, liquefied natural gas storage, liquefied natural gas import and export equipment, onshore petroleum and natural gas gathering and boosting, and onshore natural gas transmission pipeline. Regulated categories and entities include, but are not limited to, those listed in Table 1 of this preamble:

Table 1. Examples of Affected Entities by Category

Category	North American Industry Classification System (NAICS)	Examples of affected facilities
Petroleum and Natural Gas Systems	486210	Pipeline transportation of natural gas.
	221210	Natural gas distribution facilities.
	211120	Crude petroleum extraction.
	211130	Natural gas extraction.

Table 1 of this preamble is not intended to be exhaustive, but rather provides a guide for readers regarding facilities likely to be affected by this proposed action. This table lists the types of facilities that the EPA is now aware could potentially be affected by this action. Other types of facilities than those listed in the table could also be subject to reporting requirements. To determine whether you would be affected by this proposed action, you should carefully examine the applicability criteria found in 40 CFR part 99, subpart A (General Provisions). If you have questions regarding the applicability of this action to a particular facility, consult the person listed in the **FOR FURTHER INFORMATION CONTACT** section.

I. Background

A. How is this Preamble Organized?

The first section (section I.) of this preamble contains background information regarding the proposed rule. This section also discusses the EPA's legal authority under the Clean Air Act (CAA) to promulgate implementing regulations for the waste emissions charge, proposed to be codified at 40 CFR part 99 (hereafter referred to as "part 99"). Section I. of the preamble also discusses the EPA's legal authority to make confidentiality determinations for new data elements included in waste emissions charge filings (WEC filings) required by the proposed rule. Section II. of this preamble contains detailed information on the proposed provisions necessary to implement CAA section 136(c) through (g), including exemptions. Section III. of this preamble describes the general requirements for the proposed rule. Section IV. of this preamble discusses the proposed confidentiality determinations for new data reporting elements for the proposed part 99 and also discusses confidentiality determinations for two data elements reported under part 98, subpart W. Section V. of this preamble discusses the impacts of the proposed part 99. Section VI. of this preamble describes the statutory and Executive order requirements applicable to this proposed action.

B. Executive Summary

In August 2022, Congress passed, and President Biden signed, the Inflation Reduction Act of 2022 (IRA) into law. Section 60113 of the IRA amended the CAA by adding section 136, "Methane Emissions and Waste Reduction Incentive Program for Petroleum and Natural Gas Systems." CAA section 136(c) directs the Administrator of the EPA to impose and collect a "Waste Emissions Charge" on methane emissions that exceed statutorily specified waste emissions thresholds from owners or operators of applicable facilities. The waste emissions threshold is a facility-specific amount of metric tons of methane emissions calculated using the segment-specific methane intensity thresholds defined in CAA section 136(f)(1) through (3) and a facility's natural gas throughput (or oil throughput in certain circumstances). Facilities that have methane emissions below the threshold would not be required to pay the charge; facilities that have emissions above the threshold would be required to pay the charge. The waste emissions charge, or WEC, is specified in CAA section 136 to begin for emissions occurring in 2024 at $900 per metric ton of methane exceeding the threshold, increasing to $1,200 per metric ton of methane in 2025, and to $1,500 per metric ton of methane in 2026 and years after. The WEC only applies to the subset of a facility's emissions that are above the waste emissions threshold.

The WEC program applies to facilities that report more than 25,000 mt CO_2e of greenhouse gases emitted per year pursuant to the Greenhouse Gas Reporting Rule's requirements for the petroleum and natural gas systems source category (codified as 40 CFR part 98, subpart W).[1] An applicable facility, as defined in CAA section 136(d), is a facility within the following industry segments (as the following industry segments are defined in part 98, subpart W): onshore petroleum and natural gas production, offshore petroleum and natural gas production, onshore petroleum and natural gas gathering and boosting, onshore natural gas processing, onshore gas transmission compression, onshore natural gas transmission pipeline, underground natural gas storage, liquefied natural gas import and export equipment, and liquefied natural gas storage.[2] Congress structured the WEC so that it focuses on high-emitting oil and gas facilities (*i.e.*, those with emissions greater than 25,000 mt CO_2e of greenhouse gases emitted per year and that have a methane emissions intensity in excess of the statutory threshold).

CAA section 136 defines three important elements of the WEC program: 1) waste emissions thresholds; 2) netting of emissions across different facilities; and 3) exemptions for certain emissions and facilities. Facilities may owe a WEC obligation if their subpart W reported emissions exceed facility-specific waste emissions thresholds specified in CAA section 136(f).[3] Facility efficiency in terms of methane emissions per unit of production or throughput would have a large impact on the amount of the WEC owed, with more efficient facilities expected to have emissions falling below the specified thresholds.

Some facilities may have emissions that are below the waste emissions thresholds, and some facilities may have emissions above the thresholds. CAA section 136(f)(4) allows facilities

---

[1] 42 U.S.C. 7436(c) (“The Administrator shall impose and collect a charge on methane emissions that exceed an applicable waste emissions threshold under subsection (f) from an owner or operator of an applicable facility that reports more than 25,000 metric tons of carbon dioxide equivalent of greenhouse gases emitted per year pursuant to subpart W of part 98 of title 40, Code of Federal Regulations, regardless of the reporting threshold under that subpart.”).

[2] 42 U.S.C. 7436(d).

[3] 42 U.S.C. 7436(f)(1-3).

under common ownership or control to net emissions across those facilities, which could result in a reduced total charge, or avoidance of the charge.[4]

In addition, there are three exemptions that may lower a facility's WEC or exempt the facility entirely from the charge. The first exemption, found in CAA section 136(f)(5), exempts from the charge emissions occurring at facilities in the onshore or offshore petroleum and natural gas production industry segments that are caused by eligible delays in environmental permitting of gathering or transmission infrastructure.[5] The second exemption, found in CAA section 136(f)(6), exempts from the charge, if certain conditions are met, those facilities that are subject to and in compliance with final methane emissions requirements promulgated pursuant to CAA sections 111(b) and (d).[6] This exemption becomes available only if a determination is made by the Administrator that such final requirements are approved and in effect in all states with respect to the applicable facilities, and that the emissions reductions resulting from those final requirements will achieve equivalent or greater emission reductions as would have resulted from the EPA's proposed methane emissions requirements from 2021.[7] The third exemption, found in CAA section 136(f)(7), exempts from the charge reporting-year emissions from wells that are

---

[4] 42 U.S.C. 7436(f)(4) ("In calculating the total emissions charge obligation for facilities under common ownership or control, the Administrator shall allow for the netting of emissions by reducing the total obligation to account for facility emissions levels that are below the applicable thresholds within and across all applicable segments identified in subsection (d).").

[5] 42 U.S.C. 7436(f)(5). ("Charges shall not be imposed pursuant to paragraph (1) on emissions that exceed the waste emissions threshold specified in such paragraph if such emissions are caused by unreasonable delay, as determined by the Administrator, in environmental permitting of gathering or transmission infrastructure necessary for offtake of increased volume as a result of methane emissions mitigation implementation.")

[6] 42 U.S.C. 7436(f)(6) ("Charges shall not be imposed pursuant to subsection (c) on an applicable facility that is subject to and in compliance with methane emissions requirements pursuant to subsections (b) and (d) of section 7411 of this title upon a determination by the Administrator that—(i) methane emissions standards and plans pursuant to subsections (b) and (d) of section 7411 of this title have been approved and are in effect in all States with respect to the applicable facilities; and (ii)compliance with the requirements described in clause (i) will result in equivalent or greater emissions reductions as would be achieved by the proposed rule of the Administrator entitled "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review" (86 FR 63110 (November 15, 2021)), if such rule had been finalized and implemented.").

[7] *Id.*

permanently shut in and plugged.[8] In this action, the EPA proposes specific requirements for eligibility for each of these exemptions.

The EPA proposes to require that the WEC would be quantified and paid through a WEC filing submitted no later than March 31 of each calendar year for methane emissions that occurred in the previous calendar year (subpart W reporting year). The WEC filing would include information relevant to calculating the WEC, such as identification of facilities included in netting, eligibility for exemptions from WEC, and supporting information necessary for the EPA to verify information submitted regarding exemptions.

The proposed provisions of part 99 under this rulemaking are described in further detail in sections II. and III. of this preamble.

C. Background and Related Actions

Congress designed the WEC to work in tandem with several related EPA programs. The WEC provides an incentive for the early adoption of methane emission reduction practices and technologies such as those that required under the Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review (NSPS OOOOb/EG OOOOc), which Congress expected to be promulgated pursuant to CAA section 111. The sooner facilities adopt the methodologies and technologies required in those rules, the lower their assessed WEC; at full implementation of those rules, the EPA expects many of the WEC-affected facilities will be below the WEC emissions thresholds. To further support the overall goal of reducing methane emissions, CAA section 136(a) and (b) also provides $1.55 billion to, among other things, help finance the early adoption of emissions reduction methodologies and technologies and to support monitoring of methane emissions. More detailed background information on the impacts of methane on public

---

[8] 42 U.S.C. 7436(f)(7).(“ Charges shall not be imposed with respect to the emissions rate from any well that has been permanently shut-in and plugged in the previous year in accordance with all applicable closure requirements, as determined by the Administrator.”)

health and welfare and the related regulatory activities is provided in section I.C.1. of this preamble.

1. How does methane affect public health and welfare?

Elevated concentrations of greenhouse gases (GHGs) including methane have been warming the planet, leading to changes in the Earth's climate that are occurring at a pace and in a way that threatens human health, society, and the natural environment. While the EPA is not statutorily required to make any particular scientific or factual findings regarding the impact of GHG emissions on public health and welfare in support of the proposed WEC, the EPA is providing in this section a brief scientific background on methane and climate change to offer additional context for this rulemaking and to help the public understand the environmental impacts of GHGs such as methane.

As a GHG, methane in the atmosphere absorbs terrestrial infrared radiation, which in turn contributes to increased global warming and continuing climate change, including increases in air and ocean temperatures, changes in precipitation patterns, retreating snow and ice, increasingly severe weather events, such as hurricanes of greater intensity, and sea level rise, among other impacts. Methane also contributes to climate change through chemical reactions in the atmosphere that produce tropospheric ozone and stratospheric water vapor. In 2022, atmospheric concentrations of methane increased by nearly 17 parts per billion (ppb) over 2021 levels to reach 1912 ppb.[9] This was the largest increase since the start of the NOAA atmospheric record in 1984, with current concentrations now more than two and a half times larger than the preindustrial level.[10] Methane is responsible for about one third of all warming resulting from human emissions of well-mixed GHGs,[11] and due to its high radiative efficiency compared to

carbon dioxide, methane mitigation is one of the best opportunities for reducing near-term warming.

Major scientific assessments continue to be released that further advance our understanding of the climate system and the impacts that methane and other GHGs have on public health and welfare both for current and future generations. According to the Intergovernmental Panel on Climate Change (IPCC) Sixth Assessment Report, "it is unequivocal that human influence has warmed the atmosphere, ocean and land. Widespread and rapid changes in the atmosphere, ocean, cryosphere and biosphere have occurred."[12] Recent EPA modeling efforts[13] have also shown that impacts from these changes are projected to vary regionally within the U.S. For example, large damages are projected from sea level rise in the Southeast, wildfire smoke in the Western U.S., and impacts to agricultural crops and rail and road infrastructure in the Northern Plains. Scientific assessments, EPA analyses, and updated observations and projections document the rapid rate of current and future climate change and the potential range impacts both globally and in the United States,[14] presenting clear support

regarding the current and future dangers of climate change and the importance of GHG emissions mitigation.

2. Related Actions

As mandated by CAA section 136(c) and (d), the applicability of the WEC is based upon the quantity of metric tons of CO_2e emitted per year pursuant to the requirements of subpart W. Further, CAA section 136(e) requires that the WEC amount be calculated based upon methane emissions reported pursuant to subpart W. As a result, this proposed action builds upon previous subpart W rulemakings.

On August 1, 2023, the EPA proposed revisions to subpart W consistent with the authority and directives set forth in CAA section 136(h) as well as the EPA's authority under CAA section 114 (88 FR 50282) (hereafter referred to as the "2023 Subpart W Proposal"). In that rulemaking, the EPA proposed revisions to require reporting of additional emissions or emissions sources to address potential gaps in the total methane emissions reported by facilities to subpart W. For example, these proposed revisions would add a new emissions source, referred to as "other large release events," to capture large emission events that are not accurately accounted for using existing methods in subpart W. The EPA also proposed revisions to add or revise existing calculation methodologies to improve the accuracy of reported emissions, incorporate additional empirical data, and allow owners and operators of applicable facilities to submit empirical emissions data that could appropriately demonstrate the extent to which a charge is owed in implementation of CAA section 136, as directed by CAA section 136(h). The EPA also proposed revisions to existing reporting requirements to collect data that would improve verification of reported data, ensure accurate reporting of emissions, and improve the transparency of reported data. For clarity of discussion within this preamble, unless otherwise stated, references to provisions of subpart W (*i.e.,* 40 CFR 98.230 through 98.238) reflect the language as proposed in the 2023 Subpart W Proposal. The EPA's intention in this proposed rulemaking is that the final WEC rule would update the proposed cross-references to subpart W to be consistent with the final Subpart W rule resulting from the 2023 Subpart W Proposal.

Under the Greenhouse Gas Reporting Program, the EPA also recently issued a supplemental proposal to a 2022 proposed rule (88 FR 32852, May 22, 2023), which included proposed updates to the General Provisions of the Greenhouse Gas Reporting Rule to reflect revised global warming potentials (GWPs), proposed reporting of GHG data from additional sectors (*i.e.*, non-subpart W sectors), and proposed revisions to source categories other than subpart W that would improve implementation of the Greenhouse Gas Reporting Rule. The proposed revision to the GWP of methane (from 25 to 28) is expected to lead to a small increase in the number of facilities that exceed the subpart W 25,000 mt CO_2e threshold and thus become subject to the proposed part 99 requirements. This supplemental proposed rule is not expected to otherwise impact subpart W reporting requirements as they pertain to the applicability or implementation of the proposed part 99 requirements.

In addition, on November 15, 2021 (86 FR 63110), the EPA proposed under CAA section 111(b) standards of performance regulating emissions of methane and volatile organic compounds (VOCs) for certain new, reconstructed, and modified sources in the oil and natural gas source category (proposed as 40 CFR part 60, subpart OOOOb) (hereafter referred to as "NSPS OOOOb"), as well as emissions guidelines regulating emissions of methane under CAA section 111(d) for certain existing oil and natural gas sources (proposed as 40 CFR part 60, subpart OOOOc) (hereafter referred to as "EG OOOOc"). The November 15, 2021 proposal (covering both NSPS OOOOb and EG OOOOc) – and which Congress explicitly referred to in section 136 – will be referred to hereafter as the "NSPS OOOOb/EG OOOOc 2021 Proposal." The NSPS OOOOb/EG OOOOc 2021 Proposal sought to strengthen standards of performance previously in effect under section 111(b) of the CAA for new, modified and reconstructed oil and natural gas sources, and to establish emissions guidelines under section 111(d) of the CAA for states to follow in developing plans to limit methane emissions from existing oil and natural gas sources.

On December 6, 2022, the EPA issued a supplemental proposal to update, strengthen and expand upon the NSPS OOOOb/EG OOOOc 2021 Proposal (87 FR 74702). The December 6, 2022 supplemental proposal will be referred to hereafter as "NSPS OOOOb/EG OOOOc 2022 Supplemental Proposal." This supplemental proposal modified certain standards proposed in the NSPS OOOOb/EG OOOOc 2021 Proposal and added proposed requirements for sources not previously covered. Among other things, the supplemental proposal sought to: ensure that all well sites are routinely monitored for leaks, with requirements based on the type and amount of equipment on site; encourage the deployment of innovative and advanced monitoring technologies by establishing performance requirements that can be met by a broader array of technologies; prevent leaks from abandoned and unplugged wells by requiring documentation that well sites are properly shut-in and plugged before monitoring is allowed to end; leverage qualified expert monitoring to identify "super-emitters" for prompt mitigation; and strengthen requirements for flares.

On December 2, 2023, in an action titled, "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review," the EPA finalized these two rules to reduce air emissions from the Crude Oil and Natural Gas source category under section 111 of the Clean Air Act. First, the EPA finalized NSPS OOOOb regulating GHG (in the form of a limitation on emissions of methane) and VOCs emissions for the Crude Oil and Natural Gas source category pursuant to CAA section 111(b)(1)(B) (hereafter, "NSPS OOOOb"). Second, the EPA finalized presumptive standards in EG OOOOc to limit GHG emissions (in the form of methane limitations) from designated facilities in the Crude Oil and Natural Gas source category, as well as requirements under the CAA section 111(d) for states to follow in developing, submitting, and implementing state plans to establish performance standards (hereafter, "EG OOOOc").[15]

The NSPS OOOOb/EG OOOOc 2021 Proposal and Final NSPS OOOOb/EG OOOOc are relevant to this WEC proposal in two ways: first, WEC applicable facilities containing CAA section 111(b) and (d) facilities that are in compliance with the applicable standards are likely to have emissions below the thresholds specified in section II.B. of this preamble due to mitigation resulting from meeting the methane emissions requirements of NSPS OOOOb or EG OOOOc-implementing state and Federal plans, and therefore would not be expected to incur charges under the WEC program; and second, compliance with applicable standards (if certain criteria are met) may exempt facilities from the WEC under the regulatory compliance exemption outlined at CAA section 136(f)(6) (discussed in section II.D.2. of this preamble). As a part of the NSPS OOOOb/EG OOOOc 2022 Supplemental Proposal, the EPA requested comment on the criteria and approaches that the Administrator should consider in making the CAA section 136(f)(6)(A)(ii) equivalency determination, which is discussed at section II.D.2. of this preamble.

The EPA also opened a non-regulatory docket on November 4, 2022 and issued a Request for Information (RFI) seeking public input to inform program design related to CAA section 136.[16] As part of this request, the EPA sought input on issues that should be considered related to implementation of the WEC. The comment period closed on January 18, 2023.

The 2023 Subpart W Proposal, the NSPS OOOOb/EG OOOOc 2021 Proposal, the NSPS OOOOb/EG OOOOc 2022 Supplemental Proposal, and the November 2022 request for information are relevant to this proposal. While the EPA has reviewed or will review relevant comments submitted as part of the rulemaking actions and request for information, the EPA is

---

[15] In this action, the EPA also finalized several related actions stemming from the joint resolution of Congress, adopted on June 30, 2021, under the CRA, disapproving the 2020 Policy Rule, and also finalized a protocol under the general provisions for use of Optical Gas Imaging.

[16] Docket ID No. EPA-HQ-OAR-2022-0875.

not obligated to respond to those comments in this action since the comment solicitations did not accompany a proposal regarding the WEC. Commenters who would like the EPA to formally consider in this rulemaking any relevant comments previously submitted must resubmit those comments to the EPA during this proposal's comment period.

In addition to the WEC requirement, and the related revisions to subpart W to facilitate accuracy of reporting and charge calculation, as noted in section I.C. of this preamble, CAA sections 136(a) and (b) provide $1.55 billion for the Methane Emissions Reduction Program, including for incentives for methane mitigation and monitoring. The EPA is partnering with the U.S. Department of Energy and National Energy Technology Laboratory to provide financial assistance for monitoring and reducing methane emissions from the oil and gas sector, as well as technical assistance to help implement solutions for monitoring and reducing methane emissions. As designed by Congress, these incentives were intended to complement the regulatory programs and to help facilitate the transition to a more efficient petroleum and natural gas industry.

D. Legal Authority

The EPA is proposing this rule under its newly established authority provided in CAA section 136. As noted in section I.B. of this preamble, the IRA added CAA section 136, "Methane Emissions and Waste Reduction Incentive Program for Petroleum and Natural Gas Systems," which requires that the EPA impose and collect an annual specified charge on methane emissions that exceed an applicable waste emissions threshold from an owner or operator of an applicable facility that reports more than 25,000 mt CO_2e of greenhouse gases emitted per year pursuant to subpart W of the GHGRP. Under CAA section 136, an "applicable facility" is a facility within nine of the ten industry segments subject to subpart W, as currently defined in 40 CFR 98.230 (excluding natural gas distribution).

The EPA is also proposing elements of this rule under its existing CAA authority provided in CAA section 114, as well as CAA section 301. CAA section 114(a)(1) authorizes the Administrator to require emissions sources, persons subject to the CAA, or persons whom the

Administrator believes may have necessary information to monitor and report emissions and provide other information the Administrator requests for the purposes of carrying out any provision of the CAA (except for a provision of title II with respect to manufacturers of new motor vehicles or new motor vehicle engines). Thus, CAA section 114(a)(1) additionally provides the EPA broad authority to require the information that would be required by this proposed rule because the information is relevant for carrying out CAA section 136. Additionally, CAA section 301(a)(1) provides that the EPA is authorized to prescribe such regulations "as are necessary to carry out [its] functions under [the CAA]."

The Administrator has determined that this action is subject to the provisions of section 307(d) of the CAA. Section 307(d) contains a set of procedures relating to the issuance and review of certain CAA rules.

In addition, pursuant to sections 114, 301, and 307 of the CAA, the EPA is publishing proposed confidentiality determinations for the new data elements required by this proposed regulation.

II. Requirements to Implement the Waste Emissions Charge

This section summarizes the EPA's proposed approach to calculating WEC, including how WEC would be calculated at the facility level, how netting of emissions from facilities under common ownership or control would be applied, the EPA's interpretation of common ownership or control, and how the exemptions established in CAA section 136(f) would be implemented.

A. Proposed Definitions to Support WEC Implementation

In accordance with CAA section 136(d), applicable facilities under part 99 are those facilities within certain industry segments as defined under part 98, subpart W. Thus, we are proposing several definitions within the general provisions of 40 CFR 99.2. First, as the statute specifies, we are proposing a definition of "applicable facility" to mean a facility within one or more of the following industry segments: onshore petroleum and natural gas production, offshore petroleum and natural gas production, onshore petroleum and natural gas gathering and boosting, onshore natural gas processing, onshore natural gas transmission compression, onshore natural gas transmission pipeline, underground natural gas storage, LNG import and export equipment, or LNG storage, as those industry segments are defined in 40 CFR 98.230 of subpart W.[17] A single reporting facility under part 98, subpart W, typically consists of operations within a single industry segment. However, for certain industry segments a single reporting facility may represent operations in two or more industry segments. Industry segments that potentially may exist within the same reporting facility are onshore natural gas processing, onshore natural gas transmission compression, underground natural gas storage, LNG import and export equipment, and LNG storage. To accommodate for such facilities, we are proposing within the definition of "applicable facility" that such operations would be considered a single applicable facility under part 99.

We are also proposing a definition of "WEC applicable facility" in 40 CFR 99.2, which would mean an applicable facility for which the owner or operator of the subpart W reporting facility reported GHG emissions under subpart W of more than 25,000 mt CO_2e – the amount set in the statute. In cases where a subpart W facility reports under two or more of the industry segments listed in the previous paragraph, the EPA proposes that the 25,000 mt CO_2e threshold would be evaluated based on the total facility GHG emissions reported to subpart W across all of the industry segments (*i.e.*, the facility's total subpart W GHGs). As discussed in section II.B.1. of this preamble, the waste emissions threshold is the facility-specific threshold, based upon an industry segment-specific methane intensity threshold, above which the EPA must impose and collect the WEC. For the purposes of determining the waste emissions threshold for a WEC applicable facility that operates within multiple industry segments, the EPA proposes that each industry segment would be assessed separately (*i.e.*, using industry segment-specific throughput and methane intensity threshold) and then summed together to determine the waste emissions

---

[17] *See* 42 U.S.C. 7436(d).

threshold for the facility. The EPA proposes that this approach would be used in all cases where a WEC applicable facility contains equipment in multiple subpart W industry segments.

The EPA requests comment on an alternative definition of WEC applicable facility as it applies to subpart W facilities that report under two or more industry segments. This alternative approach would assess these facilities against the 25,000 mt CO_2e applicability threshold using the CO_2e reported under subpart W for each individual segment at the facility rather than the total facility subpart W CO_2e reported across all segments. CAA section 136(d) defines an applicable facility as one “within” the nine industry segments subject to the WEC and does not specify that an applicable facility is in one and only one industry segment. The EPA understands this to mean that an applicable facility constitutes an entire subpart W facility, including those that report under more than one segment. Thus, based on the statutory text, the EPA proposes to assess WEC applicability based on the entire subpart W facility’s emissions. Based on historic subpart W data, no more than two dozen facilities report data for multiple segments, and when total subpart W CO_2e is summed across all segments at these facilities, almost all of these facilities remain below the 25,000 mt CO_2e threshold. Historic data also show that the industry segments (onshore natural gas processing, onshore natural gas transmission compression, and underground natural gas storage) located at these facilities generally have methane emissions below the waste emissions thresholds. The proposed approach of using total subpart W facility CO_2e for determining WEC applicability therefore would not result in a significant number of facilities being regulated under WEC compared to an approach that assessed applicability using subpart W CO_2e for each individual industry segment at a facility. Based on historic data, the EPA does not expect the very small number of facilities with operations in multiple subpart W segments that could be subject to the WEC under the proposed approach to experience a substantially different financial impact under the alternative approach.

We are also proposing a definition for “WEC applicable emissions” in 40 CFR 99.2, which would mean the annual methane emissions, as calculated using equations specified in part

99, from a WEC applicable facility that are either equal to, below, or exceeding the waste emissions threshold for the facility after consideration of any applicable exemptions. The proposed calculation methodology for WEC applicable emissions is addressed in section II.B.2. of this preamble. We are also proposing a definition for "facility applicable emissions" in 40 CFR 99.2 which would mean the annual methane emissions, as calculated using equations specified in part 99, from a WEC applicable facility that are either equal to, below, or exceeding the waste emissions threshold for the facility prior to consideration of any applicable exemptions.

The proposed provisions of this part would apply to WEC obligated parties and WEC applicable facilities. In addition to the proposed definition for WEC applicable facility discussed earlier in this section, we are proposing a definition for the term WEC obligated party in 40 CFR 99.2. The term WEC obligated party refers to the owners or operators of one or more WEC applicable facilities. For WEC applicable facilities that have more than one owner or operator, we are proposing that the WEC obligated party is an owner or operator selected by a binding agreement among the owners and operators of the WEC applicable facility. The EPA anticipates that such an agreement would be similar to those used in carrying out 40 CFR 98.4(b) under the GHGRP.

For the purposes of submitting the WEC filing, we are proposing that the WEC obligated party's WEC applicable facilities are the WEC applicable facilities for which it is the owner or operator (including through binding agreement as noted above), as of December 31 of each reporting year. Under the proposed approach, the WEC obligated party would be responsible for any WEC obligation from facilities for which it was the facility owner or operator as of December 31 of the reporting year. The EPA recognizes that facilities may be acquired or divested at any time in the year, and that under the proposed approach the year-end owner or operator would be responsible for data and any corresponding WEC obligation for the entire reporting year. The EPA believes that this approach is both reasonable and necessary for implementation of the WEC program. First, subpart W data reporting uses the same approach;

the facility owner or operator as of December 31 is responsible for emissions for the entire year. Because the subpart W data is inextricably linked to the WEC filing, it would be inappropriate to have different facility owners or operators under each regulation. Specifically, different owners or operators for the same facility under subpart W and the WEC program could lead to challenges for WEC filings and associated data verification, and increase industry burden by requiring significant coordination between different companies. Second, subpart W data are reported on an annual basis, and there is no means by which methane emissions could be accurately allocated across multiple owners or operators in a single year. For example, emissions could not be pro-rated based on time of ownership over the reporting year because emissions do not occur uniformly over time, and emissions from certain sources cannot be linked to specific times. Similarly, there is not a direct relationship between methane emissions and oil and natural gas production, so temporal data on hydrocarbon production could not be used to accurately allocate emissions. The EPA therefore believes it would be neither practical nor accurate for the reporting responsibility and potential WEC obligation for a single facility to be split among multiple WEC obligated parties.

The EPA also recognizes that a facility’s owner or operator, and thus its WEC obligated party, may change between December 31 and March 31. In such situations, under the proposed approach the WEC obligated party associated with a facility as of December 31 would remain responsible for accounting for that facility in its WEC filing and be responsible for any WEC obligation associated with that facility.

The EPA invites comments on these proposed definitions and whether additional definitions would help with the implementation of the WEC. The EPA requests comment on the proposed definition of WEC obligated party being responsible for all facilities for which it was the facility owner or operator as of December 31, regardless of when in the reporting year it became a facility’s owner or operator. The EPA requests comment on alternative definitions of WEC obligated party, including those that would allocate facility subpart W data to multiple

WEC obligated parties and a definition that would place the WEC obligation and reporting requirements on the WEC obligated party that was a facility’s owner or operator at the time of the WEC filing (i.e., as of March 31 of the year following the reporting year rather than December 31 of the reporting year). For alternative definitions that would allocate subpart W data, the EPA requests comment on potential methodologies that would accurately split the annual subpart W data across multiple WEC obligated parties.

B. Waste Emissions Thresholds

The CAA establishes a waste emissions threshold that is defined in terms of industry segment-specific methane intensity thresholds applicable to certain facilities that report GHG emissions under subpart W of the GHGRP. The industry segment-specific methane intensity thresholds specified in CAA 136(f) and listed in Table 2 of this preamble are based on a rate of methane emissions per amount of natural gas or oil sent to sale from or through a facility. The industry segment-specific methane intensity thresholds are generally defined in terms of a percentage of throughput (*e.g.*, 0.002 percent of natural gas sent to sale). However, since the WEC is based on metric tons of methane (*e.g.*, $900/metric ton) that exceed the threshold, for the purposes of calculating the number of metric tons that are subject to the WEC, we are proposing to calculate the facility waste emissions thresholds in metric tons of methane.

For the onshore and offshore petroleum and natural gas production industry segments, CAA section 136(f) differentiates based on whether the facility is sending natural gas to sale or only sending oil to sale, and if the facility does not send natural gas to sale, the threshold is based on methane emissions per amount of oil sent to sale. For facilities that are not in the onshore or offshore production industry segments, the industry segment-specific methane intensity thresholds are based on the amount of natural gas sent to sale from or through the facility. The industry segment-specific methane intensity thresholds are applied to the natural gas or petroleum throughput attributable to that industry segment to calculate facility-specific waste emissions thresholds. See Table 2 for an overview of how the waste emissions thresholds are calculated. Facility waste emissions thresholds are compared to reported methane emissions; facilities with methane emissions that exceed the waste emissions threshold may be subject to the WEC. For WEC applicable facilities under common ownership or control of a single WEC obligated party, the WEC applicable emissions for each facility are summed to calculate the net emissions for that WEC obligated party.

Subpart W requires reporting of natural gas throughput by thousand standard cubic feet, oil by barrels, and methane by metric ton. As a practical matter, since the WEC is based on a dollar per metric ton of methane, the waste emissions thresholds must generally be converted into metric tons of methane for comparison against reported methane, generally by multiplying the thresholds by the density of methane.

Table 2. Industry Segment Throughput Metrics and Methane Intensities

Industry Segment	**Throughput Metric** [a]	**Industry Segment-Specific Methane Intensity**
Onshore petroleum and natural gas production	The quantity of natural gas produced from producing wells that is sent to sale in the calendar year, in thousand standard cubic feet; or the quantity of crude oil produced from producing wells that is sent to sale in the calendar year, in barrels, if facility sends no natural gas to sale	0.20 percent of natural gas sent to sale from facility; or 10 metric tons of methane per million barrels of oil sent to sale from facility, if facility sends no natural gas to sale
Offshore petroleum and natural gas production		
Onshore petroleum and natural gas gathering and boosting	The quantity of natural gas transported through the facility to a downstream endpoint such as a natural gas processing facility, a natural gas transmission pipeline, a natural gas distribution pipeline, a storage facility, or another gathering and boosting facility in the calendar year, in thousand standard cubic feet	0.05 percent of natural gas sent to sale from or through facility
Onshore natural gas processing	The quantity of residue gas leaving that has been processed by the facility and any gas that passes through the facility to sale without being processed by the facility in the calendar year, in thousand standard cubic feet	

Onshore natural gas transmission compression	The quantity of natural gas transported through the compressor station in the calendar year, in thousand standard cubic feet	0.11 percent of natural gas sent to sale from or through facility
Onshore natural gas transmission pipeline	The quantity of natural gas transported through the facility and transferred to third parties such as LDCs or other transmission pipelines in the calendar year, in thousand standard cubic feet	
Underground natural gas storage	The quantity of natural gas withdrawn from storage and sent to sale in the calendar year, in thousand standard cubic feet	
LNG import and export equipment	For LNG import equipment, the quantity of LNG imported that is sent to sale in the calendar year, in thousand standard cubic feet; for LNG export equipment, the quantity of LNG exported that is sent to sale in the calendar year, in thousand standard cubic feet	0.05 percent of natural gas sent to sale from or through facility
LNG storage	The quantity of LNG withdrawn from storage and sent to sale in the calendar year, in thousand standard cubic feet	

[a] Throughput metrics in this table are based on the proposed subpart W reporting elements in the 2023 Subpart W Proposal (88 FR 50282).

1. Facility Waste Emissions Thresholds

CAA section 136(f)(1) through (3) establishes facility-specific waste emissions thresholds above which the EPA must impose and collect the WEC. The CAA defines waste emissions threshold requirements, and establishes the method for calculation of the charge, for nine segments of the oil and gas industry.

CAA section 136(f)(1) requires the EPA to impose and collect the WEC on facilities in the onshore petroleum and natural gas production and offshore petroleum and natural gas production industry segments with methane emissions, in metric tons, that exceed either 0.20 percent of the natural gas sent to sale from the facility or, if no natural gas is sent to sale, 10 metric tons of methane per million barrels of oil sent to sale from the facility. To determine the waste emissions threshold from a WEC applicable facility in the onshore petroleum and natural gas production and the offshore petroleum and natural gas production industry segments, the EPA is proposing two equations based on whether the facility sends natural gas to sale, which reflect the statutory text at 136(f)(1)(A) and (B). For onshore and offshore petroleum and natural gas production WEC applicable facilities that send natural gas to sale, we are proposing to use equation B-1 of 40 CFR 99.20(a). This equation multiplies the annual quantity of natural gas sent to sale from a WEC applicable facility by 0.002 (*i.e.*, 0.20 percent) and the density of methane (0.0192 metric tons per thousand standard cubic feet).[18] For onshore and offshore petroleum and natural gas production facilities that have no natural gas sent to sale, we are proposing to use equation B-2 of 40 CFR 99.20(b). Similar to proposed equation B-2, the annual quantity of oil sent to sale from a WEC applicable facility would be multiplied by 10 metric tons of methane per million barrels of oil. [19]

For WEC applicable facilities in the onshore petroleum and natural gas gathering and boosting, onshore natural gas processing, LNG import and export equipment, and LNG storage industry segments, CAA section 136(f)(2) requires the EPA to impose and collect WEC on facilities with reported methane emissions, in metric tons, that exceed 0.05 percent of the natural gas sent to sale from or through such facility. To determine the waste emissions threshold from a WEC applicable facility in these industry segments, we are proposing to use equation B-3 under 40 CFR 99.20(c). This equation would multiply the annual quantity of natural gas sent to sale from or through a WEC applicable facility by 0.0005 (*i.e.*, 0.05 percent) and the density of methane (0.0192 metric tons per thousand standard cubic feet) to determine the facility-level

---

[18] Equation B-1 reflects the statutory text at 136(f)(1)(A), which states: "With respect to imposing and collecting the charge under subsection (c) for an applicable facility [in the onshore petroleum and natural gas production and offshore petroleum and natural gas production industry segments], the Administrator shall impose and collect the charge on the reported metric tons of methane emissions from such facility that exceed (A) 0.20 percent of the natural gas sent to sale from such facility…" 42 U.S.C. 7436(f)(1)(A).

[19] Equation B-2 reflects the statutory text at 136(f)(1)(B), which states: "With respect to imposing and collecting the charge under subsection (c) for an applicable facility [in the onshore petroleum and natural gas production and offshore petroleum and natural gas production industry segments], the Administrator shall impose and collect the charge on the reported metric tons of methane emissions from such facility that exceed… (B) 10 metric tons of methane per million barrels of oil sent to sale from such facility, if such facility sent no natural gas to sale." 42 U.S.C. 7436(f)(1)(B).

waste emissions threshold.[20] The EPA notes that certain facilities in the gathering and boosting and natural gas processing industry segments may have zero throughput values using the proposed approach, because these facilities either receive no natural gas, or process or dispose of natural gas received, in a manner that results in sending zero quantities of natural gas to sale. Treatment of these facilities is discussed in section II.B.6. of this preamble.

CAA section 136(f)(3) requires the EPA to impose and collect WEC on WEC applicable facilities in the onshore natural gas transmission compression, onshore natural gas transmission pipeline, and underground natural gas storage industry segments with methane emissions, in metric tons, that exceed 0.11 percent of the natural gas sent to sale from or through such facility. We are proposing that equation B-4 under 40 CFR 99.20(d) be used to calculate the waste emissions threshold from a WEC applicable facility in these industry segments. Using proposed equation B-4 the EPA would multiply the annual quantity of natural gas sent to sale from or through a WEC applicable facility by 0.0011 (*i.e.*, 0.11 percent) and the density of methane (0.0192 metric tons per thousand standard cubic feet) to determine the facility-level waste emissions threshold.[21]

The annual quantity of natural gas sent to sale from or through a facility reported under subpart W is reported in units of thousand standard cubic feet of natural gas per year, while facility methane emissions are reported in metric tons. The EPA is proposing to interpret the industry segment-specific methane intensity thresholds (*i.e.*, 0.20 percent, 0.05 percent, and 0.11

---

[20] Equation B-3 reflects the statutory text at 136(f)(2), which states: “With respect to imposing and collecting the charge under subsection (c) for an applicable facility in [the onshore petroleum and natural gas gathering and boosting, onshore natural gas processing, LNG import and export equipment, and LNG storage industry segments], the Administrator shall impose and collect the charge on the reported metric tons of methane emissions that exceed 0.05 percent of the natural gas sent to sale from or through such facility.” 42 U.S.C. 7436(f)(2).

[21] Equation B-4 reflects the statutory text at 136(f)(3), which states: “With respect to imposing and collecting the charge under subsection (c) for an applicable facility in [the onshore natural gas transmission compression, onshore natural gas transmission pipeline, and underground natural gas storage industry segments], the Administrator shall impose and collect the charge on the reported metric tons of methane emissions that exceed 0.11 percent of the natural gas sent to sale from or through such facility.” 42 U.S.C. 7436(f)(3).

percent) indicated in CAA section 136(f)(1) through (3) to be in units of thousand standard cubic feet of methane of emissions per thousand standard cubic feet of natural gas. This requires reconciliation of methane emissions reported on mass basis and throughput reported on a volumetric basis. Because the waste emission charge is assessed using dollars per metric ton, the amount by which a facility is below or exceeding the waste emissions threshold must ultimately be converted to metric tons. The EPA's proposed approach in equations B-1, B-3, and B-4 calculates facility waste emissions thresholds in metric tons by calculating the volume of gas at the given industry segment-specific methane intensity and then calculating what the mass of that volume would be if it were methane by multiplying by the density of methane (0.0192 metric tons per thousand standard cubic feet at standard temperature and pressure of 60° F and 14.7 psia). This allows the waste emissions threshold to be directly compared to reported metric tons of methane. The proposed approach is mathematically equivalent to, but simpler than, an approach that would convert reported methane emissions to volume, subtract a volumetric waste emissions threshold from that reported volume, and then convert the resulting value back to metric tons methane. The EPA notes that the proposed approach does not require information on the constituents or density of natural gas throughput.

As described in this section of the preamble, we are proposing to calculate waste emissions thresholds at the facility level, using the industry segment-specific methane intensity threshold given in CAA sections 136(f)(1) through (3), and the industry segment throughput reported under part 98, subpart W. The vast majority of facilities report as a single subpart W facility to a single subpart W industry segment. However, as discussed in section II.A. of this preamble, there are a small number of reporters that report as a single subpart W facility to multiple subpart W industry segments. Specifically, for facilities that report to multiple industry segments under a single subpart W facility, we are proposing in 40 CFR 99.20(e) that the facility-level waste emissions threshold is determined as the sum of the waste emissions thresholds for each industry segment that the facility operates within.

The EPA proposes to interpret "natural gas sent to sale" to mean the amount of natural gas sent to sale from a facility in the onshore or offshore petroleum and natural gas industry segments, as reported under subpart W. The EPA proposes to interpret "natural gas sent to sale from or through" to mean the natural gas throughput volume for a facility not in the onshore or offshore petroleum and natural gas industry segments that aligns with the movement of gas through a facility (*e.g.*, gas transported rather than gas received), as reported under subpart W. For facilities in the onshore and offshore petroleum and natural gas production industry segments that do not send natural gas to sale, the EPA proposes to interpret "barrels of oil sent to sale" to mean the quantity of crude oil sent to sale, as reported under subpart W. The EPA is aware of other approaches for calculating "methane intensity" currently in use. These include methodologies that allocate total methane emissions between the petroleum and natural gas value chains and/or use methane rather than natural gas as the throughput value. CAA section 136(f)(1) through (3) refers to reported facility emissions and does not discuss allocation of emissions between petroleum and natural gas. With the exception of production facilities that only produce oil, the statutory text clearly lists natural gas as the throughput value. Further, the proposed approach can be implemented with data currently reported under subpart W, while alternative methane intensity methodologies would require reporting of additional data and increase the burden on the oil and gas industry. For example, an approach that calculates intensity as methane emissions divided by the methane in natural gas throughput would require facilities to collect and report additional information of the methane content of natural gas. An approach that calculates methane intensity as the mass of methane emissions divided by the mass of natural gas would require facilities to collect and report detailed information on all of the constituents of natural gas throughput. Finally, an approach that allocates methane emissions between the petroleum and natural gas value chains based on energy content would require facilities to collect and report detailed data on the constituents and energy content of all hydrocarbon throughput. The EPA therefore believes that the proposed approaches not only follow a plain reading of CAA section 136(f) but are also the best and most reasonable approaches.

The EPA invites comments on our proposed approach for calculating the waste emissions thresholds, particularly our proposed methodology and the underlying assumptions used to calculate the waste emissions threshold in metric tons of methane.

2. Facility Methane Emissions

To determine the total methane emissions from a WEC applicable facility, the EPA proposes to use facility-level methane data as reported under subpart W. On August 1, 2023, the EPA proposed revisions to subpart W consistent with the authority and directives set forth in CAA section 136(h) as well as the EPA's authority under CAA section 114 (88 FR 50282). Facility methane emissions (and any emissions associated with exemptions from the WEC) would be calculated using methods and data required by subpart W for the emissions year covered by the annual WEC filing. For example, for the first year of the WEC (2024 emissions), WEC calculations would be based on the Subpart W requirements effective in 2024, and emissions year 2025 emissions and beyond would be based on Subpart W requirements effective in 2025 or any future revisions. The proposed approaches for calculating waste emissions thresholds and facility methane emissions align with the text of CAA section 136(f). CAA section 136(f)(1) through (3) states that the WEC is to be calculated based "on the reported metric tons of methane emissions from such facility that exceed" specified percentages of the "natural gas sent to sale from such facility" or "natural gas sent to sale from or through such facility" (or for onshore and offshore petroleum facilities that do not send gas to sale, "ten metric tons of methane per million barrels of oil sent to sale from such facility"). The EPA proposes to interpret "reported metric tons of methane emissions" to mean all reported methane emissions from a facility, as reported under subpart W. This value is an input to equation B-6.

3. Facility WEC Calculation

To calculate the amount by which a WEC applicable facility is below or exceeding the waste emissions threshold, the EPA proposes to use equation B-6 of 40 CFR 99.21, in which the facility waste emissions threshold, as determined in 40 CFR 99.20, is subtracted from facility total methane emissions. This calculation results in a value of metric tons of methane, the total facility applicable emissions, that is negative for facilities below the waste emissions threshold and positive for facilities exceeding the waste emissions threshold. The remainder of proposed 40 CFR 99.21 describes how to determine the WEC applicable emissions below or exceeding the waste emissions threshold considering any exemptions that may apply for WEC applicable facilities with total facility applicable emissions greater than 0 mt CH_4 (see section II.D. of this preamble for more information on the exemptions). As discussed in section II.C.2.b. of this preamble, the EPA proposes that WEC applicable facilities receiving the regulatory compliance exemption would be exempted from the WEC, and therefore would have zero WEC applicable emissions. For facilities in the onshore petroleum and natural gas production and offshore petroleum and natural gas production industry segments with total facility applicable emissions greater than 0 mt CH_4, any methane emissions associated with applicable exemptions would be subtracted to calculate WEC applicable emissions. For all other facilities, facility applicable emissions would equal WEC applicable emissions (unless the facility was receiving the regulatory compliance exemption).

The EPA invites comments on the proposed approach for calculating WEC applicable emissions.

4. Netting

The metric tons of methane emissions equal to, below, or exceeding the waste emissions threshold, or WEC applicable emissions, for each WEC applicable facility would be determined as specified in 40 CFR 99.21. CAA section 136(f)(4) allows for the netting of emissions at facilities below the waste emissions thresholds with emissions at facilities exceeding the waste emissions thresholds for facilities under common ownership or control within and across all applicable industry segments identified in 136(d). The EPA proposes to implement netting using equation B-8 at 40 CFR 99.22. Equation B-8 would sum the WEC applicable emissions from all WEC applicable facilities under the common ownership of control of a WEC obligated party to calculate net WEC emissions for that WEC obligated party. The EPA's proposed interpretation of common ownership and control and definition of WEC obligated party are discussed in section II.C. of this preamble.

5. Waste Emissions Charge Calculation

CAA section 136(e) establishes annual $/metric ton charges for all methane emissions from WEC applicable facilities exceeding the waste emissions thresholds. The EPA proposes that a WEC obligated party's total annual WEC, or WEC obligation, would be calculated by multiplying its net WEC emissions, as determined by proposed Equation B-8, by the annual $/metric ton charge. WEC obligated parties with net WEC emissions less than or equal to zero would not have a WEC obligation. WEC obligated parties with net WEC emissions greater than zero would have a WEC obligation and be required to pay a waste emissions charge. WEC obligation calculations would be made for calendar years 2024, 2025, 2026, and each year thereafter as per proposed 40 CFR 99.23.

6. Gathering and Boosting and Processing Facilities with Zero Reported Throughput

The EPA is aware of a small number of gathering and boosting and natural gas processing facilities that emit methane and report under subpart W, but do not send gas to sale. As a result, these facilities would report zero natural gas volumes for the throughput metrics used in the proposed waste emissions threshold calculations. For the gathering and boosting industry segment, these may be facilities that receive natural gas but then reinject it underground or otherwise do not transport any natural gas. For the processing industry segment, these may be fractionation plants that only receive and process natural gas liquids (NGLs) and do not handle natural gas. Under the proposed approach, all reported methane emissions from facilities with no reported throughput would be considered to be exceeding the waste emissions threshold. The EPA notes that the proposed approach is based on a plain reading of the statutory text; because these facilities would have a calculated waste emissions threshold of zero, all reported methane would by default be exceeding the threshold. The EPA requests comment on the treatment of gathering and boosting and natural gas processing facilities that do not report any volumes for the proposed WEC throughput metrics. The EPA requests comment on the proposed approach that would consider all reported methane from these facilities to be above the waste emissions threshold. The EPA also requests comment on an alternative approach that would consider all reported methane emissions from these facilities to be below the waste emissions threshold.

C. Common Ownership or Control for Netting of Emissions

1. EPA Interpretation and Proposal to Implement "Common Ownership or Control" for the Purposes of Part 99

CAA section 136(f)(4) allows WEC applicable facilities under "common ownership or control" to net "emissions by reducing the total obligation to account for facility emissions levels that are below the applicable thresholds within and across all applicable segments" listed in section 136(d) and as defined in subpart W. The EPA interprets this to mean that for all eligible WEC applicable facilities under common ownership or control, the amount of metric tons of methane below the waste emissions thresholds (*i.e.*, the difference between emissions equal to the waste emissions threshold and reported emissions) at facilities below the waste emissions threshold may be used to net against the amount of metric tons of methane emissions that exceed the waste emissions thresholds at facilities above the waste emissions threshold. For the purposes of establishing common ownership or control under CAA section 136(f)(4), the EPA proposes to define "WEC obligated party" in 40 CFR 99.2. The EPA proposes that each subpart W facility would be associated with a single WEC obligated party (though each WEC obligated party may be associated with multiple subpart W facilities), which would be reported under the proposed requirements at 40 CFR 99.7. As discussed in section II.B.4. of this preamble and proposed in 40

CFR 99.22, all WEC applicable facilities associated with a common WEC obligated party would be able to net emissions for the purposes of calculating the WEC obligated party's net emissions and total WEC obligation.

The EPA proposes that the WEC obligated party be the subpart W facility "owner or operator" as reported under 40 CFR 98.4(i)(3). The EPA proposes definitions for facility "owner" and "operator" that are applicable to the offshore petroleum and natural gas production, onshore natural gas processing, onshore natural gas transmission compression, underground natural gas storage, LNG import and export equipment, and LNG storage industry segments at 40 CFR 99.2. The onshore petroleum and natural gas production, onshore petroleum and natural gas gathering and boosting, and onshore natural gas transmission pipeline industry segments each have separate definitions for facility "owner or operator" proposed at 40 CFR 99.2. These proposed definitions are identical to the corresponding definitions in 40 CFR part 98; the EPA proposes that the owner or operator associated with a subpart W facility as reported under 40 CFR 98.4(i)(3) (regarding the list of owners or operators of the facility for the certification of representation of the designated representative) would also be the WEC obligated party for that facility. The EPA believes that the proposed approach for using facility owner or operator for the purpose of defining common ownership or control aligns with a plain reading of the statutory text. CAA section 136(c) states that a charge on methane emissions that exceed the waste emissions threshold shall be imposed and collected "from an owner or operator of an applicable facility." Further, in the context of required revisions to the subpart W methodologies used to calculate methane emissions, CAA section 136(h) states that those revisions must be made to "allow owners and operators of applicable facilities to submit empirical emissions data, in a manner to be prescribed by the Administrator, to demonstrate the extent to which a charge under subsection (c) is owed." Thus, CAA section 136(c) requires the charge to be imposed and collected on a facility owner or operator, and CAA section 136(h) presumes that owners and operators are responsible for submitting empirical data. Furthermore, since the list of owners or operators for each facility is directly reported under 40 CFR 98.4(i)(3), an established program at the time that Congress drafted CAA section 136, the EPA proposes that under the best reading of the statutory text, the facility owner or operator would be used as the entity for establishing common ownership or control of subpart W facilities within and across all applicable subpart W industry segments.

Although the EPA believes that the owner or operator approach is the most appropriate for netting under WEC, we seek comment on an alternative approach that would use the parent company of a facility's owner or operator for the WEC obligated party and determining common ownership or control of facilities. For each subpart W facility, the facility owner or operator and parent company are reported under 40 CFR 98.4(i)(3) and 40 CFR 98.3(c)(11), respectively. The parent company represents the highest-level company based in the United States with an ownership interest in the facility. For parent company reporting, the percent ownership in the facility is also reported under 40 CFR 98.3(c)(11). Because a parent company has an ownership interest in a subpart W facility, multiple facilities may be said to be owned by the same parent company and might also be considered as being under common ownership or control of that parent company. So, one difference between using the owner or operator rather than a parent company for establishing common ownership or control is the number of facilities that may be brought under common ownership or control in each approach. For most facilities, the reported owner or operator is a subsidiary of the reported parent company. A single parent company may have multiple different owners or operators (*i.e.*, subsidiaries) associated with facilities within and across subpart W industry segments. For example, an onshore petroleum and natural gas production facility and onshore natural gas processing facility owned by the same parent company may each have a different owner or operator. The number of "common" facilities is usually higher when the parent company is used, and lower when the owner or operator is used. The parent company approach would therefore provide a broader interpretation of common ownership or control relative to use of owner or operator. However, it is important to note that at the time CAA section 136 was enacted in 2022, the term "common ownership or common control" was a term used in the subpart W regulations. Under the subpart W regulations, the EPA has used the term "common ownership or control" to refer to the owner or operator, not to the parent company. Congress was likely aware of this definition when it enacted section 136. Therefore, the EPA is proposing to use facility owner or operator for the purpose of establishing common ownership or control based on a plain reading of CAA section 136(c), and believes that this is the better reading of the text in context with subpart W. However, the EPA requests comment on both the proposed approach using facility owner or operator and on an alternative approach using facility parent company for determining common ownership or control of WEC applicable facilities.

In some cases, a WEC applicable facility may have multiple owners or operators reported under 40 CFR 98.4(i)(3). In these situations, the EPA proposes that the facility owners or operators would designate one of the owners or operators as the WEC obligated party for that facility, as proposed in 40 CFR 99.4. Under the proposed approach, the process for selection of the WEC obligated party at facilities with multiple owners or operators would be similar to the approach for selecting a designated representative under 40 CFR part 98. This process would require selection of a single WEC obligated party for the facility by an agreement binding on each of the owners or operators associated with the facility. The proposed approach for facilities with multiple owners allocates all facility-level methane emissions below or exceeding the waste emissions thresholds to a single WEC obligated party. We request comment on the proposed approach of allocating all methane emissions below or exceeding the waste emissions thresholds from a facility with multiple owners or operators to a single WEC obligated party. We request comment on other approaches that could be used to allocate emissions to owners or operators at facilities with multiple owners or operators. We request comment on the proposed approach of requiring the group of facility owners or operators to determine which owner or operator is the

WEC obligated party, and alternative approaches for designating the WEC obligated party, at facilities with multiple owners or operators.

The EPA also evaluated an approach that would allocate facility methane emissions below or exceeding the waste emissions thresholds at facilities with multiple owners to parent companies based on their reported percent ownership in the facility. Some subpart W facilities with multiple owners have parent companies with very small (*i.e.*, less than one percent) equity shares. The minority owners may include individuals and small oil and gas companies with no operational control over the facility. Allocating methane emissions below or exceeding the waste emissions thresholds based on facility ownership would expose a larger number of individuals and small companies to potential WEC obligations. We note that allocating methane emissions from facilities with multiple owners to each owner based on facility ownership would only be possible using a parent company approach and not using the proposed owner or operator approach because GHGRP reporting does not currently include data on owner or operator facility equity share or include direct linkages between owners or operators and parent companies that could be used to assign facility ownership percentages to owners or operators. There may also be situations in which the facility owner or operator is a third-party operator with no ownership in the facility either directly or through their parent company.

We request comment on an alternate approach that would allocate methane emissions to parent companies using percent ownership in the facility as well as other possible allocation methodologies for facilities with multiple parent companies. We request comment relevant to understanding other appropriate approaches for allocating emissions from a facility with multiple parent companies or owners or operators to a single WEC obligated party or multiple WEC obligated parties. For example, how are costs allocated at such facilities, and are they usually shared by parent companies (*e.g.*, based on percent ownership in the facility), entirely borne by the facility operator, or does cost sharing vary based on facility-specific contractual agreements?

2. Facilities Eligible for the Netting of Emissions

The EPA's proposed implementation of CAA section 136(f)(4) would define which types of applicable subpart W facilities are eligible to net emissions. We propose to establish netting eligibility criteria based on a facility's total reported subpart W GHG emissions, status in relation to the regulatory compliance exemption, and overall regulated status under the GHGRP. In our proposed approach to netting, we chose interpretations which were the most consistent with a plain reading of the CAA, as well as the most transparent and straightforward to implement. As described in more detail in the following sections, our approach assumes that if a facility's emissions are not subject to the WEC, either because the facility is not a WEC applicable facility, or because a WEC applicable facility receives the regulatory compliance exemption, that facility's emissions do not factor into the netting of emissions for a WEC obligated party. In other words, only WEC applicable facilities may net, and only WEC applicable emissions may be netted. As will be explained further in section II.C.2.a. of this preamble, we believe this interpretation is consistent with CAA section 136(f)(4) "the Administrator shall allow for the netting of emissions by reducing the total obligation to account for facility emissions levels that are below the applicable thresholds within and across all applicable segments identified in subsection (d)," since the reference to "applicable thresholds" and "applicable segments", which reflect other subsections under CAA section 136, implies that only WEC applicable emissions should be considered in the netting calculation. We note that for applicable facilities with unreasonable delay or plugged well exemptions, under the proposal, emissions associated with these exemptions would be removed from any emissions exceeding the waste emissions threshold prior to netting calculations.

a. Facilities Required to Report to GHGRP and That Have Subpart W Emissions Greater Than 25,000 Metric Tons of CO_2e

In accordance with CAA section 136(c) and the proposed definition of "WEC applicable facility" in 40 CFR 99.2, we are proposing that subpart W facilities that have subpart W emissions greater than 25,000 mt CO_2e are eligible for netting, with the exception of those that are receiving the regulatory compliance exemption (as discussed in section II.D.2. of this preamble). Facilities that report less than 25,000 mt CO_2e under subpart W are not subject to the WEC, and the EPA proposes that such facilities would not be eligible for netting. These types of facilities are discussed in greater detail in section II.C.2.c. of this preamble. The EPA's proposed approach follows what the agency considers to be the best reading of the plain text of, and the relationship between CAA sections 136(d), 136(c), and 136(f) (which includes subsections 136(f)(4) and 136(f)(1)-(3)). The following sections will provide an overview of the relevant statutory text, and the corresponding basis for the EPA's belief that only WEC applicable facilities may net, and only WEC obligated emissions may be netted, under CAA section 136(f)(4).

CAA section 136(d) introduces the nine industry segments within which all subpart W facilities must fall in order to be evaluated for WEC applicability. Importantly, facilities within these segments are "applicable facilities", per CAA section 136(d), but they are not necessarily "WEC applicable facilities", subject to possible WEC obligation, unless they report over 25,000 mt CO_2e per year under subpart W. CAA section 136(c) clarifies this point. Specifically, CAA section 136(c) requires the Administrator to impose and collect a charge on the owner or operator "of an applicable facility that reports more than 25,000 metric tons of carbon dioxide equivalent of greenhouse gases emitted per year pursuant to subpart W". Thus, building upon the CAA section 136(d) definition, CAA section 136(c) establishes that only facilities which both fall within one or more of the nine CAA section 136(d) industry segments *and* report more than 25,000 mt CO_2e under subpart W are subject to the WEC program. For clarity, in this rulemaking the EPA refers to these facilities as "WEC applicable facilities".

CAA section 136(f), which is entitled "Waste Emissions Threshold", includes a series of subsections under this heading. Subsections 136(f)(1)-(3) illustrate the meaning of "waste emissions threshold" in this context, and explain that these are actually a series of thresholds which determine when and how to impose a charge on methane emissions from WEC applicable facilities, depending on which industry segment or segments they fall under. Specifically, the nine CAA section 136(d) industry segments are categorized into four groups, and a waste emissions threshold is applied to each of the four. CAA section 136(f)(1) covers offshore and onshore petroleum and natural gas production (industry segments (1) and (2) under CAA section 136(d)), and further divides this category depending on whether or not natural gas is sent to sale: "With respect to imposing and collecting the charge under subsection (c) for an applicable facility in an industry segment listed in paragraph (1) or (2) of subsection (d), the Administrator shall impose and collect the charge on the reported metric tons of methane emissions from such facility that exceed (A) 0.20 percent of the natural gas sent to sale from such facility; or (B) 10 metric tons of methane per million barrels of oil sent to sale from such facility, if such facility sent no natural gas to sale."[22]

CAA sections 136(f)(2) and (3) follow the same model: section 136(f)(2) establishes thresholds for nonproduction petroleum and natural gas systems (industry segments (3), (6), (7), and (8) under section 136(d)[23]), and imposes a charge on "the reported metric tons of methane emissions that exceed 0.05 percent of the natural gas sent to sale from or through such facility"[24]; and section 136(f)(3) establishes thresholds for natural gas transmission (industry segments (4), (5), and (9)[25]) and imposes a charge on "the reported metric tons of methane emissions that exceed 0.11 percent of the natural gas sent to sale from or through such facility."[26] But each industry-specific threshold is introduced in the same way: "With respect to *imposing and collecting the charge under subsection (c) for an applicable facility in an industry segment listed*

---

[22] 42 U.S.C. at 7436(f)(1).

[23] Specifically: (3) onshore natural gas processing; (6) liquefied natural gas storage; (7) liquefied natural gas import and export equipment; and (8) onshore petroleum and natural gas gathering and boosting.

[24] *Id.* at section 7436(f)(2).

[25] Specifically, (4) onshore natural gas transmission compression; (5) underground natural gas storage; and (9) onshore natural gas transmission.

[26] *Id.* at section 7436(f)(3).

in paragraph (x) of subsection (d), [charges shall be imposed as follows]". Following this plain text, it is clear that the CAA section 136(f) waste emission thresholds apply *only to WEC applicable facilities* – that is, facilities within one or more of the nine WEC industry segments listed in CAA section 136(d) which emit more than 25,000 mt per year CO_2e under subpart W, and thus may be subject to charge under CAA section 136(c).

Finally, in the netting provision itself, CAA section 136(f)(4), states that "in calculating the total emissions charge obligation for facilities under common ownership or control, the Administrator shall allow for the netting of emissions by reducing the total obligation to account for facility emissions levels that are below the applicable thresholds within and across all applicable segments identified in subsection (d)". As noted above, the EPA is proposing that this netting provision applies to WEC applicable facilities and WEC applicable emissions only, for three compelling reasons.

First, the EPA believes that per the best reading of the statute, the term "applicable thresholds" refers to the waste emission thresholds outlined in CAA section 136(f)(1)-(3). This is important because, as noted above, the waste emissions thresholds apply *only* to WEC applicable facilities – they determine whether, and how, a charge shall be imposed on methane emissions from a facility which has already been triggered into the WEC program by virtue of its 25,000 mt per year CO_2e in subpart W. The thresholds do not apply to facilities which emit fewer than 25,000 mt per year of CO_2e under subpart W, because under CAA section136(c), no charge may be imposed or collected on such facilities. Facilities which emit less than 25,000 mt per year of CO_2e under subpart W may emit any amount of methane, but these methane emissions are not WEC applicable emissions: they cannot be evaluated according to the waste emissions thresholds, and they cannot be considered to fall either above or below these thresholds. Thus, in "*account[ing] for facility emissions levels that are below the applicable thresholds*", the EPA understands that it must account for WEC applicable emissions from WEC applicable facilities which fall below the waste emissions thresholds, and produce a negative value under Equation B-6 (see above at section II.B.3.).

As previously stated, EPA's conclusion that the term "applicable thresholds" in CAA section 136(f)(4) refers to the waste emissions thresholds outlined in CAA section 136(f)(1)-(3) is supported by both the text and structure of the statute. First, the structure of the statute strongly supports the presumption that CAA section 136(f)(4) refers to netting based on a facility's relationship to the waste emissions thresholds because CAA section 136(f)(4) appears as part of CAA section 136(f), under the "waste emissions threshold" heading, and immediately following CAA section 136(f)(1)-(3)'s establishment of the specific waste emissions thresholds for each industry segment. It follows that CAA section 136(f)(4)'s reference to "applicable thresholds" refers to these industry segment-specific requirements, and accordingly "applicable segments" refers to the industry segments identified in CAA section 136(f)(1)-(3).

A close reading of the text also strongly supports our presumption regarding the waste emissions thresholds, because CAA section 136(f)(4) refers to facility emissions levels that are "below the *applicable thresholds*," plural. The use of the plural, and the use of the term "applicable," both indicate that Congress was referring here to the multiple waste emissions thresholds introduced in CAA sections 136(f)(1) through (3), which specifically and separately apply to WEC applicable facilities within various subsets of industry segments, defined in CAA section 136(d). Again, these separate thresholds *only* apply to WEC applicable facilities, which emit over 25,000 tons per year of CO_2e per year.

In addition to the "applicable thresholds" question, the EPA believes that Congress's use of the term "applicable segments" in stating that EPA may "redu[ce] the total obligation to account for facility emissions levels that are below the applicable thresholds *within and across all applicable segments identified in subsection (d)*," is significant here. While CAA section 136(d) introduces the nine relevant "industry segments" within which all WEC applicable facilities must fall, CAA section 136(f)(4) classes these segments into four groups, and is the only provision to use the term “applicable segments”. As noted above, CAA section 136(f) establishes a set of requirements determining when and how to impose a charge on those facilities triggered into the program, depending on their industry segment and the amount of methane they emit. It follows that CAA section 136(f)(4)’s reference to “applicable thresholds” refers to these four group-specific thresholds, and “applicable segments” refers to the nine segments within the four segment groups. In other words, each group of segments constitutes the “applicable” segments to their corresponding applicable threshold. This is important, again because the four groups laid out under CAA section 136(f) include only WEC applicable facilities.

Finally, Congress’s statement that netting shall be employed “in calculating the total emissions charge obligation for facilities under common ownership or control”, further indicates that only WEC applicable facilities may be netted. Logic indicates that only WEC applicable facilities, with WEC applicable emissions, would be relevant to a determination of total emissions charge obligation. As regards the WEC program, WEC obligated parties are concerned with methane emissions for the WEC applicable facilities for which they are responsible – not various other subpart W facilities for which a WEC charge can never be imposed. Accordingly, the EPA believes that under the best reading of this provision WEC obligated parties may net WEC applicable methane emissions between facilities in different segments, as long as all facilities are WEC applicable facilities.

b. Facilities With Subpart W Emissions Greater Than 25,000 Metric Tons of CO_2e That Are Receiving the Regulatory Compliance Exemption

The EPA proposes that during such time that a facility receives the regulatory compliance exemption, that facility would have zero WEC applicable emissions and thus would not be able to participate in the netting of methane emissions across facilities under common ownership or control of a WEC obligated party. The EPA’s proposed approach is based on a plain reading of the statutory text, and follows the same reasoning outlined in section II.C.2.a. of this preamble, which explains that under the best reading of the text, only WEC applicable facilities may net.. This section will further expand upon EPA reasoning that only WEC applicable emissions may be netted, and clarify this point for purposes of the regulatory compliance exemption.

CAA section 136(f)(6)(A) states that "[c]harges shall not be imposed pursuant to subsection (c) on an applicable facility that is subject to and in compliance with methane emissions requirements pursuant to subsections (b) and (d) of section 111" if specific criteria are met (these criteria are discussed in section II.D.2. of this preamble). The EPA's interpretation of the regulatory compliance exemption is that, for a WEC applicable facility meeting the exemption criteria, the entire facility is exempted, and therefore the facility does not generate WEC-applicable emissions. In order to net, facilities must be WEC applicable facilities (they must emit over 25,000 CO_2e per year under subpart W) and they must also generate WEC applicable emissions (methane emissions below or above the WEC emissions thresholds *that are subject to charge*.) Again, this follows from the text. Section 136(f)(4) applies "in calculating the total emissions charge obligation" only. Emissions which are subject to an exemption are by definition not subject to charge. WEC applicable emissions are only those emissions subject to charge under section 136(c). Because, under the proposed approach WEC applicable facilities with the regulatory compliance exemption would have zero WEC applicable emissions, these facilities would by default not be able to participate in netting (*i.e.*, they would have no emissions to net). The proposed approach of facilities with the regulatory compliance exemption having zero WEC applicable emissions allows for the practical implementation of the exemption within the broader framework of the proposed WEC calculations. Assigning exempted facilities zero WEC applicable emissions ensures that charges shall not be imposed on these facilities without interfering with netting calculations or removing facility-specific reporting elements necessary for WEC implementation. Such facilities would continue to be included in WEC filings reported under part 99 as long as they remain WEC applicable facilities. Further, if such facilities fall out of compliance such that the regulatory compliance exemption no longer applies and they again generate WEC applicable emissions, such facilities would again be included in netting.

The EPA notes that under the proposed approach, facilities with emissions below the waste emissions threshold would not receive the regulatory compliance exemption (see discussion in section II.D.2.f. of this preamble), and thus these facilities would always have WEC applicable emissions and would be able to participate in netting across facilities under common ownership or control.

The EPA requests comment on the proposed approach in which WEC applicable facilities receiving the regulatory compliance exemption would have zero WEC applicable emissions. The EPA requests comment on other options for WEC applicable facilities receiving the regulatory compliance exemption and their treatment in the context of netting.

c. Exclusion of Facilities Reporting 25,000 or Fewer Metric Tons of CO_2e to Subpart W of Part 98

Per CAA section 136(c), the WEC shall only be imposed on owners or operators of applicable facilities that report more than 25,000 mt CO_2e under subpart W. A large number of facilities that report under the GHGRP have subpart W emissions below 25,000 mt CO_2e. A part 98 subpart W facility is generally allowed to cease reporting or "offramp" due to meeting either the 15,000 mt CO_2e level or the 25,000 mt CO_2e level for the number of years specified in 40 CFR 98.2(i) based on the CO_2e reported, as calculated in accordance with 40 CFR 98.3(c)(4)(i) (*i.e.*, the annual emissions report value as specified in that provision). Some facilities have dropped below 25,000 mt CO_2e in total reported emissions to part 98 and are continuing to report while on the reporting offramp. Other facilities report emissions under multiple subparts (*e.g.*, subpart W and subpart C) and have total emissions equal to or greater than 25,000 mt CO_2e across both subparts, but subpart W emissions below 25,000 mt CO_2e. The latter category includes processing plants, transmission compressor stations, underground storage facilities, LNG storage facilities, and LNG import and export facilities that report their combustion emissions under subpart C. Many of these facilities have total GHGRP emissions exceeding 25,000 mt CO_2e, but subpart W emissions that alone fall below this threshold.

We are proposing that subpart W facilities with subpart W emissions equal to or below 25,000 mt CO_2e are not WEC applicable facilities and are therefore excluded from netting. This proposed approach aligns with a plain reading of the requirement in CAA section 136(c) that only applicable facilities with subpart W emissions exceeding 25,000 mt CO_2e are subject to the WEC – facilities below this threshold are not subject to the WEC and therefore do not generate WEC applicable emissions and are not able to net emissions.

d. Exclusion of Facilities Not Required to Report to the GHGRP

Per CAA section 136(c) and (d), CAA section 136(f)(4), and the proposed definition of "WEC Applicable Facility" in 40 CFR 99.2, which reflects the statutory text at CAA section 136(d), we are proposing that facilities that are not required to report to the GHGRP, and thus are not WEC applicable facilities, would not be eligible for netting. Again following the reasoning outlined in section II.C.2.a. of this preamble, the EPA's proposed approach is based on a plain reading of CAA section 136(f)(4), which states that netting is allowed within and across the nine subpart W industry segments identified in CAA section 136(d); section 136(d), which states that "applicable facility(ies)" are facilities within industry segments "as defined in subpart W"; and section 136(c), which states that the WEC is only applicable to subpart W facilities that report more than 25,000 CO_2e per year. Following the plain text, only facilities subject to subpart W may be evaluated as possible WEC applicable facilities, and only WEC applicable facilities (subpart W facilities emitting over 25,000 CO_2e) can have WEC applicable emissions that may be subject to charge. As explained in section II.C.2.a. of this preamble, only WEC applicable facilities may net, and only WEC applicable emissions may be netted. Further, CAA section 136(c) states that the WEC is only applicable to certain facilities that report under subpart W of the GHGRP.

D. Exemptions to the Waste Emissions Charge

1. Exemption for Emissions From Eligible Delays in Environmental Permitting Under CAA Section 136(f)(5)

CAA section 136(f)(5) establishes an exemption for emissions resulting from delay in environmental permitting by stating, “Charges shall not be imposed pursuant to paragraph (1) on emissions that exceed the waste emissions threshold specified in such paragraph if such emissions are caused by unreasonable delay, as determined by the Administrator, in environmental permitting of gathering or transmission infrastructure necessary for offtake of increased volume as a result of methane emissions mitigation implementation.”

This provision would exempt from the charge certain emissions occurring at facilities in the onshore and offshore production segments. Paragraph (1) referenced in the exemption refers to CAA section 136(f)(1), which establishes the waste emissions threshold for applicable facilities in the production sector, as discussed in section II.B. of this preamble. The exemption is limited to emissions occurring as a result of certain delays in permitting of gathering or transmission infrastructure necessary for offtake of increased volume as a result of methane emissions mitigation implementation. Infrastructure necessary for offtake would include gathering and transmission pipelines and compressor stations. Increased volume as a result of methane emissions mitigation implementation would include increased natural gas amounts available for transport that would have otherwise been emitted.

a. Emissions Eligible for the Permitting Delay Exemption

Given the complexity of defining and determining “unreasonable delay” related to environmental permitting, the EPA is proposing a simplified approach of establishing a set of four criteria for applying the unreasonable delay exemption established by CAA section 136(f)(5). These criteria would only apply in the context of determining eligible emission exemptions for the implementation of CAA 136(f)(5) and this proposed rulemaking; they are not intended to speak to the reasonableness of a permitting delay in any other context. The EPA understands that the issue of what constitutes an unreasonable delay is multi-faceted and may be quite different under different factual circumstances. At the same time, the EPA believes it is important in the context of this program to propose a definition that is both consistent with the statutory charge and administrable within the capabilities of the EPA. With those caveats in mind, the EPA proposes the following four criteria for implementing this exemption: (1) the facility must have emissions that exceed the waste emissions threshold; (2) neither the entity seeking the exemption, nor the entity responsible for seeking the permit, may have contributed to the delay; (3) the exempted emissions must be those (and only those) resulting from the flaring of gas that would have been mitigated without the permit delay, and the flaring that occurs must be in compliance with all applicable local, state, and Federal regulations regarding flaring emissions; and (4) a set period of months must have passed from the time a submitted permit application was determined to be complete by the applicable permitting authority.

The EPA believes this approach meets the Congressional intent of this exemption while creating a program that can be implemented annually allowing for collection of WEC in a timely manner. The proposed approach is intended to reduce burden on the companies and government compared with an approach that would not specify a timeframe or other criteria but would rely on decisions made on a case-by-case basis to determine whether the timing and other circumstances of an individual permitting action constitutes an unreasonable delay. We note, however, that these criteria outlined above, including the timeframe, are proposed for the purpose of defining the emissions eligible for an exemption for the purposes of the implementation of CAA 136(f)(5) and this proposed rulemaking only and are not applicable for defining an unreasonable delay outside of this context. The criteria introduced in this section do not apply to the determination of unreasonable delay for purposes of the National Environmental Policy Act (NEPA), the Administrative Procedure Act (APA), or any other law involved in permitting processes or any other agency actions. In particular, the timeline criterion should not be considered applicable or informative to the determination of unreasonable delay in any context other than determining emission exemptions for the implementation of CAA 136(f)(5) and this proposed rulemaking.

The first criterion, that the facility must have emissions that exceed the waste emissions threshold, is based on CAA 136(f)(5), which states that “charges shall not be imposed pursuant to paragraph (1) on emissions that exceed the waste emissions threshold specified in such paragraph if such emissions are caused by unreasonable delay.” A straightforward reading of this language limits the exemption to emissions exceeding the waste emissions threshold. In addition, since charges would not be imposed on emissions below the threshold, an exemption is unnecessary in cases where facility emissions are below the threshold. The EPA proposes that emissions from facilities that are below the waste emissions threshold would not be exempted. The EPA proposes that for facilities that exceed the waste emissions threshold, emissions eligible for the permitting delay exemption would be subtracted from the facility emissions that exceed the waste emissions threshold. The exempted emissions would not be used to reduce emissions totals below the threshold (*i.e.,* the lowest possible WEC applicable emissions for a facility with the exemption would be zero).

The second criterion relates to responsiveness on the part of the production sector WEC applicable facility reporting emissions caused by a delay in gathering or transmission infrastructure and the gathering or transmission infrastructure permit applicant: neither the entity potentially eligible for the exemption (*i.e.,* a WEC applicable facility in the onshore or offshore production sector) nor the entity seeking the environmental permit (*e.g.,* an entity seeking a permit for gathering or transmission infrastructure) has contributed to the delay in permitting.

The EPA is proposing that contributions to the delay by either the production entity potentially eligible for the exemption or the entity seeking the environmental permit would be determined based upon the timeliness of response to requests for additional information or modification of the permit application. Delays in response exceeding the response time requested by the permitting agency, or requested by the relevant production or gathering or transmission infrastructure entity seeking the permit, or responses that exceed 30 days from the request if no specific response time is requested, would be considered to contribute to the delay in processing the permit application. Note that this proposed determination of what would constitute a delay eligible for the exemption in environmental permitting would be specific solely to implementation of CAA section 136(f)(5) and this proposed rulemaking for part 99, and would not necessarily be applicable to any other section of the CAA, or any permitting program administered by the EPA or by a state or local permitting authority.

The third criterion is that the exempted emissions must be those resulting from the flaring of gas that would have been mitigated without the permit delay – and that exempted emissions must be in compliance with all applicable local, state, and Federal regulations regarding flaring emissions. The EPA believes that this approach reasonably follows from the text of section 136(f)(5), which exempts emissions caused by unreasonable delay in the permitting of "gathering or transmission infrastructure *necessary for offtake of increased volume as a result of methane emissions mitigation implementation*."[27] Following this statutory directive, the EPA is proposing that exempted emissions are flaring emissions which (1) would otherwise be captured in accordance with applicable regulations but (2) are not captured due to a delay in the permitting necessary for offtake. It is anticipated that operations seeking the exemption could include oil production sites planning to send gas to sale, rather than flaring the emissions, or facilities that produce natural gas, condensate or natural gas liquids and that expand operations and are flaring gas because a pipeline is not yet available. Only flaring emissions caused by the unreasonable delay in permitting, and occurring in compliance with all applicable regulations, would be exempt. Other emissions occurring at the wellsite would not be exempt because they are not associated with the delay or because they do not occur in compliance with applicable regulations. For example, fugitive emissions from leaks would occur with or without the delayed

---

[27] 42 U.S.C. 7436(f)(5) (emphasis added).

infrastructure, and venting emissions is widely restricted due to Federal, state, or local regulations on venting.

Flaring emissions that occur as a result of flaring that is not in compliance with applicable regulations are ineligible for the exemption. This approach accords with the text of section 136(f)(5), which states that the exemption is for emissions occurring as a result of unreasonable delay in permitting required for the build out of infrastructure "necessary for offtake of increased volume *as a result of* methane emissions mitigation."[28] Regulations limiting flaring and venting will result in an increased volume of gas that must be captured and transmitted, compared with a circumstance without methane emissions mitigation implementation, in which gas is flared or vented on site. Thus, the EPA understands that this provision is designed to exempt flaring done in compliance with regulations, where sources are prepared to capture gas but cannot yet do so due to lack of offtake infrastructure. However, a delay in permitting does not allow exemption from other applicable local, state, and Federal regulations regarding flaring. Thus, the flaring emissions exempt under 136(f)(5) cannot exceed flaring emissions allowable under other applicable local, state, and Federal regulations.

The fourth criterion is that an eligible "unreasonable delay" would be a delay that exceeds a set period of months specified in the final rule. The EPA's current assessment is that this time period would likely fall somewhere between 30 and 42 months from the date that a submitted permit application was determined to be complete by the relevant permitting authority. This time period is not tied to the timing of the WEC; a facility that meets all four criteria would be eligible for the exemption in the first year of the WEC if the time period requirement has been met. The relevant permitting authority could be the United States Federal Energy Regulatory Commission (FERC), or other federal, state or local agencies that issue environmental permits. The environmental permitting process can require multiple steps including, but not limited to: the entity preparing and submitting a permit application; the entity responding to comments with

---

[28] 42 U.S.C. 7436(f)(5)

supporting information; the regulatory agency preparing a draft permit; public comment; and preparation and issuance of the final permit. Target dates for permit actions can vary by regulatory agency and depend, for example, on whether the relevant permit is for a new or existing source, or whether the action is a major or minor modification. The EPA is proposing to set a timeframe for unreasonable delay that is not specific to particular permitting actions or agency timelines.

The EPA is proposing to set a timeline somewhere in the range of 30 to 42 months, with the default to be specified in the final rule after consideration of comments received. This preliminary range is based on the EPA's current understanding of timelines for oil and gas permitting across Federal agencies. In particular, the preliminary range is informed by the EPA's review of data made available through the Federal Permitting Improvement Steering Council (FPISC) through Title 41 of the Fixing America's Surface Transportation Act (FAST-41). The "Recommended Performance Schedules for 2020" released by FPISC contains data for the Federal review and permitting of 18 pipeline projects under the FAST-41 program.[29] For these projects, the mean time from receipt by FERC of a complete application to the issuance of a certificate of public convenience and necessity for interstate natural gas pipelines was 23 months, with three of the 18 projects (17 percent) exceeding 30 months. Criteria for inclusion in the FAST-41 program include projects that are considered likely to require investment exceeding $200,000,000 and that do not qualify for abbreviated review under applicable law; or projects of a size and complexity that the FPISC determines are likely to benefit from inclusion.[30] On this basis, the EPA believes the FAST-41 dataset may be a conservative population (*i.e.*, require

[30] Federal Permitting Improvement Steering Council, "FAST-41 Fact Sheet." Federal Infrastructure Permitting Dashboard. September 13, 2022. *https://www.permits.performance.gov/documentation/fast-41-fact-sheet*. Accessed August 28, 2023.

more complex environmental review and permitting) when compared to the total of all gathering or transmission infrastructure projects.

The proposed range of 30 to 42 months also takes into account the 2023 Fiscal Responsibility Act, which set a limit under the National Environmental Policy Act of 1 year for completion of an Environmental Assessment and 2 years for completion of an Environmental Impact Statement unless extended by the lead agency in consultation with the applicant or project sponsor. However, the amount of time necessary to complete an Environmental Assessment or Environmental Impact Statement will vary depending on the specific agency action at issue, and this proposed timeline is not intended to reflect a determination of the reasonable length of a time necessary to complete such analysis in any specific instance. For projects requiring approval or permitting from a federal agency, completion of an Environmental Assessment or Environmental Impact Statement must occur prior to the agency taking a final agency action. Additional steps in the process that must be completed following completion of review under NEPA may add several months to the overall timeframe (*e.g.,* convening of FERC to approve or deny a certificate of public convenience and necessity).

We note that all four criteria must have been met for the EPA to determine that for the purpose of this exemption, emissions were caused by an unreasonable delay. No single factor, including timing, would be determinative as to whether a delay unreasonable in the context of this exemption. We are not assessing whether a delay of any particular period of months alone (i.e., in the absence of the other three criteria) should be considered unreasonable in the context of this exemption, and we are not assessing the reasonableness of a particular timeframe or collection of conditions outside of the context of this exemption specific to CAA section 136. An assessment of reasonableness in any other context depends on the circumstances specific to that context, which can vary considerably and there is no straightforward way to determine whether a delay is reasonable or unreasonable that applies to all contexts. We note that using the approach of requiring four criteria to be met may not fully capture case-by-case circumstances and therefore may not always produce the same determination as a more holistic evaluation would. We have proposed this approach of using four criteria, including one specifying a set timeframe, for the purposes of this exemption only to simplify this process, and for clarity and administrability; we understand that longer permitting timeframes are often not unreasonable in other contexts.

As an alternative to specifying that an “unreasonable delay” requires a set period of months to have elapsed since a permit application is deemed complete (in addition to the other three criteria), the EPA considered adopting a case-by-case process for determining whether an unreasonable delay in permitting has occurred. Under such an approach, the exemption for unreasonable delay could only be utilized by a facility that has obtained a facility-specific finding of unreasonable delay from the EPA. The EPA would evaluate documentation provided by a WEC obligated party to determine if there was an unreasonable delay. A WEC obligated party would not exclude emissions it claimed are associated with the unreasonable delay exemption until such time as it obtained an unreasonable delay finding from the EPA. In other words, emissions associated with a claim of unreasonable delay for which there is not an unreasonable delay determination by the EPA could not be subtracted from the emissions totals in the initial WEC filing. If the EPA subsequently were to make such a finding, the EPA would authorize a refund in accordance with its determination. Documentation could include information such as that currently proposed to be reported, such as information on mitigation activities, permitting timing, and regulations relevant to flaring, and information currently proposed as recordkeeping requirements, such as detailed records on responsiveness, in addition to other documentation specific to the relevant gathering or transmission infrastructure environmental permit, such as on the expected timing for the specific environmental permit(s) sought and the type of information that would be needed to support the claim that the permit(s) is delayed beyond what could be considered a reasonable timeframe. A case-by-case approach for reviewing and approving the unreasonable delay exemption would help ensure the validity of individual claims, and ensure that all applicable waste emissions for each facility are subject to charge, as directed by Congress. However, the EPA decided not to propose such an approach due to the time and resource burden that would be required to administer such a process, for both covered entities and for the EPA. We expect that many types of permitting situations can arise, with many permutations. If industry were required to demonstrate unreasonable delay on a case-by-case basis, the EPA anticipates this review process would result in uncertainty for industry and could lead to a significant backlog, thus making the annual calculation of the WEC unduly burdensome. Therefore, in the interest of simplicity and making the exemption available in an efficient manner and without significant additional burden, the EPA proposes to rely on this threshold of a set period of months, in addition to the three other criteria, which can be more easily applied without detailed investigation. The EPA notes that in its verification process under the proposed approach it would review the submitted documentation to confirm that requirements are met for each facility reporting an unreasonable delay, and facilities determined to have not met the requirements would be required to submit any additional owed WEC obligation and relevant penalties.

Section II.D.1.c. below details the reporting requirements for this exemption which provide information necessary for verification of the exemption eligibility and exempted emission quantities.

We seek comment on these four criteria, each required to be met to determine emissions eligible for the unreasonable delay exemption. We seek comment on the use of responsiveness to requests regarding permitting by the permit applicant or the production segment facility experiencing delayed mitigation as a criterion. We seek comment on the use of 30 days to assess responsiveness where a specific timeframe for response is not provided. We seek comment on the criterion that exempted emissions are those resulting from flaring of gas that would have been mitigated without the permit delay, and that only flaring emissions that are in compliance with applicable regulations are eligible. We seek comment on the appropriate timeframe to be used as part of the four-factor test proposed today – specifically, what would be the best period of time (even if it is below or above the 30-42-month range EPA is leaning towards now) to use as a trigger for assessing unreasonable delay for the purposes of CAA section 136(f). We seek comment on the proposed use of one timeframe for eligibility versus an approach that might use different time frames for different types of permits. We seek comment on whether specific types of delays should be eligible or ineligible, which could be included as additional criteria or used in place of all or some of the proposed criteria. For example, we seek comment on whether we should establish that delays due to litigation regarding pipeline development are ineligible. We also seek comment on an alternative case-specific approach in which each facility with exempt emissions from unreasonable delay would provide additional facility- and permit-specific information, and in which the exemption would not be granted unless approved by the EPA. Finally, we seek comment on whether EPA should include additional criteria when defining the unreasonable delay exemption. For example, we seek comment on whether, in addition to the four criteria, we should add a criterion that entities show the flaring is necessary (i.e., other options for beneficially use or reinject of gas were infeasible).

b. Calculation of Emissions Resulting From an Unreasonable Delay

Through the provisions proposed at 40 CFR 99.32, the EPA is proposing that exempted emissions are flaring emissions caused by the delay. We are proposing that exempted flaring emissions are the methane emissions (or a subset of the methane emissions) from flaring reported under subpart W.

To calculate the exempted emissions quantity, the entity must determine the time period associated with the emissions that occurred as a result of the delay within the filing year. The EPA is proposing that the delay begins when emissions would have been avoided through the operation of the gathering or transmission infrastructure, not when construction would begin, as in many cases the infrastructure would not be immediately in place and operational at the time of permitting approval. For example, a permit to construct might be needed before construction begins, and construction could take months or more before the infrastructure would be in place.

Where the exempted emissions cover the entire reporting year, the exempted flaring emissions would be the total reported to part 98 for flare stacks, associated gas flaring, and the portion of offshore methane emissions attributable to flaring. Where exempted emissions occur in only a fraction of a reporting year, the facility is to use data on flaring emissions over that time frame if available, and if unavailable, the facility is to adjust part 98 flaring emissions using the fraction of the year that the exemption is available. Where flared emissions impacted by permitting delay only account for a portion of the total flared emissions, the facility is to adjust their part 98 reported flaring emissions using company records and/or engineering calculations.

We seek comment on the provisions proposed, including the use of reported flaring emissions to determine exempted emissions, the use of part 98 data, and the approaches for quantifying emissions for fractions of the reporting year.

c. Reporting and Recordkeeping Requirements for the Exemption for Emissions Resulting from a Permit Delay

Through the provisions proposed at 40 CFR 99.31, the EPA is proposing that the WEC obligated party receiving the exemption would provide information on each well pad or offshore platform impacted by the delay. This includes the type of permit, permitting authority, and the date that the permit application was complete. The WEC obligated party must report the planned timing of the commencement of the offtake of gas had the permit not been delayed. This includes a listing of the methane emissions mitigation activities that are impacted by the delay and the flaring emissions associated with natural gas that would have been directed to gathering or transmission infrastructure as a result of the methane emissions mitigation activities. This also includes information on all applicable local, state, and Federal regulations regarding flaring emissions and the facility’s compliance with each. The WEC obligated party must report the time period associated with the emissions that occurred as a result of the delay within the filing year. The WEC obligated party must also affirm that neither the production segment entity impacted by the delay nor the gathering or transmission infrastructure entity seeking the permit contributed to the unreasonable delay.

The EPA requires this information for the verification of exemption eligibility and of exempted emission quantity. Reported information will be used to conduct verification as discussed in section III.A.4., and reported information, records and other information as applicable will be used to conduct any auditing that occurs under section III.E.1.

The EPA seeks comment on the reporting and recordkeeping requirements for the exemption for unreasonable delay in environmental permitting. We seek comment on whether additional information should be collected or retained to allow for verification of the quantity of emissions eligible for the exemption.

2. Regulatory Compliance Exemption Under CAA Section 136(f)(6)

CAA section 136(f)(6) establishes a regulatory compliance exemption for subpart W facilities that are “subject to and in compliance with methane emissions requirements pursuant to subsections (b) and (d) of section 111” upon an Administrator determination that the criteria at CAA section 136(f)(6)(A) have been met. In this action, the EPA is proposing: when the Administrator determinations will be made; the time at which the regulatory compliance exemption would become available to eligible facilities; the process for how the Administrator determinations will be made; how to interpret CAA section 136(f)(6)(A) to govern the interaction between WEC applicable facilities and CAA section 111(b) affected facilities and CAA section 111(d) designated facilities (collectively referred to in this preamble as “CAA section 111(b) and (d) facilities”) for the purposes of the regulatory compliance exemption; how “compliance” with the methane emissions requirements promulgated under CAA sections 111(b) and (d) will be defined for the purposes of the regulatory compliance exemption; reporting requirements for the regulatory compliance exemption; and the process for resumption of the

WEC pursuant to CAA section 136(f)(6)(B) if the criteria for the regulatory compliance exemption are no longer met.

The EPA believes the Congressional intent of this exemption was twofold: 1) to be implemented such that the WEC acts as a bridge to full implementation of the Final NSPS OOOOb and EG OOOOc by encouraging methane reductions in the near term while state plans are being developed, and thereafter exempting from the charge facilities that are in compliance with the requirements pursuant to the final NSPS OOOOb and EG-OOOOc-implementing state and Federal plans,[31] and 2) to encourage timely implementation of requirements in the final NSPS OOOOb and EG OOOOc-implementing state and Federal plans in order to ensure that those requirements achieve meaningful emissions reductions. The EPA's proposed approach for implementing the regulatory compliance exemption is based on a plain reading of the statutory text in CAA section 136(f)(6). The EPA strives to create a program that is straightforward to implement and enforce.

The EPA interprets the intent of the WEC to be to incentivize reduction of methane emissions across the oil and gas industry. For industry segments not covered by NSPS OOOOb/EG OOOOc, the WEC incentivizes, but does not require, early and sustained emissions mitigation activity. For WEC applicable facilities in industry segments that are covered by NSPS OOOOb/EG OOOOc, the WEC incentivizes, but does not require, methane emissions reductions

---

[31] Under the Tribal Authority Rule (TAR), eligible Tribes may seek approval to implement a plan under CAA section 111(d) in a manner similar to a state. See 40 CFR part 49, subpart A. Tribes may, but are not required to, seek approval for treatment in a manner similar to a state for purposes of developing a Tribal implementation plan (TIP) implementing the EG codified in 40 CFR part 60, subpart OOOOc. The TAR authorizes Tribes to develop and implement their own air quality programs, or portions thereof, under the CAA. However, it does not require Tribes to develop a CAA program. Tribes may implement programs that are most relevant to their air quality needs. If a Tribe does not seek and obtain the authority from the EPA to establish a TIP, the EPA has the authority to establish a Federal CAA section 111(d) plan for designated facilities that are located in areas of Indian country. A Federal plan would apply to all designated facilities located in the areas of Indian country covered by the Federal plan unless and until the EPA approves a TIP applicable to those facilities. In this proposal, all uses of the phrase "state and Federal plans" are intended to include any Tribal plans, to the extent that any Tribal plans are developed to implement EG OOOOc.

earlier than may otherwise be required pursuant to NSPS OOOOb and EG OOOOc-derived state and Federal plans. Once those requirements are in effect, the EPA believes the purpose of the regulatory compliance exemption is to provide relief from the WEC to owners or operators that are fully complying with those requirements, and to broadly encourage compliance. This structure ensures that there is an incentive (or requirement) for methane emission reductions from new and existing sources in place at all times, while also avoiding regulation of the same emissions under both the WEC and the NSPS OOOOb and EG OOOOc-implementing state and Federal plans once the regulatory compliance exemption becomes available.

The EPA expects that, as CAA section 111(b) and (d) facilities implement and comply with the methane emissions requirements of NSPS OOOOb and EG OOOOc-implementing state and Federal plans, many of the WEC applicable facilities that contain those emissions sources subject to NSPS OOOOb and EG OOOOc-derived state and Federal plans would be expected to fall below the waste emissions thresholds, and thus not be subject to the WEC. However, the regulatory compliance exemption recognizes that certain WEC applicable facilities may remain above the waste emissions thresholds even after implementation of the requirements in the final NSPS OOOOb and approved state and Federal plans under EG OOOOc; the regulatory compliance exemption would shield such owners or operators that are in compliance with those requirements from additional regulation under the WEC.

Congress provided that the regulatory compliance exemption would only come into effect after "(i) methane emissions standards and plans pursuant to subsections (b) and (d) of section 111 have been approved and are in effect in all States with respect to the applicable facilities" and "(ii) compliance with the requirements described in clause (i) will result in equivalent or greater emissions reductions as would be achieved by [the NSPS OOOOb/EG OOOOc 2021 Proposal], if such rule had been finalized and implemented." The EPA's understanding of these provisions is that Congress intended to provide an incentive for states to move promptly in adopting their plans, and to encourage those plans to achieve meaningful emissions reductions.

These two drivers are manifested in the Administrator determinations that must be made before the regulatory compliance exemption becomes available: the first Administrator determination, per CAA section 136(f)(6)(A)(i), that the final NSPS OOOOb and all EG OOOOc-implementing state and Federal plans are "approved and in effect"; and the second Administrator determination, per section 136(f)(6)(A)(ii), that the emissions reductions achieved by these requirements are equal to or greater than the reductions that would have been achieved by the NSPS OOOOb/EG OOOOc 2021 Proposal, had that rule been finalized and implemented as proposed (the "equivalency determination"). These requirements mean that if the final NSPS OOOOb or EG OOOOc-implementing state or Federal plans are delayed, or the requirements therein are collectively less stringent than those in the NSPS OOOOb/EG OOOOc 2021 Proposal, the exemption would not be available and WEC applicable facilities that exceed the waste emissions threshold would not be eligible for the regulatory compliance exemption from the WEC until the conditions are met.

Here, we summarize the proposed approach for the regulatory compliance exemption. Elements of the proposal, other options considered, and requests for comment are discussed in more detail in the sections below.

The EPA is proposing that the prerequisite Administrator determinations for the regulatory compliance exemption would be made after all state and Federal plans pursuant to CAA section 111(d) are approved and in effect. Separate from the timing of the Administrator determinations, the WEC program must establish when the regulatory compliance exemption becomes available at the facility level (*i.e.*, when eligible facilities can be exempted from the WEC), by defining when WEC applicable facilities that are subject to methane emissions requirements pursuant to NSPS OOOOb and EG OOOOc-implementing state and federal plans are in compliance with those requirements. The EPA believes that the regulatory compliance exemption is intended to provide relief from the WEC when the requirements in the final NSPS OOOOb and EG OOOOc-implementing state and Federal plans are in effect in all states. In this interest, the EPA is proposing that WEC applicable facilities would be eligible for the regulatory compliance exemption as soon as the Administrator determinations have been made, rather than when the applicable requirements in state and Federal plans are fully implemented. Thus, under the EPA's proposed approach, the regulatory compliance exemption would become available to facilities as soon as the Administrator determinations are made under CAA section 136(f)(6)(A)(i) and (ii).

The EPA is also proposing further elements of the process for the Administrator determinations under CAA section 136(f)(6)(A)(i) and (ii), including establishing the relative points of comparison for the equivalency determination, in order to ensure that those elements align with the statutory requirements. Because the Administrator determinations cannot be made until all plans are approved and in effect, and because the timing for both Administrator determinations is aligned, the EPA proposes that two the determinations be made together via a single future administrative action.

The EPA is proposing that a WEC applicable facility's eligibility for the regulatory compliance exemption would be based on the compliance status of all of the CAA section 111(b) and (d) facilities contained within that WEC applicable facility. To be eligible for the exemption, the EPA proposes that all of the regulated emissions sources must be in full compliance with their respective methane emissions requirements under the NSPS and EG-implementing state and Federal plans.

The EPA is also proposing reporting requirements for the regulatory compliance exemption. In order to reduce the burden on industry, the EPA proposes that only WEC applicable facilities that are eligible for the exemption would be required to report all associated data elements. Finally, the EPA is proposing how access to the regulatory compliance exemption would be removed for all WEC applicable facilities if the criteria associated with the Administrator determinations were no longer met. The EPA's proposed approach for removing access to the exemption mirrors the conditions that must be met in order for it to become available.

a. Timing for Regulatory Compliance Determinations

Before the regulatory compliance exemption becomes available to facilities, CAA section 136(f)(6)(A) requires determinations to be made by the Administrator that (1) "methane emissions standards and plans pursuant to subsections (b) and (d) of section 111 have been approved and are in effect in all States with respect to the applicable facilities" and (2) that "compliance with the requirements described in clause (i) will result in equivalent or greater emissions reductions as would be achieved by the [NSPS OOOOb/EG OOOOc 2021 Proposal], if such rule had been finalized and implemented." The EPA believes that Congress intended these prerequisites to exemption availability to encourage timely implementation of the requirements in the final NSPS and state and Federal plans and to ensure that those requirements achieve meaningful emissions reductions.

The first Administrator determination is related to the timing of final methane emissions standards under CAA section 111(b) and state and Federal plans pursuant to an EG issued under CAA section 111(d). The EPA proposes to interpret the language in CAA section 136(f)(6)(A)(i) to mean that this temporal requirement is only met when <u>*both*</u> (1) emission standards for new sources under CAA section 111(b) are promulgated and in effect and (2) all state plans for existing sources pursuant to an EG issued under CAA section 111(d) have been approved by the EPA and are in effect. As to the latter element, the EPA also proposes to interpret the reference to "plans pursuant to subsection... (d) of section 111" to include the promulgation of a Federal plan where the EPA determines that one or more states have failed to submit an approvable state plan, as that is the only way a plan pursuant to CAA section 111(d) would take effect in those states. The EPA further proposes to interpret "all states" in CAA section 136(f)(6)(A)(i) to mean that every state with an applicable facility (*i.e.*, all states with subpart W facilities containing CAA section 111(b) or (d) facilities) must have an approved plan (state or Federal) before the determination can be made. Accordingly, because the emissions standards for new sources under CAA section 111(b) will be finalized before the submittal of state plans for existing sources under CAA section 111(d), approval of the final state (or Federal) plan for states with designated facilities would determine the timing for when the determination could be made under the proposed approach. The EPA proposes that this determination would be made after all CAA section 111(d) plans (*i.e.*, state or Federal plans) have been approved and are in effect. The EPA believes that the proposed approach and interpretation of "all states" is aligned with a plain reading of the statutory text. In particular, the EPA notes the relationship between the use of the singular in section 136(f)(6)(A), directing the EPA to make "a determination", and the requirements outlined in 136(f)(6)(A)(ii) and (ii), providing that this determination is dependent on EPA finding that (1) standards and plans "have been approved and are in effect in all states" and that (2) compliance with the standards and plans "will result in equivalent or greater emissions reductions as would be achieved by the [2021] proposed rule…"[32] The text strongly indicates that the EPA must make *one* determination after all standards and plans are in place in all states in order to make the exemption available, and further that the determination cannot be made until standards and plans are in place in all states because the equivalency determination must be made on a nationwide scale.[33]

The EPA considered an alternative approach for the determination that methane emissions standards and plans have been approved and are in effect in all states. This alternative would involve a determination for methane emissions standards after the promulgation of final emissions standards for CAA section 111(b) facilities and then determinations on a state-by-state basis as each state plan containing emissions standards for CAA section 111(d) facilities were

---

[32] 42 U.S.C. 7436(f)(6)(A).

[33] Note that while the EPA believes that the statute instructs us to make a determination after the plans are collectively in place (rather than making multiple state-by-state determinations), that does not preclude the EPA from reviewing and revising the determination if a standard or plan is later revised, to ensure that the conditions of section 136(f)(6)(A) are still met, consistent with the resumption of charge language in section 136(f)(6)(B).

submitted and approved by the EPA (or a Federal plan was promulgated where a state did not submit an approvable plan). The EPA believes that this state-by-state approach is inconsistent with a plain reading of CAA section 136(f)(6)(A)(i), which mandates that emissions standards and plans must be approved and in effect in *all* states with respect to the applicable facilities (*i.e.*, all states with subpart W facilities containing CAA section 111(b) or (d) facilities). The EPA requests comment on the proposed approach and an alternative approach that would make determinations on a state-by-state basis as each state plan was approved.

The second determination that must be made before the regulatory compliance exemption becomes available is whether the final “methane emissions standards and plans” provide equivalent or greater emissions reductions than would have been achieved by the NSPS OOOOb/EG OOOOc 2021 Proposal, had that proposal been finalized and implemented as proposed. Based on a plain reading of the statutory text, because plans pursuant to CAA section 111(d) will not be finalized for several years, the EPA cannot propose an equivalency determination in this action. Instead, we propose that the equivalency determination will be made via an administrative action after all CAA section 111(d) plans (*i.e.*, state or Federal plans) have been approved. This proposed timing would allow evaluation of the emissions reductions achieved by the final NSPS and by all final state and Federal plans.

The EPA also assessed making the equivalency determination for CAA section 111(b) affected facilities before making it for CAA section 111(d) designated facilities. In this proposal, the EPA interprets CAA section 136(f)(6)(ii) as requiring a comparison of the emissions reductions that will be achieved by the final NSPS OOOOb/EG OOOOc and the reductions that would have been achieved by the NSPS OOOOb/EG OOOOc 2021 Proposal if finalized as proposed. Separate equivalency determinations for CAA section 111(b) facilities and CAA section 111(d) facilities would not provide for a comparison of the total emissions reductions achieved by both rules, and therefore the EPA believes that an approach with separate equivalency determinations would be inconsistent with a plain reading of the statutory text.

Further, because both determinations must occur before the exemption becomes available, and because under the proposed approach the determination required by CAA section 136(f)(6)(i) would occur after all plans are approved and in effect, there would be no practical reason for making the equivalency determination for CAA section 111(b) facilities before making it for CAA section 111(d) facilities. Finally, the only purpose for making the equivalency determination for CAA section 111(b) facilities before CAA section 111(d) facilities would be in support of an approach that would make the regulatory compliance exemption available to CAA section 111(b) facilities before CAA section 111(d) facilities. As discussed below in section II.D.2.b of this preamble, such an approach would not align with other elements of this proposal, would not be aligned with the statutory text, and would not be technically feasible. The EPA requests comment on this alternative approach.

b. Timing of Regulatory Compliance Exemption Availability

Separate from the timing of the Administrator determinations, the WEC program must also establish when the regulatory compliance exemption will become available for facilities. Different states will have different start dates and in some cases, phased-in requirements, in state or federal plans under 111(d), resulting in some facilities being in compliance with the methane emissions requirements pursuant to CAA section 111(b) and (d) before others. The EPA believes the inclusion of the regulatory compliance exemption at CAA section 136(f)(6)allows for relief from the WEC when the requirements in the final NSPS and state and Federal plans are in effect. The EPA therefore proposes that the regulatory compliance exemption would become available to all applicable facilities meeting the criteria when the Administrator determinations required by CAA section 136(f)(6)(A)(i) and (ii) have both been made. Both determinations are required before the exemption becomes available, and the determination under CAA section 136(f)(6)(A)(i) would indicate that the requirements promulgated under CAA sections 111(b) and (d) have been approved and are in effect. Because the availability of the exemption is linked to the CAA section 136(f)(6)(A)(i) and (ii) determinations, which the EPA is proposing could only be made after all states with an applicable facility have an approved state or Federal plan in effect, the EPA is proposing that the exemption would become available to all eligible WEC applicable facilities in all states at the same time. Moreover, because methane emissions standards for CAA section 111(b) facilities would be expected to come into effect earlier than those required for CAA section 111(d) facilities in state or Federal plans, the timing for exemption availability would be largely driven by the approval and effective date for the final state or Federal plan (i.e., the last state with CAA section 111(d) facilities to have a plan approved and in effect).

The EPA believes the proposed approach is consistent with the statutory text. CAA section 136(f)(6)(A) states that charges shall not be imposed on an applicable facility "that is subject to and in compliance with methane emissions requirements pursuant to subsections (b) and (d) of section 111." In order to receive the exemption, all CAA section 111(b) and (d) facilities contained within a WEC applicable facility would need to demonstrate compliance, as discussed in section II.D.2.f. of this preamble.

This proposal makes the exemption available upon adoption of all plans pursuant to CAA section 111(d) and the issuance of the Administrator's findings under CAA section 136(f)(6)(A). The EPA proposes that the exemption be available as soon as all state or federal plans are in effect, because facilities can be in compliance with the requirements in plan even if full implementation of those requirements is not required until a future date. Provided that facilities subject to the WEC are in compliance with OOOOb requirements and the requirements in EG OOOOc-implementing plans, the proposed approach also allows such facilities to benefit from the regulatory compliance exemption much earlier than the alternative, described below, of making the regulatory compliance exemption available only once applicable compliance deadlines have passed.

The EPA notes that implementation of the requirements included in state or Federal plans may not be mandated immediately upon the date at which the plan goes into effect. In other words, the plans may include compliance schedules with compliance dates that occur at a future date after plan approval, and such requirements could be implemented over multiple compliance dates in a phased manner or include deadlines for various increments of progress. It is therefore possible for CAA section 111(d) facilities to be in compliance with the methane emissions requirements in a plan even if not all compliance dates included in the plan have come to pass. For example, if an approved state plan were to require a specific type of designated facilities to install emissions controls within a year of the effective date of the state plan, those facilities would be considered in compliance with those requirements for that first year. By providing the exemption as soon as the Administrator's determinations are made after state or Federal plans are approved and in effect rather than when the requirements in those plans must be implemented, the proposed approach would provide relief from the WEC once CAA section 111(d) facilities are effectively subject to federally enforceable methane emissions requirements pursuant to CAA section 111. The EPA requests comment on the proposed approach of making the regulatory compliance exemption available to all WEC applicable facilities at the time when the two determinations required by CAA section 136(f)(6)(A) have been made.

The EPA considered alternative approaches in developing this proposal for implementing the regulatory compliance exemption but found they would not be consistent with the statutory text, would be more challenging to implement, would unfairly advantage specific facilities and companies, or would not be technically feasible.

First, the EPA considered an approach that would make the exemption available to WEC applicable facilities meeting the criteria at a state-by-state level as the plan pursuant to CAA section 111(d) for each state was approved and became effective. For WEC applicable facilities that span multiple states, the exemption would be available when plans for all states in which the facility is located were approved and in effect. This alternative approach would likely make the exemption available earlier for certain WEC applicable facilities compared to the proposed approach, which would not make the exemption available until plans are approved and in effect in all states. The EPA believes that making the regulatory compliance available at a state-by-state level is inconsistent with the statutory text. As discussed in section II.D.2.a. of this preamble, the EPA's interpretation of CAA section 136(f)(6)(A) in this proposal is that neither of the determinations that are prerequisites to the regulatory compliance exemption's availability could be made until plans for CAA section 111(d) facilities have been approved and are in effect for all states. Based on this interpretation, it would not be possible for the exemption to become available on a state-by-state basis as state plans were approved and became effective because the prerequisite determinations could not occur until all state plans were approved and in effect. The EPA also believes the proposed approach will simplify implementation and administration of the regulatory compliance exemption compared to an approach in which the exemption would become available to states at different times. Further, a state-by-state application of the exemption could unfairly advantage and disadvantage WEC applicability facilities or companies based on their geographic location. WEC obligations for operations in states that take longer to develop state plans could be higher than those in states that are able to develop and have plans approved earlier, and thus have access to the exemption. Conversely, the proposed approach of making the exemption available to all states at the same time would be equitable and provide the industry with better regulatory certainty. The EPA requests comment on making the regulatory compliance exemption available on a state-by-state basis based on the finalization of plans for individual states.

Second, the EPA considered an approach that would make the regulatory compliance exemption available to WEC applicable facilities meeting the criteria when the methane requirements for all CAA section 111(b) and (d) facilities have been fully implemented. Under this alternative approach, WEC applicable facilities would only become eligible for the regularly compliance exemption once the compliance dates for the NSPS and the state and Federal plans have passed. Because the compliance deadlines under the final EG OOOOc may occur at some point *after* the timeline for state plan approval and issuance of a Federal plan, this alternative approach would make the regulatory compliance exemption available later than under the proposed approach. This would require the EPA to interpret the phrase "subject to and in compliance with methane emissions requirements" in CAA section 136(f)(A) to mean that the exemption from the charge is available only after all of the requirements for CAA section 111(d) facilities have been fully implemented. In other words, the EPA would read "in compliance with methane emissions requirements" to mean that *all* compliance dates in the NSPS and the state and Federal plans have passed. That might serve to give independent effect to both elements of the statutory phrase "subject to and in compliance with", but the EPA believes that this alternative approach is not as well aligned with the statutory directive. This is because compliance with the standards may occur at different points in time, both across the NSPS and the state and Federal plans, and even within standards that have phased compliance requirements. This interpretation may have the result of delaying availability of the regulatory compliance exemption for many years, even as facilities are otherwise complying with all *applicable* methane emissions requirements, thus extending the period for which many oil and gas operations would be subject to concurrent regulation under WEC and CAA section 111. Rather, the EPA proposes to conclude that CAA section 111(b) and (d) facilities can be considered to be in compliance with all applicable methane emissions requirements, even prior to the final compliance deadlines, for purposes of the regulatory compliance exemption. While the EPA is not proposing that the exemption would become available when the requirements of all state and Federal plans are fully implemented rather than when all state and Federal plans have been approved and are in effect, the agency requests comment on whether such an approach would be legally and practically justified.

Third, the EPA considered an approach that would make the regulatory compliance exemption available to WEC applicable facilities meeting the criteria at a state-by-state level as the final compliance deadline in a state or Federal plan for CAA section 111(d) facilities was reached. Under this alternative approach, WEC applicable facilities in a given state would have access to the exemption upon the final compliance date for CAA section 111(d) facilities in that state. Because state and Federal plans may establish different compliance timelines for CAA section 111(d) facilities, this approach could make the exemption available to states at different times. For WEC applicable facilities that span multiple states, the exemption would be available when the final compliance date passed in all states in which the facility is located. As with the alternative approach that would make the exemption available after the final compliance deadline for CAA section 111(d) facilities had passed in all states, the EPA does not believe an approach that provides the exemption at a state-by-state level based on compliance dates is as consistent with the statutory text and purpose of the exemption for the reasons discussed in the prior paragraph. The EPA requests comment on an approach that would make the exemption available at a state-by-state level based on each state's final compliance deadline for CAA section 111(d) facilities.

The EPA also assessed an approach that would make the regulatory compliance exemption available to CAA section 111(b) facilities before CAA section 111(d) facilities. Because compliance with emission standards for CAA section 111(b) affected facilities generally apply upon the effective date of the final NSPS and would be required before emission standards for CAA section 111(d) designated facilities are fully implemented (once state or Federal plans are finalized and in effect), there would likely be several years between compliance with methane emissions requirements for CAA section 111(b) and (d) facilities. The EPA rejected this approach for this proposal, however, based on a plain reading of the statutory text. First, as discussed in section II.D.2.e. of this preamble, the exemption is applied to an entire WEC applicable facility, not the CAA section 111(b) and (d) facilities within that WEC applicable facility, and therefore individual CAA section 111(b) or (d) facilities within a WEC applicable facility cannot be exempted. Second, CAA section 136(f)(6)(A) states that waste emission charges shall not be imposed "on an applicable facility that is subject to and in compliance with methane emissions requirements pursuant to subsections (b) *and* (d) of section 111." The EPA believes that a plain reading of this text indicates that compliance with regulations pursuant to both CAA section 111(b) and (d) must be achieved before the exemption becomes available, and that the statute therefore does not, by its terms, permit application of the exemption to CAA section 111(b) facilities before it becomes available to CAA section 111(d) facilities. As discussed in section II.D.2.a. of this preamble, the EPA proposes to make the determinations required by CAA section 136(f)(6)(A)(i) and (ii) after all state or Federal plans have been approved and are in effect. Because the determinations that are required for the exemption to become available would not be made separately for CAA section 111(b) facilities and CAA section 111(d) facilities, the exemption would not be available to CAA section 111(b) facilities before CAA section 111(d) facilities under the proposed approach.

Further, even assuming that this statutory text allowed for some ambiguity, there are practical limitations to implementing the regulatory exemption in a phased manner for CAA section 111(b) and (d) facilities. The WEC calculations are based on methane emissions and natural gas or oil throughput data for subpart W facilities that may contain both CAA section 111(b) and (d) facilities. Because reporting under subpart W does not distinguish between CAA section 111(b) and (d) facilities, there is currently no practical means of implementing a phased implementation of the regulatory compliance exemption. Revising the subpart W reporting requirements to make such distinctions would significantly increase the reporting complexity and burden for the oil and gas industry and would not be possible for certain emissions sources due to different definitions of individual emissions source types in subpart W and at CAA section 111(b) and (d) facilities. Further, while it may be feasible to distinguish emissions from new and existing sources for certain emission source categories, there is no means to distinguish natural gas throughput from CAA section 111(b) and (d) facilities at subpart W facilities that contain both CAA section 111(b) and (d) facilities.

c. Emissions Year in Which Exemption Takes Effect

While the data collected under subpart W for the purposes of WEC calculation are reported on a calendar-year basis (*i.e.*, a reporting year is a calendar year), the date at which all of the criteria for the regulatory compliance exemption will be met is not yet known and could fall at any point in the course of a reporting year. The EPA is proposing that the regulatory exemption will take effect in the reporting year in which the required conditions are met. For example, if all exemption requirements are met in June 2027, all eligible facilities meeting the proposed compliance requirements discussed in section II.D.2.f. of this preamble would be exempt from the WEC for the entire 2027 reporting year. The proposed approach is aligned with the EPA's interpretation that the regulatory compliance exemption is intended to prevent WEC applicable facilities from being subject to the WEC when their constituent CAA section 111(b) and (d) facilities are in compliance with their applicable standards. The EPA requests comment on the proposed approach, as well as an approach in which the regulatory compliance exemption became effective for eligible facilities in the next calendar year after which all required conditions are met (*e.g.*, if requirements are met in October 2027, the exemption would come into effect for the 2028 reporting year). The EPA also requests comment on an approach that would apply the regulatory exemption for a portion of the reporting year based on when all exemption requirements were met, and how reported emissions and throughput data could be quantified, such as through prorating.

d. Approach for Regulatory Compliance Determinations

In this action, the EPA is proposing certain elements related to the approach for the CAA section 136(f)(6)(A) Administrator determinations that must occur before the regulatory compliance exemption becomes available. The EPA is proposing that both determinations would be made simultaneously via a future administrative action. For the equivalency determination, the EPA is proposing the geographic scale at which the equivalency determination would be conducted and the specific elements that would be compared. The EPA proposes to address all other elements (e.g., cumulative versus year-by-year) of the equivalency determination in a future administrative action when the analysis is conducted.

The EPA proposes that when the criteria for both determinations are met, the determinations would be made through a single administrative action. As discussed in section II.D.2.a. of this preamble, under the proposed approach neither determination could be made until all state and Federal plans pursuant to CAA section 111(d) have been approved and are in effect. Because the timing for both determinations would be aligned, the EPA believes that making both determinations via a single administrative action will facilitate timely access to the regulatory compliance exemption after the CAA section 136(f)(6)(A)(i) and (ii) requirements have been met. The EPA requests comment on the proposed approach for making both determinations via a single future administrative action, as well as on alternative approaches for making the determinations.

Section 136(f)(6)(A)(ii) of the CAA requires an Administrator determination that compliance with the requirements in the final CAA section 111(b) and (d) rules "will result in equivalent or greater emissions reductions as would be achieved by the [NSPS OOOOb/EG OOOOc 2021 Proposal], if such rule had been finalized and implemented." The EPA is proposing to conduct the analysis for the purposes of this equivalency determination at a national level, comparing the national-level emissions reductions that would have been achieved under the NSPS OOOOb/EG OOOOc 2021 Proposal (if finalized as proposed) against those that will be achieved upon implementation of the final NSPS OOOOb/EG OOOOc.

The EPA believes that a national evaluation is the most appropriate geographic scale for the purposes of the equivalency determination. The primary concern for the emissions reductions achieved by the NSPS OOOOb/EG OOOOc in the context of the WEC regulatory compliance exemption are methane emissions. Because the climate impacts of these emissions are dependent on their aggregate quantity rather than where they occur, a national-level evaluation will provide an appropriate comparison of the overall impact of the reductions that would have been achieved under the NSPS OOOOb/EG OOOOc 2021 Proposal and those that will be achieved upon implementation of the final NSPS OOOOb and state and Federal plans implementing OOOOc. The EPA also considers a national evaluation to be consistent with the statutory text in CAA section 136(f)(6)(A)(ii), which requires the Administrator's determination to be based on "compliance with the requirements described in clause (i)," where clause (i) describes the collective "methane emissions standards and plans" required by CAA sections 111(b) and (d).

The EPA assessed alternative approaches that would conduct the equivalency determination at the state-by-state level (*i.e.*, each state would need to demonstrate equivalent or greater emissions reductions) and at both the national and state-by-state levels. However, the EPA is not proposing an approach that would conduct the equivalency at the state-by-state level because the EPA believes that this approach is less consistent with the statutory text and purpose. Determinations for individual states would not indicate if the emissions reductions that will be achieved by the final NSPS and state and Federal plans are equivalent or greater than the reductions that would have been achieved by the NSPS OOOOb/EG OOOOc 2021 Proposal, had that rule been finalized and implemented. In other words, if the EPA were to make determinations for individual states and make the exemption available on a state-by-state basis, that could result in not achieving emission reductions equivalent to the NSPS OOOOb/EG OOOOc 2021 Proposal, thus undermining Congress' intent in drafting this provision to incentivize a minimum level of methane emission reductions via the CAA section 111(b) and (d) regulations. The EPA requests comment on the proposed approach of conducting the equivalency determination at the national scale. The EPA requests comment on conducting the equivalency determination at other geographic scales, such as a state-by-state level, as well as an approach that would require an equivalency determination at both the national and state-by-state levels.

The EPA also considered an alternative approach that would conduct the equivalency analysis at a source-by-source level (at either a national or state-by-state scale). Under this alternative approach, the EPA would compare the reductions achieved by individual sources under the NSPS OOOOb /EG OOOOc 2021 Proposal, had that rule be finalized and implemented, and the final NSPS OOOOb/EG OOOOc. As described above, the climate impacts of methane emissions are based on their aggregate quantity, and it is that quantity, therefore, that is necessary for conducting the equivalency determination. Within the specific context of the equivalency determination, it does not matter if the emissions reductions achieved by an individual source under the final NSPS OOOOb/EG OOOOc achieves fewer reductions than it would have under the NSPS OOOOb /EG OOOOc 2021 Proposal, as long as the total emissions reductions achieved by implementation of the final NSPS OOOOb and EG OOOOc-derived state or federal plans across all sources are equivalent or greater than those that would have been achieved across all sources by the NSPS OOOOb /EG OOOOc 2021 Proposal. The EPA therefore believes that it is not reasonable to conduct the equivalency analysis on a source-by-source level and such an approach is not required by the statutory text. However, the EPA requests comment on using a source-by-source approach for the equivalency determination and requests comment on how such an analysis could be conducted.

Because the NSPS OOOOb/EG OOOOc 2021 Proposal was not itself a final rule at the time Congress enacted this Waste Emissions Charge program, no new source emissions standards or emission guidelines had been finalized for CAA section 111(b) and (d) facilities based on the NSPS OOOOb/EG OOOOc 2021 Proposal, no requirements had been finalized for what constitutes an approvable state plan, and no states had submitted state plans pursuant to such hypothetical finalized requirements. As such, the EPA proposes to use the standards proposed in NSPS OOOOb and the presumptive standards proposed in EG OOOOc as the basis for evaluating emissions reductions that would have been achieved had the NSPS OOOOb/EG OOOOc 2021 Proposal been finalized and implemented. In other words, the EPA understands the inclusion of the NSPS OOOOb/EG OOOOc 2021 Proposal as the baseline for the equivalency demonstration to mean that Congress intended for the EPA to assume, for purposes of this analysis, that the proposed standards were finalized as drafted in the NSPS OOOOb/EG OOOOc 2021 Proposal and implemented nationwide. Further, because Congress directs the EPA to compare the emissions that would have been achieved if the NSPS OOOOb/EG OOOOc 2021 Proposal were finalized and implemented against actual CAA section 111(b) and (d) standards once these are finalized and in effect, the EPA believes that Congress must have meant the EPA to assume that the NSPS OOOOb/EG OOOOc 2021 Proposal was finalized and implemented *as proposed*, which is the only way to use it as a point of comparison. Accordingly, for CAA section 111(b) facilities under the NSPS OOOOb/EG OOOOc 2021 Proposal, the EPA proposes to assess the reductions that would have been achieved had the proposed NSPS OOOOb been finalized and implemented. For CAA section 111(d) facilities under the NSPS OOOOb/EG OOOOc 2021 Proposal, the EPA proposes to assess the reductions that would have been achieved had the proposed emissions guidelines been adopted and implemented by all states as proposed.

The EPA believes the proposed points of comparison between the NSPS OOOOb/EG OOOOc 2021 Proposal and the final NSPS OOOOb and final requirements in state and Federal plans derived from EG OOOOc for the equivalency is aligned with a plain reading of CAA section 136(f)(6)(A), and with Congressional intent. The EPA requests comment on the proposed approach. The EPA recognizes that if the NSPS OOOOb/EG OOOOc 2021 Proposal had been finalized as proposed, the requirements for CAA section 111(d) facilities, and the emissions reductions associated with those requirements, would have been based on approved state or Federal plans. In those plans, it is possible that some states may have set different standards of performance than the presumptive standards proposed in EG OOOOc based on a provision of CAA section 111(d)(1) permitting states to “take into consideration, among other factors, the remaining useful life of a source.” (The EPA refers to this provision as the “remaining useful life and other factors” provision, or RULOF.) The EPA regulations at 40 CFR part 60 subpart Ba permit states to consider several factors to, with an adequate demonstration, establish standards less stringent than the degree of emission limitation otherwise required by an EG. In such circumstances, the emissions reductions achieved by those state plans would have been less than if the state plans had adopted and implemented the presumptive standards in the final emissions guidelines, had they been finalized. However, because state plans were never developed pursuant to the NSPS OOOOb/EG OOOOc 2021 Proposal, there is no means of reasonably estimating the requirements that may have been included in those state plans and what emissions reductions they would have achieved. The text also counsels against making RULOF assumptions in this case. Because Congress directs the EPA to compare the emissions that would have been achieved if the NSPS OOOOb/EG OOOOc 2021 Proposal were "finalized and implemented" against actual CAA section 111(b) and (d) standards once these are "approved and in effect," the EPA believes that Congress meant the Agency to assume that the NSPS OOOOb/EG OOOOc 2021 Proposal was finalized and implemented *as proposed*, because that will allow for comparison with emissions reductions achieved under the final CAA section 111(d) plans, which may differ from the proposal in a variety of ways, including as a result of RULOF analysis. It is also reasonable to infer that Congress wanted to guarantee the level of reductions (i.e., "equivalent or greater"[34] than expected by the NSPS OOOOb/EG OOOOc 2021 Proposal) that would ultimately be achieved by the final NSPS OOOOb and EG OOOOc-derived state and Federal plans by only allowing for the exemption if it is determined that the Final NSPS OOOOb/EG OOOOc would achieve at least the level of reductions that were expected from the proposed rule in place at the time CAA section 136 was written and passed. Thus, the EPA believes the intent of CAA section 136(f)(6)(A) is to use the proposed approach of assessing the reductions that would have been achieved had the proposed emissions guidelines in the NSPS OOOOb/EG OOOOc 2021 Proposal been adopted *and* implemented by all states as proposed. The EPA requests comment on other approaches that could be used to estimate the emissions

---

[34] 42 U.S.C. 7436(f)(A)(ii) (requiring a determination by the Administrator that "compliance with the requirements described in clause (i) will result in equivalent or greater emissions reductions as would be achieved by [the 2021 proposal]".)

reductions from CAA section 111(d) facilities had the NSPS OOOOb/EG OOOOc 2021 Proposal been finalized and implemented.

The EPA also recognizes that in the proposed approach for the equivalency determination, analysis of the reductions from CAA section 111(d) facilities under the NSPS OOOOb/EG OOOOc 2021 Proposal would be based on universal adoption of the presumptive standards in the proposed emissions guidelines, while analysis of the reductions achieved by state and Federal plans developed pursuant to the final EG OOOOc would account for any states' use of the RULOF provision to set less stringent standards. The EPA believes the proposed approach of assessing the reductions achieved by final state and Federal plans is aligned with the statutory text and Congressional intent. CAA section 136(f)(6)(A)(ii) states that the point of comparison for the emissions reductions that would have been achieved by the NSPS OOOOb/EG OOOOc 2021 Proposal are those resulting from "compliance with the requirements described in clause (i)." CAA section 136(f)(6)(A)(i) in turn refers to the "methane emissions standards and *plans* pursuant to subsections (b) and (d) of section 111." The EPA's proposed approach to use the reductions that will be achieved by approved state and Federal plans in the equivalency determination is based on the use of "plans" in CAA section 136(f)(6)(A)(i). Further, CAA section 136(f)(6)(A)(ii) establishes that EPA may not make the equivalency determination unless and until it can establish that "compliance with the requirements described in clause (i) *will result in equivalent or greater emissions reductions* as would be achieved by the [NSPS OOOOb/EG OOOOc 2021 Proposal]."[35] As similarly noted above, it is reasonable to infer from this language that Congress intended to guarantee that a minimum level of emissions reduction would be achieved by implementation of the CAA section 111 standards before the exemption became available – and because application of the RULOF provision may result in less stringent standards, Congress could not guarantee this minimum level would be achieved unless the equivalency determination considered the reductions actually achieved by the final

---

[35] 42 U.S.C. 7436(f)(6)(A)(ii) (emphasis added).

NSPS and the standards actually set in state plans, including any standards set pursuant to the RULOF provision.

The EPA considered an approach which would compare the NSPS OOOOb/EG OOOOc 2021 Proposal, as proposed, with the final NSPS OOOOb/EG OOOOc as finalized but before implementation and consideration of RULOF, but ultimately rejected this approach. Although this approach would be relatively simple to apply, not taking into account the actual standards adopted in the state plans cannot lead to a sound conclusion about whether the emission reduction target that the statute sets will actually be met in practice. In other words, this approach could not guarantee that the "result" of implementation of the plans will be equivalent reductions, as the statute requires the EPA to determine. Further, CAA section 136(f)(6)(A)(ii) states that "compliance" with the standards should result in equivalent emissions reductions, but in practice, sources are not required to comply with the EG; instead, sources must comply with standards later established in state or federal plans. For these reasons, the EPA believes that comparing the NSPS OOOOb/EG OOOOc 2021 Proposal with the final NSPS OOOOb/EG OOOOc as finalized, but before implementation, is not as well aligned with the statutory text and intent of Congress. The EPA requests comment on its proposed approach and other approaches that could be used to estimate the emissions reductions that will be achieved by plans pursuant to CAA section 111(d), including comparing the NSPS OOOOb/EG OOOOc 2021 Proposal with the final NSPS OOOOb/EG OOOOc before implementation and consideration of RULOF.

The EPA reviewed comments on this topic submitted in response to the NSPS OOOOb/EG OOOOc 2022 Supplemental Proposal. Those comments informed the EPA's proposed approach and alternative approaches. While those comments were considered in the development of this proposal, because they were submitted in response to a separate rulemaking, any duplicative or additional comments on this topic must resubmitted in response to this proposal in order to be considered in the development of the final WEC rule.

e. Application of the Regulatory Compliance Exemption to Subpart W Facilities

CAA section 136(f)(6)(A) states: "[c]harges shall not be imposed pursuant to subsection (c) on an applicable facility that is subject to and in compliance with methane emissions requirements pursuant to subsections (b) and (d) of section 111" upon an Administrator determination that "(i) methane emissions standards and plans pursuant to subsections (b) and (d) of section 111 have been approved and are in effect in all States with respect to the applicable facilities; and (ii) compliance with the requirements described in clause (i) will result in equivalent or greater emissions reductions as would be achieved by the" NSPS OOOOb/EG OOOOc 2021 Proposal.

The EPA notes that an applicable facility in CAA section 136(d) is an entire site or collection of sites, each of which contains individual emissions sources. In contrast, the terms "affected facility"[36] and "designated facility"[37] are used by the EPA in the NSPS and EG regulations, respectively, to refer to an individual emissions source or a group of emissions sources at a site (*e.g.*, a storage tank battery or a collection of pneumatic controllers) to which a standard applies. A single subpart W facility may contain hundreds or thousands of CAA section 111(b) and (d) facilities. The EPA proposes to interpret and implement the regulatory compliance exemption such that an applicable subpart W facility that contains any CAA section 111(b) or (d) facilities would be eligible for the exemption once all other criteria are met (*i.e.*, the Administrator determinations and proposed compliance elements in 40 CFR 99.40). Table 3 shows the subpart W industry segments applicable to the WEC that may contain CAA section 111(b) or (d) facilities. WEC applicable facilities in the offshore production, LNG storage, LNG import and export, and transmission pipeline industry segments do not contain CAA section 111(b) or (d) facilities under the Crude Oil & Natural Gas source category (or any other source category in 40 CFR part 60) and would not be eligible for the regulatory compliance exemption.

---

[36] "Affected facility" is defined for purposes of an NSPS at 40 CFR 60.2 to mean "with reference to a stationary source, any apparatus to which a standard is applicable."

[37] "Designated facility" is defined for purposes of an EG at 40 CFR 60.21a to mean "any existing facility. . . which emits a designated pollutant and which would be subject to a standard of performance for that pollutant if the existing facility were an affected facility."

The EPA proposes that if any future NSPS/EG rules are finalized such that additional industry segments contain CAA section 111(b) or (d) facilities, the WEC applicable facilities in those segments would be eligible for the regulatory compliance exemption.

Table 3. Subpart W Industry Segment and CAA Section 111(b) and (d) Facility Overlap

Subpart W Industry Segment Subject to WEC	**May contain CAA Section 111(b) and/or (d) Facilities?**
Onshore petroleum and natural gas production	Yes
Offshore petroleum and natural gas production	No
Onshore petroleum and natural gas gathering and boosting	Yes
Onshore natural gas processing	Yes
Onshore natural gas transmission compression	Yes
Onshore natural gas transmission pipeline	No
Underground natural gas storage	Yes
LNG import and export equipment	No
LNG storage	No

The EPA assessed other potential interpretations of the regulatory compliance exemption while developing the proposed approach. In particular, the EPA assessed an approach that would instead only exempt the emissions from individual CAA section 111(b) and (d) sources, rather than the emissions of the entire subpart W facility. For example, if certain pneumatic devices are regulated under NSPS OOOOb/EG OOOOc pursuant to CAA sections 111(b) and (d), all reported pneumatic device methane emissions from a subpart W facility would be subtracted from that facility's reported emissions. Under this approach, only emission sources at subpart W facilities that are not also CAA section 111(b) and (d) facilities (*e.g.*, methane slip from engines) would be considered when determining if a facility was above or below the waste emissions threshold. While this approach would exempt emissions associated with individual CAA section 111(b) and (d) facilities that are in compliance with the standards, as anticipated by the language in CAA section 136(f)(6)(A), the EPA does not believe that this approach would be consistent with the other text in that provision that is clear that the exemption applies to the "applicable facility," which CAA section 136(d) defines as an entire subpart W facility. Further, we do not believe that it would be practical to implement the regulatory compliance exemption in this manner because the individual emissions source types in subpart W do not always align with the individual CAA section 111(b) and (d) facilities. Exempting methane emissions from individual subpart W source types that have a similar name as a CAA section 111(b) or (d) facility may exclude a broader or narrower scope of equipment or components and associated emissions than those subject to the NSPS OOOOb/EG OOOOc. Methane emissions from CAA section 111(b) or (d) facilities therefore cannot be directly subtracted from reported subpart W data.

We request comment on the proposed approach for applying the regulatory compliance exemption to subpart W facilities and the proposed interpretation of the relevant statutory text. We also request comment on extending the regulatory compliance exemption to facilities in industry segments not currently covered by NSPS OOOOb/EG OOOOc requirements, in the event that such regulations pursuant to CAA 111(b) and (d) are finalized in the future. We recognize that the proposed approach to exempt entire subpart W facilities results in the exemption of methane emissions from sources that are not subject to NSPS OOOOb/EG OOOOc. While we believe the proposed approach is the most consistent with the language in CAA section 136(f)(6), we request comment on alternative interpretations.

f. Determining Eligibility With Respect to CAA Section 136(f)(6)(A)

It is expected that for many WEC applicable facilities, implementing NSPS OOOOb/EG OOOOc requirements would reduce methane emissions to levels below the waste emissions thresholds. The EPA interprets the regulatory compliance exemption as intending to provide relief from the WEC for WEC applicable facilities that remain above the waste emissions threshold even when their constituent CAA section 111(b) and (d) facilities (i.e. emissions sources) are in full compliance with their applicable methane emissions requirements. This structure provides a further incentive for compliance with applicable requirements.

The EPA proposes that the regulatory compliance exemption would only be available to WEC applicable facilities that exceed the waste emissions threshold. CAA section 136(f)(6)(A) states that “charges shall not be imposed pursuant to subsection (c) on an applicable facility” that meets the requirements of the regulatory compliance exemption. Subsection (c) in turn states that a charge shall be collected “on methane emissions that exceed an applicable waste emissions threshold.” Based on a plain reading of the statutory text, the EPA proposes that the exemption would not apply to WEC applicable facilities below the waste emissions threshold. Further, providing the exemption to WEC applicable facilities below the waste emissions threshold would serve no purpose as these facilities would not have positive WEC applicable emissions and therefore would not benefit from the exemption. Excluding facilities below the waste emissions threshold from the exemption would also reduce the reporting burden for those facilities, which would not be required to report information related to CAA section 111(b) and (d) compliance status.

As discussed in this section, CAA section 136(f)(6)(A) does not specify the definition of compliance for the purposes of the exemption, and many different types of compliance deviations or violations can occur. The EPA is therefore proposing what actions constitute compliance with a methane emissions requirement, pursuant to CAA section 136(f)(A), for the purposes of implementing the regulatory compliance exemption. The EPA’s proposed approach is intended to provide a clear threshold for establishing compliance status and eligibility for the exemption while minimizing the burden on industry and facilitating ease of implementation. The EPA is also proposing related reporting requirements for WEC applicable facilities that are necessary to implement the regulatory compliance exemption (see section II.D.2.g. of this preamble).

CAA section 136(f)(6)(A) states that the WEC shall not be imposed “on an applicable facility that is subject to and in compliance with methane emissions requirements pursuant to subsections (b) and (d) of section 111.” For the purpose of determining WEC facility eligibility for the regulatory compliance exemption, the EPA proposes that the compliance status of CAA section 111(b) and (d) facilities contained within a WEC applicable facility would be assessed based on compliance with the applicable methane emissions requirements for the Oil & Natural Gas Source Category (40 CFR part 60, subparts OOOOa, OOOOb, and OOOOc).

Further, the EPA proposes that should additional NSPS/EG regulations for the oil and natural gas industry source category be finalized in the future, compliance with the methane emissions requirements in those regulations would be assessed for determining eligibility for the regulatory compliance exemption. As discussed in section II.D.2.h. of this preamble, the regulatory compliance exemption could become unavailable if future NSPS/EG revisions result in a situation such that those revisions, upon implementation, result in fewer emissions reductions than achieved by the NSPS OOOOb/EG OOOOc 2021 Proposal, had that proposal been finalized and implemented. Similarly, the exemption could be reinstated upon adoption and implementation of NSPS/EG revisions that restore emissions reduction equivalency with, or improvement upon, the NSPS OOOOb/EG OOOOc 2021 proposal. In such cases where a future NSPS/EG rule only applies to equipment in a segment of the oil and natural gas industry not covered by an existing NSPS/EG rule, the EPA proposes that any WEC applicable facilities with existing access to the regulatory compliance exemption would maintain that access. In other words, the “all states” requirement in CAA section 136(f)(6)(A)(i) would be assessed separately for the additional equipment covered by the new NSPS/EG, and any existing access to the exemption would not be lost while the determination is being made that CAA section 111(d) plans pursuant to the new EG rule were approved and in effect.

The EPA requests comment on its proposed approach for how NSPS OOOOa, NSPS OOOOb, and EG OOOOc should be considered for the purposes of the regulatory compliance exemption. The EPA also requests comment on its proposed approach in light of any potential future NSPS/EG rules for the oil and natural gas industry source category, or any other additional source category that might cover emissions sources at a WEC affected facility, and the role of any such future methane emissions requirements in determining eligibility for the regulatory compliance exemption.

The EPA proposes that any WEC applicable facility that contains CAA section 111(b) or (d) facilities would receive the regulatory compliance exemption if each of the CAA section 111(b) and (d) facilities that constitute the WEC applicable facility has no deviations or violations of the methane emissions requirements promulgated pursuant to the applicable NSPS or EG-implementing state and Federal plans. The EPA is proposing that this compliance requirement would apply for each CAA section 111(b) or (d) facility for each reporting year for the WEC applicable facility. For example, if all CAA section 111(b) or (d) facilities contained in a WEC applicable facility were in compliance with the applicable methane emissions requirements during a particular reporting year, the regulatory exemption would apply for that reporting year. If any CAA section 111(b) or (d) facilities contained in a WEC applicable facility in the respective reporting year were not in compliance with emissions requirements, the regulatory exemption would not apply for that reporting year. The EPA proposes that if a WEC applicable facility were to lose access to the regulatory compliance exemption in a reporting year due to a deviation or violation in that reporting year, it would be able to receive the exemption in any subsequent reporting year if there were no deviations or violations in that applicable reporting year.

The EPA is proposing that a WEC applicable facility would not be eligible for the regulatory compliance exemption if any CAA section 111(b) or (d) facility that is contained within the WEC applicable facility has one or more deviations or one or more violations of any methane emissions requirement under the applicable NSPS or state or Federal plan issued pursuant to the EG. The EPA recognizes that there are many potential elements to compliance with the methane requirements promulgated under CAA sections 111(b) and (d), such as compliance with a quantitative emissions limit and compliance with work practice standards, as well as multiple monitoring, recordkeeping, and reporting requirements. The EPA proposes to find that a deviation or violation from any of the methane requirements promulgated under CAA sections 111(b) and (d) constitutes non-compliance for purposes of the regulatory compliance exemption. The EPA believes that this approach is most consistent with the plain language of CAA section 136(f)(6)(A), which states that charges shall not be imposed on a facility that is "*subject to and in compliance with* methane emissions requirements pursuant to subsections (b) and (d) of section 111".[38] First, Congress made clear that it is not enough for a particular facility to be subject to methane regulations; each facility must also comply with those regulations. And in establishing what it means to comply, Congress did not employ any mitigating language. It is not enough to be "substantively" in compliance, for example, or "in compliance with all major requirements". Facilities must be "in compliance with requirements" pursuant to 111(b) and (d).

The EPA evaluated several alternative criteria for the regulatory compliance exemption eligibility. Another interpretation could be to apply a threshold, such as specific quantitative threshold requirements, for the regulatory compliance exemption. For example, the EPA might specify that a WEC applicable facility would still be deemed to be in compliance for purposes of the regulatory compliance exemption where the number of deviations or violations, or a quantity of excess emissions, fall below a specified threshold, as applied for all the CAA section 111(b) and (d) facilities contained in a WEC applicable facility. However, for the reasons discussed in the following paragraph, the EPA is not proposing this alternative.

Deviations from or violations of any compliance requirements can vary significantly in severity and impact, as well as frequency. For example, a WEC applicable facility could contain many CAA section 111(b) and (d) facilities with numerous deviations that, even collectively, result in a small amount of excess emissions. Another WEC applicable facility could contain a single CAA section 111(b) or (d) facility with a single deviation or violation that resulted in methane emissions significantly exceeding those that would have resulted had the CAA section 111(b) or (d) facility been in compliance with its methane emissions requirements. Violations of the emission standards are not the only violations that may be significant. Violations of monitoring requirements can be very serious, given that failure to do monitoring, or doing it

---

[38] 42 U.S.C. 7436(f)(6)(A).

incorrectly, can result in significant emissions not being discovered or corrected. Reporting violations can also be very serious, if they result in government being unaware of significant problems and thus unable to address them. For these and many other reasons, there is often no easy way to determine the seriousness of particular violations without fact specific and resource intensive investigation. Given that deviations from and violations of requirements for emission standards under CAA section 111(b) and of state or Federal plan requirements under CAA section 111(d) can vary in type, severity, and frequency, and given that CAA section 136(f)(A) does not further specify what constitutes compliance for the purpose of the regulatory compliance exemption, the EPA is not proposing a specific quantitative threshold requirement for the regulatory compliance exemption (*e.g.*, number of violations or quantity of excess emissions).

Because under the statute the availability of the regulatory compliance exemption requires two threshold findings, including that all plans are approved and in effect, the exemption would not be available until several years after finalization of the WEC rule. See the discussion in section II.D.2.b of this preamble regarding the proposed approach for timing of the regulatory compliance exemption availability. With the exception of several sources (*e.g.*, combustion emissions for certain industry segments), most methane emission sources in covered industry segments required to report emissions under subpart W would also be subject to the CAA section 111(b) or (d) methane requirements promulgated in the final NSPS OOOOb and the plans issued and approved under EG OOOOc. The EPA expects that, as oil and gas operations implement the requirements of final NSPS OOOOb and the plans issued and approved pursuant to EG OOOOc (and undertake other methane mitigation voluntarily or due to other Federal or state regulations), total reported subpart W facility methane emissions would decline.

For many WEC applicable facilities, if the CAA section 111(b) and (d) facilities contained within a WEC applicable facility are in compliance with methane requirements promulgated under CAA sections 111(b) and (d), the WEC applicable facility would likely be below the waste emissions threshold. The Agency therefore expects that even if CAA section 111(b) or (d) facilities within these WEC applicable facility have compliance deviations, these WEC applicable facilities will likely remain below the waste emissions thresholds. In the alternative, the EPA expects that cases of significant or widespread compliance deviations or violations with the requirements promulgated under CAA section 111(b) or (d) could result in emission levels for a WEC applicable facility that could exceed the waste emissions thresholds. Because many WEC applicable facilities are expected to be below the waste emissions threshold when the regulatory compliance exemption becomes available, the EPA expects that deviations or violations will not have a significant impact for these facilities – they would not be eligible for the exemption not only because they are out of compliance, but also because they are below the waste emissions threshold, and there is no charge to exempt in that case.

The EPA requests comment on the proposed provisions for determining "compliance" for the purposes of the regulatory compliance exemption and the alternative approaches the agency considered. The EPA requests comment on specific criteria (*e.g.*, types of deviations or violations, quantitative thresholds) that could be applied to determine compliance with methane emissions requirements promulgated under CAA sections 111(b) and (d) for the purpose of assessing WEC applicable facility eligibility for the regulatory compliance exemption. The EPA requests comment on whether the criteria should consider whether the deviation or violation resulted in excess emissions, as demonstrated by monitoring and other data. The EPA also requests comment on excluding WEC applicable facilities below the waste emissions threshold from the regulatory compliance exemption.

g. Reporting and Recordkeeping Requirements for the Regulatory Compliance Exemption

We are proposing a reporting requirement at 40 CFR 99.7(b)(2)(iv) that would require that once the Administrator has made a determination that the requirements in CAA section 136(f)(6)(A) have been met, information related to the regulatory compliance exemption must be included in the WEC filing submitted by the WEC obligated party for each WEC applicable facility exceeding the waste emissions threshold that contains any CAA section 111(b) and (d) affected facilities. CAA section 136(f)(6)(A) mandates that the EPA shall not impose a charge upon WEC applicable facilities that qualify for the regulatory compliance exemption. The proposed approach for implementing the regulatory compliance exemption would make facilities that are below the waste emissions threshold ineligible for the exemption. The EPA therefore proposes that WEC obligated parties would not be required to report information related to the compliance status of CAA section 111(b) and (d) facilities contained within WEC applicable facilities for WEC applicable facilities that are below the waste emissions threshold.

The reporting requirements for facilities with the regulatory compliance exemption are proposed at 40 CFR 99.42. We are proposing that the filing would include a representation of the NSPS and state and Federal plan compliance status for each CAA section 111(b) and (d) facility located within a WEC applicable facility during the reporting year. This representation of compliance status would indicate whether the facility was in full compliance for the entirety of the reporting year (*i.e.,* for each CAA section 111(b) and (d) facility, there were no violations or deviations), or whether there were one or more deviations or violations during the reporting year. For facilities that meet all eligibility requirements for the exemption, we are proposing to require reporting of the ICIS-AIR ID (or if unavailable, the facility registry service (FRS) ID and EPA Registry ID from CEDRI) reporting identifiers for each CAA section 111(b) and (d) facility located at the WEC applicable facility. These identifiers are information necessary for the EPA to assess the accuracy of the representation of compliance status through linkages to reports and emissions and compliance data for each CAA section 111(b) and (d) facility located at the WEC applicable facility.

As supporting documentation for the representation of compliance status of WEC applicable facilities that are eligible for the exemption but were not in full compliance for the entirety of the reporting year, we are proposing to require the submittal of one report associated with the CAA section 111(b) and (d) facilities located within the WEC applicable facility that documents a deviation or violation during the reporting year. As supporting documentation for the representation of compliance status of WEC applicable facilities that are eligible for the exemption and that were in full compliance for the entirety of the reporting year, we are proposing to require the submittal of report(s) associated with the CAA section 111(b) and (d) facilities located within the WEC applicable facility. The EPA recognizes that the compliance certification period for CAA section 111(b) and (d) facilities may not align with the reporting year for which the filing is being completed and that at the time of the WEC filing due on March 31 of each year, report(s) covering the complete preceding reporting year for WEC filing may not be available. To accommodate for these cases where a report is not available for the complete reporting year of WEC filing, the EPA is proposing that the WEC obligated party would provide the report, if available, that covers a portion of the year, identify the period of time covered by the report, and for the remainder of the year provide a representation of compliance status for each CAA section 111(b) and (d) facility at the WEC applicable facility that is not included in the submitted report. It also is possible that the complete calendar year of WEC filing is covered by two annual reports, each covering a portion of the calendar year. In this case, the WEC applicable facility should submit both annual reports. The EPA further recognizes that a WEC applicable facility may contain CAA section 111(b) and (d) facilities that first became subject to requirements under CAA sections 111(b) and (d) during the reporting year associated with the filing and for which the first year of compliance is not completed. For these CAA section 111(b) and (d) facilities, we are proposing to require that the filing identify the type of facility, that date that it became subject, and a representation of the compliance status for the portion of the year in which it was subject to requirements under CAA sections 111(b) and (d). In cases where the initial filing does not include a report covering the entire reporting year, we are proposing to require that the WEC obligated party provide a revised filing once such a report becomes available. The EPA is proposing that this revised filing under the WEC rule would be required to be made on or before the date that the compliance report covering the remainder of the year would be due under the applicable requirements of CAA section 111(b) or (d). The deadlines for filing revisions to WEC filings as discussed in section III.A.4. do not apply for the submittal of compliance reports.

The EPA requires this information for the verification of exemption eligibility. Reported information will be used to conduct verification as discussed in section III.A.4., and reported information, records and other information as applicable will be used to conduct any auditing that occurs under section III.E.1.

The EPA is aware that this proposed reporting program may result in cases where a WEC obligated party makes a good-faith representation that each CAA section 111(b) and (d) facility at the WEC applicable facility is in compliance but later independently discovers the existence of one or more deviations or violations. In this proposed rulemaking, such independent discoveries would be considered to be substantive errors within the WEC filing. Proposed 40 CFR 99.7(e)(1) would require submittal of a revised WEC filing within 45 days of the discovery that a previously submitted WEC filing contains a substantive error. Provided that timely submittal of a revised filing is made, if a revised regulatory compliance exemption filing results in the imposition of WEC obligation from a WEC applicable facility that previously qualified for exemption, we are proposing that the WEC obligated party would not be subject to interest penalties normally assessed for payments made after March 31, as discussed in section III.B.1. of this preamble.

However, later discoveries of deviations or violations by the EPA or another regulatory authority, or discoveries as a result of investigation by the EPA or another regulatory authority (including information requests), are not treated the same way as errors. Where a WEC obligated party represents that each CAA section 111(b) and (d) facility at the WEC applicable facility is in compliance, but the EPA or another regulatory authority subsequently discovers the existence of one or more deviations or violations, or the CAA section 111(b) and (d) facility identifies the deviation or violation as a result of an EPA investigation (including information requests), the

WEC obligated party may be subject to enforcement and required to pay any outstanding WEC fees and interest penalties. False statements may be subject to criminal enforcement.

The EPA seeks comment on the reporting and recordkeeping requirements for the regulatory compliance exemption. We seek comment on whether additional information should be collected or retained to allow for verification of eligibility for the exemption.

h. Resumption of WEC Under CAA Section 136(f)(6)(B)

CAA section 136(f)(6)(B) states that if, at any point after the Administrator has made the determination required by CAA section 136(f)(6)(A), the conditions for such determination are no longer met, the regulatory compliance exemption ceases to apply. Because the EPA proposes to determine that the regulatory compliance exemption is only available if *all states* are subject to standards and plans pursuant to CAA sections 111(b) and (d) that are, collectively, equivalent to the NSPS OOOOb/EG OOOOc 2021 Proposal, the EPA proposes that all WEC applicable facilities would lose access to the exemption if either of the conditions in CAA section 136(f)(6)(A) ceased to apply. For example, if a state plan were legally challenged and vacated after the initial determination, plans would no longer be approved and in effect in all states, and the regulatory compliance exemption would no longer be available. Similarly, if after the initial equivalency determination methane emissions requirements promulgated under CAA section 111(b) or (d) were modified such that they no longer resulted in equivalent or greater aggregate emissions reductions than the NSPS OOOOb/EG OOOOc 2021 Proposal, the exemption would no longer be available. Note that in addition to future revisions to EG, revisions to the requirements in individual state plans pursuant to CAA section 111(d) could also result in a situation in which implementation of the final NSPS and state or federal plans does not achieve equivalent or greater emissions reductions compared to the 2021 NSPS OOOOb/EG OOOOc Proposal. (The conditions under which an individual WEC applicable facility would receive or become ineligible for the regulatory compliance exemption while the conditions in CAA section 136(f)(6)(A) are still met are discussed in section II.D.2.f. of this preamble.) The EPA proposes that any determination that the criteria in CAA section 136(f)(6)(A) are no longer met after the initial determination would be made through a future administrative action. The EPA proposes that access to the exemption would be lost for the full calendar year in which the required criteria were no longer met. The EPA proposes that if access to the regulatory compliance exemption were lost after it was initially made available because one of the two required conditions in CAA section 136(f)(6)(A) were no longer met, it could become available again following a subsequent determination that both conditions were once again achieved. Under such circumstances, the exemption would become available again for the reporting year in which the conditions were met. The EPA proposes that if the conditions ceased to apply and were then met again in the same reporting year, the exemption would be available for the entire reporting year. The EPA requests comment on alternative approaches that would revoke the regulatory compliance exemption for a portion of the year in which the requirements were no longer met and how data under such an approach could be pro-rated for the purposes of determining WEC. The EPA requests comment on the proposed implementation of CAA section 136(f)(6)(B). While the EPA believes the proposed implementation of CAA section 136(f)(6)(B) is consistent with a plain reading of the statutory text and consistent with the proposed timing of the regulatory compliance determinations under CAA section 136(f)(6)(A) (*i.e.*, methane emissions standards and plans pursuant to subsections (b) and (d) of section 111 have been approved and are in effect in *all States*), the agency requests comment on an approach in which access to the exemption would be lost at a state-by-state level. In this alternative approach, if circumstances occurred such that a state plan was no longer approved and in effect, only the WEC applicable facilities located in that state would lose access to the exemption; for WEC applicable facilities that span multiple states, access would be lost if the state plan for any of the states in which the WEC applicable facility is located were no longer approved and in effect.

3. Plugged Well Exemption Under CAA Section 136(f)(7)

Plugged wells have lower methane emissions than active wells and unplugged inactive wells; therefore, plugging wells will reduce total facility emissions potentially subject to WEC. Congress created an incentive for plugging and permanently shutting wells by including an exemption from the WEC in CAA section 136(f)(7): "[c]harges shall not be imposed with respect to the emissions rate from any well that has been permanently shut-in and plugged in the previous year in accordance with all applicable closure requirements, as determined by the Administrator.". Separately, in CAA section 136(a)(3)(D) and 136(b), Congress provided funding that can assist owners and operators who elect to voluntarily and permanently shut in and plug wells on non-Federal land.[39]

In this rule, we are proposing that this exemption would be applicable to wells in the onshore and offshore petroleum and natural gas production industry segments. We interpret this exemption to apply to the production industry segments only and not to wells in other segments, such as storage wells. Production wells are distinctly different in purpose and emissions profile than underground storage wells, which are generally replaced with new storage wells then they are plugged and abandoned. We seek comment on including wells in the underground natural gas storage industry segment under this exemption. We are proposing that in the WEC filing, exempted emissions would be those from wells permanently shut-in and plugged in the previous year (*i.e.*, if a well is permanently shut-in and plugged in 2026, the exempted emissions would be deducted from the 2026 emissions totals that are filed under WEC in 2027).

---

[39] On August 30, 2023, the EPA, U.S. Department of Energy, and National Energy Technology Laboratory announced the availability of up to $350 million in formula grant funding to eligible states to help monitor and reduce methane emissions from marginal conventional wells, including to help owners and operators voluntarily and permanently reduce methane emissions from marginal conventional wells. Inflation Reduction Act (IRA) – Mitigating Emissions from Marginal Conventional Wells, Funding Opportunity Number DE-FOA-003109, available at: *https://www.grants.gov/web/grants/view-opportunity.html?oppId=350045*.

a. Determining if the Exemption for Permanently Shut-In and Plugged Wells Applies to a WEC Applicable Facility

The EPA is proposing two criteria for determining if the exemption for permanently shut-in and plugged wells applies to a WEC applicable facility.

Consistent with the other exemptions, the first criterion is that the facility must have emissions that exceed the waste emissions threshold. CAA 136(c)(7) notes that “charges shall not be imposed” on emissions from permanently shut-in and plugged wells. Charges would not be imposed on emissions below the threshold and therefore an exemption is unnecessary in cases where facility emissions are below the threshold. The EPA proposes that emissions from facilities that are below the waste emissions threshold would not be exempted. The EPA proposes that for facilities that exceed the waste emissions threshold, emissions eligible for the plugged well exemption could be subtracted up to the point where facility emissions equal the waste emissions threshold (*i.e.*, the lowest possible WEC applicable emissions for a facility with the plugged well exemption would be zero).

Second, wells must meet the following definition of permanently shut-in and plugged in accordance with all applicable closure requirements. The EPA proposes that for the purposes of this exemption, a permanently shut-in and plugged well is one that has been permanently sealed to prevent any potential future leakage of oil, gas, or formation water into shallow sources of potable water, onto the surface, or into the atmosphere. For the purposes of this exemption, the EPA is proposing that a well would be considered to be permanently shut-in and plugged, in accordance with all applicable closure requirements, if the owner or operator has met all applicable Federal, state, and local requirements for closure in the jurisdiction where the well is located. For the purposes of this exemption, we are proposing that a well would be considered permanently shut-in and plugged on the date a metal plate or cap has been welded or cemented onto the casing end.

Section II.D.3.c. below details the reporting requirements for this exemption which provide information necessary for verification of the exemption eligibility and exempted emission quantities.

In addition to requirements specifying how to plug a well, relevant Federal, state, and local requirements often also specify requirements such as for notifications, reporting, and site remediation. For purposes of 40 CFR part 99, we propose that the applicable closure requirements would include only the requirements specific to well plugging. We are not proposing to include requirements for notifications, reporting, and site remediation as part of the exemption eligibility criteria for following "all applicable closure requirements" because the closure of the well is the key activity impacting methane emissions, which is the focus of the WEC, and these other aspects of closure are less relevant to methane emissions levels. We also note that had we proposed to include these additional requirements in our interpretation of "all applicable closure requirements," the reporting requirements would increase for permanently shut-in and plugged wells and this may lead to recalculations of WEC years after the exemption was initially applied. We request comment on whether "all applicable closure requirements" should instead be interpreted to include notifications, reporting, site remediation and other post-closure activities at plugged well.

b. Calculations of Exempted Emissions from Permanently Shut-In and Plugged Wells

The EPA proposes that the methane emissions eligible for the exemption are those that occur at the well level including those from wellhead equipment leaks, liquids unloading, and workovers with and without hydraulic fracturing in the reporting year in which the well was plugged. We are proposing to only consider these emissions sources in the calculation of exempted emissions for the permanently shut-in and plugged well as we expect use of production-related equipment or equipment associated with treating production streams generally (*e.g.*, AGRU, dehydrator, separator) to be at a minimum. We are proposing to limit the emissions quantity to the source types we expect to represent the most significant emissions share expected at permanently shut-in and plugged wells. We note that methane emissions in the reporting year from other equipment onsite (*e.g.*, separator, compressor, flare) may result from multiple wells and not just the wells that are plugged in the reporting year. We request comment on an interpretation that would exempt all methane emissions associated with the production from the permanently shut-in and plugged well – not limited to the wellhead equipment leaks, liquids unloading, and workovers as is included in this proposal – during the calendar year of closure, including the methodology by which methane emissions from non-wellhead specific sources in subpart W could be attributed to the permanently shut-in and plugged well.

For the purposes of quantifying the methane emissions from equipment leaks, liquids unloading, workovers with hydraulic fracturing, and workovers without hydraulic fracturing associated with each permanently shut-in and plugged well, we are proposing to use the methane emissions and throughput data collected or reported to subpart W of part 98. As discussed previously in this preamble, proposed amendments in the 2023 Subpart W Proposal impact the data available to best estimate the exempted emissions from the permanently shut-in and plugged well. Therefore, as described in more detail in this section, for applicable emission sources and industry segments, different approaches are proposed for certain time periods.

The current subpart W rule requires that onshore petroleum and natural gas production facilities report methane emissions from liquids unloading and workovers to be reported by sub-basin for each WEC applicable facility as well as methane emissions from equipment leaks at the facility-level. Subpart W of part 98 also currently requires offshore petroleum and natural gas production facilities and onshore petroleum and natural gas production facilities to report facility-level throughput of gas and oil handled or sent to sale, respectively. Proposed revisions included in the 2023 Subpart W Proposal would require onshore petroleum and natural gas production facilities to report additional elements that facilitate quantification of methane emissions from individual shut-in and plugged wells. Specifically, beginning in reporting year 2024, the 2023 Subpart W Proposal would require onshore petroleum and natural gas production facilities to report well-level throughput volumes for gas and oil sent to sale from wells that are permanently shut-in and plugged. Additionally, beginning in reporting year 2025, the 2023 Subpart W Proposal would increase the granularity of methane emissions reporting for liquids unloading and workovers to the well-level and methane emissions reporting for equipment leaks to the well pad level. Due to the differences in available reporting data for 2024 and future years, the proposed approach for quantifying methane emissions in part 99 for individual wells located at onshore petroleum and natural gas production facilities that are permanently shut-in and plugged in 2024 would be different than the proposed approach for quantifying methane emissions from wells located at onshore petroleum and natural gas production facilities that are permanently shut-in and plugged in 2025 and future years.

For reporting year 2024, the EPA proposes through 40 CFR 99.52 that WEC applicable facilities in the onshore petroleum and natural gas industry segment would quantify methane emissions from permanently shut-in and plugged wells by allocating the subpart W of part 98 reported facility-level equipment leak, liquids unloading, and workover methane emissions using subpart W of part 98 reported production volumes of gas and oil sent to sale. We are proposing that WEC applicable facilities in the onshore petroleum and natural gas industry segment would sum the total subpart W of part 98 reported methane emissions from equipment leaks, liquids unloading, and workovers, and multiply the sum of the methane emissions by the ratio of subpart W of part 98 reported production at the permanently shut-in and plugged well to the subpart W of part 98 reported facility-level total production.

For facilities with only gas production with exempt plugged well emissions, we are proposing that the reported gas produced from the plugged wells be divided by the total gas production at the facility to develop the ratio. For facilities with only oil production with exempt plugged well emissions, we are proposing that the reported oil produced from the plugged wells be divided by the total oil production at the facility to develop the ratio. For facilities with both gas and oil production with exempt plugged well emissions, we are proposing that gas production that is reported to subpart W of part 98 by the WEC applicable facility in the onshore petroleum and natural gas industry segment would be converted to barrels of oil equivalent using a default value of 6,000 scf/barrel, such that throughput volumes will be on the same basis for facilities that report production of gas and oil. We are seeking comment on whether the EPA should provide an option for WEC applicable facilities to use a facility-specific value for barrels of oil equivalent, including whether facilities routinely determine this value and whether significant variability is expected in this value.

For 2025 and future years, we are proposing that WEC applicable facilities in the onshore petroleum and natural gas industry segment would estimate well-level emissions in accordance with part 98 methods for the permanently shut-in and plugged well. As described previously, for 2025 and future years, subpart W of part 98 would require reporting of methane emissions from liquids unloading and workovers to be at the well-level for facilities in the onshore petroleum and natural gas industry segment, therefore we are proposing that facilities in the onshore petroleum and natural gas industry segment would utilize the methane emissions as -reported to subpart W part 98 in their part 99 exemption calculation for these emissions sources. Also, as described previously, for 2025 and future years, subpart W of part 98 would require reporting of methane emissions from equipment leaks at the well pad for facilities in the onshore petroleum and natural gas industry segment. In order to obtain a well-level estimate for the part 99 exemption calculation, we are proposing to require facilities in the onshore petroleum and natural gas industry segment to utilize the subpart W of part 98 input data and emission estimation methods for wellhead equipment leaks to calculate the methane emissions at the well level for the permanently shut-in and plugged well. For example, if the equipment leak methane emissions at the well pad that includes the permanently shut-in and plugged well were estimated using the leaker method in 40 CFR 98.233(q), the WEC applicable facility would use the count of leakers by component type (*e.g.*, valve, connector) recorded for the permanently shut-in and plugged well, the operating time of the well during the year, and the appropriate emissions factors from subpart W of part 98 to estimate the methane emissions from the permanently shut-in and plugged well. Similarly, if the equipment leak methane emissions at the well pad that includes the permanently shut-in and plugged well were estimated using the population count method in 40 CFR 98.233(q), the WEC applicable facility would use the operating time of the well during the year and the appropriate emissions factors from subpart W of part 98 to estimate the emissions from the permanently shut-in and plugged well.

For offshore petroleum and natural gas production facilities, the current subpart W of part 98 reporting requirements are based on the facility's submission to the Bureau of Ocean Energy Management (BOEM), which includes methane emissions for component-level equipment leaks. The methane emissions required to be reported by offshore facilities would be unchanged by the 2023 Subpart W Proposal as it pertains to this exemption in that these facilities will continue to report the data from their BOEM report. Subpart W of part 98 also currently requires offshore petroleum and natural gas production facilities to report facility-level throughput of gas and oil handled in the reporting year. Proposed revisions included in the 2023 Subpart W Proposal for offshore petroleum and natural gas production facilities would add requirements for the reporting of well-level throughput volumes for gas and oil sent to sale from wells that are permanently shut-in and plugged beginning in reporting year 2024. The 2023 Subpart W Proposal would also revise the terms in the current reporting elements for facility-level throughputs to refer to gas sent to sale, rather than handled, for consistency with the CAA language and with the onshore production industry segment. As noted in the preamble for the 2023 Subpart W Proposal, these verbiage changes for facility-level throughput are not expected to impact the quantity of production volumes reported and were made for consistency and clarity. For the purposes of estimating the exempted emissions for permanently shut-in and plugged wells at offshore petroleum and natural gas production facilities, we are proposing that facilities allocate the component level equipment leaks (*i.e.*, those from valves, connectors) reported to subpart W of part 98 by the ratio of production from the well that has been permanently shut-in and plugged to the total facility-level production. Analogous to the approach for onshore petroleum and natural gas production facilities for reporting year 2024, we are proposing that gas sent to sale be converted to BOE using a default value of 6,000 scf/bbl BOE.

For all reporting years and applicable industry segments, if the WEC applicable facility has more than one permanently shut-in and plugged well, we are proposing that the part 99 emissions calculations would be performed for each well and summed to determine the net annual quantity of methane emissions at the WEC applicable facility eligible for the exemption.

c. Reporting and Recordkeeping Requirements for the Exemption for Permanently Shut-In and Plugged Wells

Through the provisions proposed at 40 CFR 99.51, the EPA is proposing that the WEC obligated party receiving the exemption would provide for each well at a WEC applicable facility, the well ID number as reported to subpart W of part 98; the date the well was permanently shut-in and plugged; the statutory citation for each state, local, and Federal regulation stipulating requirements that were applicable to the closure of the permanently shut-in and plugged well; the emission attributable to the well, and for each WEC applicable facility, the total emissions attributable to all permanently shut-in and plugged wells at the facility; and a certification statement by the designated representative for the WEC obligated party that all identified wells were closed in accordance with state, local, and Federal requirements. We are proposing that the information included in the report would be subject to the general recordkeeping requirements for part 99, meaning these records must be retained for 5 years following the WEC filing year of the exemption such that they can be made available to the EPA for inspection and review.

The EPA requires this information for the verification of exemption eligibility and of exempted emission quantity. Reported information will be used to conduct verification as discussed in section III.A.4., and reported information, records and other information as applicable will be used to conduct any auditing that occurs under section III.E.1.

The EPA seeks comment on the reporting and recordkeeping requirements for the exemption for emissions from wells that are permanently shut-in and plugged. We seek comment on whether additional information should be collected or retained to allow for verification of the quantity of emissions eligible for the exemption.

III. General Requirements of the Proposed Rule

A. WEC Reporting Requirements

1. Required Reporters

The WEC obligated party would be required to submit a WEC filing annually by March 31 that would include data collected from each WEC applicable facility of which it (the WEC obligated party) is comprised as of December 31 of each reporting year. The WEC filing would provide the data necessary for the EPA to assess and verify the WEC obligation including certain part 98 emissions information and netting, as applicable, as well as supporting documentation for any WEC applicable facility exemptions.

2. Reporting Deadlines

As required under the CAA sections 136(c) and (e), the assessment of the first WEC will be based on data collected under subpart W of the GHGRP beginning on January 1, 2024. We are proposing in 40 CFR 99.5 that the first WEC filing would be due March 31, 2025, and would be required to be submitted annually by March 31 thereafter, as applicable. We have proposed the March 31 reporting deadline under this action for the purpose of quantifying WEC such that the information reported for part 99 can be done in coordination with and on the same schedule as (*i.e.*, by March 31 of the calendar year following the reporting year) the information reported under subpart W.

The EPA is proposing that final revisions to the first WEC filing, with the exception of resubmissions to provide CAA section 111(b) or (d) compliance reports or revisions to previously reportd compliance reports for the purposes of the regulaltory compliance exemption, would be due by November 1, 2025, and would be required to be submitted annually by

November 1 thereafter, as applicable (see section III.A.4. of this preamble for discussion and request for comment on this deadline).

3. Submission of the WEC Filing

The EPA proposes that each WEC filing must be submitted electronically in accordance with the requirements of 40 CFR 99.6 and in a format specified by the Administrator.

As noted previously in this section of the preamble, the EPA proposes that each WEC obligated party will submit a WEC filing annually. The WEC filing content we are proposing is expected to provide the data necessary to complete the WEC calculations as described previously in the preamble. We are proposing WEC filing reporting requirements to cover general company information including physical address, email, telephone number, list of associated WEC applicable facilities and their identifying information (*e.g.*, part 98, subpart W e-GGRT ID), as well as the net WEC emissions calculated in accordance with 40 CFR 99.22 and the WEC obligation as calculated pursuant to 40 CFR 99.23. We are also proposing that each WEC obligated party's WEC filing include certain information at the WEC applicable facility level. Specifically, we are proposing that for each WEC applicable facility that comprises the WEC obligated party, the reporting requirements would cover facility-level information including the facility's eGGRT ID, the facility's industry segment(s), the facility's waste emissions threshold calculated in accordance with 40 CFR 99.20, and the facility's WEC applicable emissions calculated in accordance with 40 CFR 99.21.

The EPA seeks comment on these reporting and recordkeeping requirements (e.g., date of WEC filing and payment for the first year). We seek comment on whether additional information should be reported to EPA or retained by the WEC obligated party or WEC applicable facility to allow for verification of the WEC filing.

The EPA is also proposing reporting requirements for each WEC obligated party related to the three WEC exemptions, which are discussed in sections II.D.1. through 3. of this preamble. Under the proposed approach, the exemptions are only available to WEC applicable facilities that exceed the waste emissions threshold. The EPA therefore proposes that these reporting requirements would only apply to WEC applicable facilities that exceed the waste emissions threshold and are otherwise eligible for the exemption(s). The EPA seeks comment on the reporting requirements for each exemption, as noted in sections II.D.1. through 3. of this preamble.

4. Verification and WEC Filing Revisions

We anticipate that the foundation of the WEC obligated party's WEC filing would be the methane emissions and throughput reported by the WEC applicable facilities in their subpart W reports. As specified in § 98.3(f) and (h) of this chapter, part 98 currently includes a verification process and resubmission process for resolving substantive error(s)[40] in reporting. These errors are either found through self-discovery by the WEC obligated party or are found by the EPA during the verification process. In part 98, errors must be resolved within 45-days from discovery or notification of the error by the EPA. The EPA may grant a 30-day extension request if the request is timely, such that a total of 75 days may be provided for complete issue resolution. Additional extensions may be approved by the Administrator in specified limited circumstances. Resolution is either made by report revision and resubmission or by providing an adequate demonstration that the previously submitted report does not contain the identified substantive error or that the identified error is not a substantive error. Upon satisfying these requirements, the EPA designates the part 98 report as verified. If the requirements in § 98.3 of this chapter are not satisfied, the EPA considers the part 98 report unverified.

We are proposing that the verification status of the WEC applicable facility with respect to the reporting in subpart W part 98 would be considered by the EPA when determining the verification status of the part 99 filing because the subpart W data would be the cornerstone of the WEC. In effect, a WEC filing may not achieve verified status until all errors associated

---

[40] 40 CFR 98.3(h)(3): A substantive error is an error that impacts the quantity of GHG emissions reported or otherwise prevents the reported data from being validated or verified.

subpart W reports that impact total WEC are corrected. For example, if the subpart W part 98 report of one WEC applicable facility contains errors related to reported emissions or throughput that affect total WEC, the EPA could by extension consider the WEC filing of the WEC obligated party that includes that WEC applicable facility to be unverified. However, there may also be situations in which an unverified subpart W part 98 report does not impact the ability to accurately calculate a WEC obligated party's WEC obligation. In these circumstances, the proposed approach would allow the EPA to verify a WEC obligated party's part 99 report even if the part 98 report of a WEC applicable facility associated with the WEC obligated party remained unverified.

Separately, there are elements of the part 99 filing that would not be tied to the subpart W report, such as the calculation of the WEC including netting and any exemption information. We are proposing to implement a similar verification procedure under part 99 to that which exists under part 98. In implementing the verification of information submitted under part 99, the EPA envisions a two-step process. First, we propose to conduct an initial centralized review of the data that would help assure the completeness and accuracy of data. Second, the EPA intends to notify WEC obligated parties of potential errors, discrepancies, or make inquiries as needed concerning the WEC filing. Specifically for this rulemaking, we anticipate that there could be errors or clarifications with respect to the supporting documentation and quantification of emissions associated with exemptions from the WEC, which may require EPA review to evaluate and confirm their validity and accuracy. The part 99 verification review would identify issues resulting from the calculation of WEC based on verified subpart W GHGRP reports and verified WEC filings to the extent possible. A thorough discussion of the separate process for unverified reports and approach for reassessment of WEC obligation due to resubmissions is discussed in section III.B. of this preamble.

We are proposing provisions that would require a WEC obligated party to resubmit their WEC filing within 45-days of either being contacted in writing by the EPA notifying them of the presence of a substantive error in their WEC filing or by self-discovering that a previously submitted WEC filing contains one or more substantive errors (except as described later in this section), or within 75 days if granted a 30-day extension per 40 CFR 99.7(e)(4). For the purposes of part 99, we are proposing to consider a substantive error to be an error that impacts the Administrator's ability to accurately calculate the WEC obligated party's obligation, which may include, but would not be not limited to, the list of WEC applicable facilities associated with a WEC obligated party and corresponding data reported in each listed WEC applicable facility part 98 report(s), emissions associated with exemptions, and supporting information for each exemption to demonstrate its validity. We are proposing that the revised WEC filing must correct all substantive errors or provide information demonstrating that the previously submitted report does not contain the identified substantive error or that the identified error is not a substantive error.

We are also proposing that if a WEC applicable facility revises and resubmits their part 98 report, which results in impacts on the WEC calculations, the WEC obligated party would also be required to submit a revised WEC filing that includes the number of corrections and information detailing the correction(s) made. In the event that a subpart W report revision results in a change in the applicability of part 99 to the facility, under the proposed provisions the WEC obligated party would either submit a WEC filing adding or removing any facilities, as appropriate. As described in the paragraph below, with the exception of resubmissions to provide CAA section 111(b) or (d) compliance reports or revisions to previously reported compliance reports for the purposes of the regulatory compliance exemption, the EPA is proposing that part 99 resubmissions would only be allowed up to November 1 of the year following the reporting year. Any part 98 resubmissions after this date that impact WEC calculations would not be required to be resubmitted in a revised WEC filing; facilities could continue to resubmit data under subpart W at any time. Resubmissions related to CAA section 111(b) or (d) compliance reports for the purposes of the regulatory compliance exemption must be made as discussed in section II.D.2.g. of this preamble.Under subpart W, facilities may resubmit data for historic reporting years via e-GGRT for the most recent five reporting years (e.g., submit updates to 2019 data in 2022). Data resubmission for historic reporting years in the context of the WEC program is extremely complicated due to the potential changes in facility ownership over time and the implications this has on netting of emissions from facilities under common ownership or control. For example, a company or a facility owned by a company in one year may be owned in whole or in part by one or multiple different companies the next year. With such changes occurring annually to multiple facilities across multiple owners and operators with more than one facility under common ownership or control, there is no practical means of incorporating resubmitted data for historic reporting years in the WEC program. This would require the EPA to engage in a potentially constant series of WEC recalculations and associated invoicing or refunds. The EPA therefore proposes a deadline of November 1 for each year, after which time no WEC filings could be resubmitted. For example, resubmissions of data initially reported by March 31, 2025, used to assess WEC for the 2024 reporting year, would be required to be submitted by November 1, 2025. This proposed approach would not allow resubmissions for historic reporting years for WEC filings, even if their corresponding subpart W data was resubmitted for historic reporting years for purposes of subpart W. Subpart W facilities would continue to be subject to part 98 existing requirements for resubmitting data for previous reporting years, but any data resubmitted under part 98 after November 1 of the calendar year following the respective reporting year would not be considered for the purposes of WEC under part 99. This deadline would apply to all WEC applicable facilities, including those with data verified by EPA. The EPA's proposed approaches for WEC filing requirements and data verification are intended to incentivize complete and accurate WEC filings under part 99, and thus corresponding reporting of complete and accurate data under part 98, by March 31 of each year. As a result, the EPA expects that there will be little need to resubmit data after this initial reporting deadline, and the seven months between March 31 and the proposed final deadline of November 1 would give facility owners or operators sufficient time to make any resubmissions. The EPA proposes that it would retain the right to reevaluate WEC obligations in WEC filings after November 1 (e.g., as part of an EPA audit of facility data). Similarly, the November 1 deadline would not apply to adjustments to WEC obligations resulting from the process to resolve unverified data, proposed at 40 CFR 99.8, should that resolution occur after November 1.

The EPA requests comment on the proposed approach of setting a deadline for WEC resubmissions under part 99 and in doing so not allowing data resubmissions for the WEC filing for previous historic reporting years. The EPA requests comment on the November 1 deadline and options for alternative deadlines. The EPA also requests comment on alternative approaches that would allow data resubmissions for historic reporting years under the WEC program, as well as comment on how such changes would be incorporated into netting for historic reporting years.

B. Remittance and Assessment of WEC

We are proposing that each WEC obligation payment must be submitted electronically in accordance with the proposed requirements of 40 CFR 99.6 and in a format specified by the Administrator as part of the submission of the WEC filing (*i.e.*, by March 31 each year covering the preceding reporting year).

For the purposes of ensuring timely payment of the WEC, the EPA is proposing financial sanctions under 40 CFR 99.10 of subpart A, pursuant to the authority included in the Federal claims provision at 31 U.S.C. 3717. These penalties would apply to delinquent WEC payments. Under 31 U.S.C. 3717, there are interest, penalties, and costs that may be imposed on outstanding or delinquent debts arising under a claim owed by a person to the U.S. Government. Specifically, under 31 U.S.C. 3717(a)(1), agencies shall charge a minimum annual rate of intereston an outstanding debt on a United States Government claim owned by a person.[41] Under

---

[41] This rate of interest is known as the Current Value of Funds Rate, or CVFR, and is published prior to November 30th of each year by Treasury. The CVFR is based on the weekly average of the Effective Federal Funds Rate, less 25 basis points, for the 12-month period ending September 30th of each year, rounded to the nearest whole percent. This rate may be revised on a quarterly basis if the annual average, on a moving basis, changes by 2 percentage points or more.

the EPA's implementing Policy Number 2540-9-P2, accounts are considered delinquent when the EPA does not receive payment by the due date specified on a bill or invoice (*i.e.*, for the WEC obligation at the time of submission of the WEC filing). The EPA is proposing to cite this Federal claims interest charge authority as the first tier of WEC payment sanctions.

Second, under 31 U.S.C. 3717(e)(1), agencies must collect an additional penalty charge of not more than six percent per year for failure to pay any part of a debt more than 90 days past due, as well as additional charge to cover the cost of processing delinquent claims. Under Policy Number 2540-9-P2, the EPA Finance Centers are responsible for issuing demand notices and conducting collection efforts for the Agency. The EPA Finance Centers would assess interest, handling, and penalty charges in 30-day increments for late payments and would assess the 6 percent penalty with the 3rd demand letter or notice.

The EPA therefore proposes to include this additional 6 percent non-payment penalty charge for WEC debts that are more than 90 days past due. This would be the second tier of sanction authority under this proposal's set of payment sanctions and would be implemented if the first tier of interest charges is not effective in causing a delinquent WEC obligated party to make their payments current. The EPA seeks comment on its proposed approach for applying interest to late WEC fee payments.

Additionally, for WEC obligated parties that fail to submit their annual WEC filing by the deadline discussed in section III.A.2. of this preamble, the EPA is proposing a daily penalty no greater than the rate associated with 42 U.S.C. 7413(d)(1) specified in Table 1 of 40 CFR 19.4, as amended. The EPA Finance Centers would assess interest, handling, and penalty charges in 30-day increments. We are proposing that the assessment of this penalty would begin on the date that the WEC filing was considered past due (*i.e.,* April 1st) and continue until such time that the WEC filing is submitted and certified by the WEC obligated party. The EPA requests comment on its proposed approach of establishing a daily penalty for unsubmitted WEC filings.

1. Process for Reassessing WEC for WEC Filings Resubmitted After the Initial Waste Emission Charge Has Been Assessed

As discussed in section III.A.4. of this preamble, WEC obligated parties may need to resubmit their WEC filings and WEC applicable facilities may need to resubmit their GHGRP reports. These resubmittals have the potential to result in recalculation of the WEC obligation for the WEC obligated party. As discussed in section III.A.4. of this preamble, the EPA proposes that data resubmissions for the previous reporting year would be required to be submitted by November 1 in order to be considered for WEC recalculations, with the exeption of resubmissions related to CAA section 111(b) or (d) compliance reports for the purposes of the regulatory compliance exemption. If the recalculated WEC obligation is less than the original WEC obligation owed by the WEC obligated party, we propose that the EPA would authorize a refund to the WEC obligated party equal to the difference in WEC obligation. If the recalculated WEC obligation is greater than the original WEC obligation owed by the WEC obligated party, the EPA would charge the WEC obligated party for the remaining balance of the WEC, including any assessed fees or penalties.[42] To encourage careful attention to detail and reduce the need for WEC filing revisions, we are proposing to charge a daily interest rate for any revised WEC filing that results in additional WEC being owed. As proposed in 40 CFR 99.8, this daily interest rate would be assessed from April 1st (*i.e.*, the day after the submission deadline) until such time that a resubmitted WEC filing and payment, that is subsequently verified by the EPA, is certified by the designated representative. We propose a daily interest rate equal to theCurrent Value of Funds Rate, consistent with 31 U.S.C. 3717(a). The EPA proposes that payment for any additional WEC, including assessed interest, would made with the resubmitted WEC filing.

---

[42] We propose that WEC obligated parties would be subject to the financial sanctions proposed in 40 CFR 99.10 for any delinquent payments of the revised WEC invoice(s), as discussed in section III.B. of this preamble.

The EPA seeks comment on the proposed approach for resubmitted WEC filings, including the application of daily interest rate for revised WEC filings that result in additional WEC being owed.

2. Process for Assessing WEC for Unverified Part 99 Filings

As discussed in section III.A.4. of this preamble, the EPA's verification review process ideally ends with the resolution of identified potential errors through either correction and resubmission of facilities' reports or justification provided through correspondence with reporters that no substantive error exists. When WEC applicable facilities or WEC obligated parties do not provide appropriate information to resolve the errors in their part 98 or part 99 data after 45 days (with the possibility of a 30-day extension) of either being contacted in writing by the EPA notifying them of the presence of a substantive error or by self-discovering that a previously submitted part 98 report or WEC filing contains one or more substantive errors, the EPA considers their WEC filing to be unverified.

If a WEC filing is unverified but the EPA is able to correct the error(s) based on reported data, we propose that the EPA will recalculate the WEC using available information and provide an invoice or refund to the WEC Obligated Party within 60 days of determining a WEC filing to be unverified. If the WEC Obligated Party resubmits a WEC filing within that timeframe, the EPA would either accept the resubmission, or take the resubmission into account when calculating the WEC. In cases where the EPA is unable to calculate the WEC with available information, the WEC Obligated Party may be required to undergo a third-party audit. The third-party auditor must review records kept by the WEC Obligated Party, quantify the WEC with available information and in accordance with the requirements of this part, and submit the updated WEC calculations and supporting data to the EPA. The EPA would then take that information into consideration and calculate the WEC and provide an invoice to the WEC Obligated Party. Third-party audits may be required to be arranged by and conducted at the expense of the WEC obligated party.

A WEC obligated party would be required to pay an invoice received from the EPA for any updated WEC obligation by the specified due date, or within 30 days of the date of the invoice or bill if a due date is not provided.

The EPA requests comment on the proposed approach for assessing WEC for unverified part 99 reports, including the EPA recalculating WEC when data are available, and the option of requiring third-party auditing of WEC obligated party records when the EPA is not able to recalculate WEC with the available information. The EPA requests comment on an alternative approach that would establish default values (*e.g.*, industry segment-specific methane intensities) that would be conservative in nature and used to calculate WEC applicable emissions from unverified reports until such time that the report becomes verified. The calculated methane emissions from the unverified report(s) would then be included when determining the WEC obligated party's WEC obligation. In this approach, the EPA envisions that similar financial sanctions as those discussed in section III.B.2. of this preamble would be applied until a verified report is submitted and certified by the WEC applicable facility. We also seek comment on additional gap-filling approaches for unverified GHGRP reports. In addition, the EPA seeks comment on an approach for unverified reports that would apply daily penalties on unverified reports, up to the rate associated with U.S. Code citation 42 U.S.C. 7413(d)(1) specified in Table 1 of 40 CFR 19.4, as amended. Under such an approach, the EPA seeks comment on the duration of the penalty (*e.g.*, 3 years or until the report is verified, whichever is sooner).

C. Authorizing the Designated Representative

We are proposing provisions for each affected WEC obligated party to identify a designated representative. We are proposing that each WEC obligated party would each have one designated representative who is an individual selected by an agreement binding on the WEC obligated party. This designated representative would act as a legal representative between the WEC obligated party and the Agency. We are proposing that the designated representative must submit a complete certificate of representation at least 60 days prior to the submission of the first

WEC filing made by the WEC obligated party. Additionally, each WEC filing would contain a signed certification by a designated representative of the WEC obligated party. On behalf of the owner or operator, the designated representative would certify under penalty of law that the WEC filing has been prepared in accordance with the requirements of 40 CFR part 99 and that the information contained in the WEC filing is true and accurate, based on a reasonable inquiry of individuals responsible for obtaining the information.

We are also proposing that the designated representative could appoint an alternate to act on their behalf, but the designated representative would maintain legal responsibility for the submission of complete, true, and accurate emissions data and supplemental data. A designated representative or alternate designated representative may delegate one or more “agents.” The agent (*e.g.*, a part 98 subpart W designated representative who can provide facility-specific information) can enter data for a part 99 WEC filing, but is not allowed to submit, certify, or sign a WEC filing.

We are proposing that within 90 days after any change in the WEC obligated party, the designated representative or any alternate designated representative must submit a certificate of representation that is complete under this section to reflect the change.

D. General Recordkeeping Requirements

We are proposing that WEC applicable facilities and WEC obligated parties must retain all required records for at least 5 years from the date of submission of the WEC report for the reporting year in which the record was generated. We are proposing that the records shall be kept in an electronic or hard-copy format (as appropriate) and recorded in a form that is suitable for expeditious inspection and auditing. Under the proposed provisions, upon request by the Administrator, the records required under this section must be made available to the EPA. We are proposing that records may be retained off site if the records are readily available for expeditious inspection and review. For records that are electronically generated or maintained, we are proposing that the equipment or software necessary to read the records shall be made available, or, if requested by the EPA, electronic records shall be converted to paper documents. The records that the EPA is proposing that must be retained would include information required to be retained under part 98, specifically subparts A and W, any other information needed to complete the WEC filing, and all information required to be submitted as part of the WEC filing, including any supporting documentation.

E. General Provisions, Including Auditing and Compliance and Enforcement

1. Auditing Provisions

We are proposing that the EPA may conduct on-site audits of facilities, as indicated in 40 CFR 99.7(c). Under the proposed general recordkeeping provision at 40 CFR 99.7(d), the records generated under this part would be available to the EPA during an on-site audit as the records must be recorded in a form that is suitable for expeditious inspection and review, and must be made available to the EPA upon request. The on-site audits may be conducted by private auditors contracted by the EPA or by Federal, State or local personnel, as appropriate, and may be required to be arranged by and conducted at the expense of the WEC obligated party.

2. Compliance and Enforcement

We are proposing that any violation of any requirement of this part shall be a violation of the Clean Air Act, including section 114 (42 U.S.C. 7414) and section 136 (*42 U.S.C. 7436*). A violation would include but is not limited to failure to submit, or resubmit as required, a WEC filing, failure to collect data needed to calculate the WEC charge (including any data relevant to determining the applicability of any exemptions), failure to retain records needed to verify the amount of WEC charge, providing false information in a WEC filing, and failure to remit WEC payment. As proposed at 40 CFR 99.4(b), it is a violation to fail to authorize a designated representative for a WEC obligated party. In the case of a facility with more than one owner or operator, failure to select a WEC obligated part would constitute a violation on the part of each owner or operator, as proposed at 40 CFR 99.4. Each day of a violation would constitute a separate violation.

IV. Proposed Confidentiality Determinations for Certain Data Reporting Elements

A. Overview and Background

In this action, the EPA is proposing to require WEC obligated parties to report the general information described in section III.A.3. of this preamble and the information specific to any applicable exemptions as described in sections II.D.1. through 3. of this preamble. This information is necessary for the EPA to verify the contents of the WEC filing, including confirming that all of the required WEC applicable facilities were included, each WEC applicable facility is eligible for any exemptions that were applied, and the WEC applicable emissions and the amount of the WEC obligation were calculated correctly. As explained in the remainder of this section, the EPA is proposing that nearly all of the data reported would be either emission data or otherwise ineligible for confidential treatment. The information that may be eligible for confidential treatment would be information included in supporting documentation required for eligible exemptions or additional information provided in software comments fields.

Section 114(c) of the CAA requires that "[a]ny records, reports, or information obtained under [CAA section 114(a)] shall be available to the public, except that upon a showing satisfactory to the Administrator by any person that records, reports, or information, or particular part thereof, (other than emission data) . . . if made public, would divulge methods or processes entitled to protection as trade secrets . . ., the Administrator shall consider such record, report, or information or particular portion thereof confidential. . . ." Thus, the CAA begins with a presumption that information submitted to the EPA may be disclosed to the public. It then provides a narrow exception to that presumption for information that "if made public, would divulge methods or processes entitled to protection as trade secrets. . . ." Section 114(c) of the CAA narrows this exception further by excluding "emission data" from the category of information eligible for confidential treatment. The EPA has interpreted CAA section 114(c) to afford confidential treatment to both trade secrets and confidential business information that are not emission data (40 FR 21987, 21990 (May 20, 1975)).

While the CAA does not define “emission data,” the EPA has done so by regulation at 40 CFR 2.301(a)(2)(i). Emission data means, with reference to any source of emissions of any substance into the air—

(A) Information necessary to determine the identity, amount, frequency, concentration, or other characteristics (to the extent related to air quality) of any emission which has been emitted by the source (or of any pollutant resulting from any emission by the source), or any combination of the foregoing;

(B) Information necessary to determine the identity, amount, frequency, concentration, or other characteristics (to the extent related to air quality) of the emissions which, under an applicable standard or limitation, the source was authorized to emit (including, to the extent necessary for such purposes, a description of the manner or rate of operation of the source); and

(C) A general description of the location and/or nature of the source to the extent necessary to identify the source and to distinguish it from other sources (including, to the extent necessary for such purposes, a description of the device, installation, or operation constituting the source).

Further, in a 1991 EPA notice of policy (56 FR 7042, February 21, 1991), the EPA stated that certain data fields constitute “emission data” and therefore cannot be withheld as confidential. The 1991 document indicated that while confidentiality determinations are typically made on a case-by-case basis, some kinds of data will always constitute emission data within the meaning of CAA section 114(c). The document listed several data fields that EPA considered to be emission data including facility identification data (*e.g.*, facility name; address; ownership; Standard Industrial Classification (SIC); emission point, device or operation description information) and emission parameters (*e.g.*, compounds emitted; origin of emissions; emission rate, concentration, release parameters, boiler or process design capacity, emission estimation method). The document clarified that the list of types of information in the document was not exhaustive and that other data might also constitute emission data.

For data that are not “emission data,” the confidentiality determination criteria at 40 CFR 2.208(a) through (d) are as follows:

Determinations issued under §§ 2.204 through 2.207 shall hold that business information is entitled to confidential treatment for the benefit of a particular business if:

(a) The business has asserted a business confidentiality claim which has not expired by its terms, nor been waived nor withdrawn;

(b) The business has satisfactorily shown that it has taken reasonable measures to protect the confidentiality of the information, and that it intends to continue to take such measures;

(c) The information is not, and has not been, reasonably obtainable without the business’s consent by other persons (other than governmental bodies) by use of legitimate means (other than discovery based on a showing of special need in a judicial or quasi-judicial proceeding); and

(d) No statute specifically requires disclosure of the information.

In *Food Marketing Institute* v. *Argus Leader Media*, 139 S. Ct. 2356 (2019) (hereafter referred to as *Argus Leader*), the U.S. Supreme Court issued an opinion addressing the meaning of the word “confidential” in Exemption 4 of the Freedom of Information Act, 5 U.S.C. Section 552(b)(4)(2012 and Supp. V. 2017) stating that “confidential” must be given its “ordinary” meaning, which is information that is “private” or “secret.” As a result, starting with the date of the *Argus Leader* ruling, the EPA no longer assesses data elements using the rationale of whether disclosure will cause a likelihood of substantial competitive harm when making confidentiality determinations. Instead, the EPA assesses whether the information is customarily and actually treated as private by the reporter and whether the EPA has given an assurance at the time the information was submitted that the information will be kept confidential or not confidential.

B. Proposed Confidentiality Determinations

Pursuant to CAA section 114(c), the EPA is proposing to make categorical emission data and confidentiality determinations in advance through this notice and comment rulemaking for the categories of information in these proposed reports under part 99. We describe the proposed emission data categories and confidentiality determinations for the reported information, as well as the basis for such proposed determinations, in this section. This approach is similar to the approach we have taken for the GHGRP under 40 CFR part 98 (see 75 FR 39094, July 7, 2010, and 75 FR 30782, May 26, 2011, for more information).

The determinations the EPA is proposing in this rulemaking, if finalized, would serve as notification of the Agency's decisions concerning: (1) the categories of information the Agency will not treat as confidential because it is emission data; (2) the information that is not emission data but is not entitled to confidential treatment; and (3) the information that the submitter may claim as confidential but will remain subject to the existing 40 CFR part 2 process. In responding to requests for information not determined in this proposal to be emission data or otherwise not entitled to confidential treatment, we propose to apply the default case-by-case process found in 40 CFR part 2.

The emission data and confidentiality determinations proposed in this rulemaking are intended to provide consistency in the treatment of the information collected by the EPA as part of the proposed WEC filings. The EPA anticipates that making these determinations in advance through this rulemaking will provide predictability and transparency for both information requesters and submitters.

The categories of information that we are proposing to determine to be emission data in this action are:

(1) Methane emissions;

(2) Calculation methodology; and

(3) Facility and unit identifier information.

The EPA is proposing to group types of information (data elements) that the Agency is proposing to require WEC obligated parties to submit under part 99 that would be considered emission data into these three categories based on their shared characteristics. For the sake of organization, for any information that logically could be grouped into more than one category, we have chosen to label information as being in just one category where we think it fits best. This approach will reduce redundancy within the categories that could lead to confusion and ensure consistency in the treatment of similar information in the future. We are requesting comment on the following: (1) our proposed categories of emission data; and (2) our placement of each data element under the category proposed.

For reporting elements that the EPA does not designate as "emission data," the EPA is proposing to assess each individual reporting element according to the *Argus Leader* criteria (*i.e.*, whether the information is customarily and actually treated as private by the submitter) and 40 CFR 2.208(a) through (d). Therefore, we are not proposing to establish categories and categorical confidentiality determinations for information that is not "emission data." However, we are proposing descriptions of the type of information that would not be eligible for confidential treatment in 40 CFR 99.13(b), including certain information demonstrating compliance with standards and information that is publicly available. We are also proposing in 40 CFR 99.13(c) through (e) to specify certain data elements and types of information that would be subject to the process for confidentiality determinations in 40 CFR part 2. The proposed provisions in 40 CFR 99.13(b) would establish the proposed confidentiality determinations of the proposed data elements in part 99 and would also provide clarity and ensure consistent treatment of new or substantively revised data elements if the content of the WEC filing is amended in a future rulemaking. Sections IV.B.2. and 3. of this preamble describe these proposed provisions, and our assessment of each individual reporting element that we are proposing is not "emission data." We are requesting comment on the proposed Agency determinations that information described in those sections of the preamble are not entitled to confidential treatment.

1. Emission Data

We are proposing to establish in 40 CFR 99.13(a) that certain categories of information the EPA would collect in the proposed WEC filings are information that meets the regulatory definition of emission data under 40 CFR 2.301(a)(2)(i). The following sections describe the categories of information we are proposing to determine to be emission data, based on application of the definition at 40 CFR 2.301(a)(2)(i) to the shared characteristics of the information in each category and our rationale for each proposed determination.

a. Information Necessary to Determine the Identity, Amount, Frequency, Concentration, or Other Characteristics of Emissions Emitted by the Source

Under 40 CFR 2.301(a)(2)(i)(A), emission data includes "[i]nformation necessary to determine the identity, amount, frequency, concentration, or other characteristics (to the extent related to air quality) of any emission which has been emitted by the source (or of any pollutant resulting from any emission by the source), or any combination of the foregoing[.]" We are proposing that the following categories of information are emission data under 40 CFR 2.301(a)(2)(i)(A):

(1) Methane emissions; and

(2) Calculation methodology.

Methane emissions. Data elements included in the Methane emissions data category are the net WEC emissions, facility waste emissions thresholds, industry segment waste emissions thresholds for each applicable industry segment within the facility (if more than one industry segment applies), and WEC applicable emissions, as well as the quantities of methane emissions that the WEC obligated party calculates should be exempted due to unreasonable delay and wells that were permanently shut-in and abandoned. The EPA proposes to determine that the emissions at each reporting level constitute "emission data." These data elements are information regarding the identity, amount, and frequency of any emission emitted by the WEC applicable facility, and, therefore, they are "emission data." As discussed in section IV.A. of this preamble, in the 1991

EPA notice of policy (56 FR 7042, February 21, 1991), the EPA identified, without attempting to be comprehensive, data elements that the EPA considered to constitute emission data. The 1991 document lists the "Emission type (*e.g.*, the nature of emissions, such as CO_2, particulate or a specific toxic compound, and origin of emissions such as process vents, storage tanks or equipment leaks)" and "Emission rate (*e.g.*, the amount released to the atmosphere over time such as kg/yr or lbs/yr)" as data that are not entitled to confidential treatment and are, therefore, releasable to the public. Our proposed determination for this data category is consistent with the 1991 document. It is also consistent with the determination for a similar category in the GHGRP under 40 CFR part 98.

Calculation methodology. The data element included in this category is the method used to determine the quantity of methane emissions that the WEC obligated party calculates should be exempt due to an unreasonable permitting delay and the method used to determine the equipment leaks emissions attributable to a plugged well. Most of the necessary calculations in part 99 do not include multiple equations or approaches that could be selected by a WEC obligated party, and in those cases, the calculation methodology used is readily apparent for any WEC obligated party. Calculations for the exemptions for unreasonable delay and plugged wells do include multiple equations that facilities may use under different circumstances.

The EPA proposes to determine that the data elements in the Calculation methodology category are "emission data" under 2.301(a)(2) because they are "information necessary to determine . . . the amount" of emissions emitted by the source. The method used to calculate emissions is emission data under 40 CFR 2.301(a)(2) because it is information necessary for the WEC obligated party to calculate the emissions and for the EPA and the public to verify that an appropriate method was used. As discussed in section IV.A. of this preamble, the 1991 EPA notice of policy provided a list of information that the EPA considered to constitute "emission data" under 40 CFR 2.301(a)(1)(2)(i). That list includes the "emission estimation method (*e.g.*, the method by which an emission estimate has been calculated such as material balance, source test, use of AP-42 emission factors, etc.)," which is the same type of data element as those that the EPA is proposing to include in this data category. Our proposed determination for this data category is consistent with the 1991 document. It is also consistent with the determination for a similar category in the GHGRP under 40 CFR part 98.

b. Information that is Emission Data Because it Provides a General Description of the Location and/or Nature of the Source to the Extent Necessary to Identify the Source and to Distinguish it from other Sources

Under 40 CFR 2.301(a)(2)(i)(C), emission data includes "a "[g]eneral description of the location and/or nature of the source to the extent necessary to identify the source and to distinguish it from other sources (including, to the extent necessary for such purposes, a description of the device, installation, or operation constituting the source)." We are proposing that the data elements in the Facility and unit identifier information category of information are emission data under 40 CFR 2.301(a)(2)(i)(C).

The proposed part 99 regulations would require WEC obligated parties to report in the WEC filing information needed to identify each facility as well as specific emission units (affected facilities) and/or well-pads associated with an exemption. Facility-identifying information must be reported for all facilities as specified in 40 CFR part 99, subpart A. Affected facility-specific identifying information is required for the regulatory compliance exemption. Well-pad-specific identifying information is reported if required by an applicable exemption for onshore petroleum and natural gas production facilities.

Data elements in this category would include the following data elements required under 40 CFR part 99, subpart A to be included in each annual WEC filing: WEC obligated party company name and address, the name and contact information for the designated representative of WEC obligated party, and a signed and dated certification statement of the accuracy and completeness of the report, which is provided by the designated representative of the owner or operator. The proposed part 99 regulations would also require that the filing include specific information about each facility covered by the annual WEC filing, including the e-GGRT ID number and the industry segment. For each exemption, the facility and unit identifier information category would include (as applicable) the facility identifier, the well-pad and/or well identifier reported under subpart W (if applicable), other facility or affected facility identifiers used to identify the facility/sources in other EPA systems (specifically, the ICIS-AIR ID or Facility Registry Service (FRS) ID and the EPA Registry ID from the Compliance and Emissions Data Reporting Interface (CEDRI)), emission source-specific methane mitigation activities impacted by an unreasonable permitting delay, and exemption-specific certification statements.

As discussed in section IV.A. of this preamble, emission data must be available to the public and is not entitled to confidential treatment under CAA section 114(c). "Emission data" is defined in 40 CFR 2.301(a)(2)(i)(C) to include "[a] general description of the location and/or nature of the source to the extent necessary to identify the source and to distinguish it from other sources . . . ." Consistent with this definition of emission data, the EPA considers facility and emission unit identifiers to be source information or "information necessary to determine the identity . . . of any emission which has been emitted by the source," and therefore emission data under 40 CFR 2.301(a)(2)(i). Further, 40 CFR 2.301(a)(2)(i)(A) specifies that emission data includes, among other things, "information necessary to determine the identity, amount, frequency, concentration, or other characteristics (to the extent related to air quality) of any emission which has been emitted by the source. . . ." The EPA considers the term "identity . . . of any emission" as not simply referring only to the names of the pollutants being emitted, but to also include other identifying information, such as from what and where (*e.g.*, the identity of the emission unit) the pollutants are being emitted.

The 1991 EPA notice of policy (discussed in section IV.A. of this preamble) provided a list of data fields that the EPA considered to be emission data. For example, in the 1991 document, the EPA considered that plant name, address, city, State, zip code, emission point or device description, SIC code, and Source Classification Code (SCC) are emission data.

Therefore, the public has been on notice that the EPA considers many of the data elements in this data category to be emission data and thus not entitled to confidential treatment. The 1991 document also makes clear that the list of data is not comprehensive and that other data might also constitute emission data. This proposed part 99 determination that these data elements are emission data is consistent with the 1991 policy statement, and also consistent with the Facility and unit identifier information category in the GHGRP under 40 CFR part 98.

2. Reported Information that is Never Entitled to Confidential Treatment.

As noted in section IV.B. of this preamble, we are proposing to assess the confidentiality of each individual part 99 reporting element that is not otherwise designated as emission data in this rulemaking according to the *Argus Leader* criteria (*i.e.*, whether the information is customarily and actually treated as private by the submitter) and 40 CFR 2.208(a) through (d). However, in this action we are proposing descriptions of the type of information that would not be eligible for confidential treatment in 40 CFR 99.13(b), in part to establish the proposed confidentiality determinations of the proposed data elements in part 99 but also to provide clarity and consistency in the event that the content of the WEC filings are amended in a future rulemaking. The WEC obligation is calculated by multiplying the net WEC emissions by a set dollar amount, depending on the reporting year. As explained in section IV.B.1.a. of this preamble, the EPA is proposing to determine that the net WEC emissions are emission data. Therefore, we are proposing that the WEC obligation, which is calculated as the net WEC emissions multiplied by a dollar per ton rate that is prescribed in CAA section 136, would not be eligible for confidential treatment.

We are also proposing that certain information considered to be compliance information in part 99, regardless of whether it is or is not designated as emission data, is still not otherwise eligible for confidential treatment. Compliance information collected under part 99 includes information necessary to demonstrate compliance with the eligibility requirements for the exemptions for unreasonable permitting delay, regulatory compliance, and wells that have been permanently shut-in and plugged. Examples of the information collected include: for the unreasonable delay exemption, the date of the permit request, the estimated date to commence operation if the application had been approved within a set period of months, the first date that offtake to the gathering or transmission infrastructure from the implementation of methane emissions mitigation occurred once the application was approved, the beginning and ending date for which the eligible delay limited the offtake of natural gas associated with methane emissions mitigation activities, information on all applicable local, state, and Federal regulations regarding flaring emissions and the facility's compliance status for each, and other compliance information related to gathering or transmission infrastructure; for the regulatory compliance exemption, copies of reports and other evidence of compliance with NSPS OOOOb or a state, Tribal, or Federal plan under 40 CFR part 62; and for the plugged well exemption, the date a well was permanently shut-in and plugged and the statutory citation for the requirements that were followed for that process. Operating and construction permits are available to the public through the State issuing the permits (as the delegated authority of the EPA), generally either through an online information system or website, or upon request to the state agency issuing the permits. These permits are expected to contain information about the type and size of process equipment operated at a facility, control devices or other measures undertaken to reduce emissions from each process, and the emission standards to which the facility is subject (including Federal standards as well as state or local standards). Reports submitted by owners and operators of facilities subject to NSPS OOOOb or a state, Tribal, or Federal plan under 40 CFR part 62 are available through the EPA's online repository "WebFIRE." See *https://www.epa.gov/electronic-reporting-air-emissions/webfire*. Finally, well-specific information, including age, production rate, and operating status, is publicly available through state oil and gas commissions and/or state databases as well as sources such as Enverus. Because this information is already publicly available, it would not be eligible for confidential treatment.

The EPA is also proposing in 40 CFR 99.13(b)(3) that any other information that has been published and made publicly available, including the publicly available reports submitted under the GHGRP and information on websites, would not be eligible for confidential treatment. Information that is publicly available does not meet the criteria for information entitled to confidential treatment specified in 40 CFR 2.208(c). This proposed paragraph 40 CFR 99.13(b)(3) would specify an additional type of information that would not be eligible for confidential treatment when evaluating the confidentiality of supporting documentation submitted as described in proposed 40 CFR 99.13(c) or (d) (see section IV.B.3. for additional information on supporting documentation).

3. Information for Which the EPA is Not Proposing a Confidentiality Determination

This section describes information for which the EPA is not proposing a confidentiality determination. The EPA would initially treat this information as confidential upon receipt, if the submitter claimed it as such, until a case-by-case determination is made by the Agency under the 40 CFR part 2 process.

We do not expect emission data to be submitted in supporting documentation, but we are proposing that information in supporting documentation as described in proposed 40 CFR 99.13(c) (*i.e.*, information not listed in proposed 40 CFR 98.13(a) or (b) as not eligible for confidential treatment) would be treated as confidential until a case-by-case determination is made under the 40 CFR part 2 process. The EPA is also proposing that information provided in software comments fields as described in proposed 40 CFR 99.13(d) would not be eligible for confidential treatment if it is listed in proposed 40 CFR 98.13(a) or (b) as not eligible for confidential treatment. Otherwise, the EPA would treat the information as confidential until a case-by-case determination is made under the 40 CFR part 2 process, as specified in proposed 40 CFR 99.13(c). The EPA recognizes that supporting documentation and reporter comments may include information that is sensitive or proprietary, such as detailed process designs or site plans. Because the exact nature of this documentation cannot be predicted with certainty, the EPA proposes to make case-by-case confidentiality determinations under CAA section 114(c) for any supporting documentation or comments claimed confidential by applicants either upon receipt of such information or upon a request for such information after receipt.

C. Proposed Amendments to 40 CFR Part 2

As previously discussed, pursuant to CAA section 114(c), the EPA must make available to the public data submitted under part 99, except for data (other than emission data) that are considered confidential under CAA section 114(c). Accordingly, the EPA may release part 99 data without further notice after submission to the EPA in accordance with the EPA's determinations of their confidentiality status in the final rule. Specifically, the EPA may release part 99 data that are determined in the final rule to be emission data or not otherwise entitled to confidential treatment under CAA section 114(c) (*i.e.*, "non-CBI"). For data elements that we determine to be entitled to confidential treatment under CAA section 114(c), the EPA would release or publish such data only if the information can be aggregated in a manner that would protect the confidentiality of these data at the facility level. Existing regulations in 40 CFR part 2, subpart B set forth procedural steps that the EPA must follow before releasing any information, either on the Agency's own initiative or in response to requests made pursuant to FOIA. In particular, the EPA is generally required to make case-by-case confidentiality determinations and to notify individual reporters before disclosing information that businesses have submitted with a confidentiality claim. As discussed in section IV.B of this preamble, in light of the voluminous data the EPA receives under subpart W of part 98 and the multiple procedural steps required under 40 CFR part 2, subpart B, the EPA would not be able to make part 99 data (determined to be emission data or non-CBI) publicly available in a timely fashion if it were required to make separate confidentiality determinations based on each submitter's individual claim of confidentiality.

To facilitate timely release of GHG data collected under part 99 that are emission data or non-CBI, the EPA proposes to amend 40 CFR 2.301, Special rules governing certain information obtained under the Clean Air Act. Specifically, the EPA is proposing to revise 40 CFR 2.301(d) to specify that the special rules for data submitted under part 98 would also apply to part 99. Under the proposed amendment, the EPA may release part 99 data that are determined to be emission data or information determined to be not entitled to confidential treatment upon finalizing the confidentiality status of these data. Consistent with the 40 CFR part 2 procedures, the approach proposed in this rulemaking would provide the WEC obligated party an opportunity to justify and substantiate any confidentiality claim they may have for the data they are required to submit (except for emission data and other data not entitled to confidential treatment pursuant to CAA section 114(c)). In addition, WEC obligated parties have the benefit of seeing the EPA's rationales and analyses prior to submitting any justification, information that they would not otherwise have under the current 40 CFR part 2 procedures. As more fully explained in section IV.E of this preamble, the WEC obligated party must provide comment explaining why it disagrees with the rationale provided by the EPA for each particular data element it intends to claim confidential and must provide information to explain how the business customarily and actually treats the information as confidential. The EPA will consider comments received on this proposal before finalizing the confidentiality determinations.

The EPA solicits comment on the proposed amendments to 40 CFR 2.301(d), Special rules governing certain information obtained under the CAA for data submitted under part 99.

D. Proposed Changes to Confidentiality Determinations for Data Elements Reported Under Subpart W

The industry segment waste emissions thresholds are calculated pursuant to 40 CFR 99.20. Except for facilities in the Offshore Petroleum and Natural Gas Production industry segment or the Onshore Petroleum and Natural Gas Production industry segment that have no natural gas sent to sale, each threshold is calculated by multiplying the specified natural gas throughput for that industry segment by two constant values, the density of methane and the industry segment-specific methane intensity threshold (as summarized in Table 2 of this preamble). As noted in section IV.B.1.a. of this preamble, the EPA is proposing that the facility waste emissions thresholds and industry segment waste emissions thresholds are emission data and would therefore be made publicly available. For two industry segments, Onshore Natural Gas Processing and Onshore Natural Gas Transmission Compression, throughput quantities similar to those specified in the industry segment waste emissions threshold calculations have historically not been made publicly available under subpart W. However, for WEC applicable facilities, once the industry segment-specific waste emissions thresholds are made publicly available, the throughputs can be calculated based on available information.

Therefore, the EPA is proposing to address confidentiality determinations for two subpart W data elements as part of this rulemaking. For the Onshore Natural Gas Processing industry segment, a new data element was proposed as part of 2023 Subpart W Proposal, the quantity of residue gas leaving that has been processed by the facility and any gas that passes through the facility to sale without being processed by the facility in the calendar year, in thousand standard cubic feet, reported under proposed § 98.236(aa)(3)(ix). The EPA made a final determination in 79 FR 70352 (November 25, 2014) that the quantity of natural gas received at the gas processing plant in the calendar year (reported under 40 CFR 98.236(aa)(3)(i)) and the quantity of processed (residue) gas leaving the gas processing plant (reported under 40 CFR 98.236(aa)(3)(ii)), should be maintained as confidential. As explained in 79 FR 70352 (November 25, 2014), the reporting of this information to the Energy Information Administration is less frequent than required under subpart W, and the EPA had not identified any reliable public sources of the quantity of residue gas produced. In the June 2023 memorandum *Proposed Confidentiality Determinations and Emission Data Designations for Data Elements in Proposed Revisions to the Greenhouse Gas Reporting Rule for Petroleum and Natural Gas Systems* (Docket ID No. EPA-HQ-OAR-2023-0234-0167), the EPA stated that the proposed new data element under 40 CFR 98.236(aa)(3)(ix) would collect similar information to 40 CFR 98.236(aa)(3)(ii). As a result, the EPA proposed to determine that the information collected under 40 CFR 98.236(aa)(3)(ix) would be eligible for confidential treatment.

However, if the EPA finalizes the proposed determination that the industry segment-specific waste emissions thresholds are emission data, then those industry segment-specific waste emissions thresholds would be made publicly available as emission data. Therefore, the EPA is no longer proposing a confidentiality determination for this throughput quantity data element (*i.e.*, the quantity of residue gas leaving that has been processed by the facility and any gas that passes through the facility to sale without being processed by the facility in the calendar year) under part 98. The confidentiality status of this data element would be evaluated on a case-by-case basis, in light of any publicly available information and in accordance with the existing regulations in 40 CFR part 2, subpart B, upon receipt of a public request for these data elements.

For Onshore Natural Gas Transmission Compression, the EPA previously decided in 2014 not to make a confidentiality determination that would apply for all facilities for 40 CFR 98.236(aa)(4)(i), the quantity of gas transported through a compressor station. In 79 FR 70352 (November 25, 2014), the EPA explained that we proposed that this data element would not be eligible for confidential treatment because natural gas transmission sector is heavily regulated by FERC and state commissions, resulting in a lack of competition between companies. However, we received comments from this industry sector noting that FERC Order 636 had introduced greater competition to this sector and that some companies charge customers less than the FERC approved rates because of competitive market pressures. The commenters indicated that quantity of gas transported through the compressor station would provide information on the quantity of gas transported by a specific pipeline, which may potentially cause competitive harm to some pipeline companies operating in more competitive market areas. Since the determination would depend on the particular market conditions for each company, the EPA did not make a determination for the data element that would apply for all reporters.[43]

In this rulemaking, the EPA is not proposing to change that previous decision and is still not proposing a confidentiality determination for the quantity of natural gas transported through a compressor station. While the Supreme Court's 2019 decision in *Argus Leader* altered the review criteria for confidentiality determinations from the Agency's 2014 decision, the basis provided by commenters to justify the confidential nature of the information is still relevant. For information pertaining to the quantity of gas transported through a compressor station collected under part 99, the EPA will conduct reviews of any claims made under the existing regulations in 40 CFR part 2, subpart B, upon receipt of a public request for this information. Any such reviews will consider the public availability of the same or similar information, including WEC filings, as part of the determination process.

E. Request for Comments on Proposed Category Assignments, Confidentiality Determinations, or Reporting Determinations

This rulemaking provides affected entities that would be subject to part 99, other stakeholders, and the general public an opportunity to provide comment on the proposed amendment to 40 CFR 2.301(d) and the proposed confidentiality determinations for part 99 data, including our proposed categories of emission data and the proposed confidentiality determinations for each data element that is not considered emission data. By proposing emission data and confidentiality determinations prior to data reporting through this proposal and rulemaking process, we are providing potentially affected entities an opportunity to submit comments, particularly comments addressing any data elements not entitled to confidential treatment under this proposal, but which companies customarily and actually treat as private. This opportunity to submit comments is intended to provide reporters with the opportunity to

---

[43] Prior to *Argus Leader*, the EPA considered whether the business had satisfactorily shown that disclosure of the information is likely to cause substantial harm to the business's competitive position when evaluating claims of confidentiality.

substantiate their confidentiality claims that would ordinarily be afforded when the EPA considers claims for confidential treatment of information in case-by-case confidentiality determinations under 40 CFR part 2. In addition, the comment period provides an opportunity to respond to the EPA's proposed determinations with more information for the Agency to consider prior to finalization. We will evaluate the comments on our proposed determinations, including claims of confidentiality and information substantiating such claims, before finalizing the confidentiality determinations. Please note that this will be reporters' only opportunity to substantiate a confidentiality claim for data elements included in this proposed rule where information being reported is proposed to be not entitled to confidential treatment. Upon finalizing the confidentiality determinations and reporting determinations of the data elements identified in this proposed rule, the EPA plans to release or withhold these data without further notice in accordance with proposed 40 CFR 2.301(d), which contains special provisions governing the treatment of part 99 data for which confidentiality determinations have been made through rulemaking pursuant to CAA sections 114, 136, and 307(d).

When submitting comments regarding the confidentiality determinations we are proposing in this action, please identify each individual proposed data element on which you are commenting and whether you consider the element to be confidential or do not consider to be "emission data" in your comments. If the data element has been designated as "emission data," please explain why you do not believe the information meets the definition of "emission data" as defined in 40 CFR 2.301(a)(2)(i). If the data has not been designated as "emission data" and is proposed to not be entitled to confidential treatment, please explain specifically how the data element is commercial or financial information that is both customarily and actually treated as private. Particularly describe the measures currently taken to keep the data confidential and how that information has been customarily treated by your company and/or business sector in the past. This explanation is based on the requirements for confidential treatment set forth in *Argus Leader*.

Members of the public may also discuss how this data element may be different from or similar to data that are already publicly available, including data already collected and published annually by the GHGRP, as applicable. Please submit information identifying any publicly available sources of information containing the specific data elements in question. Data that are already available through other sources would likely be found not to qualify for confidential treatment. In your comments, please identify the manner and location in which each specific data element you identify is publicly available, including a citation. If the data are physically published, such as in a book, industry trade publication, or Federal agency publication, provide the title, volume number (if applicable), author(s), publisher, publication date, and International Standard Book Number (ISBN) or other identifier. For data published on a website, provide the address of the website, the date you last visited the website and identify the website publisher and content author. Please avoid conclusory and unsubstantiated statements, or general assertions regarding the confidential nature of the information.

In addition to soliciting comment on our proposed confidentiality designations and proposed amendments to 40 CFR 2.301, we are also soliciting comment on the following specific issues relevant to the proposed confidentiality determinations:

"Emission Data" determination. As previously discussed, "emission data" cannot be kept confidential per CAA section 114. The EPA is seeking comment on the part 99 data elements proposed to be considered "emission data." Please specify exactly what part 99 data you think should be considered emission data, describe what part 99 data you think should not be emission data and why (and whether such non-emission data should be considered confidential and why), and clearly explain how the suggested definition of "emission data" would be consistent with the "necessary to determine" clause in 40 CFR 2.301, as well as with the purpose behind the statutory language.

Individual determinations. The EPA is proposing confidentiality determinations by data element for the majority of the data elements in part 99. We are soliciting comment on whether there are data elements proposed to be included in 40 CFR 99.13(a) and (b) for which we should not finalize a confidentiality determination for the data element as not eligible for confidential treatment and instead make no determination for the data element, such that the confidentiality status of this data element would be evaluated on a case-by-case basis, in light of any publicly available information and in accordance with the existing CBI regulations in 40 CFR part 2, subpart B, upon receipt of a public request for these data elements. If respondents believe that EPA should not make a determination for a specific data element, please describe specifics of when a case-by-case determination would be necessary.

Changes to determinations for subpart W throughputs. We request comment on the approach for the subpart W data elements specified in section IV.D. of this preamble. In particular, we request comment on no longer proposing a confidentiality determination for the quantity of residue gas leaving that has been processed by the facility and any gas that passes through the facility to sale without being processed by the facility in the calendar year, in thousand standard cubic feet, reported under proposed 40 CFR 98.236(aa)(3)(ix). We also request comment on the proposal to continue not making a confidentiality determination for the quantity of natural gas transported through a compressor station under 40 CFR 98.236(aa)(4)(i), as well as the criteria that should be used to conduct a case-by-case evaluation of the confidentiality of the data. We also request comment on whether these two data elements are customarily and actually treated as confidential, and if so, what approaches the EPA could use to treat the information as confidential while still making all emission data publicly available, as required by CAA section 114(c).

V. Impacts of the Proposed Amendments

In accordance with the requirements of Executive Order 12866, the EPA projected the emissions reductions, costs, benefits, and transfer payments that may result from this proposed action if finalized as proposed. These results are presented in detail in the *Regulatory Impact Analysis of the Proposed Waste Emission Charge* (RIA) accompanying this proposal developed in response to Executive Order 12866 and available in the docket to this rulemaking, Docket ID No. EPA-HQ-OAR-2023-0434. This section provides a brief summary of the RIA.

The WEC does not directly require emissions reductions from applicable facilities or emissions sources. However, by imposing a charge on methane emissions that exceed waste emissions thresholds, oil and natural gas facilities subject to the WEC are expected to perform methane mitigation actions and make operational changes where the costs of those changes are less than the WEC payments that could be avoided by reducing methane emissions. In addition, because VOC and HAP emissions are emitted along with methane from oil and natural gas industry activities, reductions in methane emissions as a result of the WEC also result in co-reductions of VOC and HAP emissions.

The RIA accompanying this proposal analyzes emissions changes and economic impacts of the WEC that arise through two pathways: 1) through the application of cost-effective methane mitigation technologies, and 2) through changes in oil and natural gas production and prices resulting from the WEC and associated mitigation responses. The analysis of methane mitigation is based on bottom-up engineering cost and mitigation potential information for a range of methane mitigation technologies. Application of methane mitigation technologies reduce WEC payments for WEC obligated parties by reducing methane emissions compared to a baseline without additional methane mitigation actions. The analysis assumes that methane mitigation is implemented where the engineering control costs are less than the avoided WEC payments for a particular mitigation technology.

Additionally, oil and natural gas firms may change their production and operational decisions in response to the WEC. This potential impact is modeled using a partial equilibrium model of the crude oil and natural gas markets. The total cost of methane mitigation and WEC payments is added as an increase to production costs, resulting in changes in equilibrium production of oil and natural gas and associated emissions. Projected WEC payments are estimated after methane emissions reductions from both methane mitigation and economic impacts are accounted for.

Using emissions reported to subpart W for RY2021 as an illustrative example, Table 1-1 of the RIA shows that the WEC would be imposed on less than 15 percent of national methane emissions from petroleum and natural gas systems. Total methane emissions reported to subpart W are significantly less than national methane emissions from the U.S. Greenhouse Gas Inventory. WEC-applicable facilities are the subset of GHGRP facilities that report at least 25,000 mt CO_2e to subpart W industry segments subject to the WEC. It is also important to note that the WEC would only apply to methane emissions that are above the emissions threshold, not for all emissions from WEC-applicable facilities. The WEC has exemptions related to regulatory compliance, emissions from plugged wells, and unreasonable delay in environmental permitting, although these provisions do not impact the illustrative results in Table 1-1 of the RIA. Finally, emissions subject to WEC accounts for netting of emissions between facilities. Under the proposed WEC, facilities with emissions below their emissions threshold may reduce emissions subject to the WEC at other facilities with emissions above the emissions threshold where those facilities are under common ownership or control.

The benefit-cost analysis contained in the RIA accompanying this rulemaking for the WEC considers the potential benefits and costs of the WEC arising from cost-effective mitigation actions under the WEC as well as the potential transfers from affected operators to the government in payments. Costs include engineering costs for methane mitigation actions and costs resulting from production changes in oil and gas energy markets under this rule. While the EPA expects a range of health and environmental benefits from reductions in methane, VOC, and HAP emissions under the WEC, the monetized benefits of the rule are limited to the estimated climate benefits from projected methane emissions reductions. These benefits are based on the social cost of greenhouse gases (SC-GHG). A screening-level analysis of ozone-related benefits from projected VOC reductions can be found in Appendix A of the RIA.

However, these estimates are treated as illustrative and are not included in the quantified benefit-cost comparisons in the RIA.

The EPA estimates that this action will result in cumulative emissions reductions of 960 thousand metric tons of methane over the 2024 to 2035 period. These reductions represent about 33 percent of methane emissions that would be subject to the WEC before accounting for the adoption of cost-effective emission reduction technologies. Virtually all the reduced emissions result from mitigation activities undertaken by industry to reduce WEC payments. Less than one percent of reductions are associated with decreased production activity in the oil and gas sector resulting from the proposed rule. In addition to methane emissions reductions, the WEC is estimated to result in reductions of 140 thousand metric tons of VOC and five thousand metric tons of HAP.

The WEC has important interactions and is designed to work hand-in-hand with the NSPS and EG for the Oil and Natural Gas Sector by accelerating the adoption of cost-effective methane mitigation technologies, including those that would eventually be required under the NSPS or EG. The annual projected emissions reductions, costs, and WEC obligations are significantly affected by these interactions.

The EPA proposed updates to the Oil and Gas NSPS OOOOb/EG OOOOc in 2021, published a supplemental proposal in 2022, and finalized in December 2023. In addition to requirements already in place, these rules include standards for many of the major sources of methane emissions in the oil and natural gas industry. To avoid double counting of benefits and costs, the baseline for this proposal includes reductions resulting from the NSPS OOOOb/EG OOOOc based on information from the 2023 Final RIA. Specifically, that analysis showed deep reductions in methane emissions beginning to take effect in 2028. As facilities implement emission controls required by the NSPS and EG, emissions subject to the WEC decline.

The second interaction between the WEC and NSPS OOOOb/EG OOOOc is the regulatory compliance exemption provision of the WEC. Under this provision, when certain conditions are met with respect to the implementation of the Oil and Gas NSPS OOOOb/EG OOOOc, applicable facilities in compliance with their applicable methane emissions requirements are exempted from the WEC. The analysis in the RIA assumes that the regulatory compliance exemption takes effect in 2027, such that in 2027 and later, facilities in the industry segments subject to requirements under the NSPS OOOOb/EG OOOOc do not owe WEC payments.

Climate benefits associated with this proposed rule are the monetized value of GHG reductions using the SC-GHG, which calculates the avoided climate related damages from reducing GHG emissions. Methane is the principal component of natural gas. As discussed in section I.C.1. of this preamble, methane is also a potent GHG that, once emitted into the atmosphere, absorbs terrestrial infrared radiation, which in turn contributes to increased global warming and continuing climate change.

This proposed rulemaking is projected to reduce VOC emissions, which are a precursor to ozone. Ozone is not generally emitted directly into the atmosphere but is created when its two primary precursors, VOC and oxides of nitrogen (NO_X), react in the atmosphere in the presence of sunlight. Emissions reductions under the WEC may decrease ozone formation, human exposure to ozone, and the incidence of ozone-related health effects. VOC emissions are also a precursor to $PM_{2.5}$, so VOC reductions may also decrease human exposure to $PM_{2.5}$ and the incidence of $PM_{2.5}$- related health effects.

Available emissions data show that several different HAP are emitted from oil and natural gas operations. Emissions of eight HAP make up a large percentage of the total HAP emissions by mass from the oil and natural gas sector: toluene, hexane, benzene, xylenes (mixed), ethylene glycol, methanol, ethyl benzene, and 2,2,4- trimethylpentane.[44] Reductions of HAP emissions under the WEC may reduce exposure to these and other HAP.

---

[44] U.S. EPA. The Benefits and Costs of the Clean Air Act from 1990 to 2020. Washington, DC. Retrieved from *https://www.epa.gov/sites/production/files/2015-07/documents/fullreport_rev_a.pdf*.

In section 9.3 of the RIA, the EPA identifies existing potential environmental justice issues for the communities in counties that have emissions sources that are expected to owe the WEC charge before accounting for mitigation actions and thus may be positively affected by emissions changes under the proposal. Compared to the national average, these communities include a higher percentage of individuals who identify as racial and ethnic minorities, have lower average incomes, and have slightly elevated health risks associated with various air emissions. Reductions in VOC and HAP emissions as a result of the WEC are expected to benefit communities in these counties. Because the WEC does not directly require emissions reductions, the EPA has not projected specific locations where emissions reductions might occur. In addition, detailed proximity analysis is infeasible because the emissions affected by the WEC occur at hundreds of thousands of locations.

The total cost of the proposed rule includes the engineering costs for methane mitigation actions implemented by the oil and natural gas industry in order to avoid or reduce WEC obligations. This includes the initial capital costs required to implement and install the specific mitigation technology. In addition, for mitigation technologies with expected lifetimes greater than one-year, annual recurring operations and maintenance costs, which include labor, energy and materials, are also incorporated. Finally, the total mitigation costs also include the avoided cost of natural gas losses.

The social cost of energy market impacts is the loss in consumer and producer surplus value from changes in natural gas market production and prices. The economic impacts analysis uses a partial equilibrium model and estimates that the impact of the gas market is minimal, with the largest impact occurring in the first few years with a price increase of less than 0.1 percent and a quantity reduction of less than 0.1 percent.

Table 5 presents results of the benefit-cost analysis for the proposed WEC. It presents the present value (PV) and equivalent annual value (EAV), estimated using discount rates of 2, 3, and 7 percent, of the changes in quantified benefits, costs, and net benefits relative to the baseline.[45] These values reflect an analytical time horizon of 2024 to 2035, are discounted to 2023, and are presented in 2019 constant dollars. The table includes consideration of the non-monetized benefits associated with the emissions reductions projected under this proposal.

Table 4. Projected Emissions Reductions Under the Proposed Rule, 2024-2035 Total

Pollutant	Emissions Reductions (2024-2035 Total)
Methane (thousand metric tons)[a]	960
VOC (thousand metric tons)	140
Hazardous Air Pollutant (thousand short tons)	5
Methane (million metric tons CO_2e)[b]	27

[a] To convert from metric tons to short tons, multiply the short tons by 1.102. Alternatively, to convert from short tons to metric tons, multiply the short tons by 0.907.

[b] Carbon dioxide equivalent (CO_2e). Calculated using a global warming potential of 28.

Table 5. Benefits, Costs, and Net Benefits of the Proposed Rule, 2024 Through 2035 (dollar estimates in millions of 2019 dollars) [a]

	2 Percent Near-Term Ramsey Discount Rate					
	Present Value	Equivalent Annual Value	Present Value	Equivalent Annual Value	Present Value	Equivalent Annual Value
Climate Benefits[b]	$1,900	$180	$1,900	$180	$1,900	$180
	2 Percent Discount Rate		3 Percent Discount Rate		7 Percent Discount Rate	

---

[45] Monetized climate effects are presented under a 2 percent near-term Ramsey discount rate, consistent with EPA's updated estimates of the SC-GHG. The 2003 version of OMB's Circular A-4 had generally recommended 3 percent and 7 percent as default discount rates for costs and benefits, though as part of the Interagency Working Group on the Social Cost of Greenhouse Gases, OMB had also long recognized that climate effects should be discounted only at appropriate consumption-based discount rates. OMB finalized an update to Circular A-4 in 2023, in which it recommended the general application of a 2.0 percent discount rate to costs and benefits (subject to regular updates), as well as the consideration of the shadow price of capital when costs or benefits are likely to accrue to capital. Because the SC-GHG estimates reflect net climate change damages in terms of reduced consumption (or monetary consumption equivalents), the use of the discount rate estimated using the average return on capital (7 percent in OMB Circular A-4 (2003)) to discount damages estimated in terms of reduced consumption would inappropriately underestimate the impacts of climate change for the purposes of estimating the SC-GHG. See section 6.1 of the RIA for more discussion.

	Present Value	**Equivalent Annual Value**	**Present Value**	**Equivalent Annual Value**	**Present Value**	**Equivalent Annual Value**
Total Social Costs	$390	$37	$380	$38	$340	$43
Cost of Methane Mitigation	$360	$34	$350	$35	$320	$40
Cost of Energy Market Impacts	$30	$3	$29	$3	$26	$3
Net Benefits	$1,500	$140	$1,500	$140	$1,600	$140
Non-Monetized Benefits	Climate and ozone health benefits from reducing 960 thousand metric tons of methane from 2024 to 2035					
	$PM_{2.5}$ and ozone health benefits from reducing 140 thousand metric tons of VOC from 2024 to 2035[c]					
	HAP benefits from reducing 5 thousand metric tons of HAP from 2024 to 2035					
	Visibility benefits					
	Reduced vegetation effects					

[a] Values rounded to two significant figures. Totals may not appear to add correctly due to rounding.

[b] Climate benefits are based on reductions in methane emissions and are calculated using three different estimates of the social cost of methane (SC-CH_4) (under 1.5 percent, 2.0 percent, and 2.5 percent near-term Ramsey discount rates). For the presentational purposes of this table, we show the climate benefits associated with the SC-CH_4 at the 2 percent near-term Ramsey discount rate. Please see Table 6-5 of the RIA for the full range of monetized climate benefits estimates.

[c] A screening-level analysis of ozone benefits from VOC reductions can be found in Appendix A of the RIA.

WEC payments are transfers and do not affect total net benefits to society as a whole because payments by oil and natural gas operators are offset by receipts by the government. Therefore, from a net-benefit accounting perspective, transfers are considered separately from costs and benefits (and are therefore not included in Table 5). As explained further in section 2.7 of the RIA, the approach taken here is in line with OMB guidance and the approach taken for RIAs for other rules impacting payments to the government, such as the Bureau of Land Management (BLM)'s waste prevention rule.

One of the reasons that transfers are not considered costs is because they represent payments to the U.S. Treasury that do not affect total resources available to society. Payments to the U.S. Treasury can then be used to fund other programs, and the pairing of revenue collection (e.g., the WEC payments) with commensurate expenditures (e.g., financial assistance programs) by the federal government can be designed to be revenue neutral. The Methane Emission Reduction Program created under CAA section 136 includes both collection and expenditure components. In addition to establishing the WEC, another key purpose of CAA section 136 is to encourage the development of innovative technologies in the detection and mitigation of methane emissions. See 168 Cong. Rec. E869 (August 23, 2022) (statement of Rep. Frank Pallone). CAA section 136(a) and (b) provides $1.55 billion to, among other things, help finance the early adoption of emissions reduction methodologies and technologies and to support monitoring of methane emissions. These incentives for methane mitigation and monitoring complement the WEC.

The WEC has the effect of better aligning the economic incentives of oil and natural gas companies with the costs and benefits faced by society from oil and gas activities. In the baseline scenario the environmental damages resulting from methane emissions from the oil and gas sector are a negative externality spread across society as a whole. Under the WEC, this negative externality is internalized, oil and gas companies are required to make WEC payments in proportion to the climate damages of methane emissions subject to the WEC. Alternatively, firms can avoid making WEC payments by mitigating their emissions generating climate benefits associated with the amount of mitigation.

Table 6 provides details of the calculation steps used to estimate projected WEC obligations and climate damages based on projected emission subject to WEC. In order to compare projected WEC payments to climate damages from emissions subject to the WEC, WEC payments are converted from nominal dollars to 2019 constant dollars using a chain-weighted GDP price index from the 2023 Annual Energy Outlook. Projected WEC payments after accounting for methane mitigation and energy market impacts are estimated to be about $750 million nominal dollars in 2024, and then drop significantly as the regulatory compliance exemption takes effect in 2027.

Table 6. Benefits, Costs, and Net Benefits of the Proposed Rule, 2024 Through 2035 (dollar estimates in millions of 2019 dollars) [a]

Year	Methane Emissions Subject to WEC in Policy Scenario (thousand metric tons)	Charge Specified by Congress (nominal $ per metric ton)	WEC Payments in Policy Scenario (million nominal $)	WEC Payments in Policy Scenario (million 2019$)	$SC\text{-}CH_4$ Values at 2% Discount Rate (2019$ per metric ton)	Climate Damages from Emissions Subject to WEC (million 2019$)[a]
2024	830	$900	$750	$620	$1,900	$1,600
2025	650	$1,200	$770	$630	$2,000	$1,300
2026	430	$1,500	$640	$510	$2,100	$890
2027	9	$1,500	$13	$10	$2,200	$18
2028	9	$1,500	$13	$10	$2,200	$19
2029	9	$1,500	$13	$10	$2,300	$20
2030	9	$1,500	$13	$9	$2,400	$20
2031	9	$1,500	$13	$9	$2,500	$21
2032	9	$1,500	$13	$9	$2,500	$21
2033	8	$1,500	$13	$9	$2,600	$21
2034	8	$1,500	$13	$8	$2,700	$21
2035	8	$1,500	$13	$8	$2,800	$21
Total 2024-2035	2,000	-	$2,300	$1,800	-	$4,000

[a] Climate damages are based on remaining methane emissions subject to WEC after accounting for emissions reductions and are calculated using three different estimates of the social cost of methane ($SC\text{-}CH_4$) (under 1.5 percent, 2.0 percent, and 2.5 percent near-term Ramsey discount rates). For the presentational purposes of this table, we show the climate benefits associated with the $SC\text{-}CH_4$ at the 2 percent near-term Ramsey discount rate.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders*.

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 14094: Modernizing Regulatory Review

This action is a "significant regulatory action" as defined under section 3(f)(1) of Executive Order 12866, as amended by Executive Order 14094. Accordingly, the EPA submitted this action to the Office of Management and Budget (OMB) for Executive Order 12866 review. Documentation of any changes made in response to the Executive Order 12866 review is available in the docket for this rulemaking, Docket ID No. EPA-HQ-OAR-2023-0434. The EPA prepared an analysis of the potential impacts associated with this action. This analysis**,** *Regulatory Impact Analysis of the Proposed Waste Emission Charge***,** is also available in the docket to this rulemaking and is briefly summarized in section V. of this preamble.

B. Paperwork Reduction Act (PRA)

The information collection activities in this proposed rule have been submitted for approval to the OMB under the PRA. The Information Collection Request (ICR) document that the EPA prepared has been assigned EPA ICR number 2787.01. You can find a copy of the ICR in the docket for this rule, Docket ID No. EPA-HQ-OAR-2023-0434, and it is briefly summarized here.

The EPA estimates that the proposed rule would result in an increase in burden. The burden associated with the proposed rule is due to reporting and recordkeeping requirements in the proposed rule.

The respondent reporting burden for this collection of information is estimated to be an annual average of 12,799 hours and $1,700,304 over the 3 years covered by this information collection, which includes an annual average of $1,669,752 in labor costs, $0 in operation and maintenance costs, and $30,552 in capital costs. The annual average incremental burden to the EPA for this period is anticipated at 31,200 hours and $5,670,955 ($2023) over the 3 years covered by this information collection, which includes an annual average of $2,004,288 in labor costs and $3,666,667 in non-labor costs.

Respondents/affected entities: Owners and operators of petroleum and natural gas systems that must submit a WEC filing to the EPA to comply with proposed 40 CFR part 99.

Respondent's obligation to respond: The respondent's obligation to respond is mandatory under the authority provided in CAA sections 114 and 136.

Estimated number of respondents: 536.

Frequency of response: Annually.

Total estimated burden: 12,799 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: $1.7 million (per year), includes $30,552 annualized capital or operation and maintenance costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9.

Submit your comments on the Agency's need for this information, the accuracy of the provided burden estimates and any suggested methods for minimizing respondent burden to the EPA using the docket identified at the beginning of this rule. You may also send your ICR-related comments to OMB's Office of Information and Regulatory Affairs using the interface at *https://www.reginfo.gov/public/do/PRAMain*. Find this particular information collection by selecting "Currently under Review – Open for Public Comments" or by using the search function. OMB must receive comments no later than **[INSERT DATE 30 DAYS AFTER DATE OF PUBLICATION IN THE *FEDERAL REGISTER*]**. The EPA will respond to any ICR-related comments in the final rule.

C. Regulatory Flexibility Act (RFA)

I certify that this proposed action would not have a significant economic impact on a substantial number of small entities under the RFA. The small entities that would be subject to the proposed requirements of this action are small businesses in the petroleum and natural gas industry. Small entities include small businesses, small organizations, and small governmental jurisdictions. The EPA has determined that some small entities are affected because their processes emit methane that must be reported under subpart W and thus may be subject to WEC.

To evaluate whether this proposed rule would have a significant economic impact on a substantial number of small entities, the EPA conducted a small entity analysis that evaluated the costs of the proposed rule on small entities identified in the reporting year (RY) 2021 subpart W dataset. The EPA used reported facility-to-parent company and facility-to-owner or operator data to link facilities to WEC obligated parties. The EPA then reviewed the available RY 2021 data for the WEC obligated parties of subpart W facilities to determine whether the reporters were part of a small entity and whether the annualized costs of the proposal would have a significant impact on a substantial number of small entities. The number of small entities potentially affected by the proposed WEC regulation were estimated based on the information collected for 472 WEC obligated parties. Of these, 439 were identified as small entities. Although the screening analysis suggests that some small entities may have cost-to-revenue ratios that exceed 3 percent (approximately 17 percent), the EPA’s evaluation of the impacts to small entities relied on several methodologies involving conservative assumptions. For example, the identification and classification of subpart W parent entities reporting under more than one NAICS code resulted in a designation of “small” based on whether the business information available met the SBA size classification threshold for a single NAICS code. In addition to the conservative assumptions, there were further mitigating factors not included in the screening analysis that would likely significantly reduce compliance costs, and, as a result, cost-to-revenue-ratios. For example, the compliance cost estimate used only the defined WEC cost and did not account for early adoption of mitigation measures that could lower an entity's emissions below the threshold and therefore result in no WEC charge. Details of this analysis are presented in the *Regulatory Impact Analysis of the Proposed Waste Emissions Charge*, available in the docket for this rulemaking. The cumulative effect of the mitigating factors and conservative assumptions used in the screening analysis indicates that, overall, the proposed rule would not likely have a significant impact on a substantial number of small entities.

D. Unfunded Mandates Reform Act (UMRA)

This action contains a federal mandate under UMRA, 2 U.S.C. 1531–1538, that may result in expenditures of $100 million or more for state, local and tribal governments, in the aggregate, or the private sector in any one year. Accordingly, the EPA has prepared under section 202 of the UMRA a written statement of the benefit-cost analysis, which can be found in Section V of this preamble and in the *Regulatory Impact Analysis of the Proposed Waste Emissions Charge* (RIA), available in the docket for this rulemaking. The proposed action in part implements mandate(s) specifically and explicitly set forth in CAA section 136.

The applicability, magnitude of charge, methane emissions subject to charge, and exemptions from charge for the WEC program are established by CAA section 136(c) through (g). Given that this framework is required by statute, it is not possible for EPA to consider regulatory alternatives that are inconsistent with these elements. As such, to evaluate the benefits and costs of the proposed rule, in the RIA accompanying this rulemaking two scenarios were evaluated: a baseline scenario (*i.e.,* not including the effects of the WEC program) and a policy scenario inclusive of the costs, benefits, and transfers projected under the proposed rule. This action is not subject to the requirements of section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments. This proposed rule does not apply to governmental entities unless the government entity owns a facility in the applicable petroleum and gas industry segments and reports more 25,000 mt CO_2e to subpart W of the GHGRP. It would not impose any implementation responsibilities on state, local, or tribal governments and it is not expected to increase the cost of existing regulatory programs managed by those governments. Thus, the impact on governments affected by the proposed rule is expected to be minimal.

However, consistent with the EPA's policy to promote communications between the EPA and state and local governments, the EPA sought comments from small governments concerning the regulatory requirements that might significantly or uniquely affect them in the development of this proposed rule. Specifically, the EPA previously published a Request for Information (RFI) seeking public comment in a non-regulatory docket to collect responses to a range of questions related to the Methane Emissions Reduction Program, including related to implementation of the WEC (see Docket ID No. EPA-HQ-OAR-2022-0875). The EPA received five comments from government entities related to implementation of the WEC; these comments were considered during the development of the proposed rule. The EPA continues to be interested in the potential impacts of the proposed rule amendments on state, local, or tribal governments and welcomes comments on issues related to such impacts.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government. This proposed rule will not apply to governmental entities unless the government entity owns a facility in the applicable petroleum and gas industry segments that and reports more 25,000 mt CO_2e to subpart W of the GHGRP. Therefore, the EPA anticipates relatively few state or local government facilities will be affected. However, consistent with the EPA's policy to promote communications between EPA and state and local governments, the EPA specifically solicits comment on this proposed action from state and local officials.

F. Executive Order 13175: Consultation and Coordination with Indian Tribal Governments

This action has tribal implications. However, it will neither impose substantial direct compliance costs on federally recognized tribal governments, nor preempt tribal law. This proposed regulation will apply directly to petroleum and natural gas facilities that may be owned by tribal governments. However, it will generally only have tribal implications where the tribal entity owns a facility in an applicable industry segment that emits GHGs above threshold levels; therefore, relatively few tribal facilities will be affected. Of the subpart W facilities currently reporting to the GHGRP in RY2021, we identified four facilities currently reporting to part 98, subpart W that are owned or partially owned by one tribal parent company. Based on RY2021 data, all four facilities would be WEC applicable facilities, and the WEC applicable emissions (without consideration of exemptions) for the individual facilities would range from less than 0 mt CH_4 for one facility, up to about 3,500 mt CH_4 for the largest facility (which corresponds to a WEC obligation of $3.1 million). Note that one of the facilities is within the onshore natural gas processing sector, and thus, this calculation utilizes proxy data of CBI throughput, which may not reflect the actual facility throughput and resulting WEC applicable emissions. Each of the four facilities has a different owner or operator or combination of owners or operators, so the tribe likely would not be the WEC obligated party for all four facilities. These estimates do not consider any exemptions that might apply for the three facilities with emissions greater than the facility waste emissions threshold.

In addition to tribes that would be directly impacted by the WEC due to owning a facility subject to the charge, the EPA anticipates that tribes could be impacted in cases where facilities subject to the charge are located in Indian country. For example, the EPA reviewed the location of the production wells reported by facilities under the Onshore Petroleum and Natural Gas Production industry segment and found production wells reported under subpart W on lands associated with approximately 20 tribes. Therefore, although the EPA anticipates that at most only one tribe may be designated as a WEC obligated party and has the potential to be subject to the WEC, the EPA has sought opportunities to provide information to tribal governments and representatives during rule development. On November 4, 2022, the EPA published an RFI seeking public comment on a range of questions related to the Methane Emissions Reduction Program, including implementation of the WEC (see Docket ID No. EPA-HQ-OAR-2022-0875). Further, consistent with the EPA Policy on Consultation and Coordination with Indian Tribes, the EPA specifically solicits comment on this proposed action from Tribal officials. The EPA will engage in consultation with Tribal officials during the development of this action.

G. Executive Order 13045: Protection of Children from Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of "covered regulatory action" in section 2-202 of the Executive Order. This proposed action would not establish an environmental standard intended to mitigate health or safety risks and does not focus on information-gathering actions concerned with children's health. Therefore, this proposed action is not subject to Executive Order 13045. For the same reasons, the EPA's Policy on Children's Health also does not apply.

Although this proposed action does not establish an environmental standard applicable to methane emissions or mandate methane emissions reductions, it is expected that the WEC implemented under this proposed action would result in elective methane mitigation actions by applicable facilities in the oil and gas industry in order to reduce, or eliminate, the imposition of charges. As such, the EPA believes that the impacts of this proposed action would result in a reduction in an environmental health or safety risk that has a disproportionate effect on children. Accordingly, the Agency has elected to evaluate the environmental health and welfare effects of climate change on children. Greenhouse gases, including methane, contribute to climate change and are emitted in significant quantities by the oil and gas industry. The EPA believes that the implementation of the WEC in this action, if finalized, would improve children's health as a result of methane mitigation actions and operational changes taken by oil and gas applicable facilities to avoid the imposition of WEC. The assessment literature cited in the EPA's 2009 Endangerment Findings concluded that certain populations and life stages, including children, the elderly, and the poor, are most vulnerable to climate-related health effects (74 FR 66524, December 15, 2009). The assessment literature since 2009 strengthens these conclusions by providing more detailed findings regarding these groups' vulnerabilities and the projected impacts they may experience (*e.g.*, the 2016 Climate and Health Assessment).[46] These assessments describe how children's unique physiological and developmental factors contribute to making them particularly vulnerable to climate change. Impacts to children are expected from heat waves, air pollution, infectious and waterborne illnesses resulting in physical and mental health effects from extreme weather events. In addition, children are among those especially susceptible to most allergic diseases, as well as health effects associated with storms and floods. Additional health concerns may arise in low-income households, especially those with children, if climate change reduces food availability and increases prices, leading to food insecurity within households.

H. Executive Order 13211: Actions that Significantly Affect Energy Supply, Distribution, or Use

This proposed action is not a “significant energy action” because it is not likely to have a significant adverse effect on the supply, distribution or use of energy. To make this determination, we compare the projected change in crude oil and natural gas costs and production to guidance articulated in a January 13, 2021 OMB memorandum “Furthering Compliance with Executive Order 13211, Titled "Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use."”[47] With respect to increases in the

---

[46] USGCRP, 2016: *The Impacts of Climate Change on Human Health in the United States: A Scientific Assessment*. Crimmins, A., J. Balbus, J.L. Gamble, C.B. Beard, J.E. Bell, D. Dodgen, R.J. Eisen, N. Fann, M.D. Hawkins, S.C. Herring, L. Jantarasami, D.M. Mills, S. Saha, M.C. Sarofim, J. Trtanj, and L. Ziska, Eds. U.S. Global Change Research Program, Washington, DC, 312 pp. *https://dx.doi.org/10.7930/J0R49NQX.*

[47] See *https://www.whitehouse.gov/wp-content/uploads/2021/01/M-21-12.pdf.*

cost of energy production or distribution, the guidance indicates that a regulatory action produces a significant adverse effect if it is expected to increase costs in excess of one percent. With respect to crude oil production, the guidance indicates that a regulatory action produces a significant adverse effect if it is expected to produce reductions in crude oil supply, in excess of 20 million barrels per year. With respect to natural gas production, the guidance indicates that a regulatory action produces a significant adverse effect if it reduces natural gas production in excess of 40 million thousand cubic feet (mcf) per year.[48] The economic impacts analysis conducted as part of the RIA accompanying this rulemaking estimated a maximum impact on the gas market of a 0.05 percent price increase and a 0.03 percent decrease in production. The highest impact year is estimated to be in 2026, with a production decrease of 10.7 million mcf of natural gas. The analysis projected a maximum impact on the oil market of 0.04 percent price increase and a 0.03 percent decrease in production. The highest impact year is estimated to be in 2026, with an estimated production decrease of 1.27 million barrels of oil. These impacts are substantially below the thresholds available in OMB memoranda as measures of a significant adverse effect on the energy supply. Further discussion of this analysis is available in the *Regulatory Impact Analysis of the Proposed Waste Emissions Charge,* available in the docket for this rulemaking.

I. National Technology Transfer and Advancement Act

This rulemaking does not involve technical standards.

---

[48] The 2021 E.O. 13211 guidance memo states that the natural gas production decrease that indicates the regulatory action is a significant energy action is 40 mcf per year. Because this is a relatively small amount of natural gas and previous guidance from 2001 indicated a threshold of 25 million Mcf, we assume the 2021 memo was intended to establish 40 million mcf as the indicator of an adverse energy effect. See *https://www.whitehouse.gov/wp-content/uploads/2017/11/2001-M-01-27-Guidance-for-Implementing-E.O.-13211.pdf*.

J. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations and Executive Order 14096: Revitalizing our Nation's Commitment to Environmental Justice for All

The EPA believes that the emissions reductions likely to result from this rule will improve health and environmental outcomes for communities facing disproportionate and adverse human health effects from the pollution subject to the waste emissions charge, including environmental justice communities. The EPA proposes, however, to determine that Executive Order 12898 does not apply to this rulemaking because it is a rule that addresses information collection, reporting procedures, and imposition of the waste emission charge directive of CAA section 136. Although the EPA anticipates a reduction in methane and associated co-pollutant emissions from this action, if finalized, these reductions are not the result of emissions standards or mandated reductions.

Although this regulation does not require action that will directly affect human health or environmental conditions, the EPA has identified and addressed environmental justice concerns by electing to conduct a qualitative assessment of the environmental justice outcomes from the proposed action. The EPA believes the human health or environmental conditions that exist prior to this proposed action would result in or have the potential to result in disproportionate and adverse human health or environmental effects on people of color, low-income populations, and/or Indigenous peoples. The EPA identified 563 counties where Onshore Petroleum and Natural Gas Production and/or Onshore Petroleum and Natural Gas Gathering and Boosting facilities with emissions that may be above the waste emissions threshold and therefore subject to the WEC operated in 2021. These are the counties where emissions might change due to the WEC. The EPA found that there are generally higher percentages of low income and members of minority groups in these communities who may experience higher than average health risks. The EPA believes that in aggregate the proposed action will result in reduction of methane, hazardous air pollutants, and volatile organic compounds, and, generally, this result will improve environmental justice outcomes.

The information supporting this Executive Order review is contained in the *Regulatory Impact Analysis of the Proposed Waste Emissions Charge*, available in the docket for this rulemaking.

K. Determination under CAA Section 307(d)

Pursuant to CAA section 307(d)(1)(V), the Administrator determines that this proposed action is subject to the provisions of CAA section 307(d). Section 307(d)(1)(V) of the CAA provides that the provisions of CAA section 307(d) apply to "such other actions as the Administrator may determine."

List of Subjects

40 CFR Part 2

Administrative practice and procedure, Confidential business information, Courts, Environmental protection, Freedom of information, Government employees.

40 CFR Part 99

Environmental protection, Greenhouse gases, Natural gas, Petroleum, Reporting and recordkeeping requirements, Penalties.

Michael S. Regan,
Administrator.

For the reasons stated in the preamble, the Environmental Protection Agency proposes to amend title 40, chapter I, of the Code of Federal Regulations as follows:

PART 2—PUBLIC INFORMATION

1. The authority citation for part 2 continues to read as follows:

Authority: 5 U.S.C. 552, 552a, 553; 28 U.S.C. 509, 510, 534; 31 U.S.C. 3717.

Subpart B—Confidentiality of Business Information

2. Amend § 2.301 by revising paragraph (d) to read as follows:

§ 2.301 Special rules governing certain information obtained under the Clean Air Act.

*　*　*　*　*

(d) *Data submitted under part 98 or part 99 of this chapter*—(1) Sections 2.201 through 2.215 do not apply to data submitted under part 98 or part 99 of this chapter that EPA has determined, pursuant to sections 114(c) and 307(d) of the Clean Air Act, to be either of the following:

(i) Emission data.

(ii) Data not otherwise entitled to confidential treatment pursuant to section 114(c) of the Clean Air Act.

(2) Except as otherwise provided in this paragraph (d)(2) and paragraph (d)(4) of this section, §§ 2.201 through 2.215 do not apply to data submitted under part 98 or part 99 of this chapter that EPA has determined, pursuant to sections 114(c) and 307(d) of the Clean Air Act, to be entitled to confidential treatment. EPA shall treat that information as confidential in accordance with the provisions of § 2.211, subject to paragraph (d)(4) of this section and § 2.209.

(3) Upon receiving a request under 5 U.S.C. 552 for data submitted under part 98 or part 99 of this chapter that EPA has determined, pursuant to sections 114(c) and 307(d) of the Clean Air Act, to be entitled to confidential treatment, the EPA office shall furnish the requestor a notice that the information has been determined to be entitled to confidential treatment and that

the request is therefore denied. The notice shall include or cite to the appropriate EPA determination.

(4) Modification of prior confidentiality determination. A determination made pursuant to sections 114(c) and 307(d) of the Clean Air Act that information submitted under part 98 or part 99 of this chapter is entitled to confidential treatment shall continue in effect unless, subsequent to the confidentiality determination, EPA takes one of the following actions:

(i) EPA determines, pursuant to sections 114(c) and 307(d) of the Clean Air Act, that the information is emission data or data not otherwise entitled to confidential treatment under section 114(c) of the Clean Air Act.

(ii) The Office of General Counsel issues a final determination, based on the criteria in § 2.208, stating that the information is no longer entitled to confidential treatment because of change in the applicable law or newly-discovered or changed facts. Prior to making such final determination, EPA shall afford the business an opportunity to submit comments on pertinent issues in the manner described by §§ 2.204(e) and 2.205(b). If, after consideration of any timely comments submitted by the business, the Office of General Counsel makes a revised final determination that the information is not entitled to confidential treatment under section 114(c) of the Clean Air Act, EPA will notify the business in accordance with the procedures described in § 2.205(f)(2).

* * * * *

3. Add part 99 to read as follows:

PART 99—WASTE EMISSIONS CHARGE

Sec.

Subpart A—General Provisions

Authority: 42 U.S.C. 7401–7671q; 31 U.S.C. 3717.

Subpart A—General Provisions

§ 99.1 Purpose and scope.

(a) This part establishes requirements for owners and operators of certain petroleum and natural gas systems facilities to make filings and be assessed waste emission charges as required by section 136 of the Clean Air Act.

(b) Owners and operators of facilities that are subject to this part must follow the requirements of this subpart and all applicable subparts of this part. If a conflict exists between a provision in subpart A and any other applicable subpart, the requirements of the applicable subpart shall take precedence.

§ 99.2 Definitions.

All terms used in this part shall have the same meaning given in the Clean Air Act, unless as defined in this section. Terms defined here only apply within the context of this rulemaking.

Act means the Clean Air Act, as amended, 42 U.S.C. 7401, *et seq*.

Affected facility means, for the purposes of the regulatory compliance exemption of this part, affected facilities, as defined in part 60, subpart A of this chapter, that are subject to methane emissions requirements pursuant to part 60 of this chapter.

Applicable facility means a facility within one or more of the following industry segments, as those industry segment terms are defined in § 98.230 of this chapter. In the case where operations from two or more industry segments are co-located at the same part 98 reporting facility, operations for all co-located segments constitute a single *applicable facility* under this part:

(1) Offshore petroleum and natural gas production.

(2) Onshore petroleum and natural gas production.

(3) Onshore natural gas processing.

(4) Onshore natural gas transmission compression.

(5) Underground natural gas storage.

(6) Liquefied natural gas storage.

(7) Liquefied natural gas import and export equipment.

(8) Onshore petroleum and natural gas gathering and boosting.

(9) Onshore natural gas transmission pipeline.

Carbon dioxide equivalent or CO_2e means the number of metric tons of CO_2 emissions with the same global warming potential as one metric ton of another greenhouse gas and is calculated using Equation A-1 in § 98.2(b) of this chapter.

Designated facility means, for purposes of the regulatory compliance exemption of this part, designated facilities, as defined in § 60.21a(b) of this chapter, subject to methane emissions requirements pursuant to a state, Tribal, or Federal plan implementing part 60 of this chapter.

e-GGRT ID number means the identification number assigned to a facility by the EPA's electronic Greenhouse Gas Reporting Tool for submission of the facility's part 98 report.

Facility applicable emissions means the annual methane emissions, as calculated in § 99.21, associated with a WEC applicable facility that are either equal to, below, or exceeding the waste emissions threshold for the WEC applicable facility prior to consideration of any applicable exemptions.

Gas to oil ratio (GOR) means the ratio of the volume of gas at standard temperature and pressure that is produced from a volume of oil when depressurized to standard temperature and pressure.

Gathering and boosting system means a single network of pipelines, compressors and process equipment, including equipment to perform natural gas compression, dehydration, and acid gas removal, that has one or more connection points to gas and oil production and a downstream endpoint, typically a gas processing plant, transmission pipeline, LDC pipeline, or other gathering and boosting system.

Gathering and boosting system owner or operator means any person that holds a contract in which they agree to transport petroleum or natural gas from one or more onshore petroleum and natural gas production wells to a natural gas processing facility, another gathering and boosting system, a natural gas transmission pipeline, or a distribution pipeline, or any person responsible for custody of the petroleum or natural gas transported.

Global warming potential or GWP means the ratio of the time-integrated radiative forcing from the instantaneous release of one kilogram of a trace substance relative to that of one kilogram of a reference gas (*i.e.,* CO_2). GWPs for each greenhouse gas are provided in Table A-1 of part 98, subpart A of this chapter.

Greenhouse gas or GHG means the air pollutants carbon dioxide (CO_2), hydrofluorocarbons (HFCs), methane (CH_4), nitrous oxide (N_2O), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6).

Natural gas means a naturally occurring mixture or process derivative of hydrocarbon and non-hydrocarbon gases found in geologic formations beneath the earth's surface, of which its constituents include, but are not limited to, methane, heavier hydrocarbons and carbon dioxide. Natural gas may be field quality, pipeline quality, or process gas.

Nonproduction sector means facilities in the onshore natural gas processing, the liquefied natural gas storage, the liquefied natural gas import and export equipment, and the onshore petroleum and natural gas gathering and boosting industry segments as those industry segments are defined in § 98.230 of this chapter.

Onshore natural gas transmission pipeline owner or operator means, for interstate pipelines, the person identified as the transmission pipeline owner or operator on the Certificate of Public Convenience and Necessity issued under 15 U.S.C. 717f, or, for intrastate pipelines, the person identified as the owner or operator on the transmission pipeline's Statement of Operating Conditions under section 311 of the Natural Gas Policy Act, or for pipelines that fall under the "Hinshaw Exemption" as referenced in section 1(c) of the Natural Gas Act, 15 U.S.C. 717–717 (w)(1994), the person identified as the owner or operator on blanket certificates issued under 18 CFR 284.224. If an intrastate pipeline is not subject to section 311 of the Natural Gas Policy Act (NGPA), the onshore natural gas transmission pipeline owner or operator is the person identified as the owner or operator on reports to the state regulatory body regulating rates and charges for the sale of natural gas to consumers.

Onshore petroleum and natural gas production owner or operator means the person or entity who holds the permit to operate petroleum and natural gas wells on the drilling permit or an operating permit where no drilling permit is issued, which operates a facility in the onshore petroleum and/or natural gas production industry segment (as that industry segment is defined in

§ 98.230(a)(2) of this chapter). Where petroleum and natural gas wells operate without a drilling or operating permit, the person or entity that pays the State or Federal business income taxes is considered the owner or operator.

Operator means, except as otherwise defined in this section, any person who operates or supervises a facility.

Owner means, except as otherwise defined in this section, any person who has legal or equitable title to, has a leasehold interest in, or control of an applicable facility, except a person whose legal or equitable title to or leasehold interest in the facility arises solely because the person is a limited partner in a partnership that has legal or equitable title to, has a leasehold interest in, or control of the facility shall not be considered an “owner” of the facility.

Part 98 report means the annual report required under part 98 of this chapter for owners and operators of certain facilities under the Petroleum and Natural Gas Systems source category.

Petroleum means oil removed from the earth and the oil derived from tar sands and shale.

Production sector means facilities in the offshore petroleum and natural gas production and the onshore petroleum and natural gas production industry segments as those industry segments are defined in § 98.230 of this chapter.

Reporting year means the calendar year during which data are required to be collected for purposes of the annual WEC filing. For example, reporting year 2024 is January 1, 2024 through December 31, 2024, and the annual WEC filing for reporting year 2024 is submitted to EPA by March 31, 2025.

Standard temperature and pressure means 60° F and 14.7 psia.

Transmission sector means facilities in the onshore natural gas transmission compression, the underground natural gas storage, and the onshore transmission pipeline industry segments as those industry segments are defined in § 98.230 of this chapter.

Waste emissions threshold means the metric tons of methane emissions calculated by multiplying WEC applicable facility throughput by the industry segment-specific methane intensity thresholds established in CAA 136(f) and the density of methane (0.0192 metric ton per thousand standard cubic feet).

WEC means waste emissions charge, the charge established in CAA 136(c) on methane emissions that exceed certain thresholds.

WEC applicable emissions means the annual methane emissions, as calculated in § 99.21, associated with a WEC applicable facility that are either equal to, below, or exceeding the waste emissions threshold for the WEC applicable facility after consideration of any applicable exemptions.

WEC applicable facility means an applicable facility, as defined in this section, for which the owner or operator of the part 98 reporting facility reports GHG emissions under part 98, subpart W of this chapter of more than 25,000 metric tons CO_2e.

WEC filing means the report and payment of applicable WEC obligation required to be submitted by a WEC obligated party under the requirements of this chapter. The WEC filing contains information regarding the WEC obligated party and WEC applicable facilities for the previous reporting year. For example, the WEC filing due on March 31, 2025 contains information regarding reporting year 2024, which is January 1, 2024 through December 31, 2024.

WEC obligated party means the owner or operator as defined in this section for the applicable industry segment as of December 31 of the reporting year. In cases where a WEC applicable facility has more than one owner or operator, the WEC obligated party shall be a person or entity selected by an agreement binding on each of the owners and operators involved in the transaction, following the provisions of § 99.4(b).

WEC obligation means the WEC charge amount resulting from the calculations in § 99.23.

You means a WEC obligated party subject to this part 99.

§ 99.3 Who must file?

WEC obligated parties, as defined in § 99.2, are required to submit a WEC filing and remit applicable WEC obligations and charges.

§ 99.4 How do I authorize and what are the responsibilities of the designated representative?

Each WEC obligated party must follow the procedures in paragraphs (a) through (l) of this section, as applicable, to identify a WEC obligated party designated representative. In cases where a WEC applicable facility has more than one owner or operator, the WEC obligated party shall be a person or entity selected by an agreement binding on each of the owners and operators involved in the transaction, following the provisions of paragraph (b) of this section. Failure to select a WEC obligated party for each WEC applicable facility with multiple owners or operators following the procedures of paragraph (b) of this section is considered a violation of this part for each owner and operator (as defined in § 99.2 of this part) for the applicable industry segment of the associated WEC applicable facility.

(a) *General*. Except as provided under paragraph (f) of this section, each WEC obligated party that is subject to this part shall have one designated representative, who shall be responsible for certifying, signing, and submitting WEC filings or other submissions to the Administrator under this part.

(b) *Authorization of a designated representative*. The designated representative of each WEC obligated party shall be an individual selected by an agreement binding on the owner and operator of such entity and shall act in accordance with the certification statement in paragraph (i)(3)(iv) of this section. Failure of a WEC obligated party to authorize a designated representative following the procedures of this section is considered a violation of this part.

(c) *Responsibility of the designated representative*. Upon receipt by the Administrator of a complete certificate of representation under this section for the WEC obligated party, the designated representative identified in such certificate of representation shall represent and, by his or her representations, actions, inactions, or submissions, legally bind the owner and operator of such an entity in all matters pertaining to this part, notwithstanding any agreement between the designated representative and said owner and operator. The owner and operator shall be bound by any decision or order issued to the designated representative by the Administrator or a court.

(d) *Timing*. No WEC filing or other submissions under this part for a WEC obligated party will be accepted until the Administrator has received a complete certificate of representation under this section for a designated representative of the WEC obligated party. Such certificate of representation shall be submitted at least 60 days before the deadline for submission of the WEC obligated party's WEC filing under § 99.5.

(e) *Certification of the WEC filing*. Each WEC filing and any other submission under this part for a WEC obligated party shall be certified, signed, and submitted by the designated representative or any alternate designated representative of the WEC obligated party in accordance with this section and § 3.10 of this chapter.

(1) Each such submission shall include the following certification statement signed by the designated representative or any alternate designated representative: "I am authorized to make this submission on behalf of the owner and operator of the WEC obligated party, for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

(2) The Administrator will accept a WEC filing or other submission for a WEC obligated party under this part only if the submission is certified, signed, and submitted in accordance with this section.

(f) *Alternate designated representative*. A certificate of representation under this section for the WEC obligated party may designate one alternate designated representative, who shall be an individual selected by an agreement binding on the owner and operator, and may act on behalf of the WEC obligated party designated representative. The agreement by which the alternate designated representative is selected shall include a procedure for authorizing the alternate designated representative to act in lieu of the designated representative.

(1) Upon receipt by the Administrator of a complete certificate of representation under this section for a WEC obligated party identifying an alternate designated representative, the following apply.

(i) The alternate WEC obligated party designated representative may act on behalf of the WEC obligated party designated representative.

(ii) Any representation, action, inaction, or submission by the alternate designated representative shall be deemed to be a representation, action, inaction, or submission by the WEC obligated party designated representative.

(2) Except in this section, whenever the term “designated representative” is used in this part, the term shall be construed to include the designated representative or any alternate designated representative.

(g) *Changing a designated representative or alternate designated representative*. The designated representative or alternate designated representative identified in a complete certificate of representation under this section for a WEC obligated party received by the Administrator may be changed at any time upon receipt by the Administrator of another later signed, complete certificate of representation under this section for the WEC obligated party. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous designated representative or the previous alternate designated representative of the WEC obligated party before the time and date when the Administrator receives such later signed certificate of representation shall be binding on the new designated representative and the owner and operator of the WEC obligated party.

(h) *Changes in the WEC obligated party*. Within 90 days after any change in the WEC obligated party, the designated representative or any alternate designated representative shall submit a certificate of representation that is complete under this section to reflect the change.

(i) *Certificate of representation*. A certificate of representation shall be complete if it includes the following elements in a format prescribed by the Administrator in accordance with this section:

(1) Identification of the WEC obligated party for which the certificate of representation is submitted.

(2) The name, organization name (company affiliation-employer), address, e-mail address, telephone number, and facsimile transmission number (if any) of the designated representative and any alternate designated representative.

(3) The following certification statements by the designated representative and any alternate designated representative:

(i) “I certify that I was selected as the designated representative or alternate designated representative, as applicable, by an agreement binding on the owner and operator of the entity.”

(ii) “I certify that I have all the necessary authority to carry out my duties and responsibilities under 40 CFR part 99 on behalf of the owner and operator of the entity and that such owner and operator shall be fully bound by my representations, actions, inactions, or submissions.”

(iii) “I certify that the owner and operator of the entity, as applicable, shall be bound by any order issued to me by the Administrator or a court regarding the entity.”

(iv) “If there are multiple owners and operators of the entity, I certify that I have given a written notice of my selection as the ‘designated representative’ or ‘alternate designated representative’, as applicable, and of the agreement by which I was selected to each owner and operator of the entity.”

(4) The signature of the designated representative and any alternate designated representative and the dates signed.

(j) *Documents of agreement*. Unless otherwise required by the Administrator, documents of agreement referred to in the certificate of representation shall not be submitted to the Administrator. The Administrator shall not be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

(k) *Binding nature of the certificate of representation*. Once a complete certificate of representation under this section for a WEC obligated party has been received, the Administrator will rely on the certificate of representation unless and until a later signed, complete certificate of representation under this section for the facility is received by the Administrator.

(l) Objections concerning a designated representative.

(1) Except as provided in paragraph (g) of this section, no objection or other communication submitted to the Administrator concerning the authorization, or any representation, action, inaction, or submission, of the designated representative or alternate designated representative shall affect any representation, action, inaction, or submission of the designated representative or alternate designated representative, or the finality of any decision or order by the Administrator under this part.

(2) The Administrator will not adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of any designated representative or alternate designated representative.

§ 99.5 When must I file and remit the applicable WEC obligation?

Each WEC obligated party must submit their WEC filing including the information specified in § 99.7 and remit applicable WEC obligation no later than March 31 of the year following the reporting year. All filing revisions must be received according to the schedule in § 99.7(e) to be considered for revisions to WEC obligations. If the submission date falls on a weekend or a federal holiday, the submission date shall be extended to the next business day.

§ 99.6 How do I file?

Each WEC filing, certificate of representation, and remittance of applicable WEC fees for the WEC obligated party must be submitted electronically in accordance with the requirements of this part and in a format specified by the Administrator.

§ 99.7 What are the general reporting, recordkeeping, and verification requirements of this part?

The WEC obligated party that is subject to the requirements of this part must submit a WEC filing to the Administrator as specified in this section.

(a) *Schedule*. The WEC filing must be submitted in accordance with § 99.5.

(b) *Content of the WEC filing*. For each WEC obligated party, report the information in paragraphs (b)(1)(i) through (v) of this section. For each WEC applicable facility under common ownership or control of the WEC obligated party, report the information in paragraphs (b)(2)(i) through (vii) of this section. The WEC filing must also include payment of applicable WEC obligation, as specified in paragraph (b)(3) of this section.

(1) Reporting requirements at the WEC obligated party level.

(i) The company name.

(ii) The United States address for the company.

(iii) The name, address, e-mail address, and phone number for the designated representative for the WEC obligated party.

(iv) The list of e-GGRT ID number(s) under which the WEC applicable facilities comprising the WEC obligated party as of December 31 of the reporting year report under part 98, subpart W of this chapter.

(v) The net WEC emissions, as calculated pursuant to § 99.22, and WEC obligation, as calculated pursuant to § 99.23, for the WEC obligated party.

(2) Reporting requirements for each WEC applicable facility comprising the WEC obligated party.

(i) The e-GGRT ID under which the WEC applicable facility emissions are reported under part 98, subpart W of this chapter.

(ii) The industry segment(s) for the WEC applicable facility.

(iii) For WEC applicable facilities in the offshore petroleum and natural gas production or onshore petroleum and natural gas production industry segment as defined in § 99.2, if conditions specified in § 99.30 regarding emissions from delays in permitting are met, provide information as specified in § 99.31.

(iv) If the conditions specified in § 99.40 are met regarding the regulatory compliance exemption, report whether the WEC applicable facility contains any affected facilities under part 60 of this chapter or any designated facilities under an applicable approved state, Tribal, Federal plan in part 62 of this chapter. If so, provide the information specified in § 99.41, as applicable.

(v) For WEC applicable facilities in the offshore petroleum and natural gas production or onshore petroleum and natural gas production industry segment as defined in § 99.2, if conditions specified in § 99.50 regarding emissions from permanently shut-in and plugged wells are met, you must report the information specified in § 99.51.

(vi) The facility waste emissions threshold as calculated pursuant to § 99.20, and, if there is more than one applicable industry segment within the WEC applicable facility, each industry segment waste emissions threshold for each applicable industry segment within the applicable facility, as calculated pursuant to § 99.20,

(vii) The facility applicable emissions, as calculated pursuant to § 99.21 and the WEC applicable emissions, as calculated pursuant to § 99.21.

(3) Payment of applicable WEC obligation, submitted in accordance with § 99.9.

(c) *Verification of the WEC filing*. To verify the completeness and accuracy of WEC filing, the EPA will consider the verification status of part 98 reports, and may review the certification statements described in § 99.4 and any other credible evidence, in conjunction with a comprehensive review of the WEC filing, including attachments. The EPA may conduct audits of selected WEC obligated parties and associated WEC applicable facilities. During such audits, the records generated under this part must be made available to the EPA. The on-site audits may be conducted by private auditors contracted by the EPA or by Federal, State or local personnel, as appropriate, and may be required to be arranged by and conducted at the expense of the WEC obligated party. Nothing in this section prohibits the EPA from using additional information, including reports, prepared and submitted in accordance with part 60 of this chapter, or an applicable approved state, Tribal, orFederal plan under part 62 of this chapter that implements the emission guidelines contained in part 60 of this chapter, to verify the completeness and accuracy of the filings.

(d) *Recordkeeping*. Retain all required records for at least 5 years from the date of submission of the WEC filing for the reporting year in which the record was generated. The records shall be kept in an electronic or hard-copy format (as appropriate) and recorded in a form that is suitable for expeditious inspection and review. Upon request by the Administrator, the records required under this section must be made available to EPA. Records may be retained off site if the records are readily available for expeditious inspection and review. For records that are electronically generated or maintained, the equipment or software necessary to read the records shall be made available, or, if requested by EPA, electronic records shall be converted to paper documents. You must retain the following records:

(1) All information required to be retained by part 98, subparts A and W of this chapter.

(2) Any other information not included in a part 98 report used to complete the WEC filing.

(3) All information required to be submitted as part of the WEC filing.

(e) *Annual WEC filing revisions*. Except as specified in paragraph (e)(2) of this section, the provisions of this paragraph (e) apply until November 1 of the year following the reporting year, or for a given reporting year after the November 1 deadline if the resubmission is related to the resolution of unverified data process specified at § 99.8.

(1) The WEC obligated party shall submit a revised WEC filing within 45 days of discovering that a previously submitted WEC filing contains one or more substantive errors. The revised WEC filing must correct all substantive errors. If the resubmission is due to a correction in a part 98 report resubmitted by a WEC applicable facility, the WEC obligated party must report the number of corrections made in the part 98 report(s) and a description of how the changes impact the assessment of the WEC obligation.

(2) The revisions for substantive errors as described in paragraph (e)(2)(i) and (ii) are not subject to the November 1 deadline and must be submitted according the schedule therein.

(i) Revised filings for purposes of the regulatory compliance exemption must be submitted as follows:

(A) Revised filings to submit a CAA section 111(b) or (d) compliance report which covers the remaining portion of a WEC filing year, which were not available at the time of the WEC filing, must be submitted on or before the date that the compliance report covering the remainder of the year is due under the applicable requirements of CAA section 111(b) or (d), as applicable.

(B) Revised filings to submit findings by the WEC obligated party that one or more deviations or violations discovered after the WEC filing must be submitted within 45 days of the discovery.

(ii) The Administrator may notify the WEC obligated party in writing that a WEC filing previously submitted by the owner or operator contains one or more substantive errors. Such notification will identify each such substantive error. The WEC obligated party shall, within 45 days of receipt of the notification, either resubmit the WEC filing that, for each identified substantive error, corrects the identified substantive error (in accordance with the applicable requirements of this part) or provide information demonstrating that the previously submitted report does not contain the identified substantive error or that the identified error is not a substantive error. The EPA reserves to right to revise WEC obligations for a given reporting year after the November 1 final resubmission deadline if data errors are discovered by EPA at a later date.

(3) A substantive error is an error that impacts the Administrator's ability to accurately calculate a WEC obligated party's WEC obligation, which may include, but is not limited to, the list of WEC applicable facilities associated with a WEC obligated party, the emissions or throughput reported in the WEC applicable facility part 98 report(s), emissions associated with exemptions, and supporting information for each exemption to demonstrate its validity.

(4) Notwithstanding paragraphs (e)(1) and (2) of this section, upon request the Administrator may provide an extension of the 45-day period for submission of a revised report or information under paragraphs (e)(1) and (2) of this section if adequate justification is provided by the WEC obligated party. The Administrator may provide an extension of up to 30 days provided that the request is received by email to an address prescribed by the Administrator prior to the expiration of the 45-day period and that the request demonstrates that it is not practicable to submit a revised report or information under paragraphs (e)(1) and (2) of this section within 45 days.

(5) The WEC obligated party shall retain documentation for 5 years to support any revision made to a WEC filing.

(6) If a facility changes ownership such that there is a change to the WEC obligated party, the entity that was the WEC obligated party at the time of the original filing for a reporting year remains responsible for any revisions to WEC filings for that reporting year.

(f) *Designation of unverified filings and reports*. Following the verification process discussed in § 98.3(h) of this chapter for part 98 reports and paragraph (c) of this section for WEC filings, the EPA shall designate:

(1) The annual part 98 report associated with each WEC applicable facility as either verified or unverified. An unverified report is one in which the EPA has provided notification under § 98.3(h)(2) of this chapter and the owner or operator of the WEC applicable facility has failed to revise and resubmit the report and resolve the error or provide justification to the satisfaction of the EPA that the identified error is not a substantive error (in accordance with the applicable requirements of § 98.3(h)(3) of this chapter).

(2) The annual WEC filing from each WEC obligated party submitted pursuant to § 99.7 as either verified or unverified. An unverified filing is one in which the EPA has provided notification under § 99.7(e)(2) and the WEC obligated party designated representative has failed to resubmit the report and for each identified substantive error correct the identified substantive error (in accordance with the applicable requirements of paragraph (e)(3) of this section) or provide information demonstrating that the submitted report does not contain the identified substantive error or that the identified error is not a substantive error. The determination of verification status of a part 98 report under paragraph (f)(1) of this section will be taken into consideration in the determination of the verification status of a WEC filing.

§ 99.8 What are the general provisions for assessment of the WEC obligation?

(a) *Assessment of the WEC obligation*. WEC obligation assessments shall be made pursuant to § 99.23 on the basis of information submitted by the date specified in § 99.5 and following the submittal requirements of § 99.6.

(b) *Assessment of the WEC obligation for unverified filings*. If a WEC filing is unverified but the EPA is able to correct the error(s) based on reported data, the EPA will recalculate the WEC using available information and provide an invoice or refund to the WEC obligated party within 60 days of determining a WEC filing to be unverified. If the WEC obligated party resubmits a WEC filing within that timeframe, the EPA will either verify the resubmission, or take the resubmission into account when calculating the WEC.

(c) *Third-party audits for unverified reports*. If the EPA is unable to calculate the WEC with available information, the EPA may require the WEC obligated party to undergo a third party audit. The EPA may require the WEC obligated party to fund and arrange the third-party audit. The third-party auditor must review records kept by the WEC obligated party, quantify the WEC with available information, and the updated WEC calculations and supporting data must be submitted to the EPA. The EPA will then take that information into consideration and calculate the WEC and provide an invoice or refund to the WEC obligated party.

(1) *Third party reviews*. An independent third-party audit of the information provided shall be based on a review of the relevant documents and shall identify each item required by the WEC filing, describe how the independent third-party evaluated the accuracy of the information provided, state whether the independent third-party agrees with the information provided, and identify any exceptions between the independent third-party's findings and the information provided.

(i) Audits required under this section must be conducted by a certified independent third-party. The auditor must have professional work experience in the petroleum engineering field or related to oil and gas production, gathering, processing, transmission or storage.

(ii) To be considered an independent third-party, the independent third party shall not be operated by the WEC obligated party and the independent third party shall be free from any interest in the WEC obligated party’s business.

(iii) The independent third-party shall submit all records pertaining to the audit required under this section, including information supporting all of the requirements of § 99.8(c)(1) to the WEC obligated party.

(iv) The independent third-party must provide to the WEC obligated party documentation of qualifications of professional work experience in the petroleum engineering field or related to oil and gas production, gathering, processing, transmission or storage.

(2) *Reporting and recordkeeping requirements for WEC obligated parties following third party audits*.

(i) The WEC obligated party shall provide to EPA the results of the third-party audit, including the WEC obligation amount and all supporting documentation information that is included in reporting requirements under §§ 99.7, and 99.31, 99.41, and 99.51, as applicable.

(ii) The WEC obligated party shall provide to EPA documentation of qualifications of the third-party auditor.

(iii) The WEC obligated party shall retain all records pertaining to the audit required under this section for a period of 5 years from the date of creation and shall deliver such records to the Administrator upon request.

(d) *Resubmittal of filings and reports for the current or prior reporting year*. If resubmittal of a previously submitted part 98 report and/or WEC filing, submitted as specified in §99.7(e), results in a change to the WEC obligation determined for a WEC obligated party for the reporting yearthe following process shall apply:

(1) If the WEC obligation based upon the resubmitted report or filing for the reporting year is less than the WEC obligation previously remitted by the WEC obligated party, the Administrator shall authorize a refund to the WEC obligated party equal to the difference in WEC obligation.

(2) If the WEC obligation based upon the resubmitted report or filing for the reporting year is greater than the WEC obligation previously remitted by the WEC obligated party, the

Administrator shall issue an invoice to the WEC obligated party containing a charge in the amount determined using Equation A-1 of this section. Interest shall not be assessed for a change in WEC obligation resulting from the timely submittal of a regulatory report in accordance with § 99.41(c).

$$WEC_r = \Delta WEC \times \left(1 + \frac{i_{CVFR}}{365}\right)^t \qquad \text{(Eq. A-1)}$$

Where:

WEC_r = The charge obligation of the WEC obligated party to be resubmitted for the difference in WEC obligation, including any applicable interest, in dollars.

ΔWEC = The difference in WEC obligation, calculated as the amount remitted upon the original submittal specified in § 99.5 subtracted from the quantity of WEC obligation determined based upon the resubmitted report or filing, in dollars.

i_{CVFR} = The Treasury Current Value of Funds Rate as specified in § 99.10(b).

t = The number of days after the deadline specified in § 99.5 for remittance of WEC obligation for the reporting year that the resubmitted WEC filing or part 99 report was received by the Administrator, in days. For example, if a reporting year 2024 part 99 report is resubmitted on April 28, 2025, “t” is equal to 28 days. If a reporting year 2024 part 99 report is resubmitted on April 28, 2026, “t” is equal to 393 days.

365 = Conversion factor from years to days.

§ 99.9 How are payments required by this part made?

(a) The WEC obligation owed for each reporting year must be paid by the WEC obligated party as part of the annual WEC filling, as required by § 99.7(b), and is considered due at the date specified in § 99.5.

(b) Other than the WEC obligation specified in paragraph (a) of this section, all other charges required by this part, including adjusted WEC obligations, interest fees, and penalties, shall be paid by the WEC obligated party in response to an electronic invoice or bill by the specified due date, or within 30 days of the date of the invoice or bill if a due date is not provided.

(c) All WEC obligations, interest fees, and penalties required by this subpart shall be paid to the Department of the Treasury by the WEC obligated party electronically in U.S. dollars, using an online electronic payment service specified by the Administrator.

§ 99.10 What fees apply to delinquent payments?

(a) *Delinquency*. WEC obligated party accounts are delinquent if the WEC obligation payment is not submitted in full by the date required by § 99.5. WEC obligated party accounts are also delinquent if the accounts remain unpaid after the due date specified in the invoice or other notice of the WEC amount owed.

(b) *Interest fee*. In accordance with 31 U.S.C. 3717(a), delinquent WEC obligated party accounts shall be charged a minimum annual rate of interest equal to the average investment rate for Treasury tax and loan accounts (Current Value of Funds Rate or CVFR) most recently published and in effect by the Secretary of the Treasury.

(c) *Non-payment penalty*. In accordance with 31 U.S.C. 3717(e), WEC obligated party accounts that are more than 90 days past due shall be charged an additional penalty of 6% per year assessed on any part of the debt that is past due for more than 90 days.

(d) *Penalty for non-submittal*. In accordance with 42 U.S.C. 7413(d)(1), a WEC obligated party that fails to submit an annual WEC filing by the date specified in § 99.5 may be charged an administrative penalty. The penalty assessment shall be a daily assessment per day that the WEC filing is not submitted, assessed up to the value specified in Table 1 of § 19.4, as amended, of this chapter. The assessment of penalty shall begin on the date that the WEC filing was considered past due per § 99.5 and continue until such time that the WEC filing is submitted by the WEC obligated party's designated representative.

§ 99.11 What are the compliance and enforcement provisions of this part?

Any violation of any requirement of this part shall be a violation of the Clean Air Act, including section 114 (42 U.S.C. 7414) and section 136 (42 U.S.C. 7436). A violation would include, but is not limited to, failure to submit a WEC filing, failure to collect data needed to calculate the WEC charge (including any data relevant to determining the applicability of any exemptions), failure to select a WEC obligated party, failure to retain records needed to verify the amount of WEC charge, providing false information in a WEC filing, and failure to remit WEC payment. Each day of a violation would constitute a separate violation. Each day of each violation constitutes a separate violation. Any penalty assessed shall be in addition to any WEC obligation due under this part and any fees applicable to delinquent payments due under § 99.10.

§ 99.12 What addresses apply for this part?

All requests, notifications, and communications to the Administrator pursuant to this part must be submitted electronically and in a format as specified by the Administrator.

§ 99.13 What are the confidentiality determinations and related procedures for this part?

This section characterizes various categories of information for purposes of making confidentiality determinations, as follows:

(a) This paragraph (a) applies the definition of “Emission data” in 40 CFR 2.301(a) for information reported under this part. “Emission data” cannot be treated as confidential business information and shall be available to be disclosed to the public. The following categories of information qualify as emission data:

(1) Methane emission information, including the net WEC emissions, waste emissions thresholds, WEC applicable emissions, and the quantity of methane emissions to be exempted due to unreasonable delay and wells that were permanently shut-in and abandoned.

(2) Calculation methodology, including the method used to determine the quantity of methane emissions to be exempted due to an unreasonable permitting delay and the method used to quantify emissions exempted from permanently shut-in and plugged wells.

(3) Facility and unit identifier information, including WEC obligated party company name and address, the name and contact information for the designated representative of WEC obligated party, signed and dated certification statements of the accuracy and completeness of the report, facility identifiers (*e.g.*, e-GGRT ID number), industry segment, well-pad and/or well

identifiers, and emission source-specific methane mitigation activities impacted by an unreasonable permitting delay.

(b) The following types of information are not eligible for confidential treatment:

(1) The WEC obligation, as calculated pursuant to § 99.23.

(2) Compliance information, including information regarding applicable emissions standards or other relevant standards of performance or requirements, information in construction or operating permits, and information submitted to document compliance with an emissions standard or a standard of performance, such as a periodic report, prepared and submitted in accordance with part 60 of this chapter, or an applicable approved state, Tribal, orFederal plan under part 62 of this chapter that implements the emission guidelines contained in part 60 of this chapter, (excluding any information redacted from the report and claimed as confidential).

(3) Published information that is publicly available, including information that is made available through publication of annual reports submitted under part 98 of this chapter, on company or other websites, or otherwise made publicly available.

(c) If you submit information that is not described in paragraphs (a) and (b) of this section, you may claim the information as confidential and the information is subject to the process for confidentiality determinations in 40 CFR part 2 as described in §§ 2.201 through 2.208. We may require you to provide us with information to substantiate your claims. If claimed, we may consider this substantiating information to be confidential to the same degree as the information for which you are requesting confidential treatment. We will make our determination based on your statements to us, the supporting information you send us, and any other available information. However, we may determine that your information is not subject to confidential treatment consistent with 40 CFR part 2 and 5 U.S.C. 552(b)(4).

(d) Submitted applications and reports typically rely on software or templates to identify specific categories of information. If you submit information in a comment field designated for users to add general information, we will respond to requests for disclosing that information consistent with paragraphs (a) through (c) of this section.

Subpart B—Determining Waste Emissions Charge

§ 99.20 How will the waste emissions threshold for each WEC applicable facility be determined?

The methane waste emissions threshold for each applicable industry segment within a WEC applicable facility for the reporting year will be calculated as described in paragraphs (a) through (d) of this section, as applicable. The methane waste emissions threshold for each WEC applicable facility will be determined as described in paragraph (e) of this section.

(a) For each offshore petroleum and natural gas production industry segment or onshore petroleum and natural gas production industry segment that sends natural gas to sale at a WEC applicable facility, the facility waste emissions threshold will be calculated using Equation B-1 of this section.

$$TH_{is,Prod} = 0.002 \times \rho_{CH_4} \times Q_{ng,Prod} \qquad \text{(Eq. B-1)}$$

Where:

$TH_{is,Prod}$ = The methane waste emissions threshold for the industry segment at a WEC applicable facility for the reporting year in the production sector that has natural gas sent to sale, metric tons (mt) CH_4.

0.002 = Industry segment-specific methane intensity threshold, as specified in CAA section 136(f), for methane emissions for applicable facilities with natural gas sales in the production sector, thousand standard cubic feet (Mscf) CH_4 per Mscf of natural gas sent to sale.

ρ_{CH4} = Density of methane = 0.0192 kilograms per standard cubic foot (kg/scf) = 0.0192 metric tons per thousand standard cubic feet (mt/Mscf).

$Q_{ng,Prod}$ = The total quantity of natural gas that is sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to part 98, subpart W of this chapter. For onshore petroleum and natural gas production, you must use the quantity reported pursuant to proposed § 98.236(aa)(1)(i)(B) of this chapter, in Mscf. For offshore petroleum and natural gas production, you must use the quantity reported pursuant to proposed § 98.236(aa)(2)(i) of this chapter, in Mscf.

(b) For each offshore petroleum and natural gas production industry segment or the onshore petroleum and natural gas production industry segment that has no natural gas sent to sale at a WEC applicable facility, the facility waste emissions threshold will be calculated using Equation B-2 of this section.

$$TH_{is,Prod} = 10 \times Q_{o,Prod} \times 10^{-6} \qquad \text{(Eq. B-2)}$$

Where:

$TH_{is,Prod}$ = The annual methane waste emissions threshold for the industry segment at a WEC applicable facility in the production sector that has no natural gas sent to sale, mt CH_4.

10 = Industry segment-specific methane intensity threshold, as specified in CAA section 136(f), for applicable facilities with no natural gas sales in the production sector, mt CH_4 per million barrels oil sent to sale.

$Q_{o,Prod}$ = The total quantity of crude oil that is sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to part 98, subpart W of this chapter. For onshore petroleum and natural gas production, you must use the quantity reported pursuant to proposed § 98.236(aa)(1)(i)(C) of this chapter, in barrels. For offshore petroleum and natural gas production, you must use the quantity reported pursuant to proposed § 98.236(aa)(2)(ii) of this chapter, in barrels.

10^{-6} = Conversion from barrels to million barrels.

(c) For each onshore natural gas processing industry segment, liquefied natural gas storage industry segment, the liquefied natural gas import and export equipment industry segment, or the onshore petroleum and natural gas gathering and boosting industry segment at a WEC applicable facility, the facility waste emissions threshold will be calculated using Equation B-3 of this section.

$$TH_{is,NonProd} = 0.0005 \times \rho_{CH_4} \times Q_{ng,NonProd} \qquad \text{(Eq. B-3)}$$

Where:

$TH_{is,NonProd}$ = The annual methane waste emissions threshold for the industry segment at a WEC applicable facility in the nonproduction sector, mt CH_4.

0.0005 = Industry segment-specific methane intensity threshold, as specified in CAA section 136(f), for applicable facilities in the nonproduction sector, Mscf CH_4 per Mscf of natural gas sent to sale from or through the facility.

ρ_{CH4} = Density of methane = 0.0192 kg/scf = 0.0192 mt/Mscf.

$Q_{ng,NonProd}$ = The total quantity of natural gas that is sent to sale from or through the industry segment at a WEC applicable facility in the reporting year as reported pursuant to part 98, subpart W of this chapter. For RY 2024 for onshore natural gas processing, you must use the quantity reported pursuant to § 98.236(aa)(3)(ii) of this chapter, in Mscf and for RY 2025 and later, you must use the quantity reported pursuant to proposed § 98.236(aa)(3)(ix) of this chapter, in Mscf. For LNG import and export, you must use sum of the quantities reported pursuant to § 98.236(aa)(6) and (7) of this chapter, in Mscf. For LNG storage, you must use the quantity reported pursuant to § 98.236(aa)(8)(ii) of this chapter, in Mscf. For onshore petroleum and natural gas gathering and boosting, you must use the quantity reported pursuant to § 98.236(aa)(10)(ii) of this chapter, in Mscf .

(d) For each onshore natural gas transmission compression industry segment, underground natural gas storage industry segment, or onshore natural gas transmission pipeline industry segment at a WEC applicable facility, the facility waste emissions threshold will be calculated using Equation B-4 of this section.

$$TH_{is,Tran} = 0.0011 \times \rho_{CH_4} \times Q_{ng,Tran} \qquad \text{(Eq. B-4)}$$

Where:

$TH_{is,Tran}$ = The annual methane waste emissions threshold for the industry segment at a WEC applicable facility in the transmission sector, mt CH_4.

0.0005 = Industry segment-specific methane intensity threshold, as specified in CAA section 136(f), for applicable facilities in the transmission sector, Mscf CH_4 per Mscf of natural gas sent to sale from or through the facility.

ρ_{CH4} = Density of methane = 0.0192 kg/scf = 0.0192 mt/Mscf.

$Q_{ng,Tran}$ = The total quantity of natural gas that is sent to sale from or through the industry segment at a WEC applicable facility in the reporting year as reported pursuant to part 98, subpart W of this chapter. For onshore natural gas transmission compression, you must use the quantity reported pursuant to § 98.236(aa)(4)(i) of this chapter, in Mscf. For underground natural gas storage, you must use the quantity reported pursuant to § 98.236(aa)(5)(ii) of this chapter, in Mscf. For onshore natural gas transmission pipeline, you must use the quantity reported pursuant to § 98.236(aa)(11)(iv) of this chapter, in Mscf.

(e) For each WEC applicable facility that operates in a single industry segment, the methane waste emissions threshold shall be equal to the value calculated in Equation B-1, Equation B-2, Equation B-3, or Equation B-4 of this section, as applicable. For each WEC applicable facility that operates in two or more industry segments, the facility waste emissions threshold will be calculated using Equation B-5 of this section.

$$TH_{WAF} = \sum_{s=1}^{N} TH_{is,s} \text{(Eq. B-5)}$$

Where:

TH_{WAF} = The WEC applicable facility waste emissions threshold, mt CH4.

$TH_{is,s}$ = The industry segment waste emissions threshold, as calculated in Equation B-3 or Equation B-4 of this section, for each industry segment "s" at the WEC applicable facility, mt CH_4.

N = Number of industry segments at the WEC applicable facility.

§ 99.21 How will the WEC applicable emissions for a WEC applicable facility be determined?

(a) The total facility applicable emissions for each WEC applicable facility will be calculated using Equation B-6 of this section.

$$E_{TFA,CH_4} = E_{SubpartW,CH_4} - TH_{WAF} \qquad \text{(Eq. B-6)}$$

Where:

$E_{TFA,CH4}$ = The annual methane emissions equal to, below, or exceeding the waste emissions threshold for a WEC applicable facility prior to consideration of any applicable exemptions (*i.e.*, total facility applicable emissions), mt $CH_{4.}$

$E_{SubpartW,CH4}$ = The annual methane emissions for a WEC applicable facility, as reported under part 98, subpart W of this chapter for the corresponding reporting year, mt $CH_{4.}$

TH_{WAF} = The waste emissions threshold for a WEC applicable facility, as determined in § 99.20(e), mt CH_4.

(b) If the total facility applicable emissions calculated using Equation B-6 of this section are less than or equal to 0 mt, then the WEC applicable emissions are equal to the total facility applicable emissions.

(c) If the total facility applicable emissions calculated using Equation B-6 of this section are greater than 0 mt and the regulatory compliance exemption as specified in § 99.40 applies to the WEC applicable facility, the WEC applicable emissions for that facility are equal to 0 mt.

(d) If the total facility applicable emissions calculated using Equation B-6 of this section are greater than 0 mt and the regulatory compliance exemption as specified in § 99.40 does not apply to the WEC applicable facility, the WEC applicable emissions for each WEC applicable facility will be calculated using Equation B-7 of this section.

$$E_{WA,CH_4} = E_{TFA,CH_4} - E_{Delay,CH_4} - E_{Plug,CH_4} \quad \text{(Eq. B-7)}$$

Where:

$E_{WA,CH4}$ = The annual methane emissions associated with a WEC applicable facility that are either equal to, below, or exceeding the waste emissions threshold for the WEC applicable facility (i.e., the WEC applicable emissions) , mt CH_4. If the result of this calculation is less than 0 mt CH_4, the WEC appliable emissions for the facility are equal to 0 mt CH_4.

$E_{TFA,CH4}$ = The annual methane emissions equal to, below, or exceeding the waste emissions threshold for a WEC applicable facility prior to consideration of any applicable exemptions for the reporting year, mt CH_4.

$E_{Delay,CH4}$ = The quantity of methane emissions exempted, as determined in Equation C-1 of § 99.32, at the WEC applicable facility in the offshore petroleum and natural gas production or onshore petroleum and natural gas production industry segment due to an unreasonable delay in environmental permitting of gathering or transmission infrastructure, mt CH_4.

$E_{Plug,CH4}$ = The total quantity of annual methane emissions, as determined in Equation E-5 of § 99.52, at the WEC applicable facility in the onshore petroleum and natural gas production and offshore petroleum and natural gas production industry segments, attributable to all wells that were permanently shut-in and plugged during the reporting year in accordance with all applicable closure requirements, mt CH_4.

§ 99.22 How will the net WEC emissions for a WEC obligated party be determined?

Net WEC emissions for a WEC obligated party, equal to the sum of WEC applicable emissions from all facilities with the same WEC obligated party, as specified in 99.2, will be calculated using Equation B-8 of this section.

$$E_{NetWEC,CH_4} = \sum_{j=1}^{N} E_{WA,CH_4} \text{(Eq. B-8)}$$

Where:

$E_{NetWEC,CH4}$ = The annual methane emissions subject to the WEC for the WEC obligated party for the reporting year, mt CH_4.

$E_{WA,CH4}$ = The annual methane emissions equal to, below, or exceeding the waste emissions thresholds for a WEC applicable facility “j” as calculated in § 99.21(b) or (d) under common ownership or control of a WEC obligated party, mt CH_4.

N = Total number of WEC applicable facilities under common ownership or control of a WEC obligated party, excluding any WEC applicable facilities for which the regulatory compliance exemption as specified in § 99.40 applies.

§ 99.23 How will the WEC Obligation for a WEC obligated party be determined?

(a) If the net WEC emissions for a WEC obligated party as determined in § 99.22 are less than or equal to zero, the WEC obligated party’s WEC obligation is zero and the WEC obligated party is not subject to a waste emissions charge in the reporting year.

(b) If the net WEC emissions for a WEC obligated party as determined in § 99.22 are greater than zero, the WEC obligation will be calculated according to the applicable provisions in paragraphs (b)(1) through (3) of this section.

(1) For reporting year 2024, multiply the net WEC emissions from Equation B-8 of this subpart by $900 per mt CH_4 to determine the WEC obligation.

(2) For reporting year 2025, multiply the net WEC emissions from Equation B-8 of this subpart by $1,200 per mt CH_4 to determine the WEC obligation.

(3) For reporting year 2026 and each year thereafter, multiply the net WEC emissions from Equation B-8 of this subpart by $1,500 per mt CH_4 to determine the WEC obligation.

Subpart C—Unreasonable Delay Exemption

§ 99.30 Which facilities qualify for the exemption for emissions caused by an unreasonable delay in environmental permitting of gathering or transmission infrastructure?

(a) The WEC applicable facility must be in the offshore petroleum and natural gas production or onshore petroleum and natural gas production industry segment as defined in § 99.2.

(b) The total facility applicable emissions for the WEC applicable facility as calculated in accordance with § 99.21(a) must exceed 0 mt.

(c) All requests for information regarding the permit received by either the production entity potentially eligible for the exemption or the entity seeking the environmental permit must not have exceeded the response time requested by the permitting agency, or by the relevant production or gathering or transmission infrastructure entity seeking the permit, or exceeded 30 days if no specific response time is requested.

(d) The WEC facility must report flaring emissions in the reporting year that occurred as a result of a delay in environmental permitting of gathering or transmission infrastructure, and are in compliance with all applicable local, state and federal regulations regarding flaring emissions.

(e) [A set period of months (with exact timing to be specified at final)] must have passed since submission of a complete environmental permit application, as certified by the relevant permitting authority, to construct gathering or transmission infrastructure without approval or denial of the environmental permit application.

§ 99.31 What are the reporting requirements for the exemption for emissions caused by an unreasonable delay in environmental permitting of gathering or transmission infrastructure?

(a) Upon meeting all criteria in § 99.30(a) through (f), you shall report information regarding an exemption for unreasonable delay in permitting of gathering or transmission infrastructure for a given reporting year. The unreasonable delay exemption information to be reported is described in paragraph (b) of this section. The unreasonable delay exemption shall be submitted as described in paragraph (c) of this section.

(b) For each unreasonable delay exemption, the WEC obligated party must report the information specified in paragraphs (b)(1) through (10) of this section.

(1) The company name and name of the facility that submitted the permit application to construct and/or operate gathering or transmission infrastructure.

(2) The name and e-GGRT ID number under part 98, subpart W of this chapter of the production facility impacted by the unreasonable delay in environmental permitting of gathering or transmission infrastructure.

(3) The date of the initial permit request to build gathering or transmission infrastructure.

(4) An attestation that the entity seeking the permit has been responsive to the relevant authority regarding the permit application, that is that the entity has responded to all requests from the permitting authority within the time frame requested by the relevant authority or within 30 days if no timeframe is specified.

(5) For each well-pad impacted by the unreasonable delay in permitting of gathering or transmission infrastructure:

(i) The well-pad ID for each well-pad, as reported under part 98, subpart W of this chapter.

(ii) A listing of methane emissions mitigation activities that are impacted by the unreasonable permitting delay.

(6) The estimated date to commence operation of the gathering or transmission infrastructure if application had been approved before [the set period of months elapsed (exact timing to be specified at final)].

(7) If the application has been approved and operations commenced during the reporting year, the first date that offtake to the gathering or transmission infrastructure from the implementation of methane emissions mitigation occurred.

(8) The beginning and ending date for which the eligible delay limited the offtake of Nnatural gas associated with methane emissions mitigation activities for the reporting year as determined according to § 99.32(a).

(9) The quantity of methane emissions to be exempted due to the unreasonable delay for the reporting year calculated as specified in § 99.32 and the method used to determine the quantity of methane emissions to be exempted (used § 99.32(b)(1); used § 99.32(b)(2)(i); used § 99.32(b)(2)(ii) with K_f based on volume; used § 99.32(b)(2)(ii) with K_f based on time).

(10) Information on all applicable local, state, and federal regulations regarding flaring emissions and the facility's compliance status for each.

(11) For each permit relevant to the exemption, the name/type of permit, permitting agency, and a link to information on the permit (e.g., available through the permitting agency), if available.

(c) Each submittal under this section shall be certified, signed, and submitted by the designated representative or any alternate designated representative of the WEC obligated party in accordance with this section and § 3.10 of this chapter.

§ 99.32 How are the methane emissions caused by an unreasonable delay in environmental permitting of gathering or transmission infrastructure quantified?

(a) Determine the time period associated with the emissions that occurred as a result of the eligible delay within the reporting year as specified in paragraphs (a)(1) and (2) of this section.

(1) The start date of the emissions caused by the delay in the reporting year is the latter of January 1 of the reporting year, or the date on which emissions would have been avoided through commencement of the operation of the gathering or transmission infrastructure if the application to construct and/or operate the gathering or transmission infrastructure had been approved within a set period of months as specified in § 99.31(b)(6).

(2) The end time of the emissions caused by the delay in the reporting year is the earlier of December 31 of the reporting year or the date the emissions caused by the unreasonable delay ends because the infrastructure commenced operation.

(b) For each well-pad or offshore platform at a WEC applicable facility impacted by an unreasonable delay in environmental permitting of gathering or transmission infrastructure, you must calculate the emissions that occurred at the well-pad or offshore platform that were caused by the unreasonable delay according to paragraph (b)(1) or (2) of this section, as applicable.

(1) If the unreasonable delay impacts the entire reporting year, and has resulted in the entire volume of flaring occurring from flare stacks, associated gas flaring, or offshore production flaring, then use the mass CH_4 emissions, in mt CH_4, as reported in § 98.236(m)(8)(iii), (n)(10), and/or (s)(2) of this chapter, as applicable, for the individual flare(s) in the offshore petroleum and natural gas production industry segment and onshore petroleum gas production industry segment used to flare the increased volume of gas from methane emissions mitigation implementation associated with the unreasonable delay in environmental permitting of gathering or transmission infrastructure. If multiple flares are used to flare the increased volume of gas, sum the mass CH_4 emissions for each flare used to flare the increased volume of gas from methane emissions mitigation implementation to determine the cumulative emissions associated with the permitting delay.

(2) If the unreasonable delay impacts only a portion of the reporting year or only a portion of the flaring emissions, determine the eligible emissions as specified in paragraph (b)(2)(i) or (ii) of this section, as applicable.

(i) If you have records to calculate the mass CH_4 emissions from the flare(s) used to flare the increased volume of gas from methane emissions mitigation implementation associated with the unreasonable delay in environmental permitting of gathering or transmission according to the applicable methods in subpart W of this chapter for the specific time period eligible for the exemption, you must calculate the methane emissions for the specific time period eligible for the exemption from each flare used to flare the increased volume of gas from methane emissions mitigation implementation associated with the unreasonable delay. If multiple flares are used to flare the increased volume of gas, sum the mass CH_4 emissions for each flare calculated according to this paragraph to determine the cumulative emissions associated with the permitting delay.

(ii) If you do not have records to calculate the mass CH_4 emissions for the exemption period according to paragraph (b)(2)(i) of this section, then calculate the emissions that occurred at the offshore facility or onshore well-pad caused by the unreasonable delay using Equation C-1 of this section.

$$E_{Delay,CH_4} = E_{MMFlare,CH_4} \times K_f \times X_f \tag{Eq. C-1}$$

Where:

$E_{Delay,CH4}$ = Annual CH_4 emissions associated with delay in permitting in the reporting year, mt CH_4.

$E_{MMFlare,CH4}$ = Annual CH_4 emissions from the flare(s) used to flare increased volume of gas from methane emissions mitigation implementation reported in subpart W of this chapter, mt CH_4.

K_f = Eligible timeframe adjustment factor to the CH_4 emissions flaring emissions for partial year exemption period. If you have records of the volume of gas flared from the impacted flare(s) during the exemption period, use the ratio of the volume of gas flared during the exemption period to the total annual volume of gas flared from the impacted flare(s) to determine K_f; otherwise, use the ratio of hours in the exemption period to the total annual hours in the reporting year (8760 or, for leap years, 8784) to determine K_f.

X_f = Fraction of the flared emissions reported in subpart W of this chapter that occurred from the flare(s) due to the unreasonable delay. This fraction can be estimated based on company records of flare emissions prior to the unreasonable delay or through engineering calculations of flare volumes related to other sources vented to the flare(s).

§ 99.33 What are the recordkeeping requirements for methane emissions caused by an unreasonable delay in environmental permitting of gathering or transmission infrastructure?

(a) For each communication the entity seeking the permit has had with the permitting authority regarding the permit application:

(1) The date and type of communication.

(2) The date of the facility's response to the communication.

(3) Information on whether the facility's response included modification to the permit application.

(b) Records of values used in the calculation of the emissions that occurred at the well-pad caused by the unreasonable delay.

Subpart D—Regulatory Compliance Exemption

§ 99.40 When does the regulatory compliance exemption come into effect, and under what conditions does the exemption cease to be in effect?

(a) The requirements of this subpart only apply to a WEC applicable facility when the total facility applicable emissions for that WEC applicable facility as calculated in accordance with § 99.21(a) exceed 0 mt CH_4.

(b) The requirements of § 99.41 shall only be in effect when each of the following conditions are met:

(1) A determination has been made by the Administrator that methane emissions standards and plans pursuant to subsections (b) and (d) of section 111 of the Act have been approved and are in effect in all States with respect to the applicable facilities; and

(2) A determination has been made by the Administrator that the emissions reductions achieved by compliance with the requirements described in paragraph (b)(1) of this section will result in equivalent or greater emissions reductions on a nationwide basis as would be achieved

by the proposed rule of the Administrator entitled ‘Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review’ (86 FR 63110; November 15, 2021), if such rule had been finalized and implemented.

(c) At such time that the conditions specified in paragraphs (b)(1) and (2) of this section are met, the reporting requirements of § 99.41 shall come into effect beginning with the WEC filing due on the date specified in § 99.5 in the calendar year following the calendar year in which the conditions were met. Imposition of the waste emission charge shall not be made on an applicable facility meeting the requirements for regulatory compliance exemption for methane emissions that occurred during the calendar year during which the conditions are met.

(d) If any of the conditions in paragraph (b)(1) or (2) of this section cease to apply after the Administrator has made the determinations in paragraph (b)(1) and (2) of this section, the reporting requirements of § 99.41 shall cease to be in effect beginning with the WEC filing due on the date specified in § 99.5 in the calendar year during which either of the conditions were no longer met.

§ 99.41 Which facilities qualify for the exemption for regulatory compliance?

(a) The total facility applicable emissions for the WEC applicable facility as calculated in accordance with § 99.21(a) or (d) must exceed 0 mt.

(b) The WEC applicable facility must contain one or more affected facilities or one or more designated facilities.

(c) At the WEC applicable facility, all affected facilities and all designated facilities located at this WEC applicable facility, must have no deviations or violations with the methane emissions requirements of part 60 of this chapter and the methane emissions requirements requirements of an applicable approved state, Tribal, or Federal plan in part 62 of this chapter, including all applicable emission standard, work practice, monitoring, reporting, and recordkeeping requirements.

§ 99.42 What are the reporting requirements for the exemption for regulatory compliance?

(a) A facility eligible for the regulatory compliance exemption that meets the criteria described in § 99.41 shall include information as described in paragraph (b) of this section. A facility that meets the criteria described in § 99.41(a) and (b) but is not eligible for the exemption because it does not meet the criteria in § 99.41(c) shall include information as described in paragraph (d) of this section. The regulatory compliance exemption information shall be submitted as described in § 99.7.

(b) A facility meeting the criteria in § 99.41 must report all of the information specified in paragraphs (b) of this section, as applicable.

(1) For each WEC applicable facility, an assertion that the facility meets all of the eligibility criteria in § 99.41.

(2) The ICIS-AIR ID (or Facility Registry Service (FRS) ID if the ICIS-AIR ID is not available) and EPA Registry ID from CEDRI associated with each affected facility and designated facility located at the WEC applicable facility.

(3) If a report, or reports, prepared and submitted in accordance with part 60 of this chapter, or an applicable approved state, Tribal, or Federal plan under part 62 of this chapter that implements the emission guidelines contained in part 60 of this chapter, cover the complete reporting year *(i.e.,* January 1 through December 31, inclusive), then submit as attachment(s) the applicable report(s).

(4) If a report, or reports, prepared and submitted in accordance with part 60 of this chapter, or an applicable approved state, Tribal, or Federal plan under part 62 of this chapter that implements the emission guidelines contained in part 60 of this chapter, does not cover the complete reporting year (*i.e.,* January 1 through December 31, inclusive), then submit as attachment(s) the applicable report(s).

(c) If, pursuant to paragraph (b)(4) of this section, you are unable to provide an annual report covering the entire reporting year at the time of the initial submittal specified in § 99.5, you must provide a revised WEC filing on or before such time that an annual report covering the entire reporting year is required to be submitted under the applicable requirements of part 60 of this chapter or an applicable approved state, Tribal, or Federal plan in part 62 of this chapter. This requirement also applies in the case where the initial WEC filing contains an annual report covering only a portion of the reporting year. On or before such time that an annual report is due under the applicable requirements of part 60 of this chapter or an applicable approved state, Tribal, or Federal plan in part 62 of this chapter for the portion of the reporting year for which a previously submitted report does not cover, you must provide a revised WEC filing including the subsequent annual report. The resubmission of the revised WEC filing shall be considered timely under this paragraph if it is made on or before the date that the annual report is due under the applicable requirements of part 60 of this chapter or an applicable approved state, Tribal, or Federal plan in part 62 of this chapter. In such cases where a newly available report indicates one or more deviations or violations from applicable methane emissions requirements that were not previously indicated in the WEC filing for the reporting year (*i.e.*, the WEC applicable facility would no longer qualify for the regulatory compliance exemption), a WEC applicable facility would no longer be subject the reporting requirements in § 99.42(b) and would become subject to the reporting requirements in § 99.42(d) in the revised WEC filing.

(d) If least one of the affected facilities subject to the requirements of part 60 of this chapter or designated facilities subject to the requirements of an applicable approved state, Tribal, or Federal plan in part 62 of this chapter that is contained within your WEC applicable facility has a deviation or violation from its applicable methane emissions requirements (i.e., does not meet the criteria in § 99.41(c)), provide a copy of one report, prepared and submitted in accordance with part 60 of this chapter, or an applicable approved state, Tribal, or Federal plan under part 62 of this chapter that implements the emission guidelines contained in part 60 of this chapter, that demonstrates that the affected facility or designated facility were not in compliance.

(e) A WEC applicable facility's eligibility for the regulatory compliance exemption pursuant to this subpart does not constitute a determination of compliance for part 60 of this chapter, or an applicable approved state, Tribal, or Federal plan under part 62 of this chapter that implements the emission guidelines contained in part 60 of this chapter, for any affected facility or designated facility present at the applicable facility.

(f) A WEC applicable facility's eligibility for the regulatory compliance exemption during a given reporting year does not preclude reassessment of applicable waste emissions charges for that applicable facility upon discovery by the Administrator or a delegated authority of any violation of the methane emissions requirements pursuant to part 60 of this chapter, or an applicable approved state, Tribal, or Federal plan under part 62 of this chapter that implements the emission guidelines contained in part 60 of this chapter, for the affected facilities or designated facilities present at the applicable facility.

Subpart E—Exemption for Permanently Shut-in and Plugged Wells

§ 99.50 Which facilities qualify for the exemption of emissions from permanently shut-in and plugged wells?

(a) The total facility applicable emissions for the WEC applicable facility containing permanently shut-in and plugged wells must exceed 0 mt as calculated in accordance with § 99.21(a).

(b) This exemption is applicable to WEC applicable facilities in the offshore petroleum and natural gas production or onshore petroleum and natural gas production industry segment as defined in § 99.2 that permanently shut-in and plugged well(s) during the reporting year. For the purposes of applying this exemption, a permanently shut-in and plugged well is one that has been permanently sealed, following all applicable local, state, or federal regulations in the jurisdiction where the well is located, to prevent any potential future leakage of oil, gas, or formation water into shallow sources of potable water, onto the surface, or into the atmosphere. Site reclamation following placement of a metal plate or cap is not required to be completed for the well to be considered permanently shut-in and plugged for the purposes of this part.

§ 99.51 What are the reporting requirements for the exemption for wells that were permanently shut-in and plugged?

(a) Report the following information for each well at a WEC applicable facility, in the offshore petroleum and natural gas production or onshore petroleum and natural gas production industry segment, that was permanently shut-in and plugged in the reporting year.

(1) Well identification (ID) number as reported in part 98, subpart W of this chapter.

(2) Date the well was permanently shut-in and plugged, which for the purposes of this exemption, is the date when welding or cementing of a metal plate or cap onto the casing end was completed.

(3) The statutory citation for each applicable state, local, and federal regulation stipulating requirements that were applicable to the closure of the permanently shut-in and plugged well.

(4) The equation used to calculate equipment leak emissions attributable to the well (*i.e.*, Equation E-2A or E-2B of this subpart).

(5) The emissions attributable to the well calculated using Equation E-1, E-3, or E-4 of this subpart, as applicable.

(b) The total quantity of methane emissions attributable to all wells that were permanently shut-in and plugged at a WEC applicable facility, in the offshore petroleum and natural gas production or onshore petroleum and natural gas production industry segment, during the reporting year, calculated using Equation E-5 of this subpart.

§ 99.52 How are the net emissions attributable to all wells at a WEC applicable facility that were permanently shut-in and plugged in the reporting year quantified?

(a) For the purposes of this section, the following source types (as specified in part 98, subpart W of this chapter) constitute emissions directly attributable to an offshore petroleum and natural gas production or onshore petroleum and natural gas production well:

(1) Wellhead equipment leaks.

(2) Liquids unloading.

(3) Workovers with hydraulic fracturing.

(4) Workovers without hydraulic fracturing.

(b) Calculate the annual emissions attributable to each well that was permanently shut-in and plugged during the reporting year and included in the submittal pursuant to § 99.51 using Equations E-1, E-3 or E-4 of this section, as applicable.

(1) For onshore petroleum and natural gas production wells that are part of a WEC applicable facility that are permanently shut-in and plugged in reporting years 2025 and later:

(i) Equation E-1 of this section must be used to quantify the methane emissions directly attributable to each permanently shut-in and plugged well.

$$E_{PW,CH_4} = E_{Leaks,CH_4} + E_{LU,CH_4} + E_{WwHF,CH_4} + E_{WwoHF,CH_4} \qquad \text{(Eq. E-1)}$$

Where:

$E_{PW,CH4}$ = The annual quantity of methane emissions directly attributable to an individual well that was permanently shut-in and plugged during the reporting year in accordance with all applicable closure requirements at a WEC applicable facility, mt CH_4.

$E_{Leaks,CH4}$ = The annual quantity of methane emissions attributable to the well from wellhead equipment leaks as calculated using Equation E-2A or E-2B of this section, as applicable, for the reporting year, mt CH_4.

$E_{LU,CH4}$ = The annual quantity of methane emissions attributable to the well from liquids unloading as reported pursuant to proposed § 98.236(f)(1)(x) or (f)(2)(viii) of this chapter, as applicable, for the reporting year, mt CH_4.

$E_{WwHF,CH4}$ = The quantity of methane emissions attributable to the well from workovers with hydraulic fracturing as reported pursuant to proposed § 98.236(g)(9) of this chapter for the reporting year, mt CH_4.

$E_{WwoHF,CH4}$ = The quantity of methane emissions attributable to the well from workovers without hydraulic fracturing and without flaring as reported pursuant to proposed § 98.236(h)(3)(iv) of this chapter for the reporting year, mt CH_4.

(ii) If equipment leak surveys were used to quantify methane emissions from the permanently shut-in and plugged well and reported pursuant to § 98.236(q) of this chapter in the part 98 report for a WEC applicable facility, Equation E-2A of this section must be used to calculate $E_{Leaks,CH4}$.

$$E_{Leaks,CH_4} = \sum_{p=1}^{N_p}\left(EF_p \times \sum_{z=1}^{x_p} T_{p,z}\right) \times M_{CH_4} \times k \times \rho_{CH_4} \times 10^{-3} \text{(Eq. E-2A)}$$

Where:

$E_{Leaks,CH4}$ = The annual quantity of methane emissions attributable to the well from wellhead equipment leaks as reported pursuant to § 98.236(q) of this chapter for the reporting year, mt CH_4.

p = Component type as specified in proposed § 98.233(q)(2)(iii) of this chapter.

N_p = The number of component types with detected leaks at the well.

EF_p = The leaker emission factor for component "p" as specified in proposed § 98.233(q)(2)(iii) of this chapter, scf whole gas/hour/component.

M_{CH4} = The mole fraction of CH_4 in produced gas for the sub-basin associated with the well, as reported pursuant to proposed § 98.236(aa)(1)(ii)(I), unitless.

x_p = The total number of specific components of type "p" detected as leaking at the permanently shut-in and plugged well in any leak survey during the year. A component found leaking in two or more surveys during the year is counted as one leaking component.

$T_{p,z}$ = The total time the surveyed component "z" of component type "p" was assumed to be leaking. If one leak detection survey is conducted in the calendar year, assume the component was leaking from the beginning of the reporting year until the date the well was plugged in accordance with § 99.51(a)(2), hours; assume a component found leaking in the last survey of the year was leaking from the preceding survey through the date the well was plugged in accordance with § 99.51(a)(2), hours; assume a component found leaking in a survey between the first and last surveys of the year was leaking since the preceding survey until the date the well was plugged in accordance with § 99.51(a)(2), hours; and sum times for all leaking periods. For each leaking component, account for time the component was not operational (*i.e.*, not operating under pressure) using an engineering estimate based on best available data.

k = The factor to adjust for undetected leaks by respective leak detection method, where k equals 1.25 for the methods in proposed § 98.234 (a)(1), (3) and (5) of this chapter; k equals 1.55 for the method in proposed § 98.234(a)(2)(i) of this chapter; and k equals 1.27 for the method in proposed § 98.234(a)(2)(ii) of this chapter. Select the factor for the leak detection method used for the permanently shut-in and plugged well, unitless.

ρ_{CH4} = Density of methane, 0.0192 mt/Mscf.

10^{-3} = Conversion factor from scf to Mscf.

(iii) If equipment leaks by population count were used to quantify methane emission from the permanently shut-in and plugged well and reported pursuant to § 98.236(r) of this chapter in the part 98 report for a WEC applicable facility, Equation E-2B of this section must be used to calculate $E_{Leaks,CH4.}$

$$E_{Leaks,CH_4} = EF_{wh} \times M_{CH_4} \times T \times \rho_{CH_4} \times 10^{-3} \qquad \text{(Eq. E-2B)}$$

Where:

$E_{Leaks,CH4}$ = The annual quantity of methane emissions attributable to the well from wellhead equipment leaks as reported pursuant to § 98.236(r) of this chapter for the reporting year, mt CH_4.

EF_{wh} = The population emission factor for wellheads, as listed in proposed Table W-1 of subpart W of part 98 of this chapter, scf whole gas/hour/wellhead.

M_{CH4} = The mole fraction of CH_4 in produced gas for the sub-basin associated with the well as reported pursuant to proposed § 98.236(aa)(1)(ii)(I) of this chapter, unitless.

T = The total time that has elapsed from the beginning of the reporting year until the date the well was plugged in accordance with § 99.51(a)(2), hours.

P_{CH4} = Density of methane, 0.0192 mt/Mscf.

10^{-3} = Conversion factor from scf to Mscf.

(2) For onshore petroleum and natural gas production wells that are part of a WEC applicable facility that are permanently shut-in and plugged in reporting year 2024, Equation E-3 of this section must be used to quantify the methane emissions attributable to the well:

$$E_{PW,CH_4} = (E_{LkQ,CH_4} + E_{LkR,CH_4} + E_{LU,CH_4} + E_{Ww,HF,CH_4} + E_{WwoHF,CH_4}) \times \frac{\left(\frac{Q_{ng,PW}}{6}\right) + Q_{oil,PW} + Q_{cond,PW}}{\left(\frac{Q_{ng,WAF}}{6}\right) + Q_{oil,WAF} + Q_{cond,WAF}} \quad \text{(Eq. E-3)}$$

Where:

$E_{PW,CH4}$ = The annual quantity of methane emissions attributable to an individual well that was permanently shut-in and plugged during the reporting year in accordance with all applicable closure requirements at a WEC applicable facility, mt CH_4.

E_{LkQ} = The WEC applicable facility total annual quantity of methane emissions from equipment leaks reported pursuant to proposed § 98.236(q)(2)(ix) of this chapter for the reporting year, mt CH_4.

E_{LkR} = The WEC applicable facility total annual quantity of methane emissions from equipment leaks reported pursuant to proposed § 98.236(r)(1)(vi) of this chapter for the reporting year, mt CH_4.

E_{LU} = The WEC applicable facility total annual quantity of methane emissions from liquids unloading as reported pursuant to proposed §§ 98.236(f)(1)(x) and (f)(2)(viii) of this chapter for the reporting year, mt CH_4.

E_{WwHF} = The WEC applicable facility total annual quantity of methane emissions from workovers with hydraulic fracturing as reported pursuant to proposed § 98.236(g)(9) of this chapter for the reporting year, mt CH_4.

E_{WwoHF} = The WEC applicable facility total annual quantity of methane emissions from workovers without hydraulic fracturing as reported pursuant to proposed § 98.236(h)(3)(iv) of this chapter for the reporting year, mt CH_4.

$Q_{ng,PW}$ = The total annual quantity of natural gas that is produced and sent to sale from the well in the reporting year, as reported pursuant to proposed § 98.236(aa)(1)(iii)(C) of this chapter, in thousand standard cubic feet.

6 = Conversion factor from thousand standard cubic feet of natural gas to barrel of oil equivalent.

$Q_{oil,PW}$ = The total quantity of crude oil that is produced and sent to sale from the well in the reporting year, as reported pursuant to proposed § 98.236(aa)(1)(iii)(D) of this chapter, in barrels.

$Q_{cond,PW}$ = The total quantity of condensate that is produced and sent to sale from the well in the reporting year, as reported pursuant to proposed § 98.236(aa)(1)(iii)(E) of this chapter, in barrels.

$Q_{ng,WAF}$ = The total quantity of natural gas that is produced and sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to proposed § 98.236(aa)(1)(i)(B) of this chapter, in thousand standard cubic feet.

$Q_{oil,WAF}$ = The total quantity of crude oil that is produced and sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to proposed § 98.236(aa)(1)(i)(C) of this chapter, in barrels.

$Q_{cond,WAF}$ = The total quantity of condensate that is produced and sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to proposed § 98.236(aa)(1)(i)(D) of this chapter, in barrels.

(3) For offshore petroleum and natural gas production wells that are part of a WEC applicable facility that are permanently shut-in and plugged in any reporting year, Equation E-4 of this section must be used to quantify the methane emissions attributable to the well.

$$E_{PW,CH_4} = (E_{Leaks,CH_4}) \times \frac{\left(\frac{Q_{ng,PW}}{6}\right) + Q_{oil,PW} + Q_{cond,PW}}{\left(\frac{Q_{ng,WAF}}{6}\right) + Q_{oil,WAF} + Q_{cond,WAF}} \quad \text{(Eq. E-4)}$$

Where:

$E_{PW,CH4}$ = The annual quantity of methane emissions attributable to an individual well that was permanently shut-in and plugged during the reporting year in accordance with all applicable closure requirements at a WEC applicable facility, mt CH_4.

$E_{Leaks,CH4}$ = The WEC applicable facility total annual quantity of methane emissions from non-compressor component level fugitives (*i.e.*, equipment leaks) reported pursuant to proposed § 98.236(s)(3)(ii) of this chapter for the reporting year, mt CH_4.

$Q_{ng,PW}$ = The total annual quantity of natural gas that is produced and sent to sale from the well in the reporting year as reported pursuant to proposed § 98.236(aa)(2)(iv) of this chapter, in thousand scf.

6 = Conversion factor from thousand standard cubic feet of natural gas to barrel of oil equivalent.

$Q_{oil,PW}$ = The total quantity of crude oil that is produced and sent to sale from the well in the reporting year, as reported pursuant to proposed § 98.236(aa)(2)(v) of this chapter, in barrels.

$Q_{cond,PW}$ = The total quantity of condensate that is produced and sent to sale from the well in the reporting year, as reported pursuant to proposed § 98.236(aa)(2)(vi) of this chapter, in barrels.

$Q_{ng,WAF}$ = The total quantity of natural gas that is produced and sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to proposed § 98.236(aa)(2)(i) of this chapter, in thousand scf.

$Q_{oil,WAF}$ = The total quantity of crude oil that is produced and sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to proposed § 98.236(aa)(2)(ii) of this chapter, in barrels.

$Q_{cond,WAF}$ = The total quantity of condensate that is produced and sent to sale from the WEC applicable facility in the reporting year, as reported pursuant to proposed § 98.236(aa)(2)(iii) of this chapter, in barrels.

(c) Calculate the total emissions attributable to all wells included in the submittal received pursuant to § 99.51 using Equation E-5 of this section:

$$E_{Plug,CH_4} = \sum_{j=1}^{N} E_{PW,CH_4} \text{(Eq. E-5)}$$

$E_{Plug,CH4}$ = The total quantity of annual methane emissions, as determined in subpart E of this part, at the WEC applicable facility in the onshore petroleum and natural gas production and offshore petroleum and natural gas production industry segments, attributable to all wells that were permanently shut-in and plugged during the reporting year in accordance with all applicable closure requirements, mt CH_4.

$E_{PW,CH4}$ = The annual quantity of methane emissions attributable to a well “j” that was permanently shut-in and plugged during the reporting year in accordance with all applicable closure requirements at a WEC applicable facility calculated using Equation E-1, E-3, or E-4 of this section, as applicable.

N = Total number of wells that were permanently shut-in and plugged during the reporting year in accordance with all applicable closure requirements at a WEC applicable facility.

Subject: Join Request: Challenge to Clean Air Act Section 111(d) State Implementation Plan Regulations (Joins Due: Tuesday, January 16 at noon (Eastern))

All,

Oklahoma and West Virginia invite you to join our challenge to a final rule that EPA recently promulgated changing the procedures under which States submit state implementation plans as mandated by Section 111(d) of the Clean Air Act. To meet a statutory deadline, we're asking for joins no later than **Tuesday, January 16, at noon Eastern**.

The issue sounds like a mouthful, but it's actually rather straightforward. Under Section 111(d), States must submit plans to EPA that provide for the establishment, implementation, and enforcement of standards of performance for existing emission sources, like power plants. A recently finalized rule (attached) gives States much less discretion in figuring out how these existing sources can comply. It also gives States significantly less time to comply. The comment and the attached circulation from last year lay that out in further detail.

West Virginia led comments on the proposed rule (also attached), which many of you joined. We expect our challenge will raise many of the same issues. Among other things, the rule's attempt to unduly narrow state discretion is inconsistent with the statute's express provisions. The rule also creates a state plan call process that the statute doesn't contemplate, either. And the timing provisions are arbitrary and inappropriate. We'll be making these arguments before the D.C. Circuit, as the CAA requires challenges like these to be made there.

Industry is very concerned about this rule. We've heard from some of them directly, and I understand some of you all have, too. That said, the States are in the best position to challenge the rule because it directly regulates us. So we see substantial reason to jump in. (For those involved in challenging the recent ozone SIP/FIP determinations, this process of squeezing the State on the front end to grease the skids for EPA to act on the back end should feel familiar.) The rule is also directly tied to the recently promulgated EPA methane rules and anticipated "Clean Power Plan 2.0" greenhouse gas rules.

If you'd like to join, **please email me with your join and a signature block for the petition for review**. We'll plan to circulate a draft petition for review over the next couple days. (As you know, that filing is a non-substantive, one-page document.)

As always, just reach out if you have any questions or concerns. And thank you for considering it.

Michael

Submitted Electronically via Regulations.gov

Re: Comments on the Proposed Rulemaking Titled "Adoption and Submittal of State Plans for Designated Facilities: Implementing Regulations Under Clean Air Act Section 111(d)" by the Attorneys General of the State of West Virginia, Alabama, Alaska, Arkansas, Georgia, Idaho, Indiana, Iowa, Kentucky, Louisiana, Mississippi, Missouri, Montana, Nebraska, North Dakota, Ohio, Oklahoma, South Carolina, Texas, Utah, Virginia, and Wyoming (Docket No. EPA-HQ-OAR-2021-0527)

Dear Administrator Regan:

The undersigned States appreciate the opportunity to comment on EPA's proposed revisions to the implementation regulations for state plans under Section 111(d) of the Clean Air Act. *See* 87 Fed. Reg. 79,176 (Dec. 23, 2022) ("Proposed Rule"). We are strongly committed to responsible and efficient state regulation as part of the CAA's cooperative-federalism framework. We also understand the agency's duty to respond to the D.C. Circuit's decision concerning EPA's last rule in this area. But we have four areas of concern with the Proposed Rule that we urge the agency to consider further.

First, like EPA's recent supplemental proposal on methane emissions, the Proposed Rule suggests timelines inadequate for States to effectively develop and submit their plans to EPA. *See* "Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review," 87 Fed. Reg. 74,702 (Dec. 6, 2022) ("Supplemental Proposal"). *Second*, the Proposed Rule assumes a new power to issue state plan calls that the text of Section 111(d) does not support. *Third*, the Proposed Rule encroaches on local-level discretion—on the one hand, adding onerous requirements the statute does not contemplate for States wishing to exercise their congressionally conferred discretion over source-specific factors, and on the other, dictating new extra-statutory factors that EPA wishes the States would take into account. *Fourth*, the Proposed Rule's limited promise of compliance flexibility could be an impermissible step towards the sort of outside-the-fenceline measures that Section 111(d) does *not* permit EPA to use as the basis for emission guidelines.

We respectfully urge EPA to reconsider the Proposed Rule and restore needed time and state discretion to the important process of developing Section 111(d) implementation plans.

BACKGROUND

Section 111 of the Clean Air Act creates a partnership between EPA and the States for establishing emission standards for stationary sources of air pollution. 42 U.S.C. § 7411. The CAA assigns EPA the main regulatory role in specifying standards for new and modified sources, but Section 111(d) adopts a cooperative-federalism approach for existing sources. Specifically, it requires EPA to "establish a procedure similar to that provided by [Section 110]" for States to submit plans that "establish[] standards of performance" for covered existing sources in their borders. *Id.* § 7411(d)(1). The standards of performance the States set, in turn, must "reflect[] the degree of emission limitation achievable through the application of the best system of emission reduction" that EPA "determines has been adequately demonstrated." *Id.* § 7411(a)(1). So while EPA promulgates emission guidelines based on its assessment of adequately demonstrated technology for source categories, it is up to the States to set requirements for specific sources and submit those plans to EPA under the process the agency sets out.

EPA respected this cooperative-federalism approach for several decades until it enacted the ultimately ill-fated Clean Power Plan rule. 80 Fed. Reg. 64,662 (Oct. 23, 2015). As the Supreme Court confirmed last Term, Congress did not give the agency power under Section 111(d) to effectively force a sector-wide shift in electricity production. *See West Virginia v. EPA*, 142 S. Ct. 2587, 2593 (2022).

In 2019, the agency tried a course correction when it replaced the Clean Power Plan rule with the Affordable Clean Energy rule ("ACE"). 84 Fed. Reg. 32,520 (July 8, 2019). Though the majority of litigation over that rule focused on EPA's emission-guideline-setting authority, part of the lower-court proceedings concerned the ACE rule's implementing regulations for Section 111(d). *Id.* at 32,575-84. That aspect of the rule gave States 36 months to develop and submit their plans for emission reduction and two years to demonstrate compliance progress. *See* 40 C.F.R. §§ 60.23a(a)(1), 60.27a(c). This homeostasis was short-lived, however, as the D.C. Circuit vacated the provisions relating to these timelines and other implementation details. *Am. Lung Ass'n v. EPA*, 985 F.3d 914 (D.C. Cir. 2021) ("*ALA*"). The court reasoned that EPA failed to meaningfully address why shorter deadlines were unworkable. *Id.* at 992. It also concluded that, despite EPA's statutory duty to use "similar" procedures under Sections 110 and 111(d), EPA could not graft Section 110 deadlines onto Section 111 without comparing the relative scale of effort in developing and evaluating plans under those sections. *Id.* at 992-93.

The Proposed Rule revisits Section 111(d)'s implementing regulations in response to the D.C. Circuit's decision. But once more, EPA does not meaningfully address why it chose the now *much* shorter deadlines for state plans. Nor does it appropriately reconcile them with other deadlines in the same statute. Additionally, EPA suggests "clarifying" requirements for States' consideration of certain discretionary factors, but the proposal sharply circumscribes the discretion Congress entrusted to the States and replaces it with extra-statutory factors of EPA's choosing.

DISCUSSION

The Proposed Rule does not respect the time States need to develop responsible, complex plans under Section 111(d), nor honor the discretion this portion of the CAA gives the States as EPA's regulatory partners. Though Section 111(d) requires EPA to "prescribe regulations … similar" to Section 110, EPA treats "similar" less as a default in favor of applying the same standards and more as a guideline that adjusts significantly depending on the provision. When dispensing with Section 110's 36-month timeline in favor of a new 15-month one, for instance, the Proposed Rule adjusts the dial too far with too cursory of an explanation. But elsewhere, when it seeks to implement regulatory mechanisms it has never before applied to Section 111(d), EPA adjusts the dial too far the other direction by importing those aspects of Section 110—again, without adequately justifying the change.

And this incongruence with Section 110 isn't the Proposed Rule's only problem lining up with the statutory text. It also effectively sidelines the States. States won't be able to meet the deadlines, especially now that EPA proposes saddling them with new and costly requirements simply for using their discretion—set out in the statute—to apply standards to a specific facility that deviate from EPA's category-wide assessments. And while claiming that parts of the Proposed Rule provide more flexibility to the States, we are concerned that EPA is improperly expanding its power to reject States' plans that don't conform to the agency's policy preferences.

I. States Will Be Unable To Meet EPA's Proposed Timelines.

Most of the Proposed Rule focuses on shortening the timeframe for submitting and enforcing state implementation plans after the D.C. Circuit vacated EPA's prior 36-month submission rule. 87 Fed. Reg. at 79,181-92. But EPA has overcorrected—its proposed 15-month timeline, *id.* at 79,182, does not provide enough room for States to develop appropriate plans.

The stark difference between the 36 months that States have to submit plans under Section 110 and the 15 months that EPA proposes here is the giveaway that something is amiss. Section 111(d) directs EPA to "prescribe regulations which shall establish a procedure similar to" the State-submission procedure set out in Section 110. 42 U.S.C. § 7411(d). EPA acknowledges that the "[proposed Section 111(d)] deadlines are not identical to those for SIPs under CAA section 110," and reasons that "similar" does not mean "identical." 87 Fed. Reg. at 79,182. But that acknowledgment is not an explanation why EPA thinks this approach is needed, much less how so significant a change stays faithful to the statutory text. Two procedures can hardly be called "similar" when one rushes a complex process through in less than half the time of the other. *See, e.g., Duckworth v. Allianz Life Ins. Co. of N. Am.*, 706 F.3d 1338, 1343 (11th Cir. 2013) (providing various definitions of "similar" that reflect a close and corresponding identity between two things).

Yes, the D.C. Circuit struck down the ACE rule because EPA failed to adequately explore the differences between Sections 110 and 111(d) plans and why they might justify different timelines. *ALA*, 985 F.3d at 994-96. But that doesn't mean EPA gets to start from a blank slate when it comes to how much time is enough: Section 111(d) still requires "similar[ity]" to Section 110's process, and the *statute* sets 36 months as the default. 42 U.S.C. §§ 7410(a)(1), 7411(d). Yet EPA seems to take *ALA* as an instruction to decouple the statutes entirely—and misses even *ALA*'s key point on this issue. Any timeline that EPA chooses needs to balance the harms to the public from exposure to pollutants while allowing States sufficient time to develop appropriately complex plans. *ALA*, 985 F.3d at 994-96. The Proposed Rule does not parse the differences in these statutory schemes beyond a few normative descriptions.

Walking through the Proposed Rule's analysis, EPA apparently settled on 15 months by rough comparisons to other sections of the CAA and its implementing regulations. Jumping right to other parts of the statute instead of starting with Section 110's three-year baseline is questionable as a matter of statutory interpretation. EPA should specifically explain why it is justified in setting a "shorter period." 42 U.S.C. § 7410(a)(1). In other words, Congress intentionally started with a longer period, recognizing the complexity of the task that States must undertake, so EPA must at least explain why Congress's reasoned judgment should supposedly be set aside here. *See, e.g.*, *New York v. EPA*, 964 F.3d 1214, 1228 (D.C. Cir. 2020) (Griffith, J., concurring) (noting that Section 110 "affords three years for states to craft implementation plans" and contrasting this timeframe with "divergent timelines" found in other parts of the CAA).

We have concerns with some of the conclusions EPA draws from those other parts of the statute, too.

EPA starts first with Subpart B, which gives States a nine-month timeframe to submit plans after publication of a final emission guideline. We have no quarrel with the rationale that this period would not be enough for most States to submit Section 111(d) plans: EPA correctly notes that most States either failed to submit plans or were substantially late in submitting them on that schedule. 87 Fed. Reg. at 79,183. So too for EPA's Section 129 discussion. *Id.* EPA justifies relying on Section 129 because it references Section 111(d) "in many instances, creating considerable overlap in the functionality of the programs." *Id.* EPA also fairly recognizes that Section 129's 12-month timeline is inappropriate because Section 111(d) "permits states to take into account remaining useful life and other factors," which "could involve more complicated analyses." *Id.* But beyond that, we also observe that the narrower scope of Section 129—governing only waste-incineration units—means those implementation plans should be generally simpler and easier to develop than the broader plans that will be required under Section 111(d). All together, these factors suggest that the implementation deadlines under Section 111(d) should be substantially longer than the deadlines under Subpart B.

The real problems start, though, when EPA considers Section 189 and its 18-month timeframe—the Proposed Rule subjectively judges that Section 189 plan requirements are more complex than those required under Section 111(d). 87 Fed. Reg. at 79,183. So the Proposed Rule treats its 15-month solution as a Goldilocks-like approach: 9 and 12 months are too short, 18 months is too long, so 15 months is just right. But this is not a "just right" situation.

For one thing, we do not agree that Section 189 plans are necessarily more complex than Section 111(d) plans. The latter requires States to make allowances for remaining useful life and other factors that the former does not. Even if we were to agree with EPA's premise that these factors are to be *applied* in only "limited" circumstances (and we do not), States are still required to conduct initial assessments to determine when, exactly, those "limited" circumstances might arise. *Id.* And beyond conclusory statements, EPA has not explained why it thinks Section 189 plans are so uniquely complex that other plans can be assumed to require less time.

For another thing, as we noted before, EPA's strategy takes the time that Congress set as the default (36 months) out of its balancing altogether. This approach is particularly concerning because, according to EPA's report of its own experience, the States regularly need closer to three years than 15 months to promulgate sufficient Section 111(d) plans. 84 Fed. Reg. at 32,568. And even assuming that EPA is right to move *somewhat* below three years, giving *under half* that time goes too far in light of the complexity of the States' task, which will only get harder with the additional information EPA plans to require under the new rule.

EPA also fails to consider the significant compliance issues facing the States. Notably, EPA cuts away the States' compliance period even though it does not propose shortening its *own* evaluation time, which suggests that nothing has changed about the complexity of these plans and the time needed to assess them. The fact that CAA emission regulations have been in limbo for quite a while also supports giving States more time, not less, to adapt to the new legal environment. The Proposed Rule acknowledges that there may be significant variability in how States set implementation plans, but then breezily concludes, "15 months should adequately accommodate the differences in state processes necessary for the development of a state plan that meets applicable requirements." 87 Fed. Reg. at 79,183. The Proposed Rule does not explain how EPA reconciled the state variability it acknowledged with the much shorter and nationally applicable timeline it chose. The Proposed Rule also does not acknowledge that EPA is employing its regulatory authority under Section 111(d) on multiple fronts as of late—see the recent efforts on methane—which will expand the number of sources covered and state plans needed. The States will thus likely need to develop multiple complex plans at the same time. This calls for more time, too. And EPA does not appear to have considered State-specific processes—beyond a brief footnote acknowledgement—that require significantly more time than EPA has provided here. For instance, the West Virginia Legislature must approve legislative rules, and it meets only for a few weeks each year. Meeting a fifteen-month timeframe would be next to impossible if the clock begins ticking a few months before an annual legislative session: There would not be enough time to rush a plan before it begins, and 15 months would expire before the next one. And West Virginia is not alone. Texas's legislature, for example, meets for six months every *other* year.

Nor does EPA consider how additional sections in the Proposed Rule render its proposed timeline even more divorced from reality. As explained more below, the Proposed Rule encourages States to set compliance goals and use sources outside the fenceline. 87 Fed. Reg. at 79,207. Setting aside any other concerns with that portion of the Proposed Rule, that undertaking will take more time because it requires the States to consider several additional avenues of emission reduction beyond traditional inside-the-fenceline measures. Also as discussed more below, the Proposed Rule would require extensive justification before States can take remaining useful life and other factors into account in their plans. This, of course, means additional work, too, and in less than half the time from EPA's last rule. EPA notes that the Proposed Rule limits the temporal reach of remaining useful life and other factors, which in its view supports a shorter timeframe for Section 111(d) plans. *Id.* at 79,183. But relying on time saved from improperly pruning the States' statutory discretion, *see infra* Part III, only turns one error into two.

Throughout the Proposed Rule, EPA also makes plan approval contingent on States' "meaningful engagement" with pertinent stakeholders—those most affected by and vulnerable to pollution's health or environmental effects. 87 Fed. Reg. at 79,203. In the first place, the statute does not set this task before the States or give EPA power to reject a plan if States choose not to take it up. EPA claims its authority is derived from both CAA Sections 111(d) and 301(a)(1), *id.* at 79,191, but we do not see in either of those sections support for the idea that EPA can dictate States' day-to-day administrative processes in this way. Even putting that concern to the side, if EPA will compel engagement with affected stakeholders, then it should allow more time—not less—to do so. And if engagement is needed, then the agency should not arbitrarily limit it to those stakeholders EPA thinks count the most. True engagement would also reach those who are affected economically by new restrictions and plan requirements. *See* State Plans for the Control of Certain Pollutants From Existing Facilities, 40 Fed. Reg. 53,340, 53,343 (Nov. 17, 1975) ("States will also have authority to grant variances in cases of economic hardship."). So even assuming EPA can implement these new requirements, the Proposed Rule does not explain how it can pile them on while shortening the timeline for completing them.

Lastly, a fair timeframe to account for all the relevant factors gives space for cooperation between the States and EPA to hash out disagreements or specific policies collaboratively, in the spirit of the CAA. This point proves crucial. We are deeply concerned that shortened timeframes may be an unlawful effort on EPA's part to seize more control over Section 111(d) implementation. According to EPA, even when a State submits a timely proposed implementation plan, the agency will treat the State as having submitted no plan at all if EPA later determines that the plan is incomplete. 87 Fed. Reg. at 79,185. And if by that point the initial 15-month period has run, EPA will assume immediate "authority to provide a Federal plan," *id*, even before the agency has made a formal finding of failure to submit, *id.* at 79,190. So in this scenario, even though the State has acted in good faith to comply with its Section 111(d) obligations, EPA will nevertheless afford that State no opportunity to correct the perceived deficiencies before invoking the statute's federal failsafe. *Id.* Shortened timeframes make this scenario far more likely. So given that EPA will give itself two months to make a completeness determination, *id.* at 79,182, the only way a State could try to assure itself an opportunity to supplement a plan EPA deems incomplete is to submit it at least two months before the already truncated 15-month deadline. And "at least" is doing considerable work: Even that rush on the State's part is no guarantee if EPA refuses to allow additional time to correct any perceived deficiencies, as the Proposed Rule seems to suggest. *Id.* at 79,185. This process hardly reflects the State-centric approach that Congress intended under Section 111(d). *See* 40 Fed. Reg. at 53,343 (explaining that "States will have primary responsibility for developing and enforcing control plans under section 111(d)").

II. EPA Has No Authority To Issue State Plan Calls Under Section 111(d).

We also urge EPA to reconsider its proposal to implement a state-plan-call process similar to that set out in Section 110(k)(5). EPA intends to provide that a failure to submit a revised plan in response to such a call constitutes a failure to submit a plan under Section 111(d)(2). 87 Fed. Reg. at 79,194-95. EPA has no authority to create such a process.

EPA apparently believes that Section 111(d) lets it import the substantive plan-revision requirements from Section 110(k) into its Section 111 regulations. In other words, despite dismissing Section 110(a)'s relevance to appropriate timelines, EPA strictly hews to other parts of Section 110 to justify adopting new state plan calls and other regulatory mechanisms in the Proposed Rule. But Section 111(d) does not support that approach. It directs EPA to "prescribe regulations under which States shall establish a *procedure* similar to that provided by section 7410 of this title under which each State shall *submit* to the Administrator a plan." 42 U.S.C. § 7411(d)(1) (emphases added). Regulations about how States submit their plans to EPA are materially different from regulations about how EPA may judge that plan potentially years later. *See* 87 Fed. Reg. at 79,195 (describing changed "legal or technical conditions" and inadequate "implementation" as justifications for a state plan call, both of which could arise long after EPA approves an initial plan). So while EPA must look to Section 110's *state submission* procedures—found in subsection (a)—it does not have authority to co-opt Section 110's "state plan call" provisions from subsection (k). Subsection (k) is a separate provision addressed to EPA's duties, not the State's.

Section 111(d)(2) further confirms this reading because it sets out Section-specific enforcement powers for EPA: It empowers EPA to act when a State "fails to submit a satisfactory plan" or "fails to enforce" plan provisions. 42 U.S.C. § 7411(d)(2)(A)-(B). This same provision references Section 110(c), but not all of Section 110. *Id.* It does not mention Section 110(k) at all, which sets out *different* enforcement and "error correction" powers relevant to Section 110. So EPA's enforcement power is limited to what Congress gave it in Section 111(d). It cannot claim power to assume federal oversight when a State successfully submits one satisfactory plan but then fails to submit a *second* satisfactory plan at EPA's later insistence. Given the lack of legal authority (and the lack of clear standards for when this power would be invoked), these provisions should also be removed from the Proposed Rule.

III. The Proposed Rule Invades States' Statutorily Guaranteed Discretion.

Similar to EPA's related proposals in other CAA contexts, the Proposed Rule also improperly tries to "push States into abandoning their local-level discretion" by erecting significant roadblocks for any States that seek to exercise it. *See* State of W. Va., et al., Comment Letter on Supplemental Notice of Proposed Rule Establishing New Standards of Performance for New and Modified Sources of Methane In the Oil and Natural Gas Sector 6 (Feb. 13, 2023), http://bit.ly/3XK1kb8.

In Section 111(d), Congress expressly reserved States' right to depart from EPA guidelines for particular existing sources based on their assessment of, "among other factors, the remaining useful life of the existing source." 42 U.S.C. § 7411(d). EPA traditionally interpreted this prerogative to apply in three scenarios: (1) when the cost from plant age, location, or process design is unreasonable; (2) when there is a "physical impossibility of installing [the] necessary control equipment"; and (3) when other factors make a less stringent standard "significantly more reasonable." 87 Fed. Reg. at 79,196.

The Proposed Rule says that it seeks to "clarify" this portion of Section 111(d). 87 Fed. Reg. at 79,199. But when EPA says "clarify," it actually means "restrict." *Id.* EPA wants to revise the third criterion so that it will not approve a State's decision to hold a facility to a standard less stringent than EPA prefers unless the State demonstrates the source's circumstances are "fundamentally different from the information [EPA] considered in the determination of the [best system of emission reduction]." *Id.* States striving to meet this degree of stringency will be saddled with new and unjustified obligations. The Proposed Rule requires States to detail contingencies, restrictive cost considerations, and impacted-communities analyses simply to invoke their statutory ability to factor remaining useful life and other source-specific considerations into their plans. *Id.* at 79,200-01. It is difficult to understand this new requirement other than an attempt to narrow the "range of permissible choices to the States" and to shoehorn States into complying with EPA's category-wide choices for almost every individual source. *Wis. Dep't of Health & Fam. Servs. v. Blumer*, 534 U.S. 473, 495 (2002).

We see no basis in the statute for EPA to restrict the States' congressionally conferred authority in this way. The agency proposes requiring States to go through a new and specific form of analysis that is nowhere to be found in the CAA, 87 Fed. Reg. at 79,200-01, and without accounting for the new costs these requirements will add for States that seek to depart from category-wide standards—as the statute contemplates they may. Worse still, EPA intends to *entirely foreclose* States from considering factors like remaining useful life when a plant's retirement date falls outside a prescribed range. *Id.* at 79,201. The CAA puts no bright-line limits like these on the States' discretion. And though we acknowledge that States must exercise reasonable judgment in this analysis, their judgment is not unreasonable merely because they consider source-specific factors different than EPA might.

Notably, EPA justifies its approach as a way to "fix" the current scheme, which it complains could lead to two States considering "two identically situated designated facilities and apply[ing] completely different standards of performance." 87 Fed. Reg. at 79,197. But that hypothetical difference is a quarrel with the statute. Congress invited this State-by-State variation, recognizing that States may view the collective effects of cost, structure, or other source-specific factors differently. These different views may derive, for instance, from the different composition of a particular State's energy portfolio—and may lead to equally good air quality across the board. In any event, EPA cannot justify a move toward a uniform-standard approach Congress did *not* put down in the Code based on perceived problems flowing from the cooperative-federalism regime that it *did*.

Lastly, EPA proposes to transform a provision giving States discretion to consider various factors into one that empowers the agency to require States to consider factors of EPA's own choosing. *See* 87 Fed. Reg. at 79,203 ("EPA interprets this [statutory provision] as providing discretion for the EPA to identify the appropriate factors and conditions under which the circumstance may be reasonably invoked in establishing a [less stringent] standard …."). This reads Section 111(d) backwards. The provision requires EPA to make space for the *States'* discretion ("the Administrator … shall permit the State … to take into consideration"), and contemplates that the States will decide what factors may be relevant ("among other factors"). 42 U.S.C. § 7411(d). This State-focused language gives EPA no power to force States to consider "other factors" EPA deems relevant, like "health and environmental impacts." 87 Fed. Reg. at 79,203. And even if it did, EPA would still at least need to explain why it elevated these considerations above all others, such as the economic effects on surrounding communities.

Section 111(d)'s focus on remaining useful life and other source-specific factors protects the States' role in setting standards for the existing sources in their borders. It does not greenlight an EPA-created checklist for the States to show their work or to do other work at EPA's behest.

IV. EPA Promises States Flexibility But Looks To Be Trying To Back-Door Power For Itself.

Finally, we do not object to the limited areas where the Proposed Rule promises States additional compliance flexibility. But we are concerned that this flexibility arises *only* in the context of allowing trading or averaging to meet performance standards in the aggregate. *See* 87 Fed. Reg. at 79,208 (explaining that EPA will approve state plans that use trading or averaging because "[s]uch flexibility is consistent with the framework of cooperative federalism that CAA section 111(d) establishes"). This portion of the Proposed Rule involves the same measures that the Supreme Court made clear last Term that EPA could not designate directly as a best system of emission reduction. We urge the agency not to use this lone concession to state discretion as an indirect way to reach a similar end.

With how many other provisions in the Proposed Rule cut against state discretion, the agency's ready welcome for state creativity when it comes to trading-based state plans caught our eye. We are concerned that the agency may be laying an inappropriate groundwork for "encouraging" States to adopt measures EPA cannot require outright. For one thing, the Proposed Rule states that while EPA is not addressing the type of "system" the statute allows in this rulemaking, it "may address further those limits … in future emission guidelines." 87 Fed. Reg. at 79,208. Yet the Supreme Court invalidated the agency's prior generation-shifting approach, explaining that the term "system" does not provide the "clear congressional authorization" needed to support EPA guidelines "of such magnitude and consequence." *West Virginia*, 142 S. Ct. at 2614-16. While we trust that EPA will abide by the Supreme Court's direction, this language suggests to us that the agency may still be eager to push those limits.

So we also caution against letting any state discretion to implement trading programs as a compliance mechanism become an additional checkpoint when EPA approves state plans. Whatever options States have under Section 111 to consider state-wide averaging, EPA cannot require States to adopt them. The statute would not let EPA require a State to consider these measures, for instance, or to ask why a State did *not* pursue a trading-based route if it submits a traditional technology-and-processes-based plan instead. Whether a State *could have* adopted trading would also be an inappropriate basis for rejecting a State's decision to set a particular performance standard for a given source. Put directly, if a State explains why remaining useful life and similar considerations support deviating from EPA's category-wide guidelines, EPA could not set aside that judgment because it believes the State should have required trading or similar measures to make up the difference.

In the end, the Proposed Rule is about implementation processes for States to submit plans under Section 111(d). These procedural tools cannot allow EPA to backdoor different or more stringent standards in accordance with its policy preferences. *See Texas v. EPA*, 829 F.3d 405, 411 (5th Cir. 2016) ("The statute mandates that the EPA administrator *shall* approve such a state implementation plan as a whole if it meets all the applicable requirements of this chapter" (cleaned up) (emphasis in original)). Especially given that this issue arises in the same context where the Supreme Court has spoken to EPA's limits, we will be watching if the agency takes what the Proposed Rule packages as increased state discretion and uses it to limit the States' actual range of options at the plan-approval stage.

***

We urge EPA to reevaluate the Proposed Rule along these lines and to finalize implementation guidelines that provide adequate time for developing state plans, that stay within Section 111(d)'s bounds, and that respect—not cabin—the discretion Congress safeguarded for the States in this important context. We appreciate the opportunity to provide comments in this rulemaking and are happy to discuss further with the agency as helpful.

Sincerely,

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 60

[EPA–HQ–OAR–2021–0527; FRL–8606–01–OAR]

RIN 2060–AV48

Adoption and Submittal of State Plans for Designated Facilities: Implementing Regulations Under Clean Air Act Section 111(d)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is finalizing amendments to the regulations that govern the processes and timelines for state and Federal plans to implement emission guidelines under Clean Air Act (CAA) New Source Performance Standards for existing sources (the ''implementing regulations''). The amendments include revisions to the timing requirements for state and the EPA actions related to plans; the addition of mechanisms to improve flexibility and efficiency in plan processes; and new requirements for demonstration of timely meaningful engagement with pertinent stakeholders—including, but not limited to, industry, small businesses, and communities most affected by and vulnerable to the impacts of the plan. This action additionally provides a process for states' consideration of 'remaining useful life and other factors' (RULOF) in applying a standard of performance; amends the definition of standard of performance in the implementing regulations; and clarifies compliance flexibilities that states may choose to incorporate into state plans, including trading or averaging. Finally, this action adds requirements for the electronic submission of state plans and provides several other clarifications and minor revisions to the implementing regulations.

DATES: This final rule is effective on December 18, 2023.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2021–0527. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov/.*

FOR FURTHER INFORMATION CONTACT: For questions about this action contact Dr. Michelle Bergin, Sector Policies and Programs Division (Mail Code D205–01), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, 109 T.W. Alexander Drive, P.O. Box 12055, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–2726; email address: *bergin.michelle@epa.gov.*

SUPPLEMENTARY INFORMATION: *Preamble acronyms and abbreviations.* We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

ACE	Affordable Clean Energy Rule
ALA	American Lung Association
BSER	Best System of Emission Reduction
CAA	Clean Air Act
CBI	confidential business information
CDX	Central Data Exchange
CFR	Code of Federal Regulations
EG	Emission Guideline
EGU	electric generating unit
EJ	environmental justice
EPA	Environmental Protection Agency
FIP	Federal Implementation Plan
ICR	Information Collection Request
IoP	Increments of Progress
NAAQS	National Ambient Air Quality Standards
OAQPS	Office of Air Quality Planning and Standards
OMB	Office of Management and Budget
PRA	Paperwork Reduction Act
$PM_{2.5}$	fine particulate matter (2.5 microns and less)
RTC	Response to Comments document
RFA	Regulatory Flexibility Act
RIN	Regulatory Information Number
RULOF	remaining useful life and other factors
SIP	State Implementation Plan
SpeCS	State Planning Electronic Collaboration System
TAR	Tribal Authority Rule
TAS	Treatment as a State
TIP	Tribal Implementation Plan
UMRA	Unfunded Mandates Reform Act
U.S.C.	United States Code

Organization of this document. The information in this preamble is organized as follows:

I. General Information

A. Does this action apply to me?

This action applies for the development and adoption of plans for implementation of CAA section 111(d) final emission guidelines (EGs) published in the **Federal Register** after July 8, 2019. In particular, this action applies to states in the development and submittal of state plans and to the EPA in processing state plan submissions and to the EPA in promulgating Federal plans. After the EPA promulgates a final EG, each state that has one or more designated facilities must develop, adopt, and submit to the EPA a state plan under CAA section 111(d). The term ''designated facility'' means ''any existing facility . . . which emits a designated pollutant and which would be subject to a standard of performance for that pollutant if the existing facility were an affected facility [*i.e.,* a new source].'' *See* 40 CFR 60.21a(b). If a state fails to submit a plan or if the EPA determines that a state plan is not satisfactory, the EPA has the authority to establish a Federal CAA section 111(d) plan for designated facilities located in the state.

Under the Tribal Authority Rule (TAR), eligible tribes may seek approval to implement a plan under CAA section 111(d) in a manner similar to a state. See 40 CFR part 49, subpart A. Tribes may, but are not required to, seek approval for treatment in a manner similar to a state (treatment as a state; TAS) for purposes of developing a Tribal Implementation Plan (TIP) implementing an EG. If a tribe obtains approval and submits a TIP, the EPA will use similar timelines and criteria and will follow similar procedures as those for state plans. Tribes that choose to develop plans will have the same flexibilities available to states in this process. The TAR authorizes tribes to develop and implement one or more of its own air quality programs, or portions thereof, under the CAA; however, it does not require tribes to develop a CAA program. Tribes may implement programs that are most relevant to their air quality needs. A tribe with an approved TAS under TAR for CAA 111(d) is not required to resubmit TAS approval to implement an EG subject to subpart Ba.[1] If a tribe does not seek and obtain the authority from the EPA to establish a TIP, the EPA has the authority to establish a Federal CAA section 111(d) plan for designated facilities that are located in areas of Indian country. A Federal plan would apply to all designated facilities located in the areas of Indian country covered by the Federal plan unless and until the EPA approves a TIP applicable to those facilities.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this action is available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at *https://www.epa.gov/stationary-sources-air-pollution/adoption-and-submittal-state-plans-designated-facilities-40-cfr.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version of the final rule, a memorandum showing the rule edits finalized in this action, and key supporting documents at this same website.

C. Judicial Review and Administrative Review

Section 307(b)(1) of the CAA governs judicial review of final actions by the EPA. This section provides, in part, that petitions for review must be filed in the D.C. Circuit: (i) when the agency action consists of ‘‘nationally applicable regulations promulgated, or final actions taken, by the Administrator,’’ or (ii) when such action is locally or regionally applicable, but ‘‘such action is based on a determination of nationwide scope or effect and if in taking such action the Administrator finds and publishes that such action is based on such a determination.’’ For locally or regionally applicable final actions, the CAA reserves to the EPA complete discretion whether to invoke the exception in (ii) described in the preceding sentence.[2]

This action is ‘‘nationally applicable’’ within the meaning of CAA section 307(b)(1). The final rule governs the EPA's promulgation of emission guidelines under CAA section 111(d), which are nationally applicable regulations for which judicial review is available only in the U.S. Court of Appeals for the District of Columbia (D.C. Circuit) pursuant to CAA section 307(b)(1).[3] Moreover, it revises the generally applicable, nationally consistent implementing regulations that govern the development and submission for all states of state plans and the EPA's development of Federal plans pursuant to EGs under CAA section 111(d), as well as the EPA's review of states' plans.

In the alternative, to the extent a court finds this final action to be locally or regionally applicable, the Administrator is exercising the complete discretion afforded to him under the CAA to make and publish a finding that this action is based on a determination of ‘‘nationwide scope or effect’’ within the meaning of CAA section 307(b)(1).[4] As explained above, this final action is revising a single set of nationally consistent implementing regulations that apply to every state that must develop a state plan submission pursuant to CAA section 111(d) and an EPA-issued EG, as well as apply to the EPA when it reviews state plan submissions. The regulations also govern the EPA's development of EGs pursuant to CAA section 111(d), which apply to every state that contains designated facilities.

The Administrator finds that this is a matter on which national uniformity in judicial resolution of any petitions for review is desirable, to take advantage of the D.C. Circuit's administrative law expertise, and to facilitate the orderly development of the law under the Act. The Administrator also finds that consolidated review of this action in the D.C. Circuit will avoid piecemeal litigation in the regional circuits, further judicial economy, and eliminate the risk of inconsistent results, and that a nationally consistent approach to implementation of EGs pursuant to CAA section 111(d) constitutes the best use of agency resources.

For these reasons, this final action is nationally applicable or, alternatively, the Administrator is exercising the complete discretion afforded to him by the CAA and finds that this final action is based on a determination of nationwide scope or effect for purposes of CAA section 307(b)(1) and is publishing that finding in the **Federal Register**. Under section 307(b)(1) of the CAA, petitions for judicial review of this action must be filed in the United States Court of Appeals for the District of Columbia Circuit by January 16, 2024. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Additionally, pursuant to CAA section 307(d)(1)(V), the Administrator determines that this action is subject to the provisions of CAA section 307(d). The EPA made this determination at proposal and has complied with the applicable procedural requirements in the course of this rulemaking. Section 307(d)(1)(V) of the CAA provides that the provisions of CAA section 307(d) apply to ‘‘such other actions as the Administrator may determine.’’ Section 307(d)(7)(B) of the CAA further provides that ‘‘[o]nly an objection to a rule or procedure which was raised with reasonable specificity during the period

---

[1] See the EPA website, *https://www.epa.gov/tribal/tribes-approved-treatment-state-tas,* for information on those tribes that have treatment as a state for specific environmental regulatory programs, administrative functions, and grant programs.

[2] *Sierra Club* v. *EPA,* 47 F.4th 738, 745 (D.C. Cir. 2022) (‘‘EPA's decision whether to make and publish a finding of nationwide scope or effect is committed to the agency's discretion and thus is unreviewable''); *Texas* v. *EPA,* 983 F.3d 826, 834–35 (5th Cir. 2020).

[3] See, *e.g., Nat'l Waste & Recyling Ass'n* v. *EPA,* No. 16–1371 (D.C. Cir. 2016) (consolidated challenges to the CAA section 111(d) emissions guidelines for municipal solid waste landfills in the D.C. Circuit); *Am. Lung Ass'n* v. *EPA,* 985 F.3d 914 (D.C. Cir. 2021) (consolidated challenges to, among other things, the CAA section 111(d) emission guidelines for fossil fuel-fired electric generating units known as the Affordable Clean Energy Rule).

[4] In deciding whether to invoke the exception by making and publishing a finding that an action is based on a determination of nationwide scope or effect, the Administrator takes into account a number of policy considerations, including his judgment balancing the benefit of obtaining the D.C. Circuit's authoritative centralized review versus allowing development of the issue in other contexts and the best use of agency resources.

for public comment (including any public hearing) may be raised during judicial review.'' This section also provides a mechanism for the EPA to convene a proceeding for reconsideration, ''[i]f the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within [the period for public comment] or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule.'' Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. Environmental Protection Agency, Room 3000, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

The EPA notes that the individual regulatory provisions it is revising or finalizing in this action are severable from one another because each is supported by an independent rationale. That is, the individual subsections within each of the sections of subpart Ba are generally justified independently and are therefore severable for purposes of judicial review.

II. Background

A. What is the statutory authority for this action?

The statutory authority for this action is provided by CAA section 111 (42 U.S.C. 7411). As described further in the next section, CAA section 111 requires the EPA to establish standards of performance for certain categories of stationary sources that, in the Administrator's judgment, ''cause[ ], or contribute[] significantly to, air pollution which may reasonably be anticipated to endanger public health or welfare.'' CAA section 111(b) provides the EPA's authority to regulate new and modified sources, while CAA section 111(d) directs the EPA to ''prescribe regulations which shall establish a procedure'' for states to submit plans to the EPA that establish standards of performance for existing sources of certain air pollutants to which a standard would apply if such existing source were a new source. The EPA addresses its obligation under CAA section 111(d) to establish a procedure for states to submit plans both through its promulgation of general implementing regulations, including those addressed by this action, and through promulgation of EGs for specific source categories. Additional statutory authority for this action is provided by section 301 of the CAA (42 U.S.C. 7601), which contains general provisions for the administration of the CAA, including the authority for the Administrator to ''prescribe such regulations as are necessary to carry out [the] functions'' of the CAA under section 301(a)(1).

B. What is the background for this action?

Clean Air Act section 111(d) governs the establishment of standards of performance for existing stationary sources. CAA section 111(d) directs the EPA to ''prescribe regulations which shall establish a procedure similar to that provided by [CAA section 110]'' for states to submit state plans that establish standards of performance for existing sources of certain air pollutants to which a standard of performance would apply if such an existing source were a new source under CAA section 111(b). Therefore, an existing source can only be regulated under CAA section 111(d) if it belongs to a source category that is regulated under CAA section 111(b). The EPA's implementing regulations use the term ''designated facility'' to identify those existing sources. *See* 40 CFR 60.21a(b).

CAA section 111(b)(1)(A) requires that a source category be included on the list for regulation if, ''in [the EPA Administrator's] judgment it causes, or contributes significantly to, air pollution which may reasonably be anticipated to endanger public health or welfare.'' Once a source category is listed, CAA section 111(b)(1)(B) requires that the EPA propose and then promulgate ''standards of performance'' for new sources in such source category. CAA section 111(a)(1) defines a ''standard of performance'' as ''a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any nonair quality health and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated.'' This provision requires the EPA to determine both the best system of emission reduction (BSER) for the regulated source category and the degree of emission limitation achievable through application of the BSER. The EPA must then, under CAA section 111(b)(1)(B), promulgate standards of performance for new sources that reflect that level of stringency.

Once the EPA promulgates standards of performance for new sources within a particular source category, the EPA is required, in certain circumstances, to regulate emissions from existing sources in that same source category.[5] Under CAA section 111(d), the Agency has, to date, issued EGs regulating five pollutants from six source categories that are currently in effect (*i.e.,* sulfuric acid plants (acid mist), phosphate fertilizer plants (fluorides), primary aluminum plants (fluorides), kraft pulp plants (total reduced sulfur), municipal solid waste landfills (landfill gases)), and fossil fuel-fired electric generating units (greenhouse gases [GHGs]). *See* ''Phosphate Fertilizer Plants; Final Guideline Document Availability,'' 42 FR 12022 (March 1, 1977); ''Standards of Performance for New Stationary Sources; Emission Guideline for Sulfuric Acid Mist,'' 42 FR 55796 (October 18, 1977); ''Kraft Pulp Mills, Notice of Availability of Final Guideline Document,'' 44 FR 29828 (May 22, 1979); ''Primary Aluminum Plants; Availability of Final Guideline Document,'' 45 FR 26294 (April 17, 1980); ''Emission Guidelines and Compliance Times for Municipal Solid Waste Landfills,'' 81 FR 59276 (August 29, 2016); ''Repeal of the Clean Power Plan; Emission Guidelines for Greenhouse Gas Emissions From Existing Electric Utility Generating Units; Revisions to Emission Guidelines Implementing Regulations,'' 84 FR 32520 (July 8, 2019) (Affordable Clean Energy (ACE) Rule).[6][7] Additionally, the

---

[5] In accordance with CAA section 111(d), states are required to submit plans to establish standards of performance for existing sources for any air pollutant: (1) the emission of which is subject to a Federal New Source Performance Standard; and (2) which is neither a pollutant regulated under CAA section 108(a) (*i.e.,* criteria air pollutants such as ground-level ozone and particulate matter, and their precursors, like volatile organic compound) or a hazardous air pollutant regulated from the same source category under CAA section 112. See also definition of ''designated pollutant'' in 40 CFR 60.21a(a).

[6] The EPA has also issued several EGs that have subsequently been repealed or vacated by the courts. The EPA regulated mercury from coal-fired electric power plants in a 2005 rule that was vacated by the D.C. Circuit, ''Standards of Performance for New and Existing Stationary Sources: Electric Utility Steam Generating Units; Final Rule,'' 70 FR 28606 (May 18, 2005) (Clean Air Mercury Rule), vacated by *New Jersey* v. *EPA,* 517 F.3d 574 (D.C. Cir. 2008). The EPA also issued CAA section 111(d) EGs regulating GHG emissions from fossil fuel-fired electric power plants in a 2015 rule, ''Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units; Final Rule,'' 80 FR 64662 (October 23, 2015)

EPA recently proposed EGs addressing GHG emissions from two different source categories. On November 15, 2021, the EPA proposed EGs to regulate GHG emissions (in the form of methane limitations) from sources in the oil and natural gas source category (86 FR 63110) and provided a supplemental proposal for that sector on December 6, 2022 (87 FR 74702). On May 23, 2023, the EPA proposed to repeal the existing EG for GHG emissions from certain fossil fuel-fired electric generating units (the ACE Rule) and to promulgate a new EG in order to regulate GHG emissions (in the form of carbon dioxide limitations) from existing fossil fuel-fired electric generating units. 88 FR 33240. Finally, the Agency has regulated additional pollutants from solid waste incineration units under CAA section 129 and in accordance with CAA section 111(d).[8]

The mechanism for regulating designated facilities[9] under CAA section 111(d) differs from the mechanism for regulating new facilities under CAA section 111(b). Pursuant to CAA section 111(b), the EPA promulgates standards of performance that are directly applicable to new, modified, and reconstructed facilities in a specified source category. In contrast, CAA section 111(d) operates together with CAA section 111(a)(1) to collectively establish and define roles and responsibilities for both the EPA and the states in the regulation of designated facilities. Under the statutory framework, the EPA has the responsibility to determine the BSER for designated facilities, as well as the degree of emission limitation achievable through application of that BSER. The EPA identifies both the BSER and the degree of emission limitation as part of an EG, which it may typically reflect as a presumptive standard of performance or methodology for calculating a presumptive standard of performance for designated facilities. States use the EPA's presumptive standards of performance as the basis for establishing requirements for designated facilities in their state plans. In addition to standards of performance, CAA section 111(d)(1) requires state plans to include provisions for the implementation and enforcement of such standards. CAA section 111(d)(1) also requires the EPA's regulations to permit states, in applying a standard of performance to particular sources, to take into account the source's remaining useful life and other factors, a process addressed in more detail in section III.E of this preamble.

CAA section 111(d) directs the EPA to establish a procedure for the submission of state plans, which the EPA addresses both through its promulgation of general implementing regulations for section 111(d) and through promulgation of EGs for specific source categories. While CAA section 111(d)(1) authorizes states to develop state plans that establish standards of performance and provides states with certain discretion in determining the appropriate standards, CAA section 111(d)(2) provides the EPA a specific oversight role with respect to such state plans. The states must submit their plans to the EPA, and the EPA must evaluate each state plan to determine whether each plan is ''satisfactory.'' If a state fails to submit a plan or the EPA determines that a state plan is not satisfactory, the EPA has the ''same authority'' to prescribe a Federal plan as it has to promulgate a Federal Implementation Plan (FIP) under CAA section 110(c).

In 1975, the EPA issued the first general implementing regulations to prescribe the process for the adoption and submittal of state plans for designated facilities under CAA section 111(d) (codified at 40 CFR part 60, subpart B (subpart B)). 40 FR 53340 (November 17, 1975). Responding to the direction to ''establish a procedure similar to that provided by'' CAA section 110, in promulgating subpart B, the EPA aligned the timing requirements for state and Federal plans under CAA section 111(d) with the then-applicable timeframes for State Implementation Plans (SIPs) and FIPs prescribed in CAA section 110, as established by the 1970 CAA Amendments. The implementing regulations were not significantly revised after their original promulgation in 1975[10] until 2019, when the EPA promulgated a new set of implementing regulations codified at 40 CFR part 60, subpart Ba (subpart Ba). 84 FR 32520 (July 8, 2019).

In promulgating subpart Ba in 2019, the EPA intended to update and modernize the implementing regulations to align the procedures for CAA section 111(d) state and Federal plans with CAA amendments made after subpart B was first promulgated in 1975. Notably, subpart B did not align either with CAA section 111(d) as amended by Congress in 1977 or with the timelines in CAA section 110 as amended by Congress in 1990. The EPA therefore considered it appropriate to update the implementing regulations for CAA section 111(d) to make changes similar to CAA section 110, given that section 111(d)(1) of the CAA directs the EPA to ''prescribe regulations which shall establish a procedure similar to that provided by section 110'' of the CAA for states to submit plans to the EPA. In promulgating subpart Ba, the EPA directly aligned the timing requirements for CAA section 111(d) state and Federal plans (40 CFR 60.23a(a)(1) and 60.27a(c), respectively) with the timing requirements for SIPs and FIPs under CAA section 110 (see CAA section 110(a)(1) and 110(c)(1), respectively).

In promulgating subpart Ba, the EPA also added the definition of ''standard of performance'' (40 CFR 60.21a(f)) (defined under subpart B as ''emission standard'' (40 CFR 60.21(f))) and the ''remaining useful life'' provision (40 CFR 60.24a(e)) (referred under subpart B as the ''variance'' provision (40 CFR 60.24(f))). The EPA further added required minimum administrative and technical criteria for inclusion in state plans (40 CFR 60.27a(g)). Applying these criteria, the EPA determines whether a state plan or portion of a plan submitted is complete (referred to as a completeness review). Once a state plan or portion of a plan is determined to be complete, the EPA must approve or disapprove the plan or portions of the plan. For details on the EPA's rationale for the promulgation of these provisions, see 84 FR 32520 (July 8, 2019).

The EPA proposed minor revisions to the subpart Ba applicability provision and is finalizing those revisions largely as proposed (see section III.G.2.a. of this preamble). As finalized in 2019, subpart Ba was applicable to any final 111(d) EG published, or the implementation of which was ongoing, after July 8, 2019. The EPA proposed revisions to this provision for clarity, including to

---

(Clean Power Plan). The EPA subsequently repealed and replaced the 2015 rule with the ACE Rule.

[7] The ACE Rule was initially vacated by *Am. Lung Ass'n* v. *EPA,* 985 F.3d 914 (D.C. Cir. 2021). The Supreme Court subsequently reversed and remanded the D.C. Circuit's opinion, *West Virginia* v. *EPA,* 142 S. Ct. 2587 (June 30, 2022). On October 27, 2022, the D.C. Circuit amended its judgement and recalled the partial mandate vacating the ACE Rule, effectively reinstating ACE. Order, *ALA* v. *EPA,* No. 19–1140, ECF No. 1970895.

[8] CAA section 129 directs the EPA Administrator to develop regulations under CAA section 111 limiting emissions of nine air pollutants from four categories of solid waste incineration units.

[9] A ''designated facility'' is any existing facility which emits an air pollutant, the emissions of which are subject to a standard of performance for new stationary sources but for which air quality criteria have not been issues and that is not included on a list published under CAA section 108(a) or 112, and which would be subject to a standard of performance for that pollutant if the existing facility were a new facility. See 40 CFR 60.21a.

[10] In 2012, the EPA revised several provisions of subpart B, mainly to include allowance systems as a form of standard of performance. 77 FR 9303 (February 16, 2012).

remove the phrase ''if implementation of such final guideline is ongoing.'' [11] It did not propose to change the already-established applicability date. At the time of promulgation of this rule, there are no final EGs that have been published after July 8, 2019, so subpart Ba will not retroactively apply to the implementation of any EG. Specifically, the final EG for greenhouse gas emissions from existing electric utility generating units that was included in the ACE Rule was published on July 8, 2019; [12] thus, subpart Ba as revised will not apply to that EG. Regardless, the EPA proposed to repeal the ACE Rule on May 23, 2023,[13] and intends to finalize its repeal, at which point neither states nor the EPA will have any obligations under the ACE Rule and the potential applicability of subpart Ba to this EG will be moot. In contrast, the EPA has recently proposed two EGs that would regulate GHG emissions from designated facilities in the oil and natural gas industry (86 FR 63110, November 15, 2021; 87 FR 74702, December 6, 2022) and in the power sector (88 FR 33240, May 23, 2023). If those EGs are finalized and to the extent that the final EGs do not contain EG-specific requirements superseding subpart Ba provisions, subpart Ba as revised in this action will apply. Subpart B continues to apply to CAA section 111 EGs promulgated on or prior to July 8, 2019, and to EGs issued pursuant to CAA section 129.

In January 2021, the D.C. Circuit vacated several provisions of subpart Ba related to timelines for state plans and Federal plans. *Am. Lung Ass'n* v. *EPA,* 985 F.3d 914, 991. (D.C. Cir. 2021) (*ALA*).[14] In this vacatur, the court identified several flaws in the EPA's rationale for extending CAA section 111(d) state and Federal plan timelines. First, the court found that the EPA erred in adopting the timelines for SIPs and FIPs in CAA section 110 without meaningfully addressing the differences in the scale of effort required for development and evaluation of CAA section 110 SIPs, as compared with the scale of effort needed for CAA section 111(d) state plans. *Id.* at 992–93. The court also concluded that in promulgating the timelines in subpart Ba, the EPA failed to justify why the shorter deadlines under subpart B were unworkable. *Id.* at 993. Further, the court held that the EPA was required to consider the effect of its subpart Ba timelines on public health and welfare, consistent with the statutory purpose of CAA section 111(d). In the court's view, the EPA's ''complete failure to say anything at all about the public health and welfare implications of the extended timeframes'' meant that the EPA failed to consider an important aspect of the problem. *Id.* at 992 (citing *Motor Vehicle Mfrs. Ass'n of U.S., Inc.* v. *State Farm Mut. Auto. Ins. Co.* 463 U.S. 29, 43 (1983)).

Based on these reasons, the court vacated the timeline for state plan submissions after publication of a final EG (40 CFR 60.23a(a)(1)), the EPA's deadline for taking action on state plan submissions (40 CFR 60.27a(b)), the EPA's deadline for promulgating a Federal plan (40 CFR 60.27a(c)), and the timeline associated with requirements for increments of progress (IoPs; 40 CFR 60.24 (a(d)). Because of the vacatur, subpart Ba currently does not provide generally applicable timelines for state plan submissions, a deadline for the EPA's action on state plan submissions, a deadline for the EPA's promulgation of a Federal plan, or a timeline associated with requirements for IoPs. The EPA notes that while it is finalizing generally applicable timelines for the implementing regulations, a particular EG may supersede those generally applicable timelines with its own specific timelines. 40 CFR 60.20a(a)(1). This may be appropriate, for example, based on the complexity of regulating a particular source category, such as a category with a large number of disparate facilities to be regulated.

C. What changes did we propose?

On December 23, 2022, the EPA proposed several revisions to subpart Ba both to address the vacatur of the timing provisions by the D.C. Circuit in *ALA* and to further improve the state and Federal plan development and implementation process. See 87 FR 79176 (December 23, 2022). In response to the *ALA* decision, the EPA proposed timeframes for (1) state plan submittal, (2) the timeline for the EPA to determine completeness of state plans, (3) the EPA's action on state plan submissions, (4) the EPA's promulgation of a Federal plan, and (5) requirements to establish IoPs. Additionally, the EPA proposed to remove the publication in the **Federal Register** of a ''finding of failure to submit'' as the starting point for the clock to promulgate a Federal plan.

In addition, the EPA proposed revisions to subpart Ba that would enhance the provision of reasonable notice and opportunity for public participation by requiring that states, as part of the state plan development or revision process, undertake outreach and meaningful engagement with a broad range of pertinent stakeholders. The EPA proposed to define pertinent stakeholders as including communities most affected by and vulnerable to the impacts of the plan or plan revision. Increased vulnerability, as described in the proposal, may be attributable, among other reasons, to both an accumulation of negative and lack of positive environmental, health, economic, or social conditions within these populations or communities.

To improve flexibility and efficiency in the submission, review, approval, and implementation of state plans, the EPA proposed to include the following mechanisms in subpart Ba, all of which currently exist under CAA section 110: (1) partial approval/disapproval, (2) conditional approval, (3) allowance for parallel processing, (4) a mechanism for the EPA to call for plan revisions, and (5) an error correction mechanism.

The EPA also proposed revisions to the existing regulations governing the ''remaining useful life and other factors'' (RULOF) provision of the statute. These proposed revisions were intended to promote clarity and increase consistency in situations where states or the EPA consider RULOF when applying standards of performance to individual sources and to ensure that such standards fulfill the statutory requirements of CAA section 111(d).

Finally, the EPA proposed to require electronic submissions of state plans, as well as additional modifications and clarifications to subpart Ba. In particular, the EPA proposed clarifying amendments to the subpart Ba definition of standard of performance, along with a revised interpretation of CAA section 111(d) with respect to permissible compliance flexibilities. The EPA proposed to determine that, under appropriate circumstances, the Agency may approve state plans that authorize sources to meet their emission limits in the aggregate, such as through standards that permit compliance via

---

[11] 87 FR 79176, 79208–09 (Dec. 23, 2022). As explained in section III.G.2.a. of this preamble, the EPA is finalizing the removal of this phrase from 40 CFR 60.20a(a).

[12] 84 FR 32520 (July 8, 2019).

[13] ''New source Performance Standards for Greenhouse Gas Emissions From New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; Emission Guidelines for Greenhouse Gas Emissions From Existing Fossil Fuel-Fired Electric Generating Units; and Repeal of the Affordable Clean Energy Rule,'' 88 FR 33240 (May 23, 2023).

[14] The Supreme Court subsequently reversed and remanded the D.C. Circuit's opinion. *West Virginia* v. *EPA,* 142 S.Ct. 2587 (June 30, 2022). However, no Petitioner sought certiorari on, and the Supreme Court's *West Virginia* decision did not implicate, the D.C. Circuit's vacatur of portions of subpart Ba. *See* Amended Judgment, *ALA* v. *EPA,* No. 19–1140 (D.C. Cir. October 27, 2022), ECF No. 1970898 (ordering that petitions for review challenging the timing portion of implementing regulations be granted).

trading or averaging. In doing so, the EPA also proposed to conclude that CAA section 111 does not limit the BSER to controls that can be applied at and to the source.

The EPA did not reopen any subpart Ba requirements other than the specific provisions that the EPA explicitly proposed to revise in the December 2022 notice of proposed rulemaking. Any comments received on the proposal that did not relate to the proposed revisions or additions are considered out of the scope of this action.

D. What outreach and engagement did the EPA conduct?

The EPA conducted both pre- and post-proposal outreach and meaningful engagement events with environmental justice (EJ) communities, small businesses, states, and Tribes. On July 7 and July 11, 2022, the EPA conducted two pre-proposal webinars for states addressing meaningful engagement for pertinent stakeholders, and on July 26, 2022, the Agency conducted a pre-proposal webinar for EJ communities and other key stakeholders about potential requirements for states to conduct meaningful engagement in developing their state plans. The EPA emailed an announcement of the subpart Ba proposal to Tribal nations and environmental justice communities via existing listservs on December 15, 2022. Post-proposal outreach during the public comment period with environmental justice communities included participation on the January 24, 2023 Environmental Justice National call and the January 26, 2023 National Tribal Air Association call. The EPA also conducted a public training webinar on January 31, 2023, for environmental justice community members and their representatives. Additionally, the EPA conducted post-proposal outreach with small businesses through the Small Business Environmental Assistance Program call on February 21, 2023, and with state environmental protection associations including the Association of Air Pollution Control Agencies on January 10, 2023, and the National Association of Clean Air Agencies on February 8, 2023.

III. What actions are we finalizing and what is our rationale for such decisions?

This action finalizes amendments to subpart Ba, including the timing requirements for state plan submittal, the EPA's action on state plan submissions, the EPA's promulgation of a Federal plan, and the establishment of IoPs; the addition of five regulatory mechanisms to improve state plan processing: (1) partial approval/disapproval, (2) conditional approval, (3) allowance for parallel processing, (4) a mechanism for the EPA to call for plan revisions, and (5) an error correction mechanism; new requirements for meaningful engagement with pertinent stakeholders; and amended requirements for states' and the EPA's consideration of RULOF in applying a standard of performance in certain circumstances. This action also finalizes amendments to the subpart Ba definition of ''standard of performance'' and finalizes clarifications associated with CAA section 111(d) compliance flexibilities. Finally, this action finalizes requirements for the electronic submission of state plans and several other clarifications and minor revisions to the implementing regulations. While the EPA is finalizing most amendments as proposed, in response to comments submitted on the proposal, the EPA is extending the state plan submittal timeline and the timeline for requirement of IoPs; providing for additional flexibility and guidance for meaningful engagement; as well as revising and streamlining the requirements for accounting for RULOF in applying a less-stringent standard. There are also other provisions that we are finalizing with slight revisions relative to proposal. Further detail is provided in the following sections of this preamble and additional detailed responses to comments are located in the response to comment document (RTC).

While this action amends the generally applicable requirements of subpart Ba, the EPA has recognized that, under certain circumstances, some provisions of the implementing regulations may not fit the needs of a specific EG. Therefore, the existing implementing regulations provide that each EG may include specific implementing provisions in addition to or that supersede the requirements of subpart Ba. 40 CFR 60.20a(a)(1). The EPA will address source category-specific circumstances or facts that are not accommodated by the general provisions of subpart Ba through a specific EG, as the time and processes needed for development and adoption of state plans to implement the EG may be affected by unique characteristics of a source category. For example, if a proposed EG addresses a particularly large and complex source category that necessitates a relatively long timeframe for state planning, the EPA may provide a state plan submission deadline that is longer than the 18 months being finalized for subpart Ba.[15]

A. Revised Implementing Timelines

As described in section II.A. of this preamble, the subpart Ba timing requirements were vacated by the D.C. Circuit in the *ALA* decision. These vacated timing requirements include: the timeline for state plan submissions, the timeline for the EPA to act on a state plan, the timeline for the EPA to promulgate a Federal plan, and the timeline that dictates when state plans must include IoPs. These timelines are all critical to ensuring that the emission reductions anticipated by the EPA when promulgating an EG become federally enforceable measures that are timely implemented by the designated facilities.

The EPA proposed the following timelines to replace those vacated in *ALA* (87 FR 79176, Dec. 23, 2022): 15 months for state plan submissions after publication of a final EG; 60 days after submission for the EPA to determine if a plan is complete; 12 months for the EPA to take final action on a complete state plan (*i.e.,* approve, disapprove); 12 months for the EPA to promulgate a Federal plan either after the state plan submission deadline if a state has failed to submit a complete plan, or after the EPA's disapproval of a state plan submission; and requiring state plans to include IoPs if the plan requires final compliance with standards of performance later than 16 months after the plan submission deadline.[16]

The EPA received numerous comments on these proposed timelines, most of which expressed support for timelines longer than those proposed. Some commenters asserted that the *ALA* decision does not direct the EPA to necessarily reduce timelines from those vacated, only to justify the timelines more fully. In particular, most commenters expressed the need for a longer state plan submittal timeline in order to accommodate state regulatory processes associated with plan submittals (*i.e.,* legislative and/or administrative state processes), as well as to accommodate technical development of the plans and to implement the proposed meaningful engagement requirements. However, a few commenters noted that the EPA should not accommodate all lengthy state administrative processes that would unnecessarily postpone emission-reduction obligations. Some

---

[15] See, *e.g.,* 88 FR 33240, 33402–03 (May 23, 2023) (proposing a 24-month state plan submission deadline for the EG for GHG emissions from fossil fuel-fired electric generating units).

[16] See 87 FR 79176, 79181–90 (Dec. 23, 2022).

commenters asserted that if the EPA were to finalize the state plan submittal timeline as proposed, the EPA should include a mechanism in the rule for states to request for extensions for state plan submittals.

While some commenters also asserted the need for longer timelines associated with the EPA's obligations to take action on a state plan submittal and to promulgate a Federal plan when required, as well as allowing a longer timeline before IoPs are required in the state plans, other commenters supported the proposed timelines for these milestones based, among other concerns, on the need for timely protection of health and welfare and in consideration of the EPA's ability to extend timelines if warranted in a particular EG.

In consideration of these comments and for the reasons described in detail in the sections that follow, the EPA is finalizing extended timelines from those proposed for submission of state plans, for significant state plan revisions, and for when IoPs must be considered for inclusion in state plans. The EPA is finalizing the remaining timelines as proposed. The EPA determined that these timelines will appropriately balance the need to reasonably accommodate the processes generally required by states and the EPA to develop, evaluate, and adopt plans to effectuate the EG with the need to ensure that designated facilities control emissions of dangerous pollutants as expeditiously as reasonably possible, consistent with the health and welfare-based objectives of CAA section 111(d). A summary of the timelines finalized in this action is shown in Table 1.

The final subpart Ba timelines are applicable to any final EG published pursuant to CAA section 111(d) after July 8, 2019, including, if finalized, those recently proposed to regulate GHG emissions from sources in the oil and natural gas industry (86 FR 63110, November 15, 202187 and FR 74702, December 6, 2022) and those proposed to regulate GHG emissions from fossil fuel-fired electric generating units (88 FR 33240, May 23, 2023), to the extent that the final EGs do not contain provisions superseding any of these timelines in subpart Ba.[17]

TABLE 1—FINAL 40 CFR PART 60, SUBPART Ba, TIMELINE COMPARED WITH THOSE INITIALLY PROPOSED, VACATED FROM SUBPART Ba, AND FROM SUBPART B

Process step	2023 Subpart Ba final	2022 Subpart Ba proposal	Subpart Ba (2019) vacated timelines	Subpart B (1975)
State Plan submittal after publication of EG in the **Federal Register**.	18 months	15 months	36 months	9 months.
State Plan completeness determination.	60 days after State Plan submission.	60 days after State Plan submission.	*6 months after State Plan submission.	N/A.
State Plan evaluation	12 months after completeness.	12 months after completeness.	12 months after completeness.	4 months after State Plan submittal deadline.
EPA Federal Plan promulgation.	12 months after failure to submit or disapproval.	12 months after failure to submit or disapproval.	24 months after finding of failure to submit or disapproval.	6 months after State Plan submittal deadline.
Requirements for Increments of Progress after submittal deadline.	If compliance is >20 months.	If compliance is >16 months.	If compliance is >24 months.	If compliance is >12 months.

* Although the timeline for the state plan completeness determinations was not vacated, the EPA has evaluated this timeline light of the court vacatur of the related timelines.

As described in greater detail in section II. of this preamble, the D.C. Circuit's vacatur of the extended timelines in subpart Ba was based both on the EPA's failure to substantiate the necessity for the additional time at each step of the administrative process, and the EPA's failure to address how those extended implementation timelines would impact public health and welfare. Accordingly, the EPA has evaluated these factors and is finalizing timelines, as described in the following sections, based on the minimum administrative time reasonably necessary for each step in the implementation process, thus minimizing impacts on public health and welfare by proceeding as expeditiously as reasonably possible while accommodating the time needed for states or the EPA to develop an effective plan. This approach addresses both aspects of the *ALA* decision because the EPA and states will take no longer than necessary to develop and adopt plans that impose requirements consistent with the overall objectives of CAA section 111(d).

The EPA acknowledges these timelines are not identical to those for SIPs under CAA section 110. This is consistent with the requirement of CAA section 111(d) that the EPA promulgate a procedure ''similar'' to that of CAA section 110, rather than an identical procedure. This is also consistent with the *ALA* decision, which requires the EPA to ''engage meaningfully with the different scale'' of CAA section 111(d) and 110 plans. 985 F.3d at 993. In proposing the revised timelines, the EPA evaluated each step of the state plan implementation process to independently determine the appropriate duration needed to accomplish a given step as part of the overall process. After receiving comments on the proposed timelines, the EPA again evaluated each step in light of the new information; the timelines being finalized in this action represent the Agency's revised assessment of the most reasonably expeditious timelines that are appropriate to provide as a default for EGs under these generally applicable implementing regulations.

The EPA recognizes that, under certain circumstances, the timelines being finalized in this action may not fit the needs of a specific EG because of the specific characteristics of an EG. The EPA will address source category-specific circumstances or facts that are not accommodated by the timelines of subpart Ba through a specific EG. Examples of circumstances that may require consideration for different

---

[17] Under each of these EGs the EPA proposed to supersede the 15-month state plan submittal timeline in proposed subpart Ba based on the size and complexity of the source sectors at issue.

timelines could include EGs that require states to perform extensive engineering and/or economic analyses before submitting their plans; EGs with an exceptional need to expedite implementation (*e.g.,* in order to address immediate health and welfare impacts); EGs that apply to an extraordinary number of disparate designated facilities; or EGs that are novel and/or unusually complex. For situations like these, 40 CFR 60.20a(a)(1) provides that an EG may supersede any aspect of the implementing regulations, including the implementation timelines. It is within the EPA's discretion to determine whether a proposed change in implementation time may be justified within an individual EG based on these or other appropriate factors. For EGs that supersede implementation timelines, the EPA will, in the EG, both provide a justification for the differing timelines and address how the change in timeline will impact health and welfare.

1. State Plan Submission Timelines

This section discusses the amount of time states will have to submit plans and plan revisions to the EPA following the publication of a final or revised EG in the **Federal Register**. As described in further detail in section III.E of this preamble, under CAA section 111(d), the EPA first determines a BSER and the degree of emission limitation for designated facilities and promulgates these determinations in an EG. CAA section 111(a)(1), 40 CFR 60.22a(b)(5). It is then each state's obligation to submit a plan to the EPA which establishes standards of performance based on the EG for each designated facility. See CAA section 111(d)(1), 40 CFR 60.24a(c). The implementing regulations promulgated in 1975 under subpart B provide that states have 9 months to submit a state plan after publication of a final EG. 40 CFR 60.23(a)(1). In 2019, the EPA promulgated subpart Ba and provided 3 years for states to submit plans or plan revisions for subsequently promulgated or revised EGs, consistent with the timelines provided for submission of SIPs pursuant to CAA section 110(a)(1). This 3-year timeframe was vacated by the D.C. Circuit in the *ALA* decision, and thus currently there is no applicable deadline for state plan submissions and revisions required under EGs subject to subpart Ba.

As laid out in the notice of proposed rulemaking and summarized below, in evaluating the appropriate timeline for plan submittal to replace the vacated provisions in subpart Ba, the EPA reviewed steps that states need to carry out to develop, adopt, and submit a state plan to the EPA, and its history in implementing EGs under the timing provisions of subpart B. The EPA further evaluated the statutory deadlines and processes for relatively comparable state plans under CAA section 129, and attainment planning SIPs submitted pursuant CAA sections 189(a)(2)(B) and 189(b)(2) for the 2012 National Ambient Air Quality Standards (NAAQS) for fine particulate matter ($PM_{2.5}$). 78 FR 3085 (January 15, 2013). Finally, the EPA incorporated consideration of the *ALA* decision addressing expediency in implementation of EGs for protection of public health and welfare.

To develop a CAA section 111(d) state plan, a state must complete a series of steps to ensure that the plan will meet all applicable requirements. Subpart Ba specifies the elements that must be included in a state plan submission (see 40 CFR 60.24a, 60.25a, 60.26a) as well as certain processes that a state must undertake in adopting and submitting a plan (see 40 CFR 60.23a). In addition to the requirements of these implementing regulations, there are also state-specific processes applicable to the development and adoption of a state plan, including the administrative processes (*e.g.,* permitting processes, regulatory development, legislative approval) necessary to develop and adopt enforceable standards of performance. State plan development generally involves several phases, including providing notice that the state agency is considering adopting a rule; taking public comment; and approving or adopting a final rule. The process required to formally adopt a rule at the state level differs from state to states.[18]

As previously mentioned, subpart B provides 9 months for states to submit plans after publication of a final EG. The EPA's review of state's timeliness for submitting CAA section 111(d) plans under the 9-month timeline indicated that most states either did not submit plans or submitted plans that were substantially late.[19] The EPA also noted that the plans submitted under subpart B were not subject to additional requirements for meaningful engagement and consideration of RULOF, which may add time to the state development process relative to plans developed and submitted under subpart B. For these reasons, the EPA found that 9 months is not a reasonable amount of time for most states to adequately develop a plan for an EG.

To help inform the proposal for the state plan submission deadline, the EPA also reviewed CAA section 129's statutory deadline and requirements for state plans, and the timeliness and responsiveness of states under CAA section 129 EGs. CAA section 129 references CAA section 111(d) in many instances, creating considerable overlap in the functionality of the programs. The processes for CAA sections 111(d) and 129 are similar in that states are required to submit plans to implement and enforce the EPA's EGs. However, there are some key distinctions between the two programs, most notably that CAA section 129(b)(2) specifies that state plans be submitted no later than 1 year from the promulgation of a corresponding EG, whereas the statute does not specify a particular timeline for state plan submissions under CAA section 111(d). Moreover, CAA section 129 plans are required by statute to be at least as protective as the EPA's EGs, without exception. CAA section 129(b)(2). While CAA section 111(d) permits states to take into account remaining useful life and other factors to set less stringent standards for particular sources. This suggests that the development of a CAA section 111(d) plan could involve more complicated analyses than a CAA section 129 plan and that a longer timeframe is likely reasonable for state plans under CAA section 111(d) than the 1-year timeframe the statute provides under CAA section 129.

Additionally, the EPA found that a considerable number of states have not made timely state plan submissions in response to previous CAA section 129 EGs. In instances where states submitted CAA section 129 plans, a significant number of states submitted plans between 14 to 17 months after the promulgated EG.[20] This again suggests that states will typically need more than

---

[18] In many states, the agency must submit its rule to a particular independent commission or the legislature for review and approval before the rule is finally adopted. Generally, adopted rules are filed with a state entity, such as the secretary of state, and eventually published in a register and placed into the state's administrative code. State law establishes when an adopted rule is effective.

[19] The EPA reviewed the information available in 40 CFR part 62. The supporting information reviewed is available at Docket ID No. EPA–HQ–OAR–2021–0527. Part 62 codifies the Administrator's approval and disapproval of state plans for the control of pollutants and facilities under CAA section 111(d), and under CAA section 129 as applicable, and the Administrator's promulgation of such plans or portions of plans thereof.

[20] The EPA reviewed the information available in 40 CFR part 62. The supporting information reviewed is available at Docket ID No. EPA–HQ–OAR–2021–0527. Part 62 codifies the Administrator's approval and disapproval of state plans for the control of pollutants and facilities under CAA section 111(d), and under CAA section 129 as applicable.

one year to develop a state plan to implement an EG.

In the 2019 promulgation of subpart Ba, the EPA mirrored CAA section 110 by giving states 3 years to submit plans. As previously described, the D.C. Circuit faulted the EPA for adopting the CAA section 110 timelines without accounting for the differences in scale and scope between CAA section 110 and 111(d) plans. Therefore, in proposing the revised timelines the EPA closely evaluated other statutory deadlines and requirements for state implementation plans to determine what is feasible for a CAA section 111(d) state plan submission timeline. The EPA specifically focused on statutory SIP submission deadlines and requirements in the context of attainment plans for the 2012 $PM_{2.5}$ NAAQS under CAA section 189 because it provided a comparable process. CAA section 189(a)(2)(B) requires states to submit attainment planning SIPs within 18 months after an area is designated nonattainment and there is a record of successful state submittals pursuant to this timeline. The 2012 $PM_{2.5}$ NAAQS attainment plans were, in most cases, more complicated for states to develop when compared to a typical plan that may be required under CAA sections 111(d). For example, attainment plans require states to determine how to control a variety of sources, based on extensive modeling and analyses, in order to bring a nonattainment area into attainment of the $PM_{2.5}$ NAAQS by a specified date. Identification of contributing emission sources and the development of effective control strategies can be challenging because particulate matter pollution is comprised of both primary emissions and secondary particle formation. By contrast, under CAA section 111(d), it is clear which designated facilities are subject to a state plan, in general what control methods are available for the designated pollutant from that facility, and that the standards of performance for these sources must reflect the level of stringency for the facility as determined by the EG unless a state chooses to account for RULOF.

Informed by these analyses, the EPA proposed to require that each state adopt and submit to the Administrator a plan for the control of the designated pollutant(s) to which the EG applies within 15 months of publication of a final EG. Some commenters supported the proposed timeline based on the need for urgency in achieving the emission reductions targeted by an EG. Additionally, some commenters noted that, in comparison with NAAQS SIP requirements, states are generally well-positioned to address the source sectors historically regulated under CAA section 111(d) and have access to information about control strategies and regulatory approaches for controlling emissions. Most commenters on this issue were state agencies or other state-related entities that generally expressed the need for a longer state plan submittal timeline in order to accommodate state regulatory processes associated with plan submittals (*i.e.,* legislative and/or administrative state processes), as well as to accommodate technical development of the plans and to implement the proposed meaningful engagement requirements. Approximately 10 states responded to the EPA's request with information about their state processes. The information received indicates that states argued that they need anywhere from 15 months to 36 months to adopt and submit state plans. As discussed further below, the EPA is finalizing a state plan submittal timeline of 18 months. It is doing so after consideration of comments received on the proposal and recognizing the need to protect public health and welfare. The EPA has determined that 18 months is the appropriate timeline for these general implementing regulations; for a generic EG, this represents a reasonable balance between providing states sufficient time to develop and submit a plan that satisfies the applicable requirements and ensuring that the emission reductions contemplated in an EG are achieved as expeditiously as practicable. Consistent with the existing regulations of subpart Ba, 40 CFR 60.20a(a)(1), the EPA may supersede this 18-month state plan submittal timeline in an individual EG.

The proposed 15-month submittal timeline was based on the EPA's proposed determination that this was a reasonably expeditious deadline that would provide states and stakeholders sufficient time to develop and submit an approvable state plan. However, based on public comments received, we no longer believe that 15 months will provide sufficient time to complete the substantive and procedural requirements under subpart Ba. For example, the EPA is revising subpart Ba to require that states demonstrate meaningful engagement as part of their state plan development. While the time needed to conduct meaningful engagement will depend highly on the source category, the designated pollutant, and the types of impacts associated with designated facilities and potential controls, as well as on the pertinent stakeholders under a given EG within each state, it is very likely to require additional time relative to the existing public notice and hearing requirements under CAA section 110 and subpart Ba. We received comments that 15 months would be insufficient time to identify pertinent stakeholders, develop public participation strategies, and conduct outreach and engagement. Some commenters also pointed out that adding requirements, such as meaningful engagement and RULOF, without a corresponding extension of time to develop plans may undermine states' abilities to submit timely, approvable plans. While some commenters requested 36 months to submit state plans, several indicated that a minimum timeframe of 18 months would be appropriate for a state plan under a generic EG. Given the preponderance of comments suggesting that 15 months was not a reasonable amount of time to develop an approvable state plan and in recognition of the need to promulgate a timeline that achieves emission reductions as expeditiously as practicable, the EPA believes 18 months is the most reasonable timeline to include in these generally applicable implementing regulations.

The EPA acknowledges that, as commenters asserted, state regulatory and legislative processes and resources can vary significantly and influence the time needed to develop and submit state plans (*e.g.,* legislative procedures and timelines vary by state). Some commenters opposed to a shorter state plan submission timeline asserted that they need 36 months to complete their administrative and legislative processes. However, because the CAA contains numerous, long-standing requirements under other programs for states to develop and submit plans within 18 months (or fewer),[21] the EPA believes that states should be well positioned to accommodate an 18-month submittal timeline for plans under section 111(d). In designing a submittal deadline for state plans, it is reasonable to look to what Congress has determined are appropriate timelines for SIPs and to assume that states should be able to accommodate comparable timelines under CAA section 111(d). Indeed, some commenters recommend that the EPA not defer to lengthy state administrative processes, and expressed concern that some states have adopted, or may adopt, procedures that are longer than necessary and that will unnecessarily postpone Federal emission-reduction obligations. To this point, extending

---

[21] See, *e.g.,* CAA sections 110(k)(5); 129; 179(d)(1); 189.

state plan submittal timelines to account for any and all unique state procedures would inappropriately delay reductions in emissions that have been found under CAA section 111 to endanger health or the environment.

Some commenters asserted that the *ALA* decision does not preclude the EPA from adopting a 36-month time frame for state plan submittals and that the Agency need only justify a longer timelines more fully. However, the EPA recognizes that the D.C. Circuit, in *ALA,* faulted the Agency for failing to consider the potential impacts to public health and welfare associated with extending planning deadlines. In response, the EPA is promulgating a state plan submittal timeline that reflects the generally expeditious period of time for states to develop and submit a plan per the corresponding emission guidelines that is both comprehensive and legally sound. The EPA does not interpret the court's direction to require a quantitative measure of impact, but rather consideration of the importance of meeting the public health and welfare goals when determining appropriate deadlines for implementation of regulations under CAA section 111(d). Based on EPA's assessment of the time it will take for states to develop and submit plans under these general implementing regulations, both in the notice of proposed rulemaking and this preamble and after consideration of comments received, the EPA has determined that 18 months represents the generally expeditious period of time.

Some commenters stated that reduction of the designated pollutants addressed by currently proposed emission guidelines (*i.e.,* GHG) is not urgent based on the fraction of global GHG reduced by currently proposed emission guidelines, so a longer state plan timeline would be justified. The EPA disagrees with the commenters' characterizations of the threat posed by elevated concentrations of greenhouse gases in the atmosphere. The EPA has determined that greenhouse gas air pollution may reasonably be anticipated to endanger public health or welfare[22] and has explained that ''scientific assessments, EPA analyses, and documented observed changes in the climate of the planet and of the U.S. present clear support regarding the current and future dangers of climate change and the importance of GHG emissions mitigation.''[23] Moreover, subpart Ba applies to any EG promulgated after July 8, 2019, not only to the recently proposed EGs addressing GHG emissions from two source categories. The EPA regulates source categories, through EGs, that emit pollutants the Agency has determined under CAA section 111(d) to cause or significantly contribute to an endangerment of public health or welfare. Accordingly, consistent with *ALA,* it is appropriate for the EPA to set an expeditious but reasonable schedule in these general provisions for state plan development and submission to ensure that emission reductions occur in a timely manner.

Finally, some commenters asserted that if the EPA were to finalize the state plan submittal timeline as proposed, the EPA should include a mechanism in subpart Ba for states to ask for extensions of the state plan submittal deadline. However, as we are providing additional time for state plan submittals relative to proposal, we are not providing a mechanism for states to request deadline extensions in subpart Ba. Additionally, the EPA has the ability to supersede the timelines in subpart Ba in individual EGs and will take into account any unique considerations that may result in the need for longer or shorter timelines on an EG-by-EG basis.

In summary, while the EPA proposed a 15-month state plan submittal timeline, after consideration of comments, the EPA is finalizing 40 CFR 60.23a(a)(1) to provide an 18-month timeline for the submission of state plans following publication in the **Federal Register** of a final EG. The EPA has determined that this is the generally expeditious period in which states can create and submit a plan per the EPA's corresponding EGs that is both comprehensive and legally sound. In considering the appropriate timeline, the EPA has evaluated data from previously implemented EGs and the statutory deadlines and data from analogous programs (*e.g.,* CAA sections 129 and 189). We have also considered comments that some of the requirements the EPA had proposed for subpart Ba would require additional time to implement, as well as comments asserting that certain states need up to 36 months to complete their administrative and legislative processes. While a reasonable state plan submittal timeline must provide states sufficient time to develop and submit plans that comport with the applicable requirements, the EPA also believes that state processes should be able to accommodate an 18-month timeline because the CAA already contains numerous deadlines that require SIP submissions to be developed and submitted to the Agency within 18 or fewer months. Thus, this finalized timeline should provide states reasonable time to adopt and submit approvable plans, and is also sufficiently expeditious to protect against significant adverse impacts to health and welfare resulting from foregone emission reductions during the state planning process. Providing states sufficient time to develop feasible implementation plans for their designated facilities that adequately address public health and environmental objectives also ultimately helps ensure more timely implementation of an EG, and therefore achievement in actual emission reductions, than would an unattainable deadline. Because 18 months is an expeditious time period, it follows that the EPA has appropriately considered the potential impacts to public health and welfare associated with this extension of time by providing no more time than the states reasonably need to ensure a plan is comprehensive and timely.

The EPA is also finalizing the proposed amendment to 40 CFR 60.27a(a) replacing the word ''shorten'' with ''amend''. The applicability provision at 40 CFR 60.20a(a)(1) states that ''each emission guideline may include specific provisions in addition to or that supersede requirements of this subpart.'' However, the existing provision in 40 CFR 60.27a(a) only provides for the Administrator to ''shorten the period for submission of any plan or plan revision or portion thereof.'' To make these two provisions consistent in light of the timelines for plan submission finalized in this action, the EPA is replacing the word ''shorten'' with ''amend.'' One commenter opposed the amendment stating there is no regulatory certainty for the state in state plan submittal if the Administrator can simply change the timeline as he deems necessary. However, the appropriate timeline would undergo notice and comment rulemaking as the EG is proposed and finalized so that states would have sufficient notice of the timeline. To the extent the EPA considers deviating from this 18-month timeframe in promulgating an EG in the future, the EPA will consider the public health and welfare impacts associated with extending the state plan submission timeline, consistent with the D.C. Circuit's direction in *ALA.*

The EPA is also finalizing two amendments to 40 CFR 60.28a(a), which addresses plan revisions by the state. First, the EPA is finalizing the proposed clarification that meaningful engagement requirements apply to any significant plan revision by the state. Second, the EPA is finalizing revisions

---

[22] See, *e.g.,* 80 FR 64510, 64530 (Oct. 23, 2015).

[23] 88 FR 33240, 33252 (May 23, 2023).

to the timeline for state plan revisions required in response to a revised emission guideline. At proposal, the EPA indicated in the revised regulatory text that it was proposing to shorten the timeline for state plan revisions in this specific circumstance from three years to 12 months.[24] The EPA received comments on this proposed revision asserting that the same process-related challenges that apply to initial state plan submissions, including conducting meaningful engagement and RULOF procedures and working through states' administrative and legislative processes, also apply to state plan revisions. Commenters requested that the EPA extend the timeline for state plan revisions in response to revised emission guidelines; one commenter specifically requested that the EPA leave it at 36 months. However, the EPA anticipates that, in most instances, plan revisions required in response to a revised emission guideline would be narrower in scope than the initial state plan and would not require states to reevaluate standards of performance or conduct significant new analysis. For example, the EPA may revise an emission guideline to provide for additional or updated monitoring or compliance protocols or to clarify applicability provisions. In such instances, the full period of time provided for initial state plan development and submission would not be necessary.[25] Thus, the EPA believes it is reasonable to set a default timeline for the submission of state plan revisions in these general implementing guidelines that is shorter than the timeline for initial state plan submission. Because the EPA is providing an additional three months for state plan submission in this final rule relative to the proposed timeline (18 months versus 15 months), it is finalizing a timeline for the submission of state plan revisions in response to a revised emission guideline of fifteen months, which is also three months longer than the twelve months proposed. Additionally, in recognition that some state plan revisions in response to a revised emission guideline may in fact be more complex or necessitate additional analysis or rulemaking, the EPA is finalizing the provision at 40 CFR 60.28a(a) to allow the Agency to determine a different timeline for the submission of revised state plans, which it will provide in the revised emission guideline.

2. Timeline for the EPA To Determine Completeness of State Plans

Once a state plan has been submitted to the EPA, the EPA reviews the plan for ''completeness'' to determine whether it includes certain elements necessary to ensure that the EPA can substantively evaluate the plan. The EPA determines completeness by comparing the state's submission against the administrative and technical criteria specified in subpart Ba to determine whether the submission contains the specified elements (see 40 CFR 60.27a(g)(2) for completeness criteria). The timeline to make completeness determinations in the version of subpart Ba the EPA promulgated in 2019 mirrored the language for SIPs in CAA section 110(k)(1)(B): ''Within 60 days of the Administrator's receipt of a plan or plan revision, but no later than 6 months after the date, if any, by which a State is required to submit the plan or revision, the Administrator shall determine whether the minimum criteria [for completeness] have been met.'' Like CAA section 110(k)(1)(B), subpart Ba also provided that a state plan would be deemed complete by operation of law if the EPA had not made an affirmative determination by the date 6 months after receipt of the plan submission. 40 CFR 60.27a(g)(1).

After a state plan is deemed complete through either an affirmative determination or by operation of law, the EPA will act on the state plan submission through notice-and-comment rulemaking. The timeline for the EPA to act on a state plan submission runs from the date a submission is deemed complete; more on this timeline can be found in section III.A.3. of this preamble.

If a state plan submission does not contain the elements required by the completeness criteria, the EPA would find that the state has failed to submit a complete plan and notify the state through a letter. The determination of incompleteness treats the state as if the state has made no submission at all. The determination that a submission is incomplete and that the state has failed to submit a plan is ministerial in nature.

As part of the EPA's overall effort to set implementation timelines under CAA section 111(d) that are as expeditious as possible, the EPA proposed to revise the timing element of the completeness review at 40 CFR 60.27a(g)(1). In light of the ministerial nature of the completeness determination, the EPA proposed a maximum of 60 days from receipt of the state plan submission for the EPA to make a determination of completeness. The EPA additionally proposed that any state plan or plan revision submitted to the EPA that has not received a completeness determination within 60 days of receipt, shall on that date be deemed, by operation of law, to meet the completeness criteria, which will trigger the EPA's obligation to take substantive action on the state plan. Sixty days provides an expeditious timeframe for the EPA to evaluate state plans for completeness and to notify the states of the determination. Because the EPA may be required to evaluate up to 50 state plans during this period, in addition to plans submitted by territories and tribes, the EPA explained at proposal that it did not find that this timeframe could reasonably be shortened any further.

While most commenters supported the 60-day completeness period, some commenters expressed concern that a state plan that is automatically deemed complete by operation of law as of the allotted 60 days could cause unnecessary turbulence in state plan implementation if the plan is later disapproved by the EPA due to missing information. Other commenters noted that if a plan is determined to be incomplete, a 60-day period will not allow states sufficient time to correct the deficiency and submit a complete plan. First, the EPA notes that the completeness determination is ministerial in nature and does not affect the Agency's subsequent responsibility and authority to substantively review a state plan submission against the requirements of the Act and applicable regulations, including this subpart Ba and the relevant EG. That is, a determination that a state plan is complete does not signify that it necessarily satisfies the substantive requirements. The commenters fail to explain how deeming a state plan submission complete by operation of law, in this case after 60 days, and later finding it does not satisfy an applicable requirement is a new phenomenon or would cause unnecessary turbulence in state plan implementation. Rather, a shorter period for deeming plans complete by operation of law would be less disruptive than a longer period in this instance because the EPA will complete its substantive evaluation of the plan sooner and the state will have notice earlier on of any deficiencies. Additionally, because states may submit plan revisions at any time, states may

[24] ''Docket_memo_outlining_proposed_changes_to_regulatory_text.pdf,'' *available at https://www.epa.gov/stationary-sources-air-pollution/adoption-and-submittal-state-plans-designated-facilities-40-cfr,* as well as Docket ID No. EPA–HQ–OAR–2021–0527–0002.

[25] The EPA's response to comments that the state plan submission timelines should accommodate every state's unique administrative and legislative processes is also relevant here and is provided elsewhere in this section of the preamble.

work collaboratively with the EPA on any portions of a plan identified as being deficient during both the completeness determination period and the period for the EPA's substantive review of the plan. Thus, again, a shorter completeness determination period that includes a cutoff for deeming submissions complete by operation of law merely keeps the state plan review process moving expeditiously and does not foreclose any state opportunities to correct or supplement submissions at any point in the EPA's review process.

Moreover, the EPA intends to review for completeness as soon as possible after submittal. Although the EPA believes that it will be able to provide a timely completeness determination for most if not all state plan submissions, providing for completeness through operation of the law will help ensure that the EPA's action on state plans does not significantly delay plan processing or implementation.

The EPA is therefore finalizing the completeness provision at 40 CFR 60.27a(g)(1) as proposed. The EPA notes that if the EPA determines a plan is incomplete, the EPA is required to promulgate, through notice-and-comment rulemaking, a Federal plan. See sections III.A.4. and III.B. for the discussion and final amendments associated with the timeline and triggers of the Federal Plan respectively. If a state submits a plan prior to the state plan submission deadline and the EPA also makes a determination that the plan is incomplete prior to that deadline, the EPA will treat the state as if the state has made no submission at all, but this determination does not yet trigger further action by the EPA. Instead, because the state still has an opportunity to submit a complete plan before the state plan submission deadline, the EPA's authority to promulgate a Federal plan is only triggered if the state fails to timely submit a new plan to replace the incomplete plan by the state plan deadline.

3. Timeline for the EPA's Action on State Plans

After a state plan has been determined to be complete or is deemed complete by operation of law, CAA section 111(d) provides that the EPA must evaluate whether the plan is ''satisfactory''; that is, whether the components of the plan meet all the requirements of the statute, these implementing regulations, and the corresponding EG. The EPA does so by evaluating a plan (or plan revision) to determine whether the plan or plan revision is approvable, in part or in whole (see section III.D.1. of this preamble for discussion on partial plan approvals), through a notice-and-comment rulemaking process. After the EPA proposes an action on a state plan submission (*e.g.,* approval, partial approval/partial disapproval, disapproval) and reviews comments on the proposed action, the EPA will finalize its action on the plan. If the EPA approves a state plan, the standards of performance and other components of that state plan become federally enforceable. If the state plan is disapproved, in part or in whole, the EPA is obligated to promulgate a Federal plan for designated facilities within the state that were covered by the disapproved portions of the plan (see section III.A.4. of this preamble below for the EPA's timeline to publish a Federal plan).

Subpart B requires the EPA to take action on applicable state plans (*e.g.,* approve or disapprove) within 4 months after the date required for submission. 40 CFR 60.27(b). In the development of subpart Ba, the EPA contended that 4 months was an inadequate time to review and take action on state plans and therefore instead provided a deadline of 12 months for final action on a state plan (mirroring the maximum time permitted under CAA section 110(k)(1)(2) for the EPA's action on complete SIPs). 84 FR 32520, July 8, 2019. In the *ALA* decision, the D.C. Circuit vacated this revised timeline in subpart Ba on the basis that the EPA did not adequately justify the extended timeframes and did not consider the public health and welfare impacts of extending the implementation times. As is discussed below, the EPA has in this rulemaking closely evaluated the process, steps, and timeframes for the EPA to substantively review and act upon each state plan submission through a public notice-and-comment rulemaking process. After considering the time anticipated to be necessary for generally expeditious EPA action on state plans, the EPA again proposed that it must take final action on a state plan or plan revision submission within 12 months after a plan is determined to be complete or becomes complete by operation of law.[26]

In the notice of proposed rulemaking, the EPA explained that the first step it takes once a state plan submittal has been deemed ''complete'' under 40 CFR 60.27a(g) is for an intra-agency workgroup to review the plan components to determine whether they conform to the applicable regulatory requirements. The workgroup may require a broad range of expertise in legal, technical, and policy areas, potentially including attorneys, engineers, scientists, economists, air monitoring experts, health and welfare analysts, and/or policy analysts from across a variety of the EPA programs. After review and coordination, the workgroup then develops recommendations for approval or disapproval of each plan component and presents them to Agency decision-makers for review. Once the Agency completes its internal decision-making process, the workgroup proceeds to prepare a written notice of proposed rulemaking. The notice of proposed rulemaking contains the EPA's legal, policy, and technical bases for its proposed action on a state plan submission, which must be thoroughly developed and explained in writing to provide clear and concise information and reasoning to support the public in understanding the Agency's decision and the justification for that decision, and so that the public may provide informed comments on the proposal. The EPA may further develop technical support documents as record support for the proposal. The draft proposed rulemaking and any record support then undergo a multi-layered review process across the EPA offices and levels of management before being processed for signature. The process to evaluate the state plan, draft a proposed action on a CAA section 111(d) state plan, and get the proposed action edited, reviewed, and signed typically requires a minimum of between 6 to 8 months to complete. The signed notice of proposed rulemaking is then submitted for publication in the **Federal Register***,* which may require several weeks of review and processing prior to publication.

The publication of the proposed rulemaking triggers the start of a public comment period of at least 30 days with possible extension, if requested by commenters. Because of the types of sources and pollutants regulated under CAA section 111(d), the EPA reasonably anticipates that many of its proposed actions on state plans will garner significant public interest from individuals, industry, states, and environmental and public health advocates. After completion of the comment period, the EPA then reviews all comments and determines whether, based on any information provided by the comments, it should alter its proposed action or further augment the legal, policy, and technical rationales

---

[26] The deadlines for the EPA action under subpart Ba would apply to any state plan submission regardless of when it is submitted.

supporting that action. Comments received on a proposed action may include technical information that was not available to the EPA at the time of proposal. In the event technical data are received as part of comments on the proposed action, the EPA would then be required to review the new data and evaluate whether and how it should affect the EPA's proposed conclusions regarding the state plan. If a substantive comment is raised that merits reconsideration of the EPA's proposed action, the EPA may determine that it is necessary to revise and repropose its action on the state plan or it may go to the state for more information to help the Agency determine how to proceed.

Once this review of comments is complete, the workgroup drafts and presents updated recommendations for action for internal review and consideration by Agency decision-makers. Once the Agency completes its internal decision-making process, the workgroup then drafts a notice of final rulemaking on the plan submission, which includes responses to comments, any necessary record support, and may also include final regulatory text. The draft final action is then reviewed by senior management and other interested EPA offices within the Agency prior to signature of the final rulemaking approving or disapproving, in whole or in part, a state plan. It is reasonable to permit at least 4 to 7 months for evaluation of the comments received, any necessary technical analysis, decision-making, and drafting and review of the final action.

The duration of each step in this deliberative process varies. The amount of time the EPA needs to review a state plan submission and the time it needs to finalize a notice of proposed rulemaking depends in part on the plan's complexity and the nature of the technical, policy, and legal issues that it implicates. For example, a state plan submission that includes standards of performance for dozens of facilities on different compliance schedules would be more complex and time consuming to review than a plan that simply establishes standards of performance reflecting the presumptive level of stringency for all sources. Similarly, the amount of time needed to respond to comments and issue a final rulemaking depends in part on the number and type of comments received on the EPA's proposed rulemaking. Additionally, the EPA reasonably anticipates that it will be required to review multiple plan submissions at a given time, and these phases of review for a given plan are impacted by the EPA's review of other state plan submissions, as the EPA will need to assure its review across multiple plans and regional offices is consistent from a legal, technical, and policy perspective.

While some commenters supported 12 months as an expeditious timeframe for the EPA review and action on state plan submittals, several noted that 12 months may be insufficient. These commenters asserted that the EPA must meaningfully evaluate and take action on a state plan and a 12-month timeframe may be too short for this process. However, as detailed in the discussion above, the EPA has a mapped out the time necessary to take action on a generic plan submission and believes that 12 months is the most expeditious and therefore the most appropriate period to provide for these generally applicable implementing regulations. Additionally, the EPA has completed hundreds of actions on CAA section 110 SIPs within 12 months over the past 4 years. Given that the EPA may choose to supersede the requirements of subpart Ba as necessary in an individual EG, we believe that providing the shortest period here is consistent with considering health and welfare impacts by designing timelines to achieve state plan implementation as expeditiously as reasonably possible.

The EPA is therefore finalizing as proposed 40 CFR 60.23a(b) to provide that it will take action on a state plan or plan revision within 12 months of a determination of a complete plan pursuant to 40 CFR 60.27a(g). This is a reasonably expeditious timeframe to accommodate the EPA action on a state plan or plan revision submission and the considerations described above, while ensuring that an EG is expeditiously implemented. The process and steps described in this action highlight the fact that it would be unreasonable, if not impossible, to accomplish all of the steps in a legally and technically sound manner within a 4-month timeframe as required under subpart B. Particularly, any proposed action by the EPA has to be open for public comment for at least 30 days, and therefore the 4-month timeline provided in subpart B only gave the EPA 3 months to do the substantive work of both the proposed and final actions, including evaluating the state plan submission, drafting preamble notices, responding to comments, and developing record support at both the proposed and final action stages. A 12-month timeframe after a plan is determined to be complete more reasonably accommodates the process and steps described in this action.[27]

As explained at proposal, the EPA recognizes that the court in *ALA* faulted the Agency for failing to consider the potential impacts to public health and welfare associated with extending planning deadlines. The EPA does not interpret the court's direction to require a quantitative measure of impact, but rather consideration of the importance of the public health and welfare goals of CAA section 111(d) when determining appropriate deadlines. Because 12 months is an adequate period of time in which the EPA can both expeditiously act on a plan submission *and* ensure that its action is technically and legally sound, it follows that the EPA has appropriately considered the potential impacts to public health and welfare associated with this extension of time by providing no more time than the EPA reasonably needs to ensure a plan submission contains appropriate and protective emission reduction measures. If the EPA does not have adequate time to evaluate a state plan submission, its ability to ensure the plan contains appropriate measures to satisfactorily implement and enforce the standards necessary to comply with the EG may be compromised, which would in turn compromise the EPA's ability to ensure that the public health and welfare objectives of the EG are satisfied. Although several commenters noted that the review of some plans may require a more in depth analysis, the EPA believes 12 months is a both reasonable and expeditious timeframe to evaluate and act on most state plans. Accordingly, in order to ensure that the public health and welfare objectives of CAA section 111 are timely realized, and consistent with the direction in *ALA,* the EPA does not believe it would be appropriate to finalize a timeframe longer than 12 months for the EPA action on state plans.

4. Timeline for the EPA To Promulgate a Federal Plan

CAA section 111(d)(2) provides that the EPA has the same authority to prescribe a Federal plan for a state that fails to submit a satisfactory plan as it does for promulgating a FIP under CAA section 110(c). Accordingly, the EPA's obligation to promulgate a Federal plan is triggered in three situations: where a state does not submit a plan by the plan

---

[27] While the EPA would have the discretion to act on a state's submission more quickly than 12 months where specific circumstances allow (*e.g.,* where there are no public comments on the proposed action), the EPA does not believe that it would be reasonably possible to act significantly more quickly than 12 months in most cases.

submission deadline; where the EPA determines a portion or all of a state plan submission did not meet the completeness criteria and the time period for state plan submission has elapsed and, therefore, the state is treated as having not submitted a required plan; and where the EPA disapproves a state's plan. 40 CFR 60.27a(c). The EPA is finalizing as proposed the revisions to 40 CFR 60.27a(c) providing that the Agency will promulgate a Federal plan at any time within 12 months of any of the triggers in § 60.27a(c)(1) and (2) (see section III.B. of this preamble for discussion).[28]

The EPA is obligated to promulgate a Federal plan for states that have not submitted a plan by the submission deadline. Once the obligation to promulgate a Federal plan is triggered, it can only be tolled by the EPA's approval of a state plan. If a Federal plan is promulgated, a state may still submit a plan to replace the Federal plan. A Federal plan under CAA section 111(d) is a means to ensure timely implementation of EGs, and a state may choose to accept a Federal plan for their sources rather than submit a state plan. While the EPA encourages states to timely submit plans for EGs, there are no sanctions associated with failing to timely submit an approvable plan or with the implementation of a Federal plan.[29]

The original implementing regulations in subpart B provided the EPA with 6 months to promulgate a Federal plan once its obligation to do so was triggered. 40 CFR 60.27(d). When the EPA promulgated subpart Ba in 2019, it concluded that this amount of time was insufficient and consequently extended the time for the EPA to promulgate a Federal plan to 24 months, mirroring the timeframe permitted for promulgation of a FIP under CAA section 110. 84 FR 32520, July 8, 2019. In the *ALA* decision, the D.C. Circuit vacated this revised timeline in subpart Ba on the basis that the EPA did not adequately justify the extended timeframe and did not consider the health and welfare impacts of extending the implementation timeframe.

At proposal, the EPA reevaluated the process, steps, and timeframes for the EPA to promulgate a Federal plan through a public notice-and-comment rulemaking process and proposed a 12-month timeframe to promulgate a Federal plan once its obligation to do so is triggered.[30] As explained in the notice of proposed rulemaking, a Federal plan must meet the requirements of CAA section 111(d) and therefore contain the same components as a state plan, namely standards of performance for designated facilities and measures that provide for the implementation and enforcement of such standards. CAA section 111(d)(2)(B) also explicitly requires the EPA to consider RULOF in promulgating a standard of performance under a Federal plan. Additionally, Federal plans containing standards of performance are subject to the procedural requirements of CAA section 307(d), such as the requirements for proposed rulemaking and opportunity for public hearing. CAA section 307(d)(1)(C). The EPA's regulations at 40 CFR 60.27a implement these various statutory requirements and contain general regulatory requirements for the EPA's promulgation of a Federal plan. The process, and steps for the EPA to promulgate a Federal plan consistent with these applicable requirements is described in the following paragraphs.

Once the EPA's obligation to promulgate a Federal plan is triggered, the EPA establishes an intra-agency workgroup to develop the rulemaking action to address that obligation. The workgroup first develops recommendations for the components of the Federal plan to be proposed, and on legal, policy, and technical rationales that support the recommendations. These components are identified in subpart Ba as well as in the corresponding EG and are generally the same as those required for a state plan. One of these fundamental components is the determination of standards of performance for designated facilities. Based on the requirements of CAA sections 111(d) and 111(a)(1), these standards must generally reflect the degree of emission limitation achievable through application of the BSER as determined by the EPA as part of the EG. Depending on the form of the BSER and the degree of emission limitation in a particular EG, the EPA may need to do additional work to calculate standards of performance that reflect this level of stringency. For example, an EG may translate the degree of emission limitation into a presumptive standard in the form of numerical emission rates, which a Federal plan could simply adopt as the requisite standards of performance. However, if an EG provides the degree of emission limitation in a form other than presumptive numerical standards, and the EPA may need to calculate appropriate standards of performance in the context of a Federal plan. Further, CAA section 111(d)(2) requires the EPA to consider RULOF for sources in the source category in setting standards of performance as part of a Federal plan which requires the EPA to identify whether the remaining useful lives of relevant designated facilities, among other appropriate factors, merit the EPA establishing different standards of performance for those facilities. The development of a Federal plan may also necessitate that the EPA determine appropriate testing, monitoring, reporting, and recordkeeping requirements to implement the standard if the EG does not provide presumptive requirements to address those aspects of implementation. Further, the EPA will need to consider associated compliance times for designated facilities in circumstances where they are not provided by an EG, or in cases where a standard of performance is adjusted to account for RULOF. There may also be situations where IoPs are warranted,

---

[28] The EPA has discretion to address its obligation to promulgate a Federal plan in a variety of ways for states that do not have an approved state plan. For example the EPA may initially promulgate a single Federal plan that applies to all appropriate states and then update that Federal plan as necessary to accommodate the inclusion of other states that trigger the need for a Federal plan in the future (*e.g.,* a Federal plan that applies to states that fail to submit a plan can be updated to include applicability for states that later have a plan disapproved); or the EPA may promulgate separate Federal plans each time its authority to do so has been triggered (*e.g.,* the EPA will promulgate a Federal plan for all states that fail to submit a plan and another Federal plan for all states that have their plan disapproved).

[29] CAA section 179 provides that sanctions should be applied in states that fail to submit approvable SIPs for certain specified requirements for NAAQS implementation. The EPA has not promulgated any similar sanctions provisions governing the submission of state plans pursuant to section 111(d).

[30] The EPA reviewed the information available in 40 CFR part 62 associated with the promulgation of Federal Plans under CAA section 111(d). The supporting information reviewed is available at Docket ID No. EPA–HQ–OAR–2021–0527. Under the provisions of CAA section 111 and subpart B, the EPA promulgated Federal plans for municipal solid waste landfills EG 40 CFR part 60, subpart Cc (Federal plan codified at 40 CFR part 62, subpart GGG) and municipal solid waste landfills EG 40 CFR part 60, subpart Cf (Federal plan codified at 40 CFR part 62, subpart OOO).

The EPA also reviewed information available in 40 CFR part 62 associated with the promulgation of Federal Plans under CAA 129. The supporting information reviewed is available at Docket ID No. EPA–HQ–OAR–2021–0527. Under the provisions of CAA sections 111 and 129 and subpart B, the EPA has promulgated Federal plans for large municipal waste combustors EG 40 CFR part 60, subpart Cb (Federal plan codified at 40 CFR part 62, subpart FFF); small municipal waste combustors EG 40 CFR part 60, subpart BBBB (Federal plan codified at 40 CFR part 62, subpart JJJ); hospital, medical, and infectious waste incinerators EG 40 CFR part 60, subpart Ce (Federal plan codified at 40 CFR part 62, subpart HHH); commercial and industrial solid waste incinerators EG 40 CFR part 60, subpart DDDD (Federal plan codified at 40 CFR part 62, subpart III) and sewage sludge incinerators EG 40 CFR part 60, subpart MMMM (Federal plan codified at 40 CFR part 62, subpart LLL).

and the EPA will correspondingly need to identify and determine the appropriate IoPs. The development of a Federal plan with these components, or of significant revision to a Federal plan, will also include elements of meaningful engagement, as finalized in this action including revision to section 40 CFR 60.29a and as further described in section III.C. of this preamble.

Once the recommendations for each component are developed, the workgroup presents them to Agency decision-makers for review. After the Agency completes its internal decision-making process, the workgroup proceeds to prepare a written notice of proposed rulemaking. The proposal must include the following elements, as required by CAA section 307(d)(3): the factual data on which the proposed rulemaking is based; the methodology used in obtaining the data and in analyzing the data; and the major legal interpretations and policy considerations underlying the proposed rulemaking. These elements must be thoroughly developed and explained in the proposal to meaningfully provide the public adequate information to comment on the proposal. The EPA may further develop a technical support document as record support for the proposal.

The draft proposed rulemaking and any record support are then reviewed by the relevant EPA offices and processed for signature. The signed notice of proposed rulemaking is then submitted for publication in the **Federal Register**. To develop the proposed Federal plan rulemaking, establish unique standards for RULOF, allow review of materials by senior management, go through an interagency review process and have the package signed typically requires a minimum of between six to nine months to complete.

As previously noted, the EPA's promulgation of a Federal plan is subject to the requirements of CAA section 307(d), which includes providing the public with an opportunity to provide an oral presentation at a public hearing. CAA section 307(d)(5). The Federal Register Act requires the EPA to provide sufficient notice of a public hearing, which (in the absence of a different time specifically prescribed by the relevant Act of Congress) is satisfied if the EPA provides at least 15 days' notice. 44 U.S.C. 1508. Section 307(d)(5) of the CAA further provides that the EPA must keep the record for the proposed action open for public comment for 30 days after any public hearing for the submission of rebuttal and supplemental information. Because the EPA reasonably expects to provide notice of the required public hearing at the time its proposed action is published in the **Federal Register***,* in order to allow for both a 15-day notice of the public hearing and a subsequent 30-day comment period on the open record, the EPA should allow for at least 45 days for public comment on the notice of proposed action.

As with state plans, because of the types of sources and pollutants regulated under CAA section 111(d), the EPA reasonably anticipates that many of its proposed actions on a Federal plan will garner significant public interest from individuals, industry, states, and environmental and public health advocates. After completion of the comment period, the EPA then reviews all comments and determines whether, based on any comment, it should alter any components of the proposed Federal plan, or further augment the legal, policy, and technical rationales supporting that proposed action. Additionally, in the EPA's experience, comments may include technical information that was not in front of the Agency at the time of proposal. In the event technical data are received as part of comments on the proposed action, the EPA would then be required to review the new data and evaluate whether and how it should affect the EPA's proposed Federal plan. If a substantive comment is raised that merits reconsideration of any component in the proposed Federal plan, the EPA would need to repropose the plan.

Once this review of comments is complete, the workgroup drafts and presents updated recommendations for internal review and decision making. Once the Agency completes its internal decision-making process, the workgroup then drafts a notice of final rulemaking, which includes responses to comments and any necessary record support, and final regulatory text as the Federal plan directly regulates certain designated facilities. The draft final action is then reviewed by relevant offices within the Agency prior to signature of the final rule promulgating the Federal plan. The EPA typically anticipates that the process of reviewing comments received, making corresponding changes to the rulemaking, and promulgating the final Federal plan to be between 4 and 8 months.

The duration of each step in this deliberative process varies. The amount of time the EPA needs to develop, propose, and finalize a Federal plan depends in part of the plan's complexity and the nature of the technical, policy, and legal issues that it implicates. For example, some states needing a Federal plan may have thousands, if not hundreds of thousands, of designated facilities for which the EPA will need to establish standards of performance and implementation measures, while other Federal plans may be significantly smaller in scale. Similarly, the amount of time needed to respond to comments and issue a final rule depends in part on the number and type of comments received on the EPA's proposed rulemaking. Additionally, the EPA reasonably anticipates that it may need to promulgate a Federal plan for multiple states at a given time, which can amplify the amount of time and work needed.

In response to this proposed timeline, several commenters asserted that the EPA should provide itself more than the proposed 12 months to promulgate a Federal plan, with some commenters noting additional time needed for the EPA to provide for meaningful engagement and consideration of RULOF. However, based on the assessment as presented in the preceding paragraphs, recognizing that much of the evaluation needed for promulgating a Federal plan will be performed by the EPA during development of the EG, considering the need for expeditious implementation of EGs, and noting that RULOF is expected to only be needed for certain limited circumstances, the EPA is finalizing the requirement that it promulgate a Federal plan within 12 months once its obligation to do so is triggered, *i.e.,* either the date required for submission of a state plan (for states that fail to submit a complete plan) or the date the EPA disapproves a state's plan. As with the other timelines in subpart Ba, the EPA may supersede the 12 month timeline for a Federal plan as appropriate depending on the circumstances of the applicable EG.

The EPA also recognizes that some commenters stated that the EPA need not and should not wait for its Federal plan obligation to be ''triggered'' to begin developing such a plan. The EPA agrees that early development of the Federal plan, where possible before the EPA's obligation is formally triggered, could provide the EPA with additional time to meet this deadline. The EPA notes that to further streamline the timeline associated to the issuance of a Federal plan, the EPA is also finalizing the proposed change to the trigger for the EPA's obligation and timeline to provide a Federal plan for states that do not submit a timely plan. That discussion is found in section III.B. of this preamble.

Thus, the EPA is finalizing as proposed the revisions to 40 CFR 60.27a(c) providing that the Agency will promulgate a Federal plan at any time within 12 months of any of the triggers in § 60.27a(c)(1) and (2). While retaining the authority to supersede this timeline in an EG if appropriate, the EPA has determined that 12 months reasonably accommodates the amount of time that the EPA needs to undertake the process, steps, and the considerations described above, while ensuring that an EG is expeditiously implemented. The process and steps described earlier that the EPA must be taken in promulgating a Federal plan highlight the fact that it would be unreasonable, if not an impossibility, to accomplish all of the steps in a legally and technically sound manner within a 6-month timeframe as required under subpart B.[31]

As with the EPA's finalized timeline to act on state plan submissions, 12 months is generally the period of time in which the EPA can both expeditiously complete a Federal plan *and* ensure it is technically and legally sound. Therefore, this time period considers potential impacts to public health and welfare by giving the EPA a reasonably expeditious timeframe to promulgate a Federal plan that contains appropriate and protective emission reduction measures. This is especially true in the context of a Federal plan, where there is otherwise no state plan in place that is adequately protective of public health and welfare. If the EPA does not have adequate time to promulgate a Federal plan, its ability to ensure the plan contains appropriate measures to satisfactorily implement and enforce the standards necessary to comply with the EG may be compromised, which would in turn compromise the EPA's ability to ensure that the public health and welfare objectives of the EG are satisfied.

The EPA notes that a state may submit a plan to replace a Federal plan, even after the state plan submission deadline. However, once the EPA's authority and obligation to promulgate a Federal plan has been triggered, the act of a state submitting a plan alone does not abrogate the EPA's authority or obligatory timeline to promulgate a Federal plan. Only an approved state plan can supplant an already promulgated Federal plan or abrogate the EPA's responsibility to timely promulgate a Federal plan. Where a state submits a late plan, that may have the practical effect of concurrent timelines for promulgation of the Federal plan and the EPA's action on that late state plan; the EPA is not obligated to act on a late state plan prior to promulgating a Federal plan (40 CFR 60.27a(d)).

5. Timeline for Increments of Progress (IoPs)

As part of the EPA's statutory responsibility to determine the degree of emission limitation achievable through application of the BSER and to include it in an EG, the EPA also determines in an EG ''the time within which compliance with standards of performance can be achieved.'' 40 CFR 60.22a(b)(5). Accordingly, state plans must include both standards of performance for designated facilities and compliance schedules for achieving those standards of performance.[32]

In 1975, the EPA defined in subpart B ''compliance schedule'' as ''a legally enforceable schedule specifying a date or dates by which a source or category of sources must comply with specific standards of performance contained in a plan or with any increments of progress to achieve such compliance.'' In subpart B the EPA also defined ''increments of progress'' as steps to achieve compliance which must be taken by an owner or operator of a designated facility including: (1) submittal of a final control plan for the designated facility to the appropriate air pollution control agency; (2) awarding of contracts for emission control systems or for process modifications, or issuance of orders for the purchase of component parts to accomplish emission control or process modification; (3) initiation of on-site construction or installation of emission control equipment or process change; (4) completion of on-site construction or installation of emission control equipment or process change; and (5) final compliance. The EPA adopted these definitions without change when it promulgated subpart Ba in 2019.

Subpart B requires that each state plan include emission standards and compliance schedules. 40 CFR 60.24a. In addition, subpart B specifies in 40 CFR 60.24(e)(1) that any compliance schedule extending more than 12 months from the date required for submittal of the plan must include legally enforceable increments of progress to achieve compliance for each designated facility or category of facilities. Unless otherwise specified in the applicable subpart, increments of progress must include, where practicable, each increment of progress specified in § 60.21(h) and must include such additional increments of progress as may be necessary to permit close and effective supervision of progress toward final compliance. The provision in 40 CFR 60.24(e)(1) was amended in 2000.[33] The 2000 amendments to 40 CFR 60.24(e)(1) added the words ''Unless otherwise specified in the applicable subpart'' to the requirements associated with IoPs. The EPA described in the 1999 proposal that the purpose of this amendment was to allow the EPA, in a specific subpart, discretion in the number of IoPs that a designated facility must meet. Without this amendment subpart B required designated facilities to meet all five IoPs specified in the IoP definition. In the 1999 proposal the EPA recognized that while for some categories of designated facilities the five increments are appropriate, all five IoPs may not be necessary to ensure compliance for other categories of designated facilities. Therefore, EPA proposed and finalized amendments to 40 CFR 60.24(e) to allow discretion and flexibility in establishing IoPs for a particular subpart.

In promulgating subpart Ba in 2019, the EPA largely carried over the requirement of subpart B at 40 CFR 60.24(e)(1) in a new provision 40 CFR 60.24a(d).[34] However, to align the trigger of IoPs in 40 CFR 60.24a(d) to the updated timelines it was finalizing in subpart Ba, in 2019 the EPA adopted a timeframe trigger for IoPs of 24-months instead of the 12-months as in subpart B. Per the finalized 2019 subpart Ba provision at 40 CFR 60.24a(d), unless otherwise specified in the applicable subpart, any compliance schedule extending more than 24 months from the date required for submittal of the plan must include legally enforceable IoPs to achieve compliance for each designated facility or category of facilities. As discussed previously, the D.C. Circuit vacated the extended implementation timelines in subpart Ba, including the 24-months timeline trigger for IoPs in 40 CFR 60.24a(d).[35]

---

[31] While the EPA would have the discretion to promulgate a Federal plan more quickly than 12 months where specific circumstances allow (*e.g.,* where there are no public comments on the proposed action), the EPA does not believe that would be reasonably possible to act significantly more quickly than 12 months in most cases.

[32] ''Each plan shall include standards of performance and compliance schedules.'' 40 CFR 60.24a(a).

[33] 65 FR 76380 (Dec 6, 2000).

[34] In promulgating Ba in 2019, the EPA specified that for ''For those provisions that are being carried over from the existing implementing regulations into the new implementing regulations, the EPA is not intending to substantively change those provisions from their original promulgation and continues to rely on the record under which they were promulgated.'' 84 FR 32520 (July 8, 2019).

[35] Petitioners did not challenge, and the court did not vacate in *ALA,* the substantive requirement for or definition of increments of progress.

To address the vacated timeline trigger of IoPs in 40 CFR 60.24a(d), the EPA proposed in 2022 that, unless otherwise specified in the applicable subpart, any compliance schedule extending more than 16 months from the date required for submittal of the plan must include legally enforceable IoPs to achieve compliance for each designated facility or category of facilities. The proposed 16-month trigger for IoPs overlapped with the EPA's proposed 60-day completeness review following a state plan submittal and the proposed 12-month period for the EPA to review and take action on the state's plan and would have further provided a 2-month buffer after the timeline for the EPA's action on a state plan (occurring no later than 14 months after the plan submission deadline under these general implementing regulations). In the 2022 proposal the EPA recognized the proposed 16-month timeframe trigger for IoPs provided a 2-month time buffer between the EPA's action on a state plan and the trigger of IoPs. As proposed, this 2-months buffer was less than both the 8 months previously provided by subpart B and the 6-month buffer provided by the vacated subpart Ba timeline.

In response to the proposed 16-month IoPs timeframe trigger, several commenters asserted the proposed 2-month buffer from the time of the EPA's action on a state plan to the trigger of IoPs is not practically workable. Some commenters argued that, assuming that there could be a required increment of progress right after the 16-months trigger and the EPA has 14 months to take final action on a state plan, the designated facilities would have only two months to comply with the requirement after it becomes federally enforceable. Other commenters similarly noted that if final compliance was required just after the 16-month trigger, designated facilities would similarly have only two months to complete any IoPs. The commenters explained that it is unduly burdensome for sources to expend resources on developing hypothetical final control plans and committing resources to construction projects that may ultimately be inconsistent with the EPA's action on a state plan. Several commenters that opposed the 16-months proposed timeframe trigger for IoPs suggested that the EPA extend the trigger to more than 24-months, consistent with the previously vacated subpart Ba. Some commenters argued that 24 months is the minimum time necessary to develop control strategies, design plans, procure construction materials and/or equipment, and complete the installations often necessary for compliance. Other commenters suggested that a 10-month buffer from the EPA action on a state plan to the trigger for IoPs would also be acceptable and even preferred, should the EPA miss its approval deadlines.

After consideration of comments and accounting for the discretion that EPA has in establishing IoPs in a particular EG, the EPA is extending the buffer associated with the trigger of IoPs from 2 months to 6 months, so that, unless otherwise specified in the applicable subpart, any compliance schedule extending more than 20 months from the date required for submittal of the plan must include legally enforceable IoPs to achieve compliance for each designated facility or category of facilities.

The EPA emphasizes that the timeline for the trigger for IoPs merely signals when the gap between state plan submission and final compliance is long enough that the EPA must consider whether IoPs are necessary. It is not the case that any EG with a final compliance date after the trigger for consideration of IoPs will necessarily require all of the increments listed in 40 CFR 60.21a(h). The EPA is required, per 40 CFR 60.22a(b)(4), to include within an EG ''[i]ncremental periods of time normally expected to be necessary for the design, installation, and startup of identified control systems.'' These incremental periods are determined within an EG through notice and comment rulemaking, providing an opportunity for appropriate consideration of the reasonable time needed for the designated facilities to meet the requirements associated with the pertinent standards of performance. As provided by subpart Ba, the EPA will determine in an individual EG whether IoPs are needed to achieve final compliance with the standards of performance and, if increments are needed, how many and the timeframes associated with compliance of such IoPs. However, the EPA also believes that the trigger requirement for IoPs should attach to plans that contain compliance periods that are longer than the period provided for the EPA's review of such plans and in addition provide a reasonable buffer after the EPA has acted on such plans so that designated facilities could reasonably comply with required increments. After further consideration, the EPA believes that a default 2-month buffer between an EPA action on a state plan and a hypothetical compliance deadline for a full set of IoPs is not generally sufficient.

In 2019, the EPA promulgated a trigger for IoPs of 24-months given that it was finalizing a period of up to 18 months for its action on state plans (*i.e.,* 12 months from the determination that a state plan submission is complete, which could occur up to six months after receipt of the state plan). The 24-month period would have provided a 6-month buffer for designated sources to comply with any IoPs after the EPA acted on state plans. In this action, the EPA is finalizing a trigger for consideration of IoPs that provides the same buffer provided by the EPA in the 2019 vacated increment of progress timeline trigger. The EPA believes a 6-month buffer is generally needed to appropriately balance ensuring designated facilities control emissions of harmful pollutants as expeditiously as reasonably possible with the need for designated facilities to have reasonable certainty regarding their federally enforceable regulatory compliance obligations with sufficient time before those obligations are due. In addition, the EPA determines that the 6-months buffer provides a reasonable time to come into compliance with any potential increment of progress when compliance date that extends more than 20 months from the date required for submittal of the plan. Per the EPA's assessment of the comments and in light of the *ALA* court decision, the EPA determines that a 6-month timeframe buffer before the trigger for requirements associated with IoPs provides is the most reasonable expeditious period of time associated with the requirements for IoPs in 40 CFR 60.24a(d). While some commenters argued more time is necessary to develop control strategies, design plans, procure construction materials and/or equipment, and complete the installations often necessary for compliance, the final requirements in subpart Ba does not express the EPA's intent to require that states require designated facilities to complete all potential IoPs in a 6-month period.

Several commenters also urged the EPA to link the timelines for IoPs to the date on which the EPA takes final action on a state plan, instead of with the state plan submittal deadline. However, given that there will typically be a single final compliance date specified in an EG but the dates on which the EPA takes final action on individual states plans are likely to be many and varied based on, *inter alia,* when each state plan was submitted to the Agency, such an approach would create unnecessary confusion about whether IoPs must be implemented and potentially uneven application of the requirement for state plans to include IoPs. It could also create a perverse incentive for states to delay submission of their state plans. Additionally, the timeline for IoPs initiates from the state plan submittal deadline because it is the earliest instance when all standards of performance in all timely state plans will be enforceable. It is a requirement of state plans, when submitted, to be enforceable at the state level and thus all designated facilities subject to a standard of performance in a state plan will have assurance of their requirements at the state level and can start planning for compliance while the EPA reviews and acts on the state plan.

The timeline for IoPs finalized in this action will ensure standards of performance are implemented as expeditiously as possible so that the intended emission reductions are achieved, and the public health and welfare are protected.

B. Federal Plan Authority and Timeline Upon Failure To Submit a Plan

CAA section 111(d)(2)(A) provides that the EPA has the same authority ''to prescribe a plan for a State in cases where the State fails to submit a satisfactory plan as he would have under section 7410(c) of this title in the case of failure to submit an implementation plan.'' The original implementing regulations in subpart B provide that the EPA is to ''promptly prepare and publish proposed regulations setting for a plan, or portion thereof, for a State if:'' a state fails to submit a plan within the time prescribed, the state fails to submit a plan revision within the time prescribed or the Administrator disapproves a state plan or plan revision or any portion thereof. 40 CFR 60.27(c). Subpart B further requires the EPA to promulgate the plan proposed under paragraph (c) ''within six months after the date required for submission of a plan or plan revision . . . unless, prior to such promulgation, the State has adopted and submitted a plan or plan revision which the Administrator determines to be approvable.'' 40 CFR 60.27(d).

In promulgating subpart Ba in 2019, the EPA incorporated language in the provisions associated with the Actions by the Administrator in 40 CFR 60.27a(c) from CAA sections 110(c)(1)(A) and 110(k)(1)(B) addressing the circumstances which trigger the EPA's authority under CAA section 111(d)(2) for promulgating a Federal plan. Specifically, in 2019 the EPA adopted language at 40 CFR 60.27a(c)(1) that requires the EPA to promulgate a Federal plan after it ''*[f]inds* that a state fails to submit a required plan or plan revision or *finds* that the plan or plan revision does not satisfy the minimum criteria under'' 40 CFR 60.27a(g), *i.e.,* the completeness criteria (emphasis added). Pursuant to the amendments being finalized in this action, the EPA will be required, under 40 CFR 60.27a(g), to determine whether completeness criteria have been met no later than 60 days after the date by which a state is required to submit a plan (see section III.A.2. of this preamble). These provisions under subpart Ba taken together would mean that, no later than 60 days after the state plan submission deadline has passed, the EPA must make a finding (often referred to as a ''finding of failure to submit'') as to whether any states have failed to submit a plan that meets the completeness criteria, and such finding is what triggers the EPA's obligation and timeline to promulgate a Federal plan.[36]

At proposal, the EPA acknowledged that in the CAA section 110 context, it has not always timely met its obligation to issue a finding of failure to submit, which in turn delays the timing for when the EPA promulgates a FIP to achieve the necessary emission reductions. Accordingly, the EPA proposed to streamline the process in the subpart Ba context to ensure that the emission reductions anticipated by the EG are realized in a timely way through the promulgation of any necessary Federal plan. In particular, the EPA proposed revisions to 40 CFR 60.27a(c)(1) consistent with the framework and requirements that have been effective in subpart B since 1975. As proposed the Administrator would issue a Federal plan if a state fails to submit a plan within the time prescribed without requiring the EPA to affirmatively issue a finding of failure to submit before the EPA's obligation to issue a Federal plan is triggered.

As explained in the notice of proposed rulemaking, as part of evaluating ways to streamline the steps leading to promulgation of a final Federal plan, the EPA considered the value and role of issuing findings of failure to submit in this process. A finding of failure to submit was intended to serve three purposes under subpart Ba, consistent with its purpose under CAA section 110: to notify the public of the status of state plan submissions (*i.e.,* providing transparency to the process); to notify states that the EPA has not received a plan; and to formally start the clock for the EPA to promulgate a Federal plan. While these concepts may have some utility as part of the overall Federal plan development and implementation process, the EPA finds that in the CAA section 111(d) context there is minimal value in coupling the notification aspects of a finding of failure with the initiation of the clock for the EPA to promulgate a Federal plan. These aspects are not inextricably linked to one another in that nothing about a formal finding of failure to submit substantively informs the development of a Federal plan; the EPA has the information it needs to know which states have and have not submitted complete plans. By decoupling the timeline from the finding of failure to submit, the EPA's obligation to promulgate a Federal plan can be triggered without the interim step and potential lag associated with issuing a formal finding of failure to submit notification. By removing this interim process, the EPA will be required to promulgate the Federal plan more expeditiously, and, in turn, overall implementation of the corresponding EG will be timelier. Finalizing this amendment is also consistent with the spirit of the *ALA* decision, where the D.C. Circuit emphasized the need for implementation timelines that consider potential impacts on public health and welfare. By expeditiously and efficiently promulgating a Federal plan and by removing an interim step of a finding of failure, the EPA is further addressing the potential impacts of implementation times on health and welfare.

Some commenters requested that the EPA retain a separate ''finding of failure to submit'' action as the trigger for starting the timeline on a Federal plan. They note that the ''finding of failure'' provides notification to the states, regulated community, and public of the failure, as state submissions can be difficult to track. Commenters also note that the need to first provide the finding also provides additional time for the states to submit plans or revisions. One commenter noted that the EPA should retain the ''finding of failure to submit'' procedure and avoid establishing automatic deadlines for itself on a schedule that, based on past experience, it is almost certain to miss.

First, the EPA notes that where a state has failed to timely submit a state plan, the absence of a state plan submission should be easy to track for the state,

---

[36] Note that this procedure does not address circumstances when the EPA promulgates a Federal plan for states whose plan is disapproved. In these circumstances, the state has submitted a plan so no finding of failure to submit is issued. The EPA's obligation and timeline to promulgate a Federal plan in this instance arises from the EPA's disapproval based on its conclusion that the state plan submission was unsatisfactory.

regulated community, and public; many, if not all, states maintain public websites on which they document their submissions to the EPA. The EPA expects that notification and tracking capabilities will also generally be much improved through the use of electronic submittal (see section III.F. of this preamble) and increasing public access to online information.

Second, the EPA stresses that the purpose of using a finding of failure to submit as the trigger for Federal plan development was not to give states time to develop and submit their state plans in excess of the regulatorily allotted timeframes. In this action, the Agency is finalizing timeframes for state plan submissions that are reasonably achievable and that may be superseded where necessary. Decoupling the finding of failure to submit and the trigger of state plan development should therefore not impact states' abilities to develop and submit satisfactory state plans. States always have the ability to submit state plans and state plan revisions at any time. Additionally, while the EPA recognizes that it has not always provided timely Federal plans, the Agency does not believe that changing the starting point for its Federal plan clock from a finding of failure to submit to the day after state plan submission are due will have an appreciable impact on its ability to do so. Notably, the trigger for its timeline will not change the length of time the EPA has to promulgate a plan. While the commenter implies that the EPA would use the time before it has made a finding of failure to submit to start working on a Federal plan, it is not reasonable to assume that the Agency is in a position to start developing such a plan before it has had a chance to determine if a state plan is incomplete. Therefore, the EPA is finalizing its proposed approach of removing from subpart Ba a finding of failure to submit as the trigger for starting the timeline for a Federal plan. The approach being finalized in subpart Ba is consistent with the framework and requirements that have been effective in subpart B since 1975. The regulatory text at 40 CFR 60.27a(c)(1) is being revised slightly relative to proposal to clarify that the 12-month clock starts running the day after the state plan submission deadline for instances in which a state fails to submit a plan or plan revision by that deadline, and the day after state plan submissions would be deemed complete by operation of law (*i.e.,* 60 days after the state plan submission deadline) for instances in which a state plan has been submitted but deemed incomplete.[37] These revisions merely clarify the EPA's intent at proposal to ensure that all states and stakeholders have a clear understanding of the timeline for promulgation of a Federal plan. As discussed in section III.A.4. of this preamble, the EPA is finalizing the requirement that it will have 12 months from the state plan deadline to promulgate a Federal plan for states that do not submit a plan. Note, the EPA is also finalizing a deadline of 12 months to promulgate a Federal plan for states whose plans are disapproved, but in those instances the EPA's obligation and timeline to provide a Federal plan are triggered off of its disapproval of a state plan.

The EPA notes that this amendment to subpart Ba does not affect the EPA's obligation under CAA section 110(c) to promulgate a FIP within 2 years of making a finding that a state has failed to submit a complete SIP. In the case of the CAA section 110, the obligation for the EPA to first make a finding of failure to submit is derived from the statute, whereas nothing in CAA section 111(d) obligates the EPA to make such a finding before promulgating a Federal plan. CAA section 111(d)(1) directs the EPA to promulgate a process ''similar'' to that of CAA section 110, rather than a process that is identical. Therefore, the fact that a finding of failure to submit serves as the legal predicate for the EPA's obligation to issue a FIP under CAA section 110 does not mean that the EPA is also required to treat such a finding as a legal predicate for a Federal plan under CAA section 111(d).

In summary, while recognizing that a finding of failure to submit can have value in notifying states and the public of the status of plans, the EPA does not find that it is integral to the process of promulgating a Federal plan for states that do not submit plans. Further, the requirement for the EPA to issue a finding of failure can result in significant unwarranted delays in EG implementation. The EPA is therefore finalizing the proposed amendment that this finding will no longer be the event that triggers the timeline for the EPA's issuance of a Federal plan. 40 CFR 60.27a(c)(1). While the EPA will not publish a formal finding of failure to submit in the **Federal Register**, the Agency will notify the states and the public of a failure to submit expeditiously following the state plan submission deadline or deadline for EPA determinations of completeness, as applicable. Additionally, the EPA notes that the completeness criteria in 40 CFR 60.27a(g) were promulgated in 2019, 84 FR 32520, 32578 (July 8, 2019), and, while the EPA is removing finding of failure to submit as the trigger for promulgation of a Federal rule, it emphasizes that states may have discussions with the EPA and submit revised state plans at any point. That is, there remains within this framework ample opportunity for iterative state plan development.

The regulatory provision at 40 CFR 60.27a(c)(1), as finalized, is consistent with the requirement that applies regarding the EPA's issuance of a Federal plan under subpart B. In subpart B (*i.e.,* applicable to implementing regulations for CAA section 111(d) EGs promulgated on or prior to July 8, 2019, and currently applicable implementing regulations for CAA section 129 EGs), the EPA's obligation to promulgate a Federal plan is triggered by the state plan submission deadline.

C. Outreach and Meaningful Engagement

The fundamental purpose of CAA section 111 is to reduce emissions from certain stationary sources that cause or significantly contribute to air pollution which may reasonably be anticipated to endanger public health or welfare. Therefore, a key consideration in the state's development of a state plan, in any significant plan revision,[38] and in the EPA's development of a Federal plan or significant plan revision, pursuant to an EG promulgated under CAA section 111(d) is the potential impact of the proposed plan requirements on public health and welfare. A robust and meaningful public participation process is critical to ensuring that the full range of these impacts are understood and considered.

States often rely primarily on public hearings as the foundation of their public engagement in their state plan development process because a public hearing has always been explicitly required pursuant to the applicable regulations. The existing provisions in subpart Ba (40 CFR 60.23a(c) through (f)) detail the public participation requirements associated with the development of a state plan. Per these implementing regulations, states must

---

[37] As discussed in section III.A.2., if a state submits a plan but that submission does not contain the elements required by the completeness criteria, the EPA would find that the state has failed to submit a complete plan and notify the state through a letter. That letter is for notification only and, although the EPA intends to issue such letters expeditiously, it does not start the clock for a Federal plan.

[38] A significant state plan revision includes, but is not limited to, any revision to standards of performance or to measures that provide for the implementation or enforcement of such standards.

provide certain notice of, and conduct one or more public hearings on, their state plan before such plan is adopted and submitted to the EPA for review and action.[39] The EPA is not reopening these basic and long-standing public hearing requirements in this rulemaking. However, as explained in the notice of proposed rulemaking,[40] robust and meaningful public involvement in the development of a plan should sometimes go beyond the minimum requirement to hold a public hearing depending on who may be most affected by and vulnerable to the impacts being addressed by the plan. Because the CAA section 111(d) program addresses existing facilities, some of which may be decades old, it is possible that impacted communities may not have had a voice in the process when the source was originally constructed, or previous outreach may have focused largely on engaging the industry. The EPA proposed amendments to 40 CFR part 60, subpart Ba, were intended to strengthen the public participation provisions and ensure that all affected members of the public, not just a particular subset, have an opportunity to participate in the pollution control planning process by requiring meaningful engagement with pertinent stakeholders in the state's development of a state plan, in any significant plan revision, and in the EPA's development of a Federal plan pursuant to an EG promulgated under CAA section 111(d).

The EPA proposed to add meaningful engagement with pertinent stakeholders in 40 CFR 60.23a(i) and 60.27a(f) and add the definition of meaningful engagement and of pertinent stakeholders in 40 CFR 60.21a. The EPA proposed to define meaningful engagement as it applies to this subpart as timely engagement with pertinent stakeholder representation in the plan development or plan revision process. Such engagement must not be disproportionate nor favor certain stakeholders. It must include the development of public participation strategies to overcome linguistic, cultural, institutional, geographic, and other barriers to participation to assure pertinent stakeholder representation, recognizing that diverse constituencies may be present within any particular stakeholder community. It must include early outreach, sharing information, and soliciting input on the state plan. The EPA also proposed to evaluate the approvability of state plans based on the components of the meaningful engagement definition.

The EPA proposed that pertinent stakeholders ''. . . include, but are not limited to, industry, small businesses, and communities most affected by and vulnerable to the impacts of the plan or plan revision.'' Additionally, to ensure that a robust and meaningful public engagement process occurs as the states develop their CAA section 111(d) plans, the EPA proposed to amend the requirements in 40 CFR 60.27a(g) to include, as part of the completeness criteria, the requirement for states to demonstrate in their plan submittal how they provided meaningful engagement with the pertinent stakeholders. The state would be required to provide, in their plan submittal: (1) a list of the pertinent stakeholders identified by the state; (2) a summary of engagement conducted; and (3) a summary of the stakeholder input received.

Most of the comments received on the proposed meaningful engagement requirements and proposed definitions were supportive of including meaningful engagement in the development of the state plans. Several commenters stated that they supported the inclusion of environmental justice considerations in Federal programs, including requirements for meaningful engagement. In particular, one commenter stated that outreach and meaningful engagement with stakeholders, specifically including communities most affected by and vulnerable to the pollution that would be reduced by a state plan, is an important and overdue step to ensuring that impacted communities have a voice in a process that directly impacts their health and welfare. While several commentors affirmed the EPA's authority to require meaningful engagement, some commenters said that the EPA lacks such authority. One of the commenters argued that the EPA lacks authority to require consideration of public health and welfare under CAA section 111(d) because CAA section 111 was devised as a technology-based approach to controlling emissions from stationary sources, not one predicated on the setting of standards directly and exclusively based on public health and welfare needs. One of the commenters stated the EPA lacks the authority to pass judgment on state plans submitted pursuant to CAA section 111(d) based on public engagement and argued that the only statutory requirement in CAA section 110 (which 111(d) cross-references) is the requirement that states provide ''reasonable notice and public hearings'' prior to adoption of a state plan.

Several commenters supported the EPA's definition of meaningful engagement and the proposed meaningful engagement requirement. Additionally, some comments supported the state plan approvability requirements for meaningful engagement and recommended that the EPA also require an accounting of what states have done with stakeholder input and how that input was used or not used in their state plan.

Several commenters expressed the need for additional resources in order to conduct meaningful engagement, both for states and communities. Some of the comments stated that the EPA needs to consider how these increased requirements may strain already limited state resources. One commenter said that resources needed to fulfill the requirements for meaningful engagement, including costs associated with identifying and contacting stakeholders, renting of rooms or spaces for multiple public meetings, travel, and associated staff time, will be significant and burdensome to states.

There were several comments requesting clarification on the definition of meaningful engagement, and on the proposed approvability requirements for meaningful engagement. Some commenters requested that the rule provide more clarity on what states need to do for meaningful engagement and provide a clear path for states to develop an approvable meaningful engagement demonstration. Similarly, other commenters recommended the EPA establish a more detailed definition and provide examples of best practices for states to follow in implementing meaningful engagement, particularly with vulnerable communities, and further clarify what is meant by meaningful engagement with pertinent stakeholders. Some commenters cited lack of clarity in expressing their concern with meaningful engagement being a requirement for state plan approvability.

Based on comments received, the EPA has revised the proposed definition of meaningful engagement and is finalizing revisions that are flexible enough to serve the unique needs of states and their stakeholders, rather than relying on the more prescriptive approach of the proposal. The EPA recognizes that states will generally be in the best position to understand how to meaningfully engage pertinent stakeholders within their borders as they develop state plans. The EPA also believes that states and the Federal Government may learn from each

---

[39] States may cancel a public hearing if no request for one is received during the required notification period. 40 CFR 60.23a(e).

[40] 87 FR 79176, 79190–92 (Dec. 23, 2022).

other's efforts to meaningfully engage pertinent stakeholders. The EPA further recognizes that appropriate approaches to meaningful engagement, as well as the time and resources needed, will be highly dependent on characteristics of the source category—such as the number and location of designated facilities—as well as on the type of health or environmental impacts of the emissions addressed by an EG. Additionally, as noted by a number of commenters, states are highly diverse in, among other things, their local conditions, resources, and established practices of engagement. Also as noted by commenters, vulnerable communities are highly diverse in, among other things, their technical capacities, access to resources for meaningful participation (*e.g.,* geographic distribution, transportation, childcare), languages, and available representation.

For these reasons, rather than finalizing prescriptive substantive requirements for how states should conduct meaningful engagement, the EPA is requiring in subpart Ba that states, in their state plan submissions or significant plan revisions, describe the efforts they undertook to meaningfully engage pertinent stakeholders, what input they received from stakeholders, and how that input was used or not used in their state plan. The EPA will also include this information when promulgating Federal plans or significant plan revisions. In addition, the EPA is describing some current best practices for meaningful engagement in this preamble that states may consider, that and which the Agency expects will continue to develop as states experiment with different types of meaningful engagement and share their experiences through state plans.

Consistent with these changes, the EPA is finalizing the definition of meaningful engagement, as it applies to subpart Ba, as follows: ''. . . timely engagement with pertinent stakeholders and/or their representatives in the plan development or plan revision process. Such engagement should not be disproportionate in favor of certain stakeholders and should be informed by available best practices.'' States should therefore make a good faith effort to ensure that they are engaging in a proportionate manner with all pertinent stakeholders. The EPA is also finalizing, as proposed, a definition of ''pertinent stakeholders.'' Pertinent stakeholders ''include, but are not limited to, industry, small business, and communities most affected by and/or vulnerable to the impacts of the plan or plan revision.'' Finally, the EPA is including in subpart Ba the three proposed completeness criteria requirements for meaningful engagement at 40 CFR 60.27a(g)(2)(ix) and adding a fourth completeness criterion, which will require state to include in their plans a description of how stakeholder input was considered in the development of the state plan or plan revisions.

The EPA expects that the finalized approach to meaningful engagement in state plans will provide the flexibility needed to allow states to address specific and unique issues in their states and to appropriately communicate with and respond to their stakeholders during the notice and comment process. As revised, the meaningful engagement component finalized here strengthens the framework for public participation in state plan development, a long-standing cornerstone of the cooperative federalism structures of CAA sections 110 and 111(d). The meaningful engagement component finalized here is intended to promote equitable opportunities to participate in the planning process for all stakeholders, as opposed to dictating a specific approach or set of practices that constitute meaningful engagement.

To support the goals outlined above, and in response to comments received, the EPA is finalizing the proposed completeness criteria that require documentation of meaningful engagement, including adding a fourth completeness criterion, but the EPA is not finalizing specific requirements for what types of outreach meaningful engagement must include in subpart Ba. The fourth completeness criterion will require states to include a description of how stakeholder input from the meaningful engagement process was considered in the development of the plan, which the EPA expects will both bolster accountability to stakeholders and assist states in ensuring that their meaningful engagement processes are additive to the public hearing and notification processes which has always been required under subpart Ba. See 40 CFR 60.27a(g)(1)(ix). While the EPA finds that the requirements finalized in this action are sufficient and appropriate for the general CAA section 111(d) implementing regulations, the EPA may provide additional guidance pertaining to meaningful engagement in specific EGs.

While the EPA is revising the definition of meaningful engagement relative to proposal, the definition of pertinent stakeholders is being finalized as proposed. Pertinent stakeholders include, among other stakeholders, industry, small business, and communities—in particular, communities who are most affected by and vulnerable to the health or environmental impacts of pollution from the designated facilities addressed by the plan or plan revision. Increased vulnerability of communities may be attributable to, among other reasons, an accumulation of negative environmental, health, economic, or social conditions within these populations or communities, and a lack of positive conditions. Examples of such communities have historically included, but are not limited to, communities of color (often referred to as ''minority'' communities), low-income communities, Tribal and indigenous populations, and communities in the United States that potentially experience disproportionate health or environmental harms and risks as a result of greater vulnerability and/or exposure to environmental hazards. For example, populations lacking the resources and representation to combat the effects of climate change—which could include populations exposed to greater drought or flooding, or damaged crops, food, and water supplies—experience greater vulnerability to environmental hazards. Sensitive populations (*e.g.,* infants and children, pregnant women, the elderly, and individuals with disabilities exacerbated by environmental hazards) may also be most affected by and vulnerable to the impacts of the plan or plan revision depending on the pollutants or other factors addressed by an EG.

Communities in neighboring states or neighboring Tribal nations may also be impacted by a state plan and, if so, are pertinent stakeholders. In addition, to the extent a designated facility would qualify for a less stringent standard through consideration of RULOF as described in section III.E. of this preamble, the pertinent stakeholders would include the communities most affected by and vulnerable to the health and environmental impacts from the designated facility considered in a state plan for RULOF provisions.

The EPA has determined that the definitions of meaningful engagement and pertinent stakeholders in subpart Ba provide the states sufficient specificity while allowing for flexibility in the implementation of meaningful engagement. Meaningful engagement is an enhancement of the existing public notice and comment requirements and is intended to promote the sharing of relevant information with, and the soliciting of input from, pertinent stakeholders at critical junctures during plan development. In particular, the processes for meaningful engagement should allow for fair and balanced participation, including opportunities for communities most affected by and vulnerable to the impacts of a plan an opportunity to be informed of and weigh in on that plan. These procedural requirements, in turn, help ensure that a plan will adequately address the potential impacts to public health and welfare that are the core concern of CAA section 111. Meaningful engagement can provide valuable information regarding health and welfare impacts experienced by the public (*e.g.,* recurring respiratory illness, missed work or school days due to illness associated with pollution, and other impacts) and allow regulatory authorities to explore additional options to improve public health and welfare. Because the CAA section 111(d) program is designed to address widely varying types of air pollutants that may have very different types of impacts, from highly localized to regional or global, what constitutes fair and balanced participation among a broad set of pertinent stakeholders will be highly dependent on which stakeholders are directly impacted by a particular state plan.

The EPA's authority for finalizing procedural requirements to strengthen the public participation provisions of the implementing regulations is provided by the authority of both CAA sections 111(d) and 301(a)(1). Under CAA section 111(d), one of the EPA's obligations is to ''establish a procedure similar to that provided by'' CAA section 110, under which states submit plans that implement emission reductions consistent with the BSER. CAA section 110(a)(1) requires states to adopt and submit SIPs after ''reasonable notice and public hearings.''[41] The Act does not define what constitutes ''reasonable notice and public hearings'' under CAA section 110, and the EPA has reasonably interpreted this requirement in promulgating a process under which states submit state plans.[42]

Subpart Ba currently includes certain requirements for notice and public hearing in 40 CFR 60.23a(c) through (f). The notice requirements include prominent advertisement to the public of the date, time, and place of the public hearing, 30 days prior to the date of such hearing, and the advertisement requirement may be satisfied through publication to the internet. *Id.* at paragraph (d). A state may choose to cancel a public hearing if no request for one is received during the required notification period. *Id.* at paragraph (e).

A fundamental purpose of the Act's notice and public hearing requirements is to ensure that all affected members of the public are able to participate in pollution control planning processes that impact their health and welfare.[43] In order to effectuate this purpose of the Act's notice and public hearing requirements, the notice of the proposed plans and of the public hearings should be reasonably adequate in its ability to reach affected members of the public. While many states provide for notification of public engagement through the internet consistent with the current requirements under the CAA section 111(d) implementing regulations, such notification may not be adequate to reach all those who are impacted by a CAA section 111(d) state plan and would benefit the most from participating in the state planning process. For example, data shows that as many as 30 million Americans do not have access to broadband infrastructure that delivers even minimally sufficient speeds, and that 25 percent of adults ages 65 and older report never going online.[44] Accordingly, the EPA has determined that it is appropriate to improve the procedural public engagement requirements under CAA section 111(d) to ensure the statutory objectives are met.

Given the public health and welfare objectives of CAA section 111(d) in regulating specific existing sources, it is reasonable to include a meaningful engagement component as part of the state plan development public participation process in order to further these objectives. Additionally, CAA section 301(a)(1) provides that the EPA is authorized to prescribe such regulations ''as are necessary to carry out [its] functions under [the CAA].'' As finalized, the meaningful engagement components of this rule would effectuate the EPA's function under CAA section 111(d) in prescribing a process under which states submit plans to implement the statutory directives of this section and promote the statutory objective that all pertinent stakeholders have reasonable notice of relevant information and the opportunity to participate in the state plan development throughout the process. Ongoing engagement between states and pertinent stakeholders will help ensure that plans achieve the appropriate level of emission reductions, that communities most affected by and vulnerable to the health and environmental impacts from the designated facilities share in the benefits of the state plan, and that these communities are protected from being adversely impacted by the plan.

To promote meaningful engagement, the EPA is finalizing as part of the completeness criteria in 40 CFR 60.27a(g) procedural requirements for states to describe in their plan submittals how they engaged with pertinent stakeholders. As proposed, the state will be required to describe, in its plan submittal, (1) a list of the pertinent stakeholders identified by the state; (2) a summary of engagement conducted; and (3) a summary of the stakeholder input received. The EPA is also finalizing a fourth component as part of the procedural completeness demonstration—that the state also includes (4) a description of how stakeholder input was considered in the development of the plan or plan revisions. The EPA will review the state plan to ensure it includes these required descriptions regarding meaningful public engagement as part of its completeness evaluation of a state plan submittal. If a state plan submission does not include the required elements for notice and opportunity for public participation, including the procedural requirements at 40 CFR 60.23a(i) and 60.27a(g)(2)(ix) for meaningful engagement, this may be grounds for the EPA to find the submission incomplete or (where a plan has become complete by operation of law) to disapprove the plan.

While the EPA is finalizing procedural requirements for meaningful engagement as completeness criteria and is not prescribing how states proceed with such engagement, we understand states would find it useful to consider guidance as to how such engagement could be meaningfully conducted. In light of this interest, the following paragraphs provide examples and guidance which the EPA

[41] 42 U.S.C. 7410(a)(1).

[42] See 40 CFR 51.102; 40 CFR part 51, appendix V, section 2.1.

[43] Consistent with this principle of providing reasonable notice under the CAA, under programs other than CAA section 111(d), current regulations governing other CAA programs similarly require states to provide specific notice to an area affected by a particular proposed action. See *e.g.,* 40 CFR 51.161(b)(1) (requiring specific notice for an area affected by a state or local agency's analysis of the effect on air quality in the context of the New Source Review program (40 CFR 51.102(d)(2), (4), and (5) (requiring specific notice for an area affected by a CAA section 110 SIP submission).

encourages states to consider in designing their own meaningful engagement programs.

In considering approaches for meaningful engagement, states should consider the identification of pertinent stakeholders; developing a strategy for engagement with the identified pertinent stakeholders; making information available in a transparent manner; and providing adequate and accessible notice. First, it would be reasonable for states to identify pertinent stakeholders considering information specific to the applicable EG, including the nature of the designated pollutants at issue and the communities likely to be impacted by facilities in the source category. The EPA intends to specifically provide information on impacts of designated pollutant emissions to assist states in the identification of their pertinent stakeholders, in addition to any other guidance that EPA may find it reasonable to provide in the applicable EG. Moreover, in developing a strategy for engagement, it would be reasonable for states to share information and solicit input on plan development and on any accompanying assessments. Finally, in providing transparent and adequate notice of plan development, states should consider that internet notice alone may not be adequate for all stakeholders, given lack of access to broadband infrastructure in many communities. Thus, in addition to internet notice, examples of prominent advertisement for engagement and public hearing may include notice through newspapers, libraries, schools, hospitals, travel centers, community centers, places of worship, gas stations, convenience stores, casinos, smoke shops, Tribal Assistance for Needy Families offices, Indian Health Services, clinics, and/or other community health and social services as appropriate for the emission guideline addressed.

The EPA believes the following example, while not tailored to specific designated facilities but to a source category for recent EG development, provides states with ideas for how they can structure their own meaningful engagement activities.[45] Prior to the November 2021 proposal for the ''Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review'' (86 FR 63110), the EPA conducted meaningful engagement with pertinent stakeholders. For the pre-proposal stakeholder outreach, the EPA engaged with stakeholders through information posted on the internet, meetings, training webinars, and public listening sessions to disseminate information regarding this action, communicate how to submit comments on the proposed rule, and receive stakeholder input about the industry and its impact. In addition to the pre-proposal stakeholder engagement, the EPA conducted additional post-proposal training during the comment period on the proposed rule and held a public hearing. The EPA conducted three half-day post-proposal trainings to provide background information, an overview of the proposed rule, stakeholder panel discussions, and information on how to effectively engage in the regulatory process. The trainings were open to the public, focusing on individuals from and representatives of communities with EJ concerns, Tribes, and small businesses. Further considerations, analyses, and outreach relevant to meaningful engagement are presented in sections VI.[46] and VII.[47] of the preamble for that action and could help states in designing, planning, and developing their own outreach and engagement plans associated with the development and implementation of their state plans. An additional resource is the memorandum on stakeholder outreach [48] for the ''New Source Performance Standards for Greenhouse Gas Emissions from New, Modified, and Reconstructed Fossil Fuel-Fired Electric Generating Units; Emission Guidelines for Greenhouse Gas Emissions from Existing Fossil Fuel-Fired Electric Generating Units; and Repeal of the Affordable Clean Energy Rule'' proposed rule (88 FR 33240, May 23, 2023). This memorandum provides states with another example of the types of activities and processes that the EPA has found appropriate for meaningfully engaging with stakeholders in the particular context of EG development.

The EPA recognizes that the state planning process is different than a national rulemaking and may benefit from different types of engagement. Nonetheless, the information and examples the EPA has provided on meaningful engagement can serve as an example of what types of engagement states should consider for their meaningful engagement processes. In addition, to further assist states in the meaningful engagement efforts, the EPA expects to develop resources to aid states in establishing meaningful engagement best practices, while recognizing that states have differing situations and that best practices will not be ''one size fits all.'' One resource that states may find helpful in developing their own best practices is the ''Public Involvement Policy of the US Environmental Protection Agency,'' [49] which is currently under revision. Another helpful resource the EPA has developed is the ''Capacity Building Through Effective Meaningful Engagement'' booklet.[50] The booklet is also available in the docket for this rule. Additionally, most states have opted into the EPA Climate Pollution Reduction Grant Program (CPRG),[51] developed under the Inflation Reduction Act.[52] To assist states that are participating in the CPRG, the EPA is conducting training for states on meaningful engagement, sharing case studies, best practices, and lessons learned through ongoing EPA-led CPRG forums. The EPA expects that, with experience and shared access to information on best practices, approaches to address challenges and barriers, and other resources and collaborative opportunities, meaningful engagement practices at the state and Federal level will continue to improve.

D. Regulatory Mechanisms for State Plan Implementation

CAA section 111(d)(1) requires the EPA to promulgate regulations that establish a procedure ''similar'' to that provided by CAA section 110 for each state to ''submit to [the EPA] a state plan which . . . establishes standards of performance . . . and . . . provides for the implementation and enforcement of such standards.'' The EPA reasonably interprets this provision, particularly

---

[45] The EPA emphasizes that the appropriateness of any meaningful engagement strategy will depend on the specific context, including the sources and pollutants addressed by the EG, the scope and scale of the proposed regulation or plan, and the pertinent stakeholders. The activities and processes included in the examples of meaningful engagement in this preamble were tailored to the specific circumstances of EPA's EG development.

[52] Inflation Reduction Act section 60114.

the ''similar'' clause, as referring to all the procedural provisions provided in CAA section 110 which serve the same purposes of providing useful flexibilities for states and EPA actions that help ensure emission reductions are appropriately and timely implemented.

The EPA proposed to incorporate 5 regulatory mechanisms as amendments to the implementing regulations under 40 CFR part 60, subpart Ba, governing the processes under which states submit plans and the EPA acts on those plans. 87 FR 79176, 79193–96 (Dec. 23, 2022). The proposed additional regulatory mechanisms include: (1) partial approval and disapproval of state plans by the EPA; (2) conditional approval of state plans by the EPA; (3) parallel processing of plans by the EPA and states; (4) a mechanism that allows the EPA to call for revision of a previously approved state plan; and (5) an error correction mechanism for the EPA to revise its prior action on a state plan.[53] These mechanisms were proposed to update the implementing regulations to better align with the flexible procedural tools that Congress added into section 110 of the CAA in the 1990 Amendments. The EPA is finalizing the adoption and incorporation of these mechanisms into subpart Ba as the EPA has interpreted and applied them in the context of CAA section 110.

As explained in the notice of proposed rulemaking, the interpretation that CAA section 111(d)(1) authorizes the EPA to adopt procedures ''similar'' to those under CAA section 110 for the entire state plan process, and not just the initial plan submission process, is strengthened by the provisions in CAA section 111(d)(2), which provide that the EPA has the ''same'' authority to promulgate a Federal plan for a state that has failed to submit a satisfactory plan as under CAA section 110(c), and to enforce state plan requirements as it does for SIPs under CAA sections 113 and 114. This is because, read together, CAA section 111(d)(1) and (2) call for the set of essential procedural requirements for state and Federal plan development and implementation and enforcement that generally reflect the essential procedural requirements for SIPs and FIPs in section 110.[54] In that context, it is reasonable to read CAA section 111(d)(1) as authorizing the EPA to promulgate procedures for section 111(d) that are comparable to CAA section 110 procedures for the overall state plan process. Moreover, the EPA believes that it is reasonable, in promulgating the regulations required under CAA section 111(d)(1), to look to the mechanisms and flexibilities that Congress has deemed appropriate for states and the EPA to use in the highly analogous context of state and Federal implementation plans.

The availability of these 5 regulatory mechanisms will streamline the state plan review and approval process, accommodate variable state processes, facilitate cooperative federalism, further protect public health and welfare, and generally enhance the implementation of the CAA section 111(d) program. Together, these mechanisms provide greater flexibility, may reduce processing time, and have proven to be very useful tools for the review and processing of CAA section 110 SIPs.

Overall, the comments received for incorporating the 5 regulatory mechanisms were favorable, in particular noting that the mechanisms would offer not only procedural improvements long sought by state agencies but also reflect the flexibility offered in section 111 of the CAA, consistent with the Act's cooperative approach, and would expand state planning options while conserving state resources. However, one commenter noted generally that for 111(d) plans, the CAA directs the EPA to establish a procedure similar to CAA section 110 for SIP submittals but does not require those procedures to be identical. This commenter contended that while the CAA specifically authorized various flexible mechanisms in sections 110(k)(2)–(6), the plain language of CAA section 111 does not provide for these options for 111(d) plans.

The EPA agrees that procedures adopted under CAA section 111(d)(1) need not be identical to CAA section 110 procedures, but interprets section 111(d)(1) to authorize the EPA to adopt procedures under 111(d)(1) which are substantially the same as those outlined under section 110, including section 110 procedural mechanisms.[55] Additionally, as explained above, while CAA section 111(d)(1) directs EPA to establish ''a procedure . . . under which each State shall submit to the Administrator a plan,'' section 111(d)(2) further provides that EPA also has authority to prescribe a Federal plan where states fail to submit a satisfactory plan and to enforce the provisions of state plans in cases where states fail to do so. Congress saw fit to provide mechanisms such as conditional approval and SIP calls under CAA section 110 for the purpose of EPA evaluation and action on, and enforcement of, SIPs, and the Agency believes it is reasonable to look to section 110 as evidence of the types of mechanisms that are reasonable for EPA to provide for the same purposes under section 111(d).

These regulatory mechanisms will provide flexibility and support efficiency to the states and the EPA in the submission and processing of state plans. For the reasons discussed in the following sections, the EPA is finalizing these provisions.

1. Partial Approval and Disapproval

The EPA proposed a provision similar to that under CAA section 110(k)(3) for the EPA to partially approve and partially disapprove severable portions of a state plan submitted under CAA section 111(d). Under CAA section 110(k)(3), ''[i]f a portion of the plan revision meets all the applicable requirements of this chapter, the Administrator may approve the plan revision in part and disapprove the plan revision in part. The plan revision shall not be treated as meeting the requirements of this chapter until the Administrator approves the entire plan revision as complying with the applicable requirements of this chapter.'' Subpart Ba currently authorizes the EPA to ''approve or disapprove [the state] plan or revision or each portion thereof'' (40 CFR 60.27a(b)) but does not explicitly specify whether such actions may be partial.

One commenter stated that the partial approval and disapproval mechanisms the EPA proposed appear to be aimed at providing a way for the EPA to approve model rule provisions and disapprove RULOF provisions. The EPA disagrees with this comment. The EPA reviews each provision of a state plan, regardless of the type of provision, to determine whether it meets the applicable

---

[53] These regulatory mechanisms were also previously proposed to be added to subpart B in 2015 and largely received support from states, the public, and stakeholders, but were never finalized. 80 FR 64965 (October 23, 2015).

[54] Compare CAA section 111(d)(1) (requiring states to submit state plans that include specified types of measures that, in turn, meet minimum EPA requirements) and section 111(d)(2) (indicating that the EPA must review and approve or disapprove state plans, requiring the EPA to promulgate a Federal plan if the state does not submit a satisfactory plan, authorizing the EPA to enforce state plan measures) with section 110(a)(1)–(2) (requiring states to submit SIPs that include specified types of measures that in turn meet minimum EPA requirements), section 110(k) (requiring the EPA to review and approve or disapprove SIPs), section 110(c) (requiring the EPA to promulgate a FIP if the state does not submit a plan or the EPA disapproves the state plan) and 113(a)(1) (authorizing the EPA to enforce SIP measures).

[55] See Merriam Webster's Dictionary, defining ''Similar'' as ''having characteristics in common'' or ''alike in substance and essentials.'' *https://www.merriam-webster.com/dictionary/similar.*

statutory and regulatory requirements. If it meets the applicable requirements, the EPA must approve it. It is entirely possible, and in fact common, for some state plan provisions to comport with the applicable requirements and others not to. Pursuant to this mechanism, the EPA may partially approve or partially disapprove a state plan when portions of the plan are approvable, but other discrete and severable portions are not. In such cases, the purposes of a CAA section 111(d) EG, as well as section 111(d)'s framework of cooperative federalism, would be better served by allowing the state to move forward with implementing those portions of the plan that are approvable, rather than to disapproving the full plan and potentially delaying implementation of beneficial emission reductions. This mechanism is consistent with the *ALA* decision's emphasis on ensuring timely mitigation of harms to public health and welfare, as problematic parts of a state plan submission would not stall the implementation of emission reductions at designated facilities for which a portion of a plan could be approved, thus efficiently reducing the time from EG promulgation to implementation of emission reductions at those facilities.

The EPA is finalizing this provision so that it is similar to CAA section 110(k)(3), providing clarity on the EPA's authority to partially approve plans and the circumstances under which it may be used. As explained at proposal, the portion of a state plan that the EPA may partially approve must be ''severable.'' A portion is severable when: (1) the approvable portion of the plan does not depend on or affect the portion of the plan that cannot be approved, and (2) approving a portion of the plan without approving the remainder does not alter the approved portion of a state plan in any way that renders it more stringent than the state's intent. See *Bethlehem Steel* v. *Gorsuch,* 742 F.2d 1028, 1034 (7th Cir. 1984). The EPA's decision to partially approve and partially disapprove a plan must go through notice and comment rulemaking. As a result, the public will have an opportunity to submit comment on the appropriateness and legal application of this mechanism on a particular state plan submission. A partial disapproval of a plan submission would have the same legal effect as a full disapproval for purposes of the EPA's authority under CAA section 111(d)(2)(A) to promulgate, for the partially disapproved portion of the plan, a Federal plan for the state to fill the gap. See section III.A.4 of this preamble for finalized timelines for promulgation of a Federal plan. If the EPA does promulgate a Federal plan for a partially disapproved portion, the state may, at any time, submit a revised plan to replace that portion. If the state does so, and the EPA approves the revised plan, then the EPA would withdraw the Federal plan for that state.

This partial approval/disapproval mechanism also enables states to submit, and authorizes the EPA to approve or disapprove, state plans that are partial in nature and to address only certain elements of a broader program. For example, with this mechanism, states will be able to submit partial plans intended to replace discrete portions of a Federal plan, where appropriate. Partial submittals must meet all completeness criteria.

2. Conditional Approval

The EPA proposed a mechanism analogous to the authority under CAA section 110(k)(4) to grant the EPA the ability to conditionally approve a state plan under CAA section 111(d). Under CAA section 110(k)(4), ''[t]he Administrator may approve a plan revision based on a commitment of the state to adopt specific enforceable measures by a date certain, but not later than 1 year after the date of approval of the plan revision. Any such conditional approval shall be treated as a disapproval if the state fails to comply with such commitment.'' The proposed provision would authorize the EPA to conditionally approve a plan submission that substantially meets the requirements of an EG but that requires some additional, specified revisions to be fully approvable. For the EPA to conditionally approve a submission, the state Governor or their designee must commit to adopt and submit specific enforceable provisions to remedy the stipulated plan deficiency. The provisions required to be submitted by the state pursuant to a conditional approval would be treated as an obligation to submit a plan revision and be subject to the same processes and timeframes for the EPA action as other plan revisions (*e.g.,* completeness determination, approval and/or disapproval).

Comments were generally supportive of including the mechanism in subpart Ba for use by the EPA in acting on CAA 111(d) state plans. One commenter submitted that the EPA should limit conditional approvals to plans either with only procedural deficiencies or with substantive deficiencies that (1) apply to few designated facilities (*e.g.,* no more than 5); (2) do not lead to impacts on vulnerable communities; and (3) are likely to be remedied by the state within one year. Comments were received both supporting and opposing the proposed 12-month time period for adopting and submitting the necessary revisions associated with a conditional approval. In particular, one commenter recommended allowing more than 12 months for submission of subsequent revisions that are required as part of conditional approvals that relate to RULOF provisions. After considering the comments received, the EPA is declining to explicitly limit the circumstances in which conditional approval may be used and is finalizing the 12-month period for submission of a plan revision pursuant to a conditional approval as proposed. First, the EPA views the conditional approval mechanism as a beneficial flexibility for states in instances in which partial disapproval may be appropriate because a discrete portion of a state plan does not meet the applicable requirements, but that deficiency is not so significant that it affects the substantial adequacy of the plan. CAA section 110(k)(4) supports this view, as Congress provided only 12 months for states correct the deficiency; 12 months is likely not sufficient for states to remedy significant substantive deficiencies in a plan. Thus, the EPA believes both that structure of the conditional approval mechanism already appropriately circumscribes its use and that extending the timeline for states to submit plan revisions pursuant to conditional approval would abrogate its utility as a way to address minor issues in a plan and encroach on circumstances in which partial disapproval is more appropriate. Second, under the provisions being finalized in this rulemaking, in the event that EPA did partially disapprove a state plan in lieu of conditionally approving it, the Agency would have 12 months to promulgate a Federal plan to fill the gap. See 40 CFR 60.27a(c)(2). It would be inappropriate to provide states a longer period of time in the same circumstances to remedy a deficiency.

As finalized, if the state fails to meet its commitment to submit the measures within 12 months, the conditional approval automatically converts to a disapproval. If a conditionally approved state plan converts to a disapproval due to either the failure of the state to timely submit the required measures or if the EPA finds the submitted measures to be unsatisfactory, such disapproval would be grounds for implementation of a Federal plan under CAA section 111(d)(2)(A). The EPA will publish a notice in the **Federal Register** and, if appropriate, on the public website established for the EG notifying the public that the conditional approval is converted to a disapproval. As described in section III.A.4. of this preamble, the EPA would be required to promulgate a Federal plan within 12 months of state's failure to submit the required measures or the EPA's disapproval of measures submitted to address the conditional approval.

Commenters asserted that the EPA should take action to develop a Federal plan immediately upon issuing a conditional approval, and further asserted that the EPA should not allow the conditional approval mechanism to toll the Federal plan clock and thereby delay needed public health and welfare protections. A conditional approval is not a disapproval and therefore there has been no failure on the part of the state and thus will not trigger a corresponding Federal plan for the given state nor initiate a timeline for the EPA to provide a Federal plan. Conditional approvals will be evaluated and designed on a case-by-case basis, with consideration of public health and welfare, and are expected to result in approved state plans and therefore not require the development of a Federal plan. The commenters also noted the EPA proposed to allow 12 months in which to impose a Federal plan following disapproval of a previously conditionally approved plan and stated instead the EPA should start the clock for developing a Federal plan as soon as a state plan submission is conditionally approved if the EPA has determined that there is a significant possibility that the deficiencies will not be corrected. The EPA disagrees with this comment because the Agency would not conditionally approve a plan if the deficiencies were not expected to be corrected; in this instance, a partial disapproval of the plan would be appropriate.

Another commenter requested that the EPA clarify the applicable compliance deadline for a state plan that is conditionally approved by the Agency. The commenter contended that the proposed rule did not specify the ''trigger'' date for compliance deadlines when the EPA conditionally approves a state plan, and recommended that, in this scenario, compliance deadlines should begin to run when the state satisfies the condition(s) established by the EPA. However, the EPA notes that compliance timeframes for designated facilities are specified in the applicable EGs. To the extent that the Administrator conditionally approves a plan, the compliance timeframes must still meet the requirements in the EG. A conditional approval may not be an appropriate action if the result would be a significant delay in compliance, as that is inconsistent with the intention of adding this flexibility for state plan processing.

Incorporating this mechanism under the subpart Ba will have the benefit of allowing a state with a substantially complete and approvable program to begin implementing it, while also promptly making specific changes that ensure it fully meets the requirements of CAA section 111(d) and of the applicable EGs. The EPA is therefore finalizing this provision as proposed at 40 CFR 60.27a(b)(2).

3. Parallel Processing

The EPA proposed to include a mechanism similar to that for SIPs under 40 CFR part 51 appendix V, section 2.3.1., for parallel processing a plan that does not yet meet all of the administrative completeness criteria under 40 CFR 60.27a(g)(2). This streamlined process allows the EPA to propose approval of such a plan in parallel with the state completing its process to fully adopt the plan in accordance with the required administrative completeness criteria, and then allows the EPA to finalize approval once those criteria have been fully satisfied and a final plan has been submitted.

At proposal, the EPA explained that parallel processing under subpart Ba would be subject to certain conditions. In lieu of the letter required under 40 CFR 60.27a(g)(2)(i), the state must submit the proposed plan with a letter requesting the EPA propose approval through parallel processing. Under the parallel processing procedures, a state will be temporarily exempt from the administrative completeness criteria as defined by 40 CFR 60.27a(g)(2) regarding legal adoption of the plan (40 CFR 60.27a(g)(2)(ii) and (v)) and from some of the public participation criteria (40 CFR 60.27a(g)(2)(vi), (vii), and (viii)). However, as with parallel processing for SIPs under 40 CFR part 51, appendix V, in lieu of these administrative criteria, the state must include a schedule for final adoption or issuance of the plan and a copy of the proposed/draft regulation or the document indicating the proposed changes to be made, where applicable. Note that a proposed plan submitted for parallel processing must still meet all the criteria for technical completeness as defined by 40 CFR 60.27a(g)(3) and meet all other administrative completeness criteria as defined by 40 CFR 60.27a(g)(2). If these conditions are met, the submitted plan may be considered for purposes of the EPA's initial plan evaluation and proposed rulemaking action.

The exceptions to the administrative criteria described above only apply to the EPA proposing action on the state plan. If the EPA has proposed approval through parallel processing, the state must still submit a fully adopted and final plan that meets all of the completeness criteria under 40 CFR 60.27a(g), including the requirements for legal adoption and public engagement, before the EPA can finalize its approval. If the state finalizes and submits to the EPA a plan that includes changes relative the plan that the EPA proposed to approve, the EPA will evaluate those changes for significance. If any such changes are found by the EPA to be significant (*e.g.,* changes to the stringency or applicability of a particular standard of performance), then the state submittal would be treated as an initial submission and the EPA would be required to re-propose its action on the final plan and to provide an opportunity for public comment.

Note further that once the state plan submission deadline passes, the EPA retains the authority to initiate development of a Federal plan at any time for a state that has not submitted a complete plan, even if a state has requested parallel processing and the EPA has proposed an action. The EPA intends to continue working collaboratively with states who are in the process of adopting and submitting state plans but notes that states must remain mindful of regulatory deadlines for CAA section 111(d) plan submissions even when seeking to use the parallel processing mechanism.

While comments were generally supportive of the EPA adopting parallel processing for CAA section 111(d) plans, some commenters expressed concern that the purpose and benefits of meaningful engagement would not be realized in the state plan development process if this mechanism were finalized as proposed. One commenter noted that the proposed parallel processing provision appeared to indicate that the state can submit its plan to the EPA prior to conducting meaningful engagement, and that the EPA is expecting an informational meeting rather than actual engagement from the public during the meaningful engagement process. Another commenter remarked that if a state does not include meaningful engagement before submitting its initial plan to the EPA, the proposed parallel processing mechanism creates an inherent disincentive for the state to modify a plan under this mechanism in response to any public engagement which occurs subsequent to submittal, and further stated this would increase the disparity between the feedback received from the individuals the EPA designed the meaningful engagement provisions to protect and feedback from individuals or organizations with plentiful resources for proactive engagement. The commenters also asserted that members of the public, knowing that a version of the plan is already under Federal review, would be more likely to doubt that their feedback would have an impact on the final product.

The EPA agrees with these commenters that, as proposed, exempting meaningful engagement from completeness criteria requirements under parallel processing would be a disincentive to meeting to the goals of meaningful engagement. In fact, as defined in this action, meaningful engagement is the ''*timely* engagement with pertinent stakeholders and/or their representatives in the plan development or plan revision . . .'' (emphasis added). Thus, meaningful engagement should occur well in advance of a state being ready to submit a plan to the EPA for parallel processing. The EPA is therefore excluding the meaningful engagement completeness criteria defined at 40 CFR 60.27a(g)(2)(ix) from the completeness criteria exceptions provided under the finalized parallel processing provision at § 60.27a(h)(4). That is, states must include the information required under § 60.27a(g)(2)(ix) in any proposed state plans submitted to the EPA for parallel processing. Meaningful engagement is integral in early state plan development and should be included as part of the completeness criteria for parallel processing.

The EPA is finalizing as part of the completeness criteria in 40 CFR 60.27a(g) procedural requirements for states to describe in their plan submittals how they engaged with pertinent stakeholders. The state will be required to describe, in its plan submittal, (1) a list of pertinent stakeholders identified by the state; (2) a summary of engagement conducted; (3) a summary of the stakeholder input received; and (4) a description of how stakeholder input was considered in the development of the plan or plan revisions.

4. State Plan Call

Under CAA section 110(k)(5), the EPA may call for a revision of a state implementation plan ''[w]henever the Administrator finds that the applicable implementation plan . . . is substantially inadequate to . . . comply with any requirement of [the Act].'' The EPA proposed to add a mechanism analogous to this ''SIP call'' provision to subpart Ba at 40 CFR 60.27a(i) under CAA section 111(d), which would authorize the EPA to find that a previously approved state plan does not meet the applicable requirements of the CAA or of the relevant EG and to call for a plan revision. This mechanism is a useful tool for ensuring that approved state plans continue to meet the requirements of the EGs and of the CAA over time. This may be particularly important because EGs that achieve emission reductions from specific source categories may be implemented over many years.

As proposed, the state plan call provision stated that, whenever the Administrator finds that the applicable plan is substantially inadequate to meet the requirements of the applicable EG, to provide for the implementation of such plan or to otherwise comply with any applicable requirement of subpart Ba or the CAA, the Administrator shall require the state to revise the plan as necessary to correct such inadequacies. The EPA explained that a plan call would be generally appropriate under two circumstances: when legal or technical conditions arise after the EPA approves a state plan that undermine the basis for the approval and when a state fails to adequately implement an approved state plan. In the first circumstance, a change in conditions or circumstances could render an approved plan inconsistent with the EG, subpart Ba, and/or the CAA, necessitating a plan revision to realign it with the applicable requirements. For example, a court decision subsequent to the approval of a plan may render that plan substantially inadequate to meet applicable CAA requirements resulting from the change in law.[56] Or, the EPA may determine that technical conditions, such as design assumptions, about control measures that were the basis for a state plan approval later prove to be inaccurate, meaning that the plan would be substantially inadequate to achieve the emission reductions required by the EG and therefore the plan should be revised.[57]

The second circumstance in which a state plan call may be appropriate is when a state fails to adequately implement an approved state plan. In this case, the approved state plan may facially meet all applicable requirements, but a failure in implementation (*e.g.,* due to changes in available funding, resources, or legal authority at the state level) renders the plan substantially inadequate to meet the requirements of the EG and CAA section 111(d). In this circumstance, a state, in response to a plan call, would either be required to submit a plan revision that provides for implementation of the plan's requirements given the state's actual circumstances or to provide demonstration that the plan is being adequately implemented as approved.

Consistent with the SIP call process under CAA section 110(k)(5), the EPA proposed that, after it finds that a state's approved plan is substantially inadequate to comply with applicable requirements, it would require the state to revise the plan as necessary to correct inadequacies. The EPA proposed that such finding and notice must be public. The plan call notice would identify the plan inadequacies leading to the plan call and establish a reasonable deadline (not to exceed 12 months after the date for such notice) for submission of a plan revision and/or demonstration of appropriate implementation of the approved plan.

A number of commenters asserted that the EPA is not authorized to issue a call for state plans under CAA section 111(d) because Congress did not provide this explicit authority in CAA section 111. Some commenters also expressed concern that this mechanism undermines the regulatory certainty approved plans provide to facilities. Additionally, some commenters contended that CAA sections 113 and 114 address the condition of states not properly implementing approved state plans such that a state plan call mechanism is unnecessary.

As explained at the start of this section of the preamble (section III.D.), the EPA interprets CAA section 111(d)(1)'s direction to prescribe regulations establishing a procedure similar to that provided by CAA section 110 for the submission of state plans to authorize the EPA to adopt the section 110 procedural mechanisms. Additionally, CAA section 111(d)(2) provides that EPA shall have the same authority as under CAA section 110(c) to prescribe a Federal plan where a state fails to submit a satisfactory plan, as well as the same authority as under CAA sections 113 and 114 to enforce the

---

[56] An example of this circumstance in the context of CAA section 110 is the 2015 ''SSM SIP Call'', which required states to correct previously approved SIP provisions based on subsequent court decisions regarding startup, shutdown, and malfunctions (SSM) operations. 80 FR 33840, June 12, 2015.

[57] For example, the 1998 ''NO_X SIP call'' required states to submit SIP revisions addressing NO_X emissions found, after SIP approvals, to significantly impact the attainment of air quality standards in other states due to atmospheric transport. 63 FR 57356, October 27, 1998.

provisions of a state plan where the state fails to enforce them. Congress did not specify how the EPA is to exercise its authority to approve or disapprove state plans, promulgate Federal plans, and oversee and enforce state plan implementation on an ongoing basis, and the EPA finds it reasonable to look to other mechanisms under the CAA that Congress has provided for substantially the same purpose. That is, the EPA believes CAA sections 111(d)(1) and 111(d)(2), taken together, provide the legal basis for incorporating mechanisms into subpart Ba that ensure the ongoing compliance of state plans with the applicable requirements, including the state plan call mechanism of CAA section 111(k)(5).

While CAA sections 113 and 114 provide the EPA authority to enforce the provisions of state plans through, *inter alia,* issuance of administrative orders and penalties, civil actions in the case of violations, and use of monitoring, reporting, recordkeeping, and compliance certifications, the EPA believes it is also reasonable and helpful to provide a mechanism for states to bring their state plans into compliance with the applicable requirements. A state's failure to implement its approved plan may result if that plan's implementation or enforcement measures, *e.g.,* monitoring, reporting, and verification requirements, prove inadequate to enable a state to ensure that a designated facility is meeting its standards of performance. A failure to implement may also arise, as described above, where an approved state plan contains the appropriate implementation and enforcement measures but changes in, *e.g.,* available funding, resources, or legal authority at the state level render the plan, as it is being implemented, substantially inadequate to meet the requirements of subpart Ba, the EG, or CAA section 111(d). In either instance, a reasonable alternative to EPA enforcement may be for the Agency to issue a state plan call in order to give the state an opportunity to remedy the deficiency or to provide demonstration that the plan is being or will be adequately implemented as approved. As with all of the regulatory mechanisms being incorporated into subpart Ba in this rulemaking, the EPA interprets CAA sections 111(d)(1) and (2) as collectively providing the authority to provide for procedures for ensuring that state plans remain ''satisfactory'' over the long time periods over which they are implemented, given that subsequent findings or conditions may affect the basis for a previous plan approval.

The EPA acknowledges that a call for revision of a state plan may result in a change in the requirements to which regulated entities are subject under than plan. However, as explained above, state plan calls are appropriate in two general circumstances: when legal or technical conditions arise that abrogate the basis of the initial state plan approval and when a state fails to adequately implement an approved state plan. In either of these two instances, the plan as it is currently being implemented fails to meet the applicable requirements. The EPA believes it would be neither consistent with the statute nor reasonable to fail to correct a state plan under these circumstances and that the state plan call mechanism, which provides for notice to the state and the public and a process for revising the state plan that is intended to cause as little disruption to the original plan as possible, is appropriate. The state plan call provisions state that ''[a]ny finding under this paragraph shall, to the extent the Administrator deems appropriate, subject the State to the requirements of this part to which the State was subject when it developed and submitted the plan for which such finding was made, except that the Administrator may adjust any dates applicable under such requirements as appropriate.'' [58]

Several commenters noted that the proposed ''not to exceed 12 months'' timeline associated with the state call revision provision may be inadequate for states to respond to a state plan call and noted that this time is shorter than that provided for plan development. However, because a state plan call would represent that a plan is substantially inadequate to meet an EG after implementation of the plan was supposed to be underway, and compliance deadlines may have already passed, a more expeditions timeline to fix the problem than the deadline for initial plan development is imperative to the public health concerns. Additionally, the EPA anticipates that in many instances a state plan call would impact a discrete portion or element of a plan that will not require the same amount of time the EPA is allotting for initial state plan development and submission, *i.e.,* 18 months, to correct. The EPA believes 12 months is a reasonable timeframe and allows for public outreach and state processes while ensuring the deficiency is expeditiously corrected to address any outstanding public health and welfare concerns associated with a deficient plan, consistent with the *ALA* decision. However, the Agency also acknowledges that this may not be true in every instance. The EPA is therefore finalizing the state plan call mechanism with a change relative to proposal to provide that plan revisions associated to a state plan call shall be submitted to the Administrator within 12 months or within a period as determined by the Administrator, instead of ''not to exceed 12 months.'' Because the CAA contains numerous deadlines requiring states to submit various state implementation plans within 12 months of a triggering event,[59] the EPA believes it is reasonable to expect states to be able to submit state plan revisions pursuant to a state plan call within this timeframe as well. The final language provides more flexibility and allows that the EPA may supersede this 12-month timeframe in appropriate circumstances.

While this period is less than the time allotted for the submission of a full state plan (finalized in section III.A.1. of this preamble above as 18 months), it can provide a reasonable timeframe for public outreach and state processes while ensuring the deficiency is expeditiously corrected to address any outstanding public health and welfare concerns associated with a deficient plan, consistent with the *ALA* decision.

With the exception of this revision to the timeline for states to submit revised state plans, the EPA is finalizing the state plan call mechanism at 40 CFR 60.27a(i) as proposed. As explained at proposal, any failure of a state to submit necessary revisions by the date set in the call for state plan revisions constitutes a failure to submit a required plan submission. Therefore, pursuant to CAA section 111(d)(2)(A), the EPA would have the authority to promulgate a Federal plan for the state within 12 months after the necessary revisions are due. If the state fails to submit a plan revision, to make an adequate demonstration within the prescribed time pursuant to 40 CFR 60.27a(i)(1), or if the EPA disapproves a submission, then the EPA would be required to promulgate a Federal plan addressing the deficiency for sources within that state.

---

[58] The regulations being finalized at § 60.27a(i)(1) further provided that if the Administrator makes the finding in § 60.27a(i) on the basis that a State is failing to implement an approved plan, or part of an approved plan, the State may submit a demonstration to the Administrator it is adequately implementing the requirements of the approved state plan in lieu of a plan revision. Such demonstration must be submitted by the deadline established under § 60.27a(i).

[59] See, *e.g.,* CAA sections 110(k)(4), 129(b)(2), and 179(d).

5. Error Correction

Under CAA section 110(k)(6), the EPA may, on its own accord, revise its prior action on a state implementation plan under certain circumstances: ''[w]henever the Administrator determines that the Administrator's action approving, disapproving, or promulgating any plan or plan revision (or part thereof) . . . was in error, the Administrator may in the same manner as the approval, disapproval, or promulgation revise such action as appropriate without requiring any further submission from the State.'' The EPA proposed to add a mechanism analogous to this ''error correction'' provision to subpart Ba at 40 CFR 60.27a(j) under CAA section 111(d) and is finalizing that mechanism as proposed.

As explained in the notice of proposed rulemaking, this error correction provision would authorize the EPA to revise its prior action when the EPA determines its own action on the state plan was in error. Specifically, this provision allows the EPA to revise its prior action in the same manner as used for the original action (*e.g.,* through rulemaking) without requiring any further submissions from the state. In this manner, the error correction mechanism does away with unnecessary burdens on states based solely on an error made by the EPA, such as submitting a plan revision and the public participation related requirements under 40 CFR 60.23a (*e.g.,* providing notice and holding a public hearing).

CAA section 110(k)(6) is phrased broadly, and its legislative history makes clear that it ''explicitly authorizes EPA on its own motion to make a determination to correct any errors it may make in taking any action, such as . . . approving or disapproving any plan.'' See House Report No. 101–490 at 220. The circumstances that may give rise to an error that the EPA may correct with this mechanism depend on the specific facts and plan at issue, and the use of the mechanism is justified on a case-by-case basis. The EPA has previously used CAA section 110(k)(6) for correction of technical or clerical errors,[60] for removal of substantive provisions from an EPA-approved state plan that did not relate to implementation, enforcement, or maintenance of the NAAQS or is otherwise permissible under the CAA for inclusion in the plan,[61] and when the EPA in error approved a SIP that did not meet applicable requirements.[62] These examples are not the only circumstances when the EPA has used CAA section 110(k)(6) in the past and do not limit the EPA for circumstances of error correction under section 111(d) in the future.

One commenter, while not objecting to the inclusion of this mechanism, suggested the EPA should make clear in the regulations that this provision cannot be used to effect a change in policy because of a change in perspective on implementation that may arise from an administration transition, citing the need for designated facilities to have regulatory certainty and to avoid unexpected changes in regulatory requirements. Other commenters also noted that the proposed regulatory text does not place any limitations on the EPA's ability to use the error correction provision and that the EPA should impose meaningful limits on its ability to use this mechanism to effectuate significant changes to a prior action or to implement new policy perspectives. The EPA acknowledges the concern expressed by the commenters. The Agency intends the same intrinsic limits on its error correction authority that exist under CAA section 110(k)(6) to apply to its use under subpart Ba: the EPA must determine that its action on a state plan submission was ''in error.'' The EPA reviews state plan submissions against the applicable requirements of the statute, general implementing regulations, and specific EG. If the submission meets those requirements, it is ''satisfactory'' and the EPA must approve it. A subsequent change in Agency policy alone does not constitute an error that the EPA committed in acting on the state plan. The EPA's history of using error correction mechanisms under CAA section 110(k)(6), including to correct clerical or typographic errors and remove provisions from SIPs that it was without authority to approve in the first instance (as described earlier), gives good indication of how the EPA intends to use this mechanism under subpart Ba. The EPA also notes that use of error correction is fact- and context-specific, and a determination that a previous action was in error is subject to scrutiny and review by the state and public. Additionally, due to the complex facts and circumstances that frequently characterize state plans and state plan implementation, the EPA believes that any attempt to further define the circumstances in which use of error correction may or may not be permissible is likely to inadvertently limit its use where otherwise appropriate. Thus, the Agency does not find it necessary to prescribe further limits on its use of error correction under these CAA section 111 implementing regulations. The EPA is therefore finalizing use of error correction for state plan actions at 40 CFR 60.27a(j) as proposed. While the EPA maintains that this error correction mechanism would be available for acting on state plans when appropriate, it also expects that it will work with states, as it has done previously in the SIP context, to correct any deficiencies in their plans.

E. Remaining Useful Life and Other Factors (RULOF) Provisions

The EPA is finalizing revisions to certain provisions of 40 CFR 60.24a to clarify the framework for applying standards of performance based on RULOF in state plans[63] under CAA section 111(d). Consistent with Congress's mandate in CAA section 111(d), the EPA's implementing regulations have guided the implementation of RULOF for decades. See 40 CFR 60.24(d), (f). The existing subpart Ba regulations[64] contain provisions at 40 CFR 60.24a(e) governing the circumstances under which states may take RULOF into consideration when applying standards of performance to particular sources in state plans. The EPA proposed revisions to these existing provisions as well as additional RULOF-related requirements to ensure consistency with the statute and to enhance clarity and equitable treatment for states. The EPA is finalizing some of these provisions as proposed, is finalizing other provisions with changes relative to proposal in response to public comments, and is choosing not to finalize yet other provisions.

Section III.E.1. of this preamble describes the statutory and regulatory background of RULOF under CAA section 111 and section III.E.2. of this preamble explains the authority and rationale for the collective regulatory revisions. Section III.E.3. of this

---

[60] For example, see 74 FR 57051, November 3, 2009, for correction of clerical and typographical errors in a portion of an Arizona SIP.

[61] For example, see 86 FR 24505 (May 7, 2021) (removal of asbestos requirements from a Kentucky SIP).

[62] For example, see 86 FR 23054, April 30, 2021, for error correction with respect to Kentucky's ''good neighbor obligations'' and SIP disapproval.

[63] As explained in section III.E.1. of this preamble, any discussion and requirements that apply to states' consideration of RULOF in state plans also apply to the EPA's consideration of RULOF in the context of a Federal plan.

[64] The D.C. Circuit's vacatur of certain provisions of subpart Ba in *ALA* did not impact the existing RULOF provision at 40 CFR 60.24a(e).

preamble describes in detail the proposed RULOF provisions and the EPA's approach to each provision in this final rule.

1. Statutory and Regulatory Background

Under CAA section 111(d), the EPA is required to ''establish a procedure . . . under which each State shall submit to the Administrator a plan which (A) establishes standards of performance for'' designated facilities and ''(B) provides for the implementation and enforcement of such standards of performance.'' As the Supreme Court explained in *West Virginia* v. *EPA* (in the context of an EG addressing existing power plants): ''Although the States set the actual rules governing existing power plans, EPA itself still retains the primary regulatory role in Section 111(d).'' [65] The Court elaborated that the ''[t]he Agency, not the States, decides the amount of pollution reduction that must ultimately be achieved. It does so by again determining, as when setting the new source rules, 'the best system of emission reduction . . . that has been adequately demonstrated for [existing covered] facilities.' 40 CFR part 60.22(b)(5) (2021); see also 80 FR 64664, and n. 1. The States then submit plans containing the emissions restrictions that they intend to adopt and enforce in order not to exceed the permissible level of pollution established by EPA. See parts 60.23, 60.24; 42 U.S.C. part 7411(d)(1).'' [66]

Accordingly, while states establish the standards of performance for individual sources, EPA must ensure that such standards reflect the degree of emission limitation achievable through the application of the BSER. This obligation derives from the definition of ''standard of performance'' under CAA section 111(a)(1), which is ''a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which . . . the Administrator determines has been adequately demonstrated.'' Consistent with this definition, the EPA identifies the degree of emission limitation achievable through application of the BSER for a category (or sub-category) of existing sources as part of its EG. 40 CFR 60.22a(b)(5). States must then establish standards of performance for existing sources in their state plans that reflect the EPA's degree of emission limitation.

CAA section 111(d)(1) also requires that the ''regulations which establish a procedure'' for submission of state plans must ''permit'' states, ''in applying a standard of performance to any particular source under a plan,'' to consider, ''among other factors, the remaining useful life of the existing source.'' Thus, while standards of performance must generally reflect the degree of emission limitation achievable through application of the BSER determined by the EPA pursuant to CAA section 111(a)(1), see 40 CFR 60.24a(c), CAA section 111(d)(1) also contemplates circumstances in which states would be permitted to deviate from the degree of emission limitation in the applicable EG based on consideration of RULOF for particular sources.

The 1970 version of CAA section 111(d) made no reference to the consideration of RULOF in the context of standards for existing sources.[67] In the 1975 regulations promulgating subpart B to implement the 1970 CAA section 111(d), however, the EPA included a provision that would allow states to provide ''variances'' from the EPA's emission guideline on a case-by-case basis.[68] For health-based pollutants, the regulations provided that states could apply a standard of performance less stringent than the EPA's EGs based on cost, physical impossibility, and other factors specific to a designated facility that would make the application of a less stringent standard significantly more reasonable. 40 CFR 60.24(f). For welfare-based pollutants, the regulations provided that states could apply a less stringent standard by balancing the requirements of an EG ''against other factors of public concern.'' 40 CFR 60.24(d).

In proposing this variance provision, the EPA explained that the application of less stringent emission standards on a case-by-case basis is allowed, provided that sufficient economic justification is demonstrated in each case. Such justification must be presented for each case in the plan and may include, for example, unreasonable cost of control resulting from plant age, location, or basic process design or physical impossibility of installing specified control systems.[69] In response to a comment received on its proposal arguing that the EPA did not have authority to promulgate a variance provision, the Agency explained that, although section 111(d) does not explicitly provide for variances, it does require consideration of the cost of applying standards to existing facilities. Such a consideration is inherently different than for new sources, because controls cannot be included in the design of an existing facility and because physical limitations may make installation of particular control systems impossible or unreasonably expensive in some cases. For these reasons, EPA believes the provision (§ 60.24(f)) allowing States to grant relief in cases of economic hardship (where health-related pollutants are involved) is permissible under section 111(d).[70]

The Agency further explained in the 1975 rulemaking that the ''EPA's emission guidelines will reflect its judgment of the degree of control that can be attained by various classes of existing sources without unreasonable costs.'' [71] States were required to establish emission standards for existing sources that are equivalent to the EPA's emission guidelines; states would also be free to apply more stringent standards for particular sources within a class of sources that can achieve greater control without unreasonable costs, or where they otherwise believe that additional control is necessary or desirable.[72]

As part of the 1977 CAA amendments, Congress amended CAA section 111(d)(1) in a way that codified the provision of a variance as contained in the EPA's 1975 regulations. Specifically, Congress amended CAA section 111(d)(1) to require that the EPA's regulations under this section ''shall permit the State in applying a standard of performance to any particular source under a plan submitted under this paragraph to take into consideration, among other factors, the remaining useful life of the existing source to which such standard applies.'' The EPA considered the variance provision under subpart B to meet this requirement and did not revise the provision subsequent to the 1977 CAA amendments until the Agency promulgated new implementing regulations in 2019 under subpart Ba. As part of the 2019 revisions, the EPA removed the health- and welfare-based pollutants distinction and collapsed the associated requirements of the previous variance provision into a single, then-

[72] See id.

new RULOF provision.[73] As did subpart B before it, this subsection provides that, in applying a standard of performance to a particular source, the state may take into consideration factors including the remaining useful life of such source, provided that the state demonstrates one or more of three circumstances: unreasonable cost of control resulting from plant age, location, or basic process design; physical impossibility of installing necessary control equipment; or other factors specific to the facility that make application of a less stringent standard or compliance time significantly more reasonable. The 2019 RULOF provision also allows, as did the 1975 version, for the variance to be provided for a particular facility or class of such facilities.

CAA section 111(d)(2) provides that ''[t]he Administrator shall have the same authority . . . to prescribe a plan for a State in cases where the State fails to submit a satisfactory plan as he would have under section 7410(c) of this title [*i.e.,* CAA section 110(c)] in the case of failure to submit an implementation plan.'' When CAA section 111(d)(2) was enacted in 1970, CAA section 110(c) stated that the Administrator shall promptly propose a Federal implementation plan for a state if ''(1) the State fails to submit an implementation plan . . . within the time prescribed, (2) the plan, or any portion thereof, submitted for such State is determined by the Administrator not to be in accordance with the requirements of this section, or (3) the State fails, within 60 days after notification by the Administrator or such longer period as he may prescribe, to revise an implementation plan as required pursuant to a provision of its plan . . . .''[74]

Thus, CAA section 111(d)(2), through its reference to CAA section 110(c), provides the EPA the authority and the obligation to review state plans for compliance with CAA requirements.[75] [76] If a state has not submitted a state plan or if the EPA determines that a state plan is not ''satisfactory,'' *i.e.,* not in accordance with the requirements of CAA section 111, the EPA must promulgate a Federal plan.

Congress further provided in CAA section 111(d)(2) that the EPA shall, in promulgating a standard of performance under a Federal plan, ''take into consideration, among other factors, remaining useful lives of the sources in the category of sources to which such standard applies.'' Thus, the RULOF regulations the EPA has previously promulgated in subparts B and Ba, and the revisions to the RULOF regulations in subpart Ba being finalized in this action, apply not only to states when promulgating state plans, but also to the EPA when promulgating a Federal plan. Throughout this section III.E. of the preamble, discussion of provisions and requirements that apply to states' consideration of RULOF in state plans also apply to the EPA's consideration of RULOF in the context of a Federal plan.

2. Authority and Rationale for the Revisions

The primary authority for these revisions is in CAA section 111(d)(1). The rationale for the revisions finalized here is to more fully align the implementing regulations with the statute and to enhance clarity for states as well as the equitable treatment of states and sources.

CAA section 111(d)(1) directs the EPA to ''prescribe regulations which establish a procedure'' under which states submit state plans. These regulations must ''permit'' states, in applying a standard of performance to any particular source, to consider RULOF. That is, Congress gave the EPA the authority and the obligation to establish procedures that permit states to consider RULOF.

The EPA has been guiding consideration of RULOF for over fifty years, consistent with Congress's direction. ''Permit'' means ''to consent to formally; to allow (something) to happen, esp[ecially] by an official ruling, decision, or law.''[77] It is well understood that there may be parameters or rules as a condition of someone consenting to or allowing something to be done. For example, a building permit generally does not allow a person to build in any way they like, but contains conditions and requirements such as compliance with safety codes and limitations on height. In general, ''permit,'' whether a verb or noun, carries with it an expectation of rules and parameters designed to ensure consistency with the applicable framework, as opposed to open-ended discretion.[78] CAA section 111(d)(1) provides that ''*regulations* of the Administrator . . . *shall permit* the State'' to consider RULOF (emphasis added). The natural reading of this provision is that Congress intended the EPA to set out parameters and conditions that govern states' consideration of RULOF.[79]

The EPA's role in implementing RULOF finds further support in the Supreme Court's understanding of this provision as laid out in *American Electric Power* v. *Connecticut.*[80] In describing the statutory framework of CAA section 111, the Court explained that the EPA sets standards of performance based on CAA section 111(a)(1). It further recognized that, pursuant to the EPA's subpart B general implementing regulations for state plans, 40 CFR 60.24(f), ''EPA may permit state plans to deviate from generally applicable emissions standards upon demonstration that costs are '[u]n-reasonable.' ''[81]

At the same time that Congress clearly directed the EPA to prescribe rules governing states' consideration of RULOF, it also provided that those rules establish a *procedure* under which

[74] Public Law 91–604, section 110(c) (Dec. 31, 1970), 84 Stat. 1681–82.

[75] See also 40 CFR 60.27(c) (''The Administrator will, after consideration of any State hearing record, promptly prepare and publish proposed regulations setting forth a plan, or portion thereof, for a State if: (1) The State fails to submit a plan within the time prescribed; . . . (3) The Administrator disapproves the State plan or plan revision or any portion thereof, as unsatisfactory because the requirements of this subpart have not been met.''); 60.27(d) (providing for promulgation of a proposed Federal plan).

[76] Congress subsequently updated CAA section 110(c) in 1977 and again in 1990. The current version of CAA section 110 splits the EPA's Federal implementation plan authority and the criteria for disapproval of State implantation plans across subsections 110(c) and 110(k)(3). CAA section 110(c)(1) provides that ''[t]he Administrator shall promulgate a Federal implementation plan at any time within 2 years after the Administrator—'' (A) finds that a State has failed to make a complete plan submission, or ''(B) disapproves a State implementation plan submission in whole or in part, unless the State corrects the deficiency, and the Administrator approves the plan or plan revision, before the Administrator promulgates such Federal plan.'' CAA section 110(k)(3), which addresses ''[f]ull and partial approval and disapproval,'' states that the Administrator shall approve all or certain portions of the plan that ''meet[] the applicable requirements of this chapter.'' Thus, a plan, or any portion thereof, that fails to meet the applicable CAA requirements must be disapproved.

[78] See, *e.g., U.S.* v. *Chau,* 293 F.3d 96, 101 (3d Cir., 2002) (a provision requiring an entity to provide notice to the EPA prior to acting is not a ''permit'' because ''[a] requirement that someone provide written notice of an intention to perform an act is not the same at the EPA's granting of a license, or other permission, to the person to perform the act in question . . . .'').

[79] This contrasts with other provisions of the Clean Air Act where Congress granted states unbounded discretion. *See, e.g.,* CAA section 116 (''nothing in this chapter shall preclude or deny the right of any State or political subdivision thereof to adopt or enforce'' more stringent requirements).

[80] 564 U.S. 410 (2011).

[81] Id. at 427.

states submit state plans, including any standards of performance pursuant to consideration of RULOF. CAA section 111(d)(1) states, ''The Administrator shall prescribe regulations which shall establish a procedure . . . . Regulations of the Administrator under this paragraph shall permit the State in applying a standard of performance to any particular source . . . to take into consideration, among other factors, the remaining useful life of the existing source to which such standard applies.'' Consistent with this statutory direction, the EPA's RULOF provisions, both the existing provisions and those being finalized in this action, are fundamentally procedural in nature. They prescribe the series of steps and considerations states must undertake to apply a less stringent standard of performance that is consistent with CAA section 111(d).

As discussed in section III.E.1. of this preamble, Congress also granted the EPA a role in ensuring that states applying standards of performance based on RULOF do so in an appropriate manner. CAA section 111(d)(2) requires the EPA to evaluate standards of performance in state plans and approve them only if they are ''satisfactory,'' *i.e.,* if they meet the applicable requirements.[82] Thus, while states have responsibility for establishing, implementing, and enforcing standards of performance for designated facilities, the EPA has an obligation to ensure that those standards of performance—including any standards of performance based on consideration of RULOF—are consistent with the statute. The regulations the EPA is promulgating in this final rule provide greater clarity and thus enable states to apply less stringent standards of performance that are consistent with CAA section 111(d). Having clear, detailed regulations also aids the EPA in evaluating less stringent standards of performance included in state plans, which maximizes the Agency's ability to provide for fair and equitable treatment across the states and sources that use the RULOF provision.

In addition, the parameters for considering RULOF set out in this final rule are consistent with the role of RULOF as an important tool for states in the unusual circumstance in which the EPA's BSER determination is unreasonable for a particular source. As explained in detail in section III.E.3.b. of this preamble, the EPA's longstanding interpretation is that RULOF provision in CAA section 111(d)(1) allows the Agency to permit states to provide variances for existing facilities in certain circumstances. These circumstances are limited to when a state can demonstrate that it is unreasonable for a particular facility to achieve the degree of emission limitation determined by the EPA in the applicable EG.

Under CAA section 111, EPA must provide BSER and degree of emission limitation determinations that are, to the extent reasonably practicable, applicable to all designated facilities in the source category. In many cases, this requires the EPA to create subcategories of designated facilities, each of which has a BSER and degree of emission limitation[83] tailored to its circumstances.[84] Thus, the EPA endeavors, to the extent practicable, to promulgate BSER and degree of emission limitation determinations that are achievable for all designated facilities covered by an EG. However, as Congress recognized, this may not be possible in every instance because, *e.g.,* it is not be feasible for the Agency to know and consider the idiosyncrasies of every designated facility in a source category or because the circumstances of individual facilities change after the EPA determined the BSER. The EPA believes Congress intended RULOF to allow the EPA to permit the use of variances for states to adjust a standard of performance in unusual circumstances in which the EPA's determination regarding the degree of emission limitation achievable through the BSER is not reasonable for a particular designated facility.

This view of the RULOF provision as a limited variance from the EPA's determinations in an EG has a long history. The EPA's description of how it develops EGs in the preamble to the 1975 subpart B implementing regulations stated that ''emission guidelines will reflect subcategorization within source categories where appropriate, taking into account differences in sizes and types of facilities and similar con- . . . siderations [*sic*], including differences in control costs that may be involved for sources located in different parts of the country.''[85] As a result, emission guidelines ''will in effect be tailored to what is reasonably achievable by particular classes of existing sources, and States will be free to vary from the levels of control represented by the emission guidelines in the ways mentioned above.''[86] The ''ways mentioned above'' included establishing more stringent standards under CAA section 116 where states believe additional control is necessary or desirable, as well as setting more lenient standards, subject to EPA review, in cases of economic hardship.[87] The EPA subsequently explained that such cases could arise because controls were not included in the design of existing sources or because physical limitations may make installation of particular control systems impossible or unreasonably expensive in some cases.[88]

Thus, the EPA's long-standing interpretation is that the standards of performance established by states must generally reflect the degree of emission limitation determined by the Agency, except where, based on RULOF, states provide ''sufficient justification'' that the EPA's determination is ''unreasonable'' for a particular source.[89] Although the EPA endeavors to address the circumstances of all designated facilities in its EG, there may remain instances in which the circumstances of a particular facility justify application of a less stringent standard of performance.

---

[82] CAA section 111(d)(2)(A) authorizes the EPA to promulgate a Federal plan for any state that ''fails to submit a satisfactory plan'' under section 111(d)(1). Accordingly, the EPA interprets ''satisfactory'' as the standard by which the EPA reviews state plan submissions. The EPA discusses the ''satisfactory'' standard of review in greater detail in section III.E.3.b of this preamble.

[83] The EPA, in different contexts, uses the phrase ''degree of emission limitation'' to refer to both the degree of emission limitation achievable through application of the BSER at the level of an individual source, *e.g.,* the best system can achieve an 85% reduction in end-of-stack emissions when applied to a designated facility, and to the overall level of stringency that results from applying the BSER to the source category as a whole. In this section of the preamble, this phrase refers to the emission reductions that are achievable at an individual source.

[84] See 40 CFR 60.22a(b)(5) (EPA may specify different degrees of emission limitation and compliance times for different subcategories of designated facilities).

[85] 40 FR 53343.

[86] Id.

[87] See id.

[88] Id. at 53344. Similarly, in the 1974 notice of proposed rulemaking for the subpart B regulations, the EPA explained that ''it is the Administrator's judgment that section 111(d) permits him to approve State emission standards only if they reflect application of the best systems of emission reduction (considering the cost of such reduction) that are available.'' The EPA further stated: ''It is recognized, however, that application of such standards may be unreasonable in some situations. For example, to require that existing controls be upgraded by a small margin at a relatively high cost may be unreasonable in some cases. The proposed regulations, therefore, provide that States may establish less stringent emission standards on a case-by-case basis provided that sufficient justification is demonstrated in each case.'' 39 FR 36102, 36102 (Oct. 7, 1974).

[89] 39 FR 36102; see also 40 CFR 60.24(c), (f) (EPA's longstanding regulations in subpart B require standards of performance in state plans to be no less stringent than the corresponding EG except where a state has satisfied the regulatory requirements for invoking RULOF).

Finally, and relatedly, to be consistent with the statutory purpose of reducing dangerous air pollution under CAA section 111; the statutory framework under which to achieve that purpose the EPA is directed to set the degree of emission limitation achievable through application of the best system of emission reduction; and the history of the statutory RULOF provision as a limited variance from that degree of emission limitation to address unusual circumstances at particular facilities, the EPA's regulations must ensure that application of less stringent standards of performance pursuant to consideration of RULOF does not undermine the degree of emission limitation achievable through application of the BSER.

Thus, for the reasons explained above, the EPA has the authority to promulgate the regulatory updates included in this final rule, which flow from the statute's direction for the Agency to ''establish procedures'' that, among other things, ''permit'' states to consider RULOF. The EPA believes these updates are warranted to provide additional clarity to the states (when developing state plans) and the EPA (when issuing Federal plans and reviewing state plans) regarding the appropriate procedures for considering RULOF and to ensure the predictable and equitable treatment of states and sources in implementing EGs under CAA section 111(d). Furthermore, the updates to the framework are needed to ensure that consideration of RULOF adheres to statutory purpose, structure, and historical context discussed above.

Critically, the regulatory revisions also provide a framework for how states and the EPA calculate and apply less-stringent standards of performance. Neither the RULOF provision in subpart B nor the 2019 update to that provision in subpart Ba clearly delineate the process for states or the EPA after they have determined that a source cannot reasonably achieve the degree of emission limitation in the applicable emission guideline. As such, the existing regulations are not adequate to ensure that standards of performance pursuant to RULOF are no less stringent than required to address the basis for providing a variance from the EPA's degree of emission limitation in the first instance.

Consistent with the long-held interpretation of the RULOF provision as a limited variance, the EPA is aware of only a small handful of instances in which a state has used this provision to apply a less-stringent standard of performance to a designated facility in a state plan. In three of these instances, the Agency approved less stringent standards of performance for welfare-related designated pollutants for which, under subpart B (40 CFR 60.24(d)), there was a lower bar for doing so.[90] In the fourth instance, the state invoked RULOF to apply a less-stringent standard for a health-related designated pollutant and the EPA disapproved the less-stringent standard for failing to satisfy the requirements of 40 CFR 60.24(f).[91] At the time of this rulemaking, however, there are two new EGs for which rulemaking is ongoing; each of these EGs would address large, complex, and highly diverse source categories.[92] Commenters on these proposed EGs have suggested that there may be more of a role for RULOF than in past EGs.[93] The revisions to the RULOF provisions are thus timely to give states greater clarity on and predictability for applying less stringent standards of performance consistent with CAA section 111.

Note that the RULOF provisions are distinct from the flexible compliance mechanisms such as trading and averaging, discussed in section III.G.1. of this preamble. The RULOF provisions apply where a state intends to *depart* from the degree of emission limitation in the EG and propose a less stringent standard for a designated facility (or class of facilities). That is, the RULOF provisions are relevant to a state's process of applying a standard of performance to a designated facility in the first instance. In contrast, trading and averaging are mechanisms that, when permitted in an EG, states may use to demonstrate compliance with the standards of performance that are contained within their state plans.

3. Proposed and Finalized RULOF Provisions

The EPA proposed revisions to the existing RULOF provision at 40 CFR 60.24a(e), which details the circumstances under which states or the EPA may apply a less stringent standard of performance. The EPA also proposed to add new provisions: a procedure for determining less stringent standards when a state has properly invoked RULOF (proposed and finalized at 40 CFR 60.24a(f)); a clarification that state plans may not apply less stringent standards if a designated facility can reasonably achieve the presumptive standard of performance using a technology other than the BSER (proposed at 40 CFR 60.24a(g)); a clarification that any less stringent standards must meet all other applicable requirements (proposed at 40 CFR 60.24a(l), finalized at 60.24a(h)); requirements related to when operating conditions that are relied on for a less stringent standard must be included as enforceable requirements in state plans (proposed at 40 CFR 60.24a(h), finalized at 40 CFR 60.24a(g)); requirements related to the consideration of remaining useful life (proposed 40 CFR 60.24a(i)); a clarification regarding the burden of proof and information on which RULOF demonstrations are based (proposed 40 CFR 60.24a(j));

requirements to consider potential impacts and benefits of control to communities most affected by and vulnerable to emissions from a designated facility for which a state is proposed a less stringent standard (proposed 40 CFR 60.24a(k)); and a clarification that states may account for other factors in applying a more stringent standard of performance (proposed 40 CFR 60.24a(m)). In addition, the EPA proposed changes to the existing 40 CFR 60.24a(f) (proposed at 40 CFR 60.24a(n), finalized at § 60.24(i)) reflecting the Agency's revised interpretation that CAA sections 111(d) and 116 authorize states to include standards of performance more stringent than the EPA's presumptive standards in their state plans as enforceable requirements.

The EPA received a wide range of comments on its proposed RULOF provisions. Some commenters expressed support for the proposed revisions, noting that the EPA has the authority to specify how RULOF is implemented and the obligation to ensure that its use does not undermine the emission reductions that are achievable through application of the BSER. Supportive commenters also noted that providing a regulatory structure is important to ensure that RULOF is applied in a reliable, consistent, and appropriate manner. Commenters opposed to the proposed RULOF revisions stated that there is no basis in the statute for the EPA to restrict states' authority to consider RULOF and apply less-stringent standards of performance. Some commenters also argued that the EPA's proposed regulations were too prescriptive and burdensome. Other commenters generally supported the EPA's proposed revisions but had questions or concerns regarding specific provisions, including the requirements around source-specific standards of performance and consideration of impacted communities. One commenter requested that the EPA clarify that the revised RULOF provisions would apply to design, equipment, work practice, or operational standards issued under CAA sections 111(d) and 111(h)(1).

After consideration of these comments, the EPA is finalizing a subset of the requirements that it proposed. As a general matter, the EPA is finalizing as requirements the provisions that must apply under any EG to provide necessary clarity to both the states and the EPA in applying or approving less stringent standards of performance. This clarity and predictability with regard to what constitutes a satisfactory, and therefore approvable, less stringent standard is crucial to ensuring the equitable treatment of states and sources that are considering RULOF in state plans. The requirements the EPA is finalizing are additionally necessary to ensure that use of RULOF is consistent with the statutory purpose of reducing emissions of dangerous air pollutants, the framework under which the EPA is directed to achieve that purpose through determining the degree of emission limitation, and history of RULOF as a limited variance to address unusual circumstances when it is not possible for a particular facility to achieve the EPA's degree of emission limitation. The proposed RULOF provisions that are not being included as regulatory requirements remain important considerations when applying RULOF; however, the EPA is not finalizing them in these general implementing regulations.

The EPA recognizes that in finalizing these updates it is imposing certain requirements on states' use of RULOF. Consistent with the framework of cooperative federalism under which CAA section 111(d) operates, states apply standards of performance pursuant to consideration of RULOF, as well as provide the compliance measures for implementing such standards, subject to the applicable statutory requirements. The Agency again notes that it has placed requirements on states' ability to apply less stringent standards of performance since it first created a variance provision in subpart B in 1975. See 40 CFR 60.24(c) through (e). When Congress later adopted the RULOF provision into the statute, it directed the EPA in CAA section 111(d)(1) to establish a procedure *permitting* states to consider RULOF. Moreover, as discussed further in section III.E.3.b, these updates are consistent with the historical interpretation of RULOF as a variance from the EPA's degree of emission limitation. The EPA also notes that the requirements being finalized in this action establish a process for states in applying less stringent standards of performance. These final regulations ensure, consistent with the statutory purpose, that any less stringent standards are no less stringent than necessary to address the reason that the variance is needed in the first place.

Finally, the EPA confirms that the RULOF provisions, including those being finalized in this action, apply to standards of performance promulgated pursuant to CAA sections 111(d) and 111(h)(1). The existing definition of ''standard of performance'' in 40 CFR 60.21a(f) includes ''a legally enforceable regulation . . . prescribing a design, equipment, work practice, or operational standard, or combination thereof.'' Therefore, the RULOF provisions in 40 CFR 60.24a, which may be invoked to apply a ''standard of performance'' to a particular designated facility, also apply to standards of performance applied under CAA section 111(h)(1).[94]

a. Threshold Requirements for Considering Remaining Useful Life and Other Factors

The existing RULOF provision at 40 CFR 60.24a(e) addresses the circumstances in which states may invoke RULOF to deviate from the BSER and degree of emission limitation determinations the EPA has made pursuant to CAA section 111(a)(1). It allows states to consider RULOF to apply a less stringent standard of performance for a designated facility or class of facilities if they demonstrate one of the three following circumstances: (1) unreasonable cost of control resulting from plant age, location, or basic process design; (2) physical impossibility of installing necessary control equipment; or (3) other factors specific to the facility (or class of facilities) that make application of a less stringent standard or final compliance time significantly more reasonable.

As discussed in the notice of proposed rulemaking, the proposed amendments largely retained this provision, including the three circumstances under which a less stringent standard of performance may be applied, and provided further clarification of what a state must demonstrate in order to invoke RULOF in a state plan. Specifically, the proposed amendments required the state to demonstrate that a particular facility cannot reasonably apply the BSER to achieve the degree of emission limitation determined by the EPA, based on one or more of the three circumstances. The EPA's proposal retained the first circumstance in whole and revised the second circumstance to add the ''technical infeasibility'' of installing a control as another situation in which application of RULOF may be appropriate. The proposal further clarified the third circumstance for invoking RULOF, the existing version of which provides that states may invoke RULOF when other factors specific to the facility make a less stringent standard of performance ''significantly more reasonable.'' The EPA proposed to revise this circumstance, under which the first two circumstances also fall, to specify that states may consider RULOF

---

[94] See also 40 CFR 60.24a(b).

to apply a less stringent standard if circumstances specific to a facility are fundamentally different from the information the EPA considered in determining the BSER. This proposed clarification was intended to provide clear parameters for developing and assessing state plans, as the existing third circumstance is vague and potentially open-ended.

The EPA explained at proposal that the revisions clarified the RULOF provision by tethering a state's RULOF demonstration to the statutory factors the EPA considered in the BSER determination. As discussed in section III.E.1. of this preamble, CAA section 111(a)(1) gives the EPA the responsibility of determining the BSER and degree of emission limitation that is required of designated facilities in the source category; the EPA endeavors, to the extent reasonably practicable based on the information before it, to promulgate determinations that are achievable for every designated facility covered by an EG. Per the statutory requirements, the EPA determines the BSER by first identifying control methods that it considers to be adequately demonstrated and then determining which is the best system of emission reduction by evaluating the statutory factors: (1) the cost of achieving such reduction, (2) nonair quality health and environmental impacts, (3) energy requirements, and (4) the amount of emission reductions.[95] The EPA's BSER determination thus represents a system that is ''adequately demonstrated'' and reasonable for sources broadly within the source category; CAA section 111(a)(1) requires that standards of performance must reflect the degree of emission limitation that is achievable through application of the BSER.

In considering the BSER, the D.C. Circuit has stated that to be ''adequately demonstrated,'' the system must be ''reasonably reliable, reasonably efficient, and . . . reasonably expected to serve the interests of pollution control without becoming exorbitantly costly in an economic or environmental way.'' *Essex Chem. Corp.* v. *Ruckelshaus,* 486 F.2d 427, 433 (D.C. Cir. 1973). Thus, in making the BSER determination, the EPA must evaluate whether a system of emission reduction is ''adequately demonstrated'' for the source category or sub-category based on the physical possibility and technical feasibility of control. Similarly, the court has interpreted CAA section 111(a)(1) as using reasonableness in light of the statutory factors as the standard in evaluating cost, so that a control technology may be considered the ''best system of emission reduction . . . adequately demonstrated'' if its costs are reasonable (*i.e.,* not exorbitant, excessive, or greater than the industry can bear), but cannot be considered the BSER if its costs are unreasonable.[96] In light of the statutory factors the EPA is required to consider, it follows that most designated facilities within the source category or subcategory should be able to implement the BSER at a reasonable cost to achieve the degree of emission limitation determined by the EPA. Consideration of RULOF is appropriate only for particular sources for which implementing the BSER to achieve that degree of emission limitation would impose unreasonable costs or would otherwise not be feasible due to facility-specific circumstances that are not applicable to the broader source category (or subcategories) and that the EPA did not consider in determining the BSER.

For example, if the EPA applied a specific cost threshold in determining the BSER, application of RULOF based on cost would only be appropriate where the cost of achieving the associated degree of emission limitation at a particular designated facility is unreasonably high relative to the costs the EPA considered for the BSER. Or, by way of further example, if the EPA were to determine that a specific back-end control technology is adequately demonstrated and the BSER for a source category, a state may need to evaluate whether it would be physically possible to install that control technology at a designated facility given the particular size and physical constraints of that facility. Application of RULOF to deviate from the EPA's determinations pursuant to CAA section 111(a)(1) may be appropriate, *e.g.,* where the state could show that the cost of achieving the degree of emission limitation would be significantly higher at a specific designated facility than the cost-per-ton EPA considered in setting the BSER, or that a specific designated facility does not have adequate space to reasonably accommodate the installation of the BSER and the facility cannot reasonably achieve the degree of emission limitation using a different control technology. The EPA proposed to require states to hew to the same types of factors and analyses the EPA's considered in its BSER determination when demonstrating that the EPA's determinations are not reasonable for a particular designated facility; the Agency explained that this would be consistent with the statutory framework under which RULOF is a limited exception to the level of stringency otherwise required by the BSER.[97]

Related to the proposed revisions at 40 CFR 60.24a(e), the EPA also proposed to add new § 60.24a(g) to the regulations, which would explicitly provide that a state plan may not apply a less stringent standard of performance in cases where a designated facility cannot reasonably apply the BSER to achieve the degree of emission limitation determined by the EPA, but *can* reasonably implement a different technology or other system to achieve that same degree of emission limitation. This is consistent with the statutory framework, which does not require sources to implement the EPA's BSER but rather permits states to allow their sources to comply with their standards of performance using systems of their choosing.

The EPA received a range of comments on the proposed revisions to the threshold circumstances for invoking RULOF to apply a less-stringent standard of performance. Some commenters agreed with the EPA that the existing criteria are not specific or clear enough to ensure that RULOF is invoked only when a designated facility cannot achieve the degree of emission limitation that the EPA has determined pursuant to section 111(a)(1). Several commenters supported the EPA's proposal that application of RULOF is only appropriate where a facility cannot reasonably apply the BSER to achieve the degree of emission limitation determined by the EPA based on fundamental differences between that facility and the factors the EPA considered in the BSER determination. Some commenters also urged the EPA to explicitly apply the ''fundamentally different'' standard to all three circumstances under 40 CFR 60.24a(e).

However, other commenters argued that the EPA cannot preclude states from considering factors specific to particular facilities on the basis that the EPA did not consider those factors in

---

[95] Although CAA section 111(a)(1) may be read to state that the factors enumerated in the parenthetical are part of the ''adequately demonstrated'' determination, the D.C. Circuit's case law may be read to treat them as part of the ''best'' determination. *See Sierra Club* v. *Costle,* 657 F.2d 298, 330 (D.C. Cir. 1981). Under either approach, the EPA's analysis and ultimate determination as to the BSER would be the same. In determining the ''best'' system of emission reduction, the EPA also considers the advancement of technology, consistent with D.C. Circuit caselaw. See id. at 347.

[96] See *Lignite Energy Council* v. *EPA,* 198 F.3d 930, 933 (D.C. Cir. 1999), *Sierra Club* v. *Costle,* 657 F.2d 298, 343 (D.C. Cir. 1981), *Portland Cement Ass'n* v. *EPA,* 513 F.2d 506, 508 (D.C. Cir. 1975).

[97] 87 FR 79199.

determining the BSER, and that the ''fundamentally different'' standard unlawfully narrows states' consideration of site-specific factors under the third RULOF criterion. Some commenters further contended that states should have wide latitude and flexibility to consider RULOF and that the EPA lacks authority to restrict states' abilities to apply RULOF in circumstances they deem appropriate. The EPA also received a request from one commenter asking the Agency to clarify how the proposed provisions at 40 CFR 60.24a(e) and (g) interact with each other.

The EPA is finalizing the provisions for invoking RULOF at 40 CFR 60.24a(e) with clarifying revisions relative to proposal. Based on these changes, the proposed addition of 40 CFR 60.24a(g) is redundant; the EPA is therefore not finalizing this provision.

These revisions to 40 CFR 60.24a(e) are necessary to ensure that state plans comply with CAA section 111(d). As explained above, the EPA's determination of the degree of emission limitation achievable through application of the BSER is the level of stringency required by CAA section 111(d), unless it can be demonstrated that something about the EPA's determination does not hold true for a particular designated facility. The enumerated circumstances for invoking RULOF in 40 CFR 60.24a(e) mirror the information the EPA considers in making its BSER and degree of emission limitation determination pursuant to CAA section 111(a)(1): information related to determining that a system is adequately demonstrated (including physical possibility and technical feasibility), the cost of achieving emission reductions, and other factors, which include nonair quality health and environmental impacts and energy requirements. Thus, the long-standing RULOF provision [98] is formulated for states to examine, at a minimum, the same factors the EPA considered in determining the BSER in order to determine the reasonableness of the EPA's BSER and degree of emission limitation as it applies to a particular designated facility. In this action, the EPA is clarifying the circumstances in 40 CFR 60.24a(e) for invoking RULOF in order to provide more objective and consistent criteria that will aid both states and the EPA in developing and reviewing standards of performance consistent with CAA section 111(d), as well as ensure the equitable treatment of states and sources that avail themselves of the RULOF provision.

The EPA disagrees with commenters who argued that the proposed revisions to the third circumstance unlawfully constrain states' authority to invoke RULOF. On the contrary, the EPA believes these revisions provide necessary clarity to ensure that states invoke RULOF in appropriate circumstances. First, as discussed more fully in section III.E.2. of this preamble, Congress directed the EPA to promulgate regulations for the submission of state plans that ''permit'' states to consider RULOF. Rather than granting states unfettered discretion to consider RULOF in applying standards of performance, the statute directs the EPA to establish regulations describing the ''permissible'' use of such consideration. Thus, the EPA has the authority and obligation to guide states' consideration of RULOF.

Second, the revisions to 40 CFR 60.24a(e) provide a clear and easily replicable standard for when it is appropriate to apply a less stringent standard of performance: when there are fundamental differences between the information the EPA considered in determining the degree of emission limitation and the information specific to a facility that make the EPA's degree of emission limitation unreasonable for the facility. In addition to clarifying the circumstances under which consideration of RULOF is appropriate, this standard also provides greater specificity that will aid both states and the EPA in implementing the provision. This standard is further consistent with statutory purpose, structure, and history of CAA section 111(d), under which the generally applicable requirement is the degree of emission limitation determined by the EPA and RULOF serves as a variance to that requirement.[99] Moreover, the revisions to 40 CFR 60.24a(e) will provide a framework for the EPA to use when considering any requests for less stringent standards of performance when the Agency is promulgating a Federal plan, which is again critical to ensuring both the equitable treatment of states and sources and the integrity of an EG's emission reduction purpose.

This revision will additionally provide the EPA with clear criteria to use when evaluating any invocation of RULOF in state plans to determine whether providing a less-stringent standard of performance is consistent with the statutory framework and therefore approvable as ''satisfactory.'' As noted above, it provides an objective, replicable benchmark against which to assess states' plans, which can be further elaborated on in individual EGs.

The ''fundamentally different'' standard ensures that RULOF is invoked for circumstances where application of the statutory factors would lead to a result that is outside the realm of what the EPA considered reasonable in determining the BSER. The EPA makes BSER determinations on a source category, or sub-category, basis. Necessarily, therefore, the Agency considers information relevant to potential BSERs for representative, average units or as average values for the set of designated facilities. Implicit in an EPA determination that a system is the BSER based on average, representative information is a determination that values around those average representative values are also reasonable, including some portion of unit-specific values that will deviate from but are not significantly different than the average representative values. Therefore, in order to justify deviating from the EPA-determined degree of emission limitation, the circumstances of a particular source must be not just different but fundamentally different from those the Agency considered in determining the BSER.

Furthermore, as explained at proposal, the ''fundamentally different'' standard is also consistent with other variance provisions that courts have upheld for environmental statutes. For example, in *Weyerhaeuser Co.* v. *Costle,*[100] the court considered a regulatory provision promulgated under the Clean Water Act (CWA) that permitted owners to seek a variance from the EPA's national effluent limitation guidelines under CWA sections 301(b)(1)(A) and 304(b)(1). The EPA's regulation permitted a variance where an individual operator demonstrates a ''fundamental difference'' between a CWA section 304(b)(1)(B) factor at its facility and the EPA's regulatory findings about the factor ''on a national basis.'' [101] The court upheld this standard as ensuring a meaningful opportunity for an operator to seek dispensation from a limitation that would demand more of the individual facility than of the industry generally, but also noted that such a provision is not a license for avoidance of the Act's strict pollution control requirements.[102]

---

[98] The circumstances for invoking RULOF in the existing subpart Ba provision at 40 CFR 60.24a(e) are identical to those in the original variance provision of subpart B at 40 CFR 60.24(f).

[99] See the discussion in section III.E.3.b. of this preamble.

[100] 590 F.2d 1011 (D.C. Cir. 1978).

[101] Id. at 1039.

[102] Id. at 1035.

The EPA is revising the regulatory text of 40 CFR 60.24a(e) relative to proposal to explicitly provide that the ''fundamentally different'' standard applies to all three categories of circumstances for invoking RULOF. This change is consistent with the stated intent at proposal; for example, the EPA proposed ''to require that, in order to demonstrate that a designated facility cannot reasonably meet the presumptive level of stringency based on one of these three criteria, the state must show that implementing the BSER is not reasonable for the designated facility due to fundamental differences between the factors the EPA considered in determining the BSER, such as cost and technical feasibility of control and circumstances at the designated facility.'' [103] As explained above, in order to be consistent with the statutory framework, the fundamentally different standard necessarily applies to any consideration that may be cause to invoke RULOF to provide a less-stringent standard of performance.

There may be instances in which the EPA has not considered, in making its BSER determination, a circumstance that makes the BSER unreasonable for a particular facility because that circumstance is not applicable to the average or typical designated facility in the source category. Where the EPA did not consider a circumstance that is relevant to a particular designated facility and that circumstance causes the BSER to be unreasonable for that facility due to one or more of the reasons enumerated in 40 CFR 60.24a(e), a state may find there is a fundamental difference from the information the EPA considered in determining the degree of emission limitation achievable through application of the BSER. That is, if the EPA did not consider any information pertaining to a certain circumstance in making its determination, facility-specific information relevant to that circumstance that demonstrates that achieving the degree of emission limitation is unreasonable pursuant to 40 CFR 60.24a(e) may be ''fundamentally different'' from the information the EPA considered. The EPA notes that, in many cases, facility-specific circumstances can be considered in terms of differences in cost. For example, an issue of the technical feasibility of implementing a control to achieve a certain degree of emission limitation may, at its root, be an issue of being able to achieve that degree of emission limitation *at a reasonable cost.* Because cost is generally a more quantifiable and replicable metric, where possible the EPA expects states to include the impacts of any facility-specific circumstances in the cost calculation, rather than evaluating those circumstances under a different factor or consideration.

The EPA is also finalizing its proposed clarifying revisions to 40 CFR 60.24a(e) with further updates. The existing provision in subpart Ba was not clear, unless it was read directly in conjunction with 40 CFR 60.24a(c), that its specific purpose is application of less stringent standards of performance pursuant to consideration of RULOF; it did not mention less stringent standards until 40 CFR 60.24a(e)(3).[104] The EPA therefore proposed and is finalizing revisions so that the provision's purpose is now clearly stated at the outset. The EPA is also making two further revisions relative to the proposed 40 CFR 60.24a(e). First, it is adding back in language allowing the RULOF provision to be used to provide a compliance schedule longer than otherwise required by an applicable emission guideline. In proposing to revise 40 CFR 60.24a(e), the EPA inadvertently deleted the phrase ''that make application of a less stringent . . . final compliance time significantly more reasonable'' in the document containing redline/strikeout of the subpart Ba regulations.[105] It was not the EPA's intent to preclude the use of RULOF to provide a longer compliance schedule; this has been part of the provision since the original variance in 1975.[106] However, as the language pertinent to providing a longer compliance time no longer fits in its original sub-paragraph, the EPA is adding this allowance back elsewhere in 40 CFR 60.24a(e).

Second, the EPA is revising this provision relative to proposal to change the circumstances under which invoking RULOF is appropriate from the state demonstrating that ''the facility cannot reasonably apply the best system of emission reduction to achieve the degree of emission limitation determined by the EPA . . .'' to the state demonstrating that ''the facility cannot reasonably achieve the degree of emission limitation determined by the EPA. . . .'' At proposal, the EPA explained that ''the state must show that implementing the BSER is not reasonable for the designated facility due to fundamental differences between the factors the EPA considered in determining the BSER, such as cost and technical feasibility of control and circumstances at the designated facility.'' [107] However, it is not sufficient that a facility not be able to implement the BSER; the state must demonstrate that the facility cannot otherwise reasonably achieve the EPA's degree of emission limitation (for example, through a different system of emission reduction) in order for a facility to be eligible for a less stringent standard of performance. This is consistent with the definition of ''standard of performance'' in CAA section 111(a)(1), which is a ''standard for emissions of air pollutants'' that ''reflects the degree of emission limitation achievable through application of the [BSER],'' as opposed to a standard requiring the application of the BSER. That is, the statute requires a certain degree of emission limitation, not the use of a particular technology. Therefore, the fact that a facility cannot apply the BSER on its own is not sufficient to invoke RULOF.

The EPA believes that simplifying the language in 40 CFR 60.24a(e) will reduce confusion about the ultimate circumstances under which invoking RULOF is appropriate: where a particular facility cannot meet the degree of emission limitation determined by the EPA. Because the degree of emission limitation is based on the EPA's BSER determination, the information the EPA considered in determining the BSER remains the touchstone for determining when a particular facility cannot reasonably achieve the degree of emission limitation in the applicable emission guideline. Furthermore, given that the BSER presumptively reflects a system that is adequately demonstrated and reasonable for all designated facilities within a source category or subcategory, the EPA anticipates that in many if not most instances a state considering RULOF will in fact be evaluating the reasonableness of applying the BSER to achieve the degree of emission limitation. However, even if the state is evaluating the use of a different system to achieve the degree of emission limitation determined by the EPA, the factors and information the EPA considered in the EG, *e.g.,* cost effectiveness, will remain relevant to this inquiry.

As a corollary to this change, the EPA is not finalizing the provision proposed at 40 CFR 60.24a(g), which would have provided that a state could not apply a less stringent standard of performance where a facility could reasonably

---

[103] 87 FR 79199.

[104] 84 FR 32520, 32577 (July 8, 2019).

[105] Memorandum, ''Redline/Strikeout for proposed amendments to 40 CFR 60 Subpart Ba: Adoption and Submittal of State Plans for Designated Facilities,'' Docket ID No, EPA–HQ–OAR–2021–0527–0035.

[106] See 40 CFR 60.24(f).

[107] 87 FR 79199.

implement a system of emission reduction other than the BSER to achieve the degree of emission reduction determined by the EPA. This provision is redundant now that the EPA is clarifying in 40 CFR 60.24a(e) that states may apply less stringent standards of performance only when they demonstrate that a facility cannot reasonably achieve the degree of emission limitation determined by the EPA.

Both subpart B at 40 CFR 60.24(f) and the existing regulations of subpart Ba at 40 CFR 60.24a(e) provide that use of RULOF is appropriate if a state demonstrates that one of the three circumstances is met ''with respect to each facility (or class of such facilities).'' In the notice of proposed rulemaking for this action, the EPA stated that, ''[t]o the extent that a state seeks to apply RULOF to a class of facilities that the state can demonstrate are similarly situated in all meaningful ways, the EPA proposes to permit the state to conduct an aggregate analysis of [the five BSER factors] for the entire class.'' [108] The EPA is reiterating in this final rule that invoking RULOF and providing a less-stringent standard or performance or longer compliance schedule for a class of facilities is only appropriate where all the facilities in that class are similarly situated in all meaningful ways. That is, they must not only share the circumstance that is the basis for invoking RULOF, they must also share all other characteristics that are relevant to determining whether they can reasonably achieve the degree of emission limitation determined by the EPA in the applicable EG. For example, it would not be reasonable to create a class of facilities for the purpose of RULOF on the basis that the facilities do not have space to install the EPA's BSER control technology if some of them are able to install a different control technology to achieve the degree of emission limitation in the EG. Similarly, it would not be appropriate for a state to conduct a single evaluation pursuant to 40 CFR 60.24a(f) to apply the same less stringent standard of performance to a class of facilities if individual facilities within that class have different characteristics that could result in different standards of performance. The evaluation of when it is appropriate to create a class of facilities is extremely source-sector and EG-specific; the EPA will address circumstances in which it may or may not be permissible to group facilities for purposes of RULOF in individual EGs.

In summary, the EPA is finalizing its proposed revisions to 40 CFR 60.24a(e) with additional clarifications. The first is to reflect that the ''fundamentally different'' standard applies to all three circumstances for invoking RULOF. This clarification reinforces that invocation of RULOF is appropriate when the circumstances of a particular designated facility are fundamentally different from those the EPA considered such that the facility cannot reasonably achieve the degree of emission limitation the EPA determined pursuant to CAA section 111(a)(1). Second, the EPA is revising the circumstances under which invoking RULOF is appropriate from a demonstration that a facility cannot reasonably apply the BSER to achieve the degree of emission limitation determined by the EPA to a demonstration that the facility cannot reasonably achieve the degree of emission limitation determined by the EPA. This change is intended to simplify and clarify the provision as it is the degree of emission limitation determined by the EPA, not the system used to achieve it, that has always been the relevant consideration under CAA sections 111(d) and 111(a)(1). Third, the EPA is clarifying the provision that states may use RULOF to provide for a longer compliance timeline as well as less-stringent standards of performance, which was inadvertently omitted from the proposed regulatory text. In general, the EPA is revising 40 CFR 60.24a(e) to provide more objective and consistent criteria for when it is appropriate to invoke RULOF in order to guide states in applying standards of performance to particular designated facilities and the EPA in evaluating state plans. The EPA is not finalizing proposed 40 CFR 60.24a(g), as this provision is now superfluous given the updates to 40 CFR 60.24a(e).

The EPA acknowledges that what is considered reasonable in light of the statutory factors is a fact-specific inquiry based on the source category and pollutant that is being regulated pursuant to a particular EG, and that the EPA cannot anticipate and address all circumstances that may arise in these general implementing regulations. Thus, the EPA may consider additional factors and establish additional parameters governing the consideration of RULOF, including what deviations from the EPA's determinations may be within the range of reasonable versus deviations that constitute fundamental differences between facility-specific circumstances and the EPA's degree of emission limitation determination, in a particular EG.

b. Calculation of a Standard Which Accounts for Remaining Useful Life and Other Factors

If a state has demonstrated, pursuant to 40 CFR 60.24a(e), that there is a fundamental difference between the information the EPA considered in the applicable EG and the information specific to a particular source that makes it unreasonable for that source to achieve the degree of emission limitation, the state may then apply a less stringent standard of performance.[109] The current RULOF provision, 40 CFR 60.24a(e), does not specify how a less stringent standard is to be calculated and applied. While this provision stands on its own and permits states to consider RULOF to apply a less stringent standard of performance, the lack of a process for determining any such standards makes it difficult for states to know whether the result will be approvable and additionally makes it difficult for the EPA to review less stringent standards in a consistent and equitable manner. In order to provide clarity and ensure the integrity of the emission reduction purpose of CAA section 111(d), as well as to ensure the equitable treatment of designated facilities across states, the EPA is promulgating a framework in 40 CFR 60.24a(f) for the calculation of a standard of performance that accounts for RULOF. As explained in this section of the preamble, the process the EPA is finalizing differs from the proposed framework, but the material components of calculating and applying a less stringent standard of performance, and the underlying purpose and direction of the EPA's framework, remain the same.

The EPA proposed to require that states determine a source-specific BSER for each designated facility for which RULOF has been invoked pursuant to 40 CFR 60.24a(e) and include a standard of performance that reflects the degree of emission limitation achievable through application of that BSER in their state plans. The notice of proposed rulemaking explained that the statute requires the EPA to determine the BSER by considering emission control methods that it finds to be adequately demonstrated, and then determining which is the best system of emission

---

[108] 87 FR 79200 n.46.

[109] States intending to apply a less-stringent standard of performance pursuant to RULOF would include all information, demonstrations, etc. necessary to satisfy 40 CFR 60.24a(e) through (h) in their state plan submissions. The EPA will first review a state's demonstration that invocation of RULOF pursuant to 40 CFR 60.24a(e) is appropriate for a particular designated facility against the applicable requirements. If the EPA finds that demonstration satisfactory, it will proceed to evaluate the standard of performance for that facility applied pursuant to 40 CFR 60.24a(f).

reduction by evaluating (1) the cost of achieving such reduction, (2) nonair quality health and environmental impacts, (3) energy requirements, and (4) the amount of reductions.[110] To be consistent with this statutory construct, the EPA proposed to require that in determining a source specific BSER for a designated facility (or class of such facilities [111]), a state must also consider all these factors in applying RULOF for that source.

Specifically, the EPA proposed that a state in its plan submission would identify all control technologies available for the source and evaluate the BSER factors for each technology, using the same factors and evaluation metrics as the EPA did in developing the EG. For example, if the EPA evaluated the cost factor using the evaluation metric of capital costs in determining the BSER, the EPA proposed that the state must do the same in evaluating a control technology for an individual designated facility, rather than selecting a different evaluation metric for cost. The state would then calculate the emission reductions that applying the source-specific BSER would achieve and select the standard of performance which reflects this degree of emission limitation. This standard would be in the form or forms (*e.g.,* numerical rate-based emission standard) as required by the specific EG.

While the EPA proposed to require that states identify all control technologies or other systems of emission reduction available for the source and evaluate each system using the same factors and evaluation metrics as the EPA did in determining the BSER, it also solicited comment on whether there are additional factors, not already accounted for in the BSER analysis, that the EPA should permit states to consider in determining a less stringent standard of performance. The EPA further solicited comment on whether it should provide that the manner in which the EPA conducted the BSER analysis would be a presumptively approvable framework for applying a less-stringent standard rather than requirements and, if so, what different approaches states might use to evaluate and identify less stringent standards of performance.

The EPA also noted at proposal that CAA section 111(d) requires that state plans include measures that provide for the implementation and enforcement of a standard of performance. This requirement applies to any standard of performance established by a state, including one that accounts for RULOF. Such measures include monitoring, reporting, and recordkeeping requirements, as required by 40 CFR 60.25a, as well as any additional measures specified under an applicable EG. In particular, any standard of performance that accounts for RULOF is also subject to the requirement under subpart Ba that the state plan submission include a demonstration that each standard is quantifiable, non-duplicative, permanent, verifiable, and enforceable. 40 CFR 60.27a(g)(3)(vi). The EPA did not reopen these existing requirements of subpart Ba in this rulemaking.

The EPA received both comments in support of and comments opposed to the proposed requirements for calculating facility-specific standards of performance under RULOF. Some commenters supported the addition of a regulatory framework for facility-specific BSER analysis and stated that the BSER factors encompass all relevant information to a state's determination of an appropriate standard for a facility. Other commenters opposed the proposed framework. Comments in opposition largely fell into two categories: Some commenters asserted there is no basis in the statute for requiring states to conduct facility-specific BSER analyses pursuant to RULOF and, relatedly, that the EPA should not put restrictions on what states may consider in applying a less stringent standard of performance for a particular source but should rather maintain the wide latitude afforded to states under CAA section 111. Others stated that the EPA's proposed requirements would constitute a heavy lift for state agencies and would require substantial work for states to implement. In this vein, one commenter requested that the EPA not require states to evaluate, as part of their facility-specific BSER analyses, control technologies that the Agency has previously excluded from the BSER on the basis of technological or economic feasibility. Rather, the only control technologies that states should be required to evaluate are technologies that result in less emission reduction than the technology the EPA determined to be the BSER.

As explained below, the EPA disagrees with comments that there is no basis for putting a framework in place for states and the Agency to use in applying and evaluating less stringent standards of performance. The EPA believes that such a framework is well supported by the statutory purpose, text, and context of the RULOF provision. In particular, after considering the comments, the EPA believes that the purpose, text, and context support a requirement that states (or the EPA in the case of a Federal plan) calculate and apply a standard of performance that varies from the EPA's degree of emission limitation in the applicable emission guideline only to the extent necessary to address the fundamental difference that is the basis for invoking RULOF.

First, providing a framework for calculating less stringent standards of performance is consistent with the text of CAA section 111(d) and is responsive to Congress's directive in that provision that the Agency prescribe regulations establishing a procedure for state plans, including regulations that ''permit'' states ''in applying'' a standard of performance to a particular source to ''take into consideration'' RULOF. The provisions the EPA is promulgating in this action set out a procedure—the series of steps and considerations states must undertake to apply a less stringent standard of performance. As described in section III.E.2. of this preamble, to ''permit'' something means to allow or give consent for that thing to occur. In this case, the EPA is prescribing the procedures that allow for states to apply less stringent standards of performance. To ''apply'' means ''to put to a special use or purpose'' or ''put into practical operation,'' [112] and ''consideration'' means ''the action of taking into account.'' [113] Thus, the state's authorization to ''apply[]'' a standard of performance to any particular source, ''tak[ing] into consideration'' RULOF, means the state may particularize a standard of performance for a given source by accounting for remaining useful life and other factors where there are fundamental differences between the information specific to a facility and the information the EPA considered in determining the degree of emission limitation achievable through application of the BSER. In doing so, the state must remain as consistent as possible with that degree of emission limitation in light of what the Supreme

Court has recognized as the EPA's ''primary regulatory role in section 111(d)'' [114] and the emission reduction purpose of CAA section 111.

Second, the history and context of CAA section 111(d) supports the EPA's authority to provide a framework for states' consideration of RULOF. As explained in section III.E.2. of this preamble, the standards of performance that states establish in state plans must generally be no less stringent than the degree of emission limitation that Congress required, which is the degree of emission limitation that EPA determines in the applicable EG.[115] However, in the original 1975 subpart B implementing regulations, the EPA allowed states to grant variances from this degree of emission limitation in cases of economic hardship based on the age of the plant and other factors, as long as the states could justify the variances.[116] Congress then, in the 1977 CAA Amendments, included the RULOF provision in CAA section 111(d)(1), which similarly allows states to deviate from the EPA's degree of emission limitation based on consideration of an existing source's age (*i.e.,* remaining useful life) and other factors.

Congress's inclusion of the RULOF provision in CAA section 111(d)(1) should be interpreted as expressing its intent to confirm that the EPA has authority to promulgate a regulatory variance provision, including the provision the EPA had, at that time, recently promulgated. The EPA, following its 1974 proposal of the subpart B implementing regulations, had received a comment arguing that it did not have authority to promulgate such a variance provision, to which it responded by asserting that it did have the authority and explaining that such a provision is consistent with CAA section 111(d).[117] The Courts have held that Congress is presumed to be aware of an administrative interpretation under certain circumstances.[118] Accordingly, Congress's adoption of the RULOF provision in the 1977 CAA Amendments should be interpreted as expressing its intent to make explicit under CAA section 111(d) the EPA's authority to promulgate regulations that include a variance provision.[119]

It is also clear that the EPA understood the RULOF provision in CAA section 111(d)(1) to be a variance in the same way it had provided a variance in subpart B. This is evidenced by the fact that following the 1977 CAA Amendments the EPA did not revise its 1975 regulations, which were premised on this understanding, for over forty more years.[120] This indicates that the EPA viewed its 1975 regulations granting a variance as authorized under the RULOF provision enacted in 1977.

The regulations the EPA is promulgating at 40 CFR 60.24a(f) are consistent with the long-held view that the Agency's implementing regulations provide a variance. While 40 CFR 60.24a(e) provides the process for invoking this variance, to date the regulations have not included the second part: how to address a source that has qualified for the variance.[121] Although variances may operate in different ways in the context of different statutory and regulatory schemes, it is clear from both the language and the context of the RULOF provision that Congress intended it to provide for alternative compliance with CAA section 111(d), *i.e.,* a less stringent standard of performance, to the extent necessary to address the fundamental differences between the EPA's EG and the circumstances of a particular facility. Such variances are common throughout environmental statutes and, for the environmental protection aim to be achieved, must be crafted so that the alternative is as close as possible to the statutory standard, even as it departs from the generally applicable requirement.

For example, Clean Water Act (CWA) section 301(b)(2) requires, in part, certain sources to achieve effluent limitations consistent with application of the best available technology economically achievable, which will result in reasonable further progress toward eliminating the discharge of all pollutants. These limitations must be determined in accordance with factors specified in the statute and are provided by either effluent limitation guidelines issued by the EPA or the permitting authority on a best professional judgment basis where no such national effluent limitation guidelines exist. CWA section 301(n) authorizes the EPA to grant variances for existing sources from the best available technology requirements of its effluent limitation guidelines where a facility can demonstrate that it is fundamentally different with respect to the factors (other than cost) specified in the statute and considered by the EPA in establishing those requirements. CWA section 301(n) further requires that, where a variance is warranted, the EPA must provide an alternative requirement that (1) is no less stringent than justified by the fundamental difference, and (2) will not result in a non-water quality environmental impact which is markedly more adverse than the impact considered in establishing the rule.[122]

Similarly, section 3004(m)(1) of the Resource Conservation and Recovery Act (RCRA) requires the EPA to promulgate regulations specifying the levels or methods of treatment of hazardous waste, if any, that ''substantially diminish the toxicity of the waste or substantially reduce the

[116] 40 CFR 60.24(f); 40 FR 53344.

[117] 40 FR 53344.

[118] See *Lorillard* v. *Pons*, 434 U.S. 575, 580 (1978) (''Congress is presumed to be aware of an administrative or judicial interpretation of a statute and to adopt that interpretation when in re-enacts a statute without change.'').

[119] In the notice of proposed rulemaking for this rule, the EPA stated that ''[t]here are noticeable differences between the subpart B variance provision and the CAA section 111(d) RULOF provision that indicate Congress did not intend to incorporate and ratify all aspects of the EPA's regulatory approach when amending CAA section 111(d) in 1977.'' The EPA thus proposed to conclude that it could not ''clearly ascertain whether the statutory RULOF provision ratified the variance provision under subpart B . . . .'' 87 FR 79176, 79205 (Dec. 23, 2022). Upon further consideration, however, the EPA believes the most reasonable interpretation of the statutory RULOF provision, given its history and context, is that Congress intended it to authorize the EPA to provide variances from the required degree of emission limitation on a case-by-case basis. However, the EPA agrees with its assessment at proposal that Congress did not necessarily incorporate or ratify specific aspects of the Agency's 1975 variance provision; it is reasonable that Congress would not have codified the precise regulations that the EPA promulgated in 1975 and instead leave the Agency space to revise those regulations as needed, as it is did in 2019 and is doing in the present rule.

[120] The ACE rule, in which the EPA promulgated subpart Ba in 2019, declined to refer to the RULOF provision as a ''variance,'' apparently because the term conflicted with that rule's view that RULOF would be used to establish standards of performance as a general matter. 84 FR 32520,32570 n. 291 (July 8, 2019). The ACE rule misunderstood the RULOF provision. As explained throughout section III.E. of this preamble, this provision authorizes a state to depart from the degree of emission limitation the EPA determines under CAA section 111(a)(1) when applying a standard of performance to a particular source pursuant to consideration of RULOF. As the 1975 regulations indicated, 40 FR 53332, 53344 (Nov. 17, 1975), it is appropriate to call this type of departure or exception a ''variance.''

[121] The EPA explains the reasons it believes it is now necessary to provide the second part of the process for this variance—how to calculate a less stringent standard of performance—in section III.E.2. of this preamble.

[122] As another example, CWA section 301(c) provides that the EPA may modify the best available technology requirements for particular sources if a facility can demonstrate that a modified standard will (1) represent the maximum use of technology within the economic capability of the owner or operator and (2) will result in reasonable further progress toward the elimination of the discharge pollutants.

likelihood of migration of hazardous constituents from the waste so that short-term and long-term threats to human health and the environment are minimized.'' The EPA has set generally applicable regulatory standards for the treatment of hazardous waste under RCRA section 3004(m)(1). The Agency has also has provided regulatorily for waste-specific variances in instances in which it is not physically possible, or it is inappropriate, to treat waste to the level specified in the Agency's treatment standard or to treat waste using the method the Agency specified as the treatment standard.[123] In order for the EPA to grant a variance, the party requesting it must provide an alternative waste treatment requirement that is sufficient to minimize threats to human health and the environment posed by disposal of the waste, *i.e.,* that is sufficient to satisfy the underlying statutory requirement, even though it differs from the generally applicable treatment standard prescribed by the EPA.

The discussion above highlights examples of environmental statutes that require adherence to a generally applicable standard, but under which either Congress or the EPA has authorized variances when it is impossible or unreasonable for a particular regulated entity to achieve that standard. For a general statutory standard requiring the ''best'' technology or ''substantial'' progress, the variances are an alternative way of achieving the statutory standard, as opposed to an exemption from that standard. In the case of the CWA variances, in particular, this means that the alternative requirement pursuant to the variance constitutes a degree of pollutant limitation that deviates as little as possible from the EPA's regulation pursuant to that statutory standard. That is, the alternative requirement constitutes a particular regulated entity's best effort to achieve the generally applicable standard.

The EPA has crafted 40 CFR 60.24a(e) and (f) to be a variance in the same vein as the CWA and RCRA statutory and regulatory provisions discussed above. It is clear from both the history and plain language of CAA section 111(d)(1) that Congress did not provide an exemption from regulation, but rather a method for providing alternative compliance with the general statutory requirement of that section.[124] CAA section 111(d) provides that states must submit plans that include ''standards of performance,'' and CAA section 111(a)(1) defines ''standard of performance'' as ''a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which . . . the Administrator determines has been adequately demonstrated.'' Thus, the underlying statutory standard is the degree of emission limitation determined by the EPA in the applicable EG. A variance from this statutory standard is not available if a source can reasonably achieve the EPA's degree of emission limitation. If a variance is warranted, the alternative requirement, *i.e.,* a standard of performance pursuant to consideration of RULOF, must be a standard for emissions of air pollutants that is no less stringent than necessary to address the fundamental differences identified under 40 CFR 60.24a(e). That is, the degree of emission limitation of a standard of performance pursuant to RULOF must deviate as little as possible from the degree of emission limitation in the applicable EG.[125] Consistent with the structure of CAA section 111(d) generally, the RULOF provision does not prescribe the use of any particular system of emission reduction in conjunction with a less stringent standard of performance but instead focuses on ensuring that the degree of emission limitation deviates no more than necessary; anything less would be inconsistent with the general statutory framework.

Thus, 40 CFR 60.24a(f)(1) requires that a less stringent standard of performance be no less stringent (or have a compliance schedule no longer) than necessary to address the fundamental differences identified under 40 CFR 60.24a(e). It also contains a framework that states must use, to the extent necessary to satisfy that criterion, to determine the less stringent standard of performance. In some instances, determining the standard of performance that is no less stringent than necessary to address the fundamental differences will be straightforward and the state will not need to undertake the analysis of additional systems of emission reduction that is laid out in the second and third sentences of 40 CFR 60.24a(f)(1). For example, where the BSER the EPA has identified in the applicable EG may be implemented at the source at either a lower stringency or with a longer compliance schedule and it is clear that no other system of emission reduction will result in greater stringency or a shorter schedule, it is unnecessary for a state to evaluate other systems in order to satisfy the first sentence of paragraph (f)(1). In this case, the state would simply justify the degree of emission limitation or compliance schedule as the most stringent or shortest reasonably possible.

However, where a particular source cannot implement the types of controls that comprise the BSER or where it is not apparent that implementation of the BSER at lower stringency or with a longer compliance schedule will result in a standard of performance that is no less stringent than necessary, evaluation of additional systems of emission reduction will be necessary under 40 CFR 60.24a(f)(1). In this situation, the EPA does not believe it is reasonably possible to determine a standard of performance that satisfies the criterion of § 60.24a(f)(1) without considering the systems of emission reduction that the EPA determined, in the applicable EG, have been adequately demonstrated.[126] As discussed below, however, it may not be necessary for a state to evaluate every system of emission reduction that the EPA considered. Thus, the EPA is requiring that, to the extent necessary to determine a standard of performance that is no less stringent than necessary, states must evaluate the systems of emission reduction in the applicable EG. As further discussed below, the EPA expects states will leverage the information and analysis the Agency has provided in that EG for their evaluations, particularizing that information to the circumstances of the particular facility as needed.

Similarly, it is not reasonably possible to craft a standard of performance that is no less stringent than necessary to address a fundamental difference between a particular facility's circumstances and the information the EPA considered in determining the degree of emission limitation without engaging with that information.[127] In

[124] See CAA section 111(d)(1) (requiring that states considering RULOF for a particular source nonetheless apply a standard of performance to that source); 39 FR 36102, 36102 (Oct. 7, 1974) (proposed regulations ''provide that States may establish less stringent emission standards on a case-by-case basis provided that sufficient justification is demonstrated in each case'').

[125] Cf. *Weyerhauser Co.* v. *Costle,* F.2d 1011, 1035 (D.C. Cir. 1978) (Clean Water Act variance provision ''authorizes the Agency to relieve a particular point source operator from any demands that the Act does not allow the Agency to make of the industry generally.'' However, the point source operator must still, consistent with the general statutory requirement for the industry, use the best available technology economically available and ''the variance may not halt progress toward eliminating pollution.'').

[126] See 40 CFR 60.22a(b)(2).

[127] Cf. *Weyerhauser Co.* v. *Costle,* F.2d 1011, 1035 (D.C. Cir. 1978) (CWA section 304(b)(2)(B) lays out

determining the degree of emission limitation in an EG, the EPA considers whether available systems of emission reduction have been adequately demonstrated, the amount of emissions they reduce, the cost of achieving such reduction, any nonair quality health and environmental impacts, and energy requirements.[128] To evaluate whether a state's less stringent standard of performance is no less stringent than necessary, both states and the EPA need to be able to compare the information relevant to the source category (or subcategory) with the facility-specific information. Additionally, to ensure equitable consideration and treatment of sources in different states that have invoked RULOF to apply less stringent standards of performance, it is necessary that each state is using a common set of factors and metrics as the bases for their decisions. Using the factors [129] and evaluation metrics [130] that the EPA considered in determining the degree of emission limitation ensures ''apples-to-apples'' comparisons, both between the EPA's degree of emission limitation and a state's less stringent standard of performance and between different sources in different states. Thus, to the extent that states are evaluating systems of emission reduction to determine a less stringent standard of performance under 40 CFR 60.24a(f)(1), they must use the same factors the EPA considered, and the evaluation metrics the EPA used to consider the factors, in doing so.

For example, assume the EPA considered cost using the evaluation metric dollars per ton of pollutant reduced and concluded that costs of up to $500/ton of pollutant reduced are reasonable. A state has invoked RULOF for a particular source under 40 CFR 60.24a(e) because, based on that source's shortened remaining useful life, the cost, in dollars per ton of pollutant reduced, of achieving the degree of emission limitation in the applicable EG is fundamentally different from $500/ton. The state, in determining a less stringent standard of performance pursuant to 40 CFR 60.24a(f), must evaluate the systems of emission reduction in the EG using the cost evaluation metric dollars per ton of pollutant reduced. In doing so, the state would consider the reasonableness of the costs of those systems against the benchmark of $500/ton.

The regulations at 40 CFR 60.24a(e) also allow states to invoke RULOF based on a fundamental difference unrelated to cost, *e.g.,* physical impossibility of implementing control equipment necessary to achieve the EPA's degree of emission limitation. In this instance, a state may find that a particular facility's footprint is such that there are no systems of emission reduction that could be installed at the facility to achieve the degree of emission limitation in the applicable EG. Under 40 CFR 60.24a(f)(1), the state would evaluate the systems of emission reduction in the EG using the factors—technical feasibility, amount of emission reductions, cost of achieving such reductions, nonair quality health and environmental impacts, and energy requirements—and evaluation metrics the EPA considered in order to determine the standard of performance that is both physically possible for the source to achieve and that is no less stringent than necessary.

As explained in section III.E.3.a., there may be facility-specific circumstances and factors that the EPA did not anticipate and consider in the applicable EG that make achieving the EPA's degree of emission limitation unreasonable for that facility. Such facility-specific information may constitute an ''other factor specific to the facility'' under 40 CFR 60.24a(e) and could potentially represent a fundamental difference between the information the EPA considered in determining the degree of emission limitation and the information specific to a facility. Such facility-specific ''other factors'' may also be relevant in determining and applying a less stringent standard of performance. Thus, pursuant to the process the EPA is finalizing in 40 CFR 60.24a(f)(1), states may consider ''other factors specific to the facility'' that were the basis of the demonstration under paragraph (e) in determining and applying a less stringent standard of performance.

In some instances, the fundamental difference between the information the EPA considered in the applicable EG and the information specific to a facility will manifest as a difference in whether or how an enumerated factor applies to a particular facility. For example, parasitic load may be an appropriate evaluation metric for considering energy requirements for some systems of emission reduction but not for others, or water availability may not have been important to the EPA's consideration of nonair quality environmental impacts but may be relevant for a source located in a particularly water-scarce region. If such information represents a fundamental difference that make the EPA's degree of emission limitation determination unreasonable for a particular facility pursuant to 40 CFR 60.24a(e), it would be reasonable and permissible for a state to consider such information in applying a less stringent standard of performance under 40 CFR 60.24a(f)(1).

In addition to ''other factors'' that the EPA did not necessarily consider, there may be circumstances in which a system of emission reduction that the EPA did not consider in the applicable EG or that the EPA concluded was not adequately demonstrated because, *e.g.,* it is not available on a source-category wide basis, is available, technically feasible, and potentially reasonable for a particular facility.

The EPA is therefore providing in 40 CFR 60.24a(f)(1) that states may consider, in determining a less stringent standard of performance, ''other factors specific to a facility'' that were the basis for the fundamental difference and invoking RULOF under 40 CFR 60.24a(e), as well as systems of emission reduction in addition to those the EPA considered in the applicable EG. At the same time, however, the EPA in a particular EG makes certain judgments about which systems are available and adequately demonstrated, as well as how the factors are reasonably considered when evaluating those systems for designated facilities within the source category. To ensure that any additional considerations do not result in a standard of performance that deviates more than necessary from the

---

the minimum factors the EPA must consider in determining the best available technology economically achievable on a source-category basis. In deciding whether a variance sought by a particular point source owner represents the ''maximum use of technology within the economic capability of (that) owner, the permit-granting agency, and the EPA in supervising that agency, must consider the factors laid out in section 304(b)(2)(B).'').

[128] The D.C. Circuit has stated that in determining the ''best'' system of emission reduction, the EPA must also take into account the role of ''technological innovation.'' See *Sierra Club* v. *Costle*, 657 F.2d 298, 347 (D.C. Cir. 1981). However, because technological innovation is less likely to be relevant at the scale of a single facility than it is on a source-category basis, the EPA is not explicitly requiring states to consider it under 40 CFR 60.24a(f)(1).

[129] Under 40 CFR 60.24a(f)(1), as finalized in this action, states must evaluate the systems of emission reduction identified in the applicable EG. The EPA's EGs include systems of emission reduction that have been ''adequately demonstrated.'' There is therefore no need for states to revisit the ''adequately demonstrated'' consideration. However, ''adequately demonstrated'' includes ''technical feasibility'' and the EPA acknowledges that systems of emission reduction that are adequately demonstrated for the source category may not be technically feasible for a particular source. The EPA is thus adding ''technical feasibility'' to the list of factors states must consider in determining a less stringent standard of performance.

[130] An ''evaluation metric'' includes both the form of the EPA's consideration of a factor and any threshold or level of reasonableness the EPA considered in the applicable EG.

EPA's degree of emission limitation, the state must justify how any additional consideration results in a standard of performance that is no less stringent than necessary to address the fundamental differences identified under paragraph (e).

In addition to being consistent with statutory and regulatory precedent on variances, the procedure the EPA is promulgating in 40 CFR 60.24a(f)(1) for determining standards of performance that are no less stringent than necessary is also consistent with CAA section 111. As explained throughout this section of the preamble, CAA section 111(a)(1) defines a standard of performance as a standard for emissions of air pollutants that reflects a certain degree of emission limitation and gives the EPA the ''primary regulatory role'' [131] of determining that degree of emission limitation. Congress required that, in doing so, the EPA evaluate systems of emission reduction that have been adequately demonstrated and determine which is best based on the amount of emission reductions, cost of achieving such reduction, nonair quality health and environmental impacts, and energy requirements. As also explained in this section of the preamble, CAA section 111(d) directs the EPA to prescribe regulations that ''permit'' states ''in applying'' a standard of performance to a particular source to ''take into consideration'' RULOF. The requirements the EPA is promulgating in 40 CFR 60.24a(f)(1) ''permit'' a state to particularize a standard of performance for any given source by accounting for RULOF where there are fundamental differences between the information specific to a facility and the information the EPA considered in determining the degree of emission limitation in the applicable EG. In doing so, the state must remain as consistent as possible with that degree of emission limitation in light of what the Supreme Court has recognized as the EPA's primary regulatory role in CAA section 111(d) and the emission reduction purpose of CAA section 111. Because Congress has identified the factors noted above as relevant considerations for the EPA in determining a standard of performance, the Agency believes it is also reasonable to require states to consider these systems, factors, and evaluation metrics in the manner that the EPA did in applying standards of performance pursuant to 40 CFR 60.24a(f).

Furthermore, the EPA's authority to promulgate 40 CFR 60.24a(f) is buttressed by CAA section 111(d)(2). As discussed in sections III.E.1. and 2. of this preamble, CAA section 111(d)(2) provides that the EPA shall have the same authority as under CAA section 110(c) to prescribe a Federal plan where a state fails to submit a satisfactory plan. The EPA's long-standing interpretation of this subsection is that it provides the Agency authority to substantively review states' standards of performance.[132] The existing regulations of subpart Ba and the EPA's emission guidelines provide the substantive criteria for the Agency's evaluation of standards of performance generally; [133] the regulations the EPA is promulgating at 40 CFR 60.24a(f) constitute the substantive criteria for evaluating standards of performance states have applied pursuant to RULOF.

Some commenters on proposed 40 CFR 60.24a(f) dislike the EPA's approach to determining what constitutes a ''satisfactory'' less stringent standard of performance but offer no alternatives, other than states should have complete discretion to apply standards pursuant to RULOF. This cannot be correct. If this was the case, the EPA would have no choice but to approve plans in which states have applied business-as-usual standards, or standards that allows designated facilities' emissions to *increase,* even if more stringent standards of performance are reasonable for that facility. Such an outcome would be inconsistent with the text, context, and purpose of CAA section 111. The EPA believes the criteria it is providing for the Agency's substantive review of less stringent standards of performance are a reasonable approach to fulfilling its statutory obligation under CAA section 111(d)(2) to substantively review standards of performance in state plans.

Moreover, it is not uncommon for the EPA to promulgate regulatory frameworks to guide states in areas in which Congress has granted them discretion. For example, under the visibility protection provisions of CAA section 169A, Congress directed the EPA to promulgate regulations to assure that reasonable progress towards meeting the national goal for visibility improvement in mandatory class I Federal areas, as well as to assure compliance with the requirements of CAA section 169A. Section 169A further provides that states implement the visibility protection requirements through state implementation plans, in which they must include emission limitations for sources of visibility impairing pollutants. The statute provides two types of control analyses for states to use in determining the applicable emission limitations: reasonable progress and best available retrofit technology.[134] Although Congress directed states to determine the best available retrofit technology for their existing sources, the EPA, in promulgating its implementing regulations, provided a detailed methodology and requirements for doing so in 40 CFR 51.308(e) and 40 CFR part 51, appendix Y. The EPA has similarly prescribed requirements for states to determine the emission reduction measures that are necessary to make reasonable progress in 40 CFR 51.308(f).[135] These requirements create procedural and substantive frameworks within which states exercise their discretion in order to ensure the outcomes of their control analyses are consistent with the statutory requirements and purpose. The regulatory framework and associated guidance also provide states useful clarity as to how the EPA will fulfill its statutory obligation to review and approve or disapprove state plans, and how the EPA will promulgate Federal plans.

The EPA is not providing that states can forgo analyzing control technologies or other systems of emission reduction that the EPA has excluded from being the BSER on the basis of technological or economic feasibility, as suggested by commenters. The EPA conducts BSER analyses on a source-category basis. It may be that a system of emission

[132] See 40 FR 53342 (CAA section 111(d)'s references to CAA section 110 suggest that Congress intended the Administrator to apply some substantive criterion to his review of State plans).

[133] See 40 CFR 60.24a(c).

[134] CAA section 169A(g)(1) and (2). The statutory factors that states must use to determine reasonable progress are ''costs of compliance, the time necessary for compliance, and the energy and nonair quality environmental impacts of compliance, and the remaining useful life of any existing source subject to such requirements.'' The statutory factors for best available retrofit technology analysis are: ''costs of compliance, the energy and nonair quality environmental impacts of compliance, any existing pollution control technology in use at the source, the remaining useful life of the source, and the degree of improvement in visibility which may reasonably be anticipated to result from the use of such technology.''

[135] The EPA has also issued extensive and detailed guidance for states in conducting reasonable progress analyses for sources of visibility impairing pollutants. See Guidance on Regional Haze State Implementation Plans for the Second Implementation Period (2019), available at *https://www.epa.gov/visibility/guidance-regional-haze-state-implementation-plans-second-implementation-period;* Clarifications Regarding Regional Haze State Implementation Plans for the Second Implementation Period (2021), available at *https://www.epa.gov/visibility/clarifications-regarding-regional-haze-state-implementation-plans-second-implementation.*

reduction is generally adequately demonstrated but is not the BSER because it cannot be applied to designated facilities across the category at a reasonable cost or because it is technically infeasible for a certain portion of the category. However, designated facilities that are eligible to receive a less-stringent standard of performance are in demonstrably different circumstances than facilities in the source category generally. Therefore, control technologies or other systems that may not be the BSER for the source category may be reasonable for a source that has invoked RULOF. Similarly, to avoid inadvertently precluding consideration of a system that could allow a state to apply a standard of performance that is no less stringent than necessary, the EPA is not providing that states must consider only control technologies or systems that result in less emission reductions than the EPA's BSER. While it is true that states should only be in the position of applying less stringent standards of performance if they have demonstrated that a designated facility cannot achieve the degree of emission limitation, there may be situations in which it is not practical or feasible to ascertain *a priori* what degree of emission limitation a technology or system could achieve when applied to a particular source. Thus, the EPA does not believe it is reasonable to narrow the scope of control technologies or other systems of emission reduction that states must consider under these general implementing regulations. The Agency may find it appropriate to do so in the context of an individual EG.

Some commenters noted the resources and potential burden associated with conducting the proposed source-specific BSER analyses. While the EPA is not finalizing a requirement for states to conduct source-specific BSER analyses, it acknowledges that stakeholders could have similar concerns in the context of the provision being promulgated at 40 CFR 60.24a(f). However, the EPA does not believe the RULOF provisions will significantly add to states' planning processes. First, as explained in section III.E.2. of this preamble, consistent with the statutory framework the EPA believes that use of RULOF should be an exception to the general rule that the EPA's degree of emission limitation is reasonable for designated facilities within the applicable source category. Given the EPA's ability to subcategorize source categories and to tailor its EG to the circumstances of each subcategory, using RULOF to apply a less stringent standard of performance should be appropriate in only very limited circumstances.

Second, as explained above, the EPA is providing in 40 CFR 60.24a(f)(1) that states must evaluate the systems of emission reduction in the applicable EG using the factors and evaluation metrics the EPA considered ''[t]o the extent necessary to determine a standard of performance'' that is no less stringent than necessary to address the fundamental differences identified under paragraph (e). As noted above, the EPA anticipates that in some if not many cases, states will be able to demonstrate that the less stringent standard of performance they are applying is no less stringent than necessary without evaluating all of the systems of emission reduction in the applicable EG. For example, if the EPA's degree of emission limitation is 95% reduction in emissions and a state applies a less stringent standard of performance that results in 90% reduction, the state may reasonably forgo evaluating additional systems of emission reduction if, based on the information in the EG, it is clear that none is able to achieve comparable reductions. Similarly, a state may not need to consider every system of emission reduction in an applicable EG if it starts by evaluating the system or systems that achieve the greatest emission reductions and applies a standard of performance corresponding to one of those systems.

Third, the EPA anticipates states applying less stringent standards of performance would leverage the information and analyses the Agency has provided in the applicable EG. In promulgating an EG, the EPA is required to provide the elements listed in 40 CFR 60.22a(b), which include ''[a] description of systems of emission reduction which, in the judgment of the Administrator, have been adequately demonstrated,'' and ''[i]nformation on the degree of emission limitation which is achievable with each system, together with information on the costs, nonair quality health environmental [sic] effects, and energy requirements of applying each system to designated facilities,'' as well as ''[s]uch other available information as the Administrator determines may contribute to the formulation of State plans.'' In many cases, the EPA provides extensive technical support documents including feasibility and cost analyses. The Agency also typically discusses the types of nonair quality health and environmental effects and energy requirements that might be expected in conjunction with various systems of emission reduction applicable to the source category. Although designated facilities for which RULOF has been invoked are in fundamentally different circumstances that the average or typical facilities that EPA considers in the context of its own analysis, the information provided in an EG will provide a starting point and, in at least some cases, much of the analytical basis for states' evaluations.

Fourth, in the event the state needs to analyze different systems of emission reduction to determine a less stringent standard of performance, the EPA believes it would be in this position regardless of any requirements the Agency does or does not provide. That is, because CAA section 111(d)(1) requires a standard of performance for each existing source, the EPA does not believe the framework being provided in 40 CFR 60.24a(f) will significantly alter states' workload if and when invoking RULOF. Rather, it is intended to provide clarity for states in developing standards of performance consistent with the statutory requirements. The EPA intends for these requirements to in fact reduce planning burdens overall, as they provide a framework for states to submit approvable standards of performance for sources invoking RULOF, thereby obviating the need for subsequent plan revisions to address any disapproved standards.

As noted above, the EPA requested comment on whether to provide consideration of the five BSER factors as part of a source-specific BSER analysis as a presumptively approvable framework for applying a less stringent standard of performance, as opposed to requirements. The framework the EPA is finalizing in this action differs from the proposed approach under which states would conduct source-specific BSER analyses; the process the EPA is finalizing at 40 CFR 60.24a(f) is premised on determining the appropriate variance from the EPA's degree of emission limitation. The EPA is providing this framework as requirements for states applying a less stringent standard of performance. As explained elsewhere in this section of the preamble, the EPA does not believe it is possible, as a practical matter, to determine a standard of performance that is no less stringent than necessary without evaluating the systems of emission reduction that the EPA determined are adequately demonstrated and engaging with the factors and evaluation metrics that the EPA used to evaluate those systems in the applicable EG. Therefore, the EPA believes that states must use the framework laid out in 40 CFR 60.24a(f) in order for the resulting variance to be consistent with CAA section 111(d). As laid out in the § 60.24a(f)(1), states may also consider additional systems and other factors specific to the facility that were the basis of the fundamental difference identified under 40 CFR 60.24a(e), so long as they justify that any such consideration is consistent with applying a standard of performance that is no less stringent than necessary.

In sum, the EPA is not finalizing its proposed requirement under 40 CFR 60.24a(f)(1) that states that have invoked RULOF for a particular facility determine a source-specific BSER. As a result, it is also not finalizing the provision proposed at 40 CFR 60.24a(f)(2) that would have required states to calculate the emission reductions a source-specific BSER would achieve and apply the standard of performance that reflects this degree of emission reduction. However, consistent with its proposal, the EPA continues to believe it is necessary for the Agency to provide a process for states that have invoked RULOF for a particular facility to follow in applying a less stringent standard of performance. The EPA is therefore promulgating requirements at 40 CFR 60.24a(f) to ensure that states that have invoked RULOF for a particular designated facility apply a standard of performance that is no less stringent than necessary to address the fundamental differences identified under 40 CFR 60.24a(e). These provisions are necessary to ensure consistency with the purpose, text, and context of CAA section 111(d), including an understanding of RULOF as a limited variance from the degree of emission limitation in the applicable EG. The provisions at 40 CFR 60.24a(f)(1) as finalized will require states to determine a less stringent standard of performance that is no less stringent than necessary. In doing so, states must, to the extent necessary, evaluate the systems of emission reduction in that EPA using the factors and evaluation metrics that the EPA considered. States may also consider, as justified, other factors specific to the facility that were the basis for invoking RULOF under 40 CFR 60.24a(e), as well as additional systems of emission reduction. The EPA is finalizing the provision proposed at 40 CFR 60.24a(f)(3), requiring that a less stringent standard of performance pursuant to RULOF be in the form[136] required by the applicable EG, at paragraph (f)(2).

c. Contingency Requirements

The EPA recognizes that a source's operations may change over time in ways that cannot always be anticipated or foreseen by the EPA, state, or designated facility. This is particularly true where the basis of the application of RULOF is a designated facility's operational conditions, such as the source's remaining useful life or restricted capacity. If the designated facility subsequently changes its operating conditions after the state or EPA applies a less stringent standard of performance, the basis for the variance may be abrogated and the standard of performance may no longer be no less stringent than necessary. For example, a state may seek to invoke RULOF for an EGU on the basis that it is running at lower utilization than the EPA considered in determining the degree of emission limitation and intends to do so for the duration of the compliance period required by an EG. Under this scenario, the state may be able to demonstrate that it is not reasonably cost-effective for the designated facility to achieve the degree of emission limitation and the state could set a less stringent standard of performance for this EGU. However, because reduced utilization is not a physical constraint on the designated facility's operations, it is possible that the source's utilization could increase in the future without any other legal constraint.

The EPA proposed to address this potential scenario by adding a contingency requirement to the RULOF provision at 40 CFR 60.24a(h) that would require a state to include in its state plan an instrument making a source's operating condition, such as remaining useful life or restricted capacity, enforceable whenever the state seeks to rely on that operating condition as the basis for a less stringent standard. This requirement would not extend to instances where a state applies a less stringent standard on the basis of an unalterable condition that is not within the designated source's control, such as technical infeasibility, space limitations, water access, or geologic sequestration access. Rather, this requirement addresses operating conditions such as operation times, operational frequency, process temperature and/or pressure, fuel parameters, and other conditions that are subject to the discretion and control of the designated facility.

Many commenters on this subject supported the EPA's proposed approach to operating conditions that are within a designated facility's control. They noted that, in the absence of an enforceable requirement, a designated facility could change its operations with the result being foregone emission reductions and undermining of the level of stringency in the EG. One commenter stated that the EPA should not permit a source that has legally committed to a retirement date as a condition of invoking RULOF to receive a less-stringent standard to postpone that date because, even if it committed to meet the emission limitation in the EG from that point forward, it could not make up for its excess emissions before that time. Other commenters opposed the EPA's proposed requirement and asserted that the EPA had cited no legal authority or record basis for a need to require states to make operational conditions that are the basis of less stringent standards into enforceable requirements in state plans. One commenter noted that states should have latitude in their regulatory and permit processes to determine what additional restrictions or contingencies are necessary to ensure that the less stringent standard remains appropriate over time.

The EPA continues to believe the requirement proposed at 40 CFR 60.24a(h) is a necessary and reasonable safeguard to ensure that designated facilities' standards of performance are consistent with the level of stringency Congress required. Where are particular facility's operating conditions are the basis for a variance from the EPA's degree of emission limitation, that variance is warranted only so long as the operating condition remains a fundamental difference between that facility's circumstances and the information the EPA considered in the applicable EG. Therefore, in order for a state plan to include satisfactory standards of performance as well as measures for the implementation and enforcement of those standards pursuant to CAA section 111(d)(1), the contingency must be an enforceable requirement in that plan; upon EPA approval of the plan the contingency becomes a federally enforceable requirement (in addition to being enforceable through the state-law instrument that was included in the plan). Inclusion in a state permit, rule, or other instrument alone is not sufficient to satisfy CAA section 111(d)(1). A state-only instrument can additionally be changed outside the state plan revision process, which could result in the lifting of the operational condition without a corresponding adjustment to the designated facility's less stringent standard of performance.

The EPA notes that it has a practice of requiring operational conditions that

---

[136] "Form" of the less stringent standard of performance refers to a numerical emissions standard versus a work practice standard, the units in which a standard is expressed, or both.

are the basis of less stringent emission limitations to be included in state plans or state implementation plans under CAA section 111 or 110, respectively, including in the Affordable Clean Energy Rule[137] and under the CAA's regional haze program.[138]

States may revise their state plans to allow a designated facility that has committed to retiring as the basis for invoking RULOF to postpone its retirement date. There could be many reasons a designated facility that previously agreed to a federally enforceable commitment to cease operations by a certain date might need to extend that date. The EPA is unable to assess, in the context of these general implementing regulations, an appropriate approach for all possible circumstances to ensure that the level of stringency of the EG is not undermined. The EPA anticipates addressing this consideration in individual EGs.

As previously discussed, the state plan submission must also include measures for the implementation and enforcement of a standard that accounts for RULOF. For standards that are based on operating conditions that a facility has discretion over and can control, the operating condition and any other measure that provides for the implementation and enforcement of the less stringent standard must be included in the plan submission and as a component of the standard of performance. For example, if a state applies a less stringent standard for a designated facility on the basis of a lower capacity factor, the plan submission must include an enforceable requirement for the source to operate at or below that capacity factor, and include monitoring, reporting, and recordkeeping requirements that will allow the state, the EPA, and the public to ensure that the source is in fact operating at that lower capacity. A specific EG may detail supplemental or different requirements on implementing the proposed general requirement that a state plan submission include both the operating condition that is the basis for a less stringent standard, and measures to provide for the implementation and enforcement of such standard.

The EPA notes there may be circumstances under which a designated facility's operating conditions change permanently so that there may be a potential violation of the contingency requirements approved as federally enforceable components of the state plan. For example, a designated facility that was previously running at lower capacity now plans to run at a higher capacity full time, which conflicts with the federally enforceable state plan requirement that the facility operate at the lower capacity. To address this concern, a state may submit a plan revision to reflect the change in operating conditions. Such a plan revision must include a new standard of performance that accounts for the change in operating conditions. The plan revision would need to include a standard of performance that reflects the degree of emision limitation required by the EG and meet all applicable requirements, or if a less stringent standard is still warranted for other reasons, the plan revision would need to meet all of the applicable requirements for considering RULOF. The new standard of performance would only become effective upon the EPA's determination that the plan revision is satisfactory.

The EPA is finalizing as proposed the requirement that, where a plan applies a less stringent standard of performance on the basis of an operating condition within the designated facility's control, such as remaining useful life or restricted capacity, the plan must also include such operation condition or conditions as an enforceable requirement (this requirement was proposed at 40 CFR 60.24a(h) and is being finalized at 40 CFR 60.24a(g)). The plan must also include requirements to provide for the implementation and enforcement of the operating condition, such as monitoring, reporting, and recordkeeping requirements.

d. Requirements Specific to Remaining Useful Life

CAA section 111(d) explicitly requires that the EPA permit states to consider remaining useful life in applying a standard of performance. While the EPA may consider the age of designated facilities within a source category as a general matter in determining the BSER, it is a factor that can have considerable variability from facility to facility. The annualized costs can change considerably based on the applied technology at any particular designated facility given the amortization period. When the EPA determines a BSER, it considers cost and, in many instances, specifically considers annualized costs associated with payment of the technology associated with the BSER. The shorter that payback period is (*i.e.,* shorter remaining useful life), the less cost-effective that BSER may become. The current RULOF provision in subpart Ba generally allows for a state to account for remaining useful life to set a less stringent standard. However, the provision does not provide guidance or parameters on when and how a state may do so.

Consistent with the principles described previously in section III.E., the EPA proposed requirements for when a state seeks to apply a less stringent standard on grounds that a designated facility will retire in the near future. Specifically, the EPA proposed that the Agency would be required to identify in an EG the outermost retirement date for designated facilities that could qualify for consideration of remaining useful life, or a methodology and considerations for states to use in determining such an outermost date. The proposed regulations would have also allowed states to apply a routine maintenance standard of performance to designated facilities with ''imminent'' retirement dates and additionally provided that the EPA may define the timeframe for imminent retirements in an EG. Finally, consistent with the proposed provisions regarding contingency requirements, the EPA proposed that any state plan that applies a standard of performance that is based on a particular designated facility's remaining useful life must include the retirement date as an enforceable commitment and provide measures for its implementation and enforcement.

Several commenters supported the EPA's proposal to identify in an EG an outermost and imminent retirement date to guide states' consideration of remaining useful life in setting less stringent standards. Some supportive commenters also urged the EPA to prescribe further requirements for designated facilities that rely on a shorter remaining useful life, including prohibiting them from extending their retirement dates and defining an imminent retirement as one that occurs within two years of state plan submission. Other commenters opposed the EPA's proposed requirements around the consideration of remaining useful life. Some argued that the requirements would foreclose states from considering remaining useful life when a designated facility's retirement date falls outside the prescribed range and that, although states must reasonably exercise their discretion, the

---

[137] 84 FR 32520, 32558 (July 8, 2019). The EPA has proposed to repeal the ACE Rule on other grounds. See 88 FR 33240 (May 23, 2023).

[138] See, *e.g.,* 76 FR 12651, 12660–63 (March 8, 2011) (best available retrofit technology requirements for Oregon source based on enforceable retirement that were to be made federally enforceable in state implementation plan); Guidance on Regional Haze State Implementation Plans for the Second Implementation Period at 34, EPA–457/B–19–003, August 2019 (to the extent a state relies on an enforceable shutdown date for a reasonable progress determination, that measure would need to be included in the SIP and/or be federally enforceable).

CAA puts no limits on their consideration of this factor. Adverse commenters also noted that the remaining useful life consideration is very source-specific and that there may be relevant factors that the EPA would not necessarily take into account when determining the outermost and imminent dates in an EG.

After consideration of the comments received, the EPA has decided not to finalize the provisions proposed at 40 CFR 60.24a(i) regarding remaining useful life. As a general matter, the proposed requirement for the EPA to identify an outermost and imminent retirement date for the consideration of remaining useful life was intended to assist states in developing their state plans and to provide transparency and consistency in states' application of, and the EPA's review of, standards of performance based on this factor. As explained in the preamble to the proposed rule, a designated facility's remaining useful life generally impacts a cost analysis by changing the amortization period, or the period of time over which a facility pays the capital costs for a system of emission reduction. The shorter the period, the higher the annualized costs. The EPA generally assumes a certain amortization period in its BSER determination based on, *e.g.,* the lifespan of the system under consideration and the characteristics of facilities within the source category. A designated facility that has a shorter remaining useful life than the amortization period the EPA assumed in its BSER determination will likely find that achieving the degree of emission based on application of the BSER has higher annualized costs; the larger the difference between a particular facility's remaining useful life and the EPA's assumed amortization period, the larger the difference in annualized costs. However, as a factual matter, there is a point at which a designated facility's remaining useful life is long enough so that the difference in annualized costs for that facility and the costs the EPA considered reasonable in the applicable EG are not fundamentally different. At this point, it would be unreasonable for a state to use remaining useful life as the basis for a less-stringent standard for that facility because it could achieve the EPA's degree of emission limitation at a reasonable cost.

Similarly, an imminent retirement date could serve to streamline states' planning for sources with remaining useful lives that are so short that, as a factual matter, no available system of emission reduction could have reasonable costs. What constitutes a reasonable cost in the context of a specific EG could depend on, *inter alia,* the source category, the emission reductions available, and the designated pollutant.

However, the EPA agrees with commenters that states' consideration of remaining useful life and what constitutes reasonable consideration of this factor will necessarily depend on the source category, the variability of the individual designated facilities within the source category, and the structure of the applicable EG. In some instances, the nature of the designated facilities and structure of the EG may render a designated facility's remaining useful life of little relevance. For example, where a BSER is based on operational changes or activities that entail little to no capital cost, the remaining useful life of a designated facility should not change the reasonableness of the system and there would be no need for the EPA to prescribe imminent and outermost retirement dates in an EG. Alternatively, designated facilities within the source category may, by virtue of how an industry developed, fall into discrete age classes based on their remaining useful lives such that the EPA considers this characteristic in creating subcategories and determining appropriate BSERs for each subcategory. In this case, too, there might be little utility in the EPA defining imminent and outermost dates for consideration of remaining useful life in an EG.

The EPA is therefore choosing not to finalize the provisions proposed at 40 CFR 60.24a(i), although it may be appropriate to include outermost and imminent retirement dates for the consideration of remaining useful life in individual EGs. The proposed provisions included a requirement that any plan that applies a less-stringent standard based on remaining useful life must include the retirement date for the designated facility as an enforceable commitment, including any measures that provide for the implementation and enforcement of such a commitment. The EPA notes that although it is not finalizing the proposed 40 CFR 60.24a(i)(3), as discussed in section III.E.3.c. of this preamble plans that include less-stringent standards based on remaining useful life will still be required to include the relevant designated facilities' retirement dates as enforceable commitments and include any measures necessary to provide for the implementation and enforcement of those commitments pursuant to the requirement being finalized at 40 CFR 60.24a(g).

The EPA also reiterates that the obligation to include a standard of performance in a state plan applies to any designated facility that meets the applicability requirements of an EG as of that EG's compliance date. That is, a state plan must include a standard of performance for a designated facility that is retiring after the compliance date, even if the facility has an enforceable commitment to retire imminently following that date. In the case of an imminently retiring designated facility, it may be reasonable for a state to apply a standard reflecting that facility's business as usual; the EPA will address this and other potential considerations, including how such a standard would be calculated, in individual EGs.

e. Reasoned Decision Making and the EPA's Review of State Plans Invoking RULOF

As discussed previously in section III.E. of this preamble, under CAA section 111(d)(2), the EPA has the obligation to determine whether a state plan submission is ''satisfactory.'' This obligation extends to all aspects of a state plan, including the application of a less stringent standard of performance that accounts for RULOF. States carry the primary responsibility to develop plans that meet the requirements of CAA section 111(d) and therefore have the obligation to justify any consideration of RULOF in applying standards less stringent than the degree of emission limitation provided by the EG. That states must provide a reasoned basis including, where applicable, technical analyses and other documentation to support the decisions they make in their plans is fundamental to the structure of CAA section 111(d).[139] As explained in section III.E.3.a. of this preamble, consistent with the statutory framework of CAA section 111(d), state plans must ensure that designated facilities achieve the degree of emission limitation achievable through application of the BSER as determined by the EPA unless doing so would be unreasonable for a particular facility. The fundamental tenet has been reflected in the EPA's regulations since 1975.[140] Thus, a ''satisfactory'' plan is one that, *inter alia,* applies less-stringent standards only where the state has demonstrated that achieving the EPA's degree of emission limitation would be unreasonable pursuant to 40 CFR 60.24a(e). A demonstration that a particular designated facility cannot

---

[139] See, *e.g.,* 84 FR 32558 (ACE Rule explained that state plans must adequately document and demonstrate the process and underlying data used to establish standards of performance so that EPA can adequately and appropriately review the plan to determine whether it is satisfactory).

[140] See 40 CFR 60.24(c), 60.24a(c).

reasonably achieve the degree of emission limitation determined by the EPA will, in most cases, necessarily be supported by technical analysis that assesses a particular designated facility and compares its circumstances to those the EPA considered in its EG.

While it is within states' discretion to apply a less stringent standard of performance where the state has identified fundamental differences for a particular facility (or class of facilities), the state must support its decision making and demonstrate that it results in a standard of performance that is no less stringent than necessary to address the fundamental differences and that meet the applicable requirements. When a state invokes RULOF and applies a less-stringent standard, it must demonstrate that the standard is no less stringent than necessary to address the fundamental difference identified by the state. Absent such a demonstration, the EPA cannot ascertain that a less-stringent standard meets the requirements of CAA section 111; that is, it cannot determine that a less-stringent standard is ''satisfactory.''

The requirements proposed at 40 CFR 60.24a(j) were intended to explicitly clarify states' responsibilities when invoking RULOF and to assist them in developing standards in a manner that enables the Agency to determine whether such standards are ''satisfactory.'' The proposed requirements provided that states would carry the burden of making any demonstrations in support of less-stringent standards pursuant to the RULOF provisions. States would carry the primary responsibility to develop plans that meet the requirements of CAA section 111(d) and therefore have the obligation to justify any accounting for RULOF in support of standards less stringent than those provided by the EG. While the EPA has discretion to supplement a state's demonstration, the Agency may also find that a state plan's failure to include a sufficient RULOF demonstration is a basis for concluding the plan is not ''satisfactory'' and therefore disapprove the plan. The EPA further proposed that for the required demonstrations, states must use information that is applicable to and appropriate for the specific designated facility, and must show how information is applicable and appropriate. As RULOF is a source-specific determination, it is appropriate to require that the information used to justify a less stringent standard for a particular designated facility be applicable to and appropriate for that source. Finally, the EPA proposed to require that the information used for states' demonstrations under the new RULOF provisions must come from reliable and adequately documented sources, such as EPA sources and publications, permits, environmental consultants, control technology vendors, and inspection reports.

Comments received on the proposed requirements regarding states' burden of demonstration and the use of site-specific information were generally supportive while also requesting further clarification of and flexibility in the types of information that the EPA would consider acceptable. One commenter suggested that the EPA allow states to use historical data even if not published or documented by third parties, as this constitutes site-specific information, while another suggested allowing verified industry information, even if it is not site-specific.

Despite the generally supportive commenters received, the EPA is not finalizing the requirements proposed at 40 CFR 60.24a(j). While the EPA continues to find that states carry the burden of making any demonstrations in support of less-stringent standards pursuant to RULOF in developing their plans, we have determined that it is not necessary to promulgate this expectation as a standalone regulatory requirement. States always bear the responsibility of reasonably documenting and justifying the standards of performance in their plans.[141] If the EPA cannot ascertain, based on the information and analysis included in a state plan submission, whether a standard of performance meets the statutory requirements, it cannot find that standard satisfactory. Additionally, it is *de facto* necessary to use information that is applicable to and appropriate for the designated facility when analyzing systems of emission reduction for that particular facility. For example, for a designated facility invoking RULOF based on its unique design features, the state plan must provide information corroborating the uniqueness of those features and analysis demonstrating how they result in the facility being unable to reasonably achieve the degree of emission limitation determined by the EPA. It would not be reasonable in this instance for a state to use generic industry data, whether verified or not, as the basis of demonstrations pursuant to 40 CFR 60.24a(e) and (f).

While the proposed requirements would have simply codified generally applicable tenets of reasoned decision making, the EPA recognizes that the specific types and provenances of information needed to justify a less-stringent standard can vary significantly between not only source categories, but between individual designated facilities within a source category. As a result, the proposed provisions had the potential to be both over- and underinclusive. While we are not finalizing these provisions as generally applicable requirements for state plans, they and the accompanying discussion in the notice of proposed rulemaking[142] remain important guidance for plan development. The EPA may also choose to promulgate requirements for RULOF demonstrations in individual EGs.

f. Consideration of Impacted Communities

While the consideration of RULOF can be warranted to apply a less stringent standard of performance to a particular facility, such standards have the potential to result in disparate health and environmental impacts to communities most affected by and vulnerable to those impacts from the designated facilities being addressed by the state plan. These communities could be put in the position of bearing the brunt of the greater health or environmental impacts resulting from that source implementing less stringent emission controls than would otherwise have been required pursuant to the EG. The EPA considers that a lack of attention to such potential outcomes would be antithetical to the public health and welfare goals of CAA section 111(d) and the CAA generally. Because of CAA section 111(d)(2)'s requirement that the EPA determine whether a state plan is ''satisfactory'' applies to such plan's consideration of RULOF in applying a standard of performance to a particular facility, the EPA must determine whether a plan's consideration of RULOF is consistent with CAA section 111(d)'s overall health and welfare objectives.

In order to address the potential exacerbation of health and environmental impacts to these communities as a result of applying a less stringent standard, the EPA proposed to require states to consider such impacts when applying the RULOF provision to establish those standards. Under the proposed provisions at 40 CFR 60.24a(k), to the extent a designated facility would qualify for a less stringent standard through

---

[141] Where a state has relied on information or analyses the EPA provided in an applicable EG as part of its source specific BSER determination, a state would explain why such reliance is reasonable and cite or otherwise incorporate that information or analyses in its state plan submission.

[142] See 87 FR 79176, 79202–03 (Dec. 23, 2022).

consideration of RULOF, the state, in calculating such standard, would have been required to demonstrate consideration of the potential health and environmental impacts and potential benefits of control to communities most affected by and vulnerable to the impacts from the designated facility considered in a state plan for RULOF provisions. These communities will be identified by the state as pertinent stakeholders under the finalized meaningful engagement completeness requirements described in section III.C. of this preamble.

The notice of proposed rulemaking further explained that state plan submissions seeking to invoke RULOF for a source would be required to identify where and how a less stringent standard impacts these communities. In evaluating a RULOF option for a facility, states should describe the health and environmental impacts anticipated from the application of RULOF for such communities, along with any feedback the state received during meaningful engagement regarding its draft state plan submission, including on any standards of performance that consider RULOF. Additionally, to the extent there is a range of options for reasonably controlling a source based on RULOF, the EPA proposed that in determining the appropriate standard of performance, states should consider the health and environmental impacts to the communities most affected by and vulnerable to the impacts from the designated facility considered in a state plan for RULOF provisions and provide in the state plan submission a summary of the results that depicts potential impacts for those communities for that range of reasonable control options.

The EPA received a wide range of comments on the proposed requirements for state plans to consider the potential pollution impacts and benefits of control to communities most affected by and vulnerable to emissions from a designated facility that is invoking RULOF. Several commenters supported the proposal and agreed that, given that the purpose of regulating stationary source pollution under CAA section 111 is to address emissions that endanger public health and welfare, requiring states that are applying less-stringent standards to take into account how air pollution above the level reflected by application of the BSER may impact the health and welfare of local communities furthers the statutory design. Other commenters agreed that the EPA has authority to require states to consider the impacts of less-stringent standards of performance on vulnerable communities but expressed concern that the lack of specificity of and guidance for implementing the proposed requirements would cause uncertainty among state regulators and impacted communities and lead to unequal application across states. Similarly, one commenter noted the differences between community impacts when considering localized pollutants versus regional or global pollutants and that impacts of the latter are more diffuse and difficult to assess. Some commenters, however, disagreed that the EPA has authority to require states to consider potential health and environmental impacts of less-stringent standards on vulnerable communities. These commenters generally asserted that the state-focused language of the RULOF provision in CAA section 111(d)(1) does not mandate an analysis of vulnerable communities and does not give the EPA power to force states to consider ''other factors'' that it deems relevant.

The EPA is not finalizing the proposed provisions at 40 CFR 60.24a(k) as requirements under the general implementing regulations. We agree with commenters that additional specificity and guidance with regard to how states should consider the potential pollution impacts and benefits of control to communities most affected by and vulnerable to emissions from a designated facility invoking RULOF would be key to ensuring meaningful implementation of this provision. However, given the diversity of source categories, designated facilities, and designated pollutants that are regulated and could be regulated in CAA section 111(d), as well as the wide range of potential impacts on vulnerable communities that may result from less-stringent standards of performance under any given EG,[143] the EPA does not believe it is either feasible or appropriate to prescribe a universally applicable approach or standard for approvability for this consideration. Instead, to protect all communities, including the most vulnerable ones, the EPA is finalizing a provision that will ensure that any less stringent standards of performance applied by states are no less stringent than necessary. Moreover, because consideration of health and environmental impacts is inherent in consideration of both the nonair quality health and environmental impacts and amount of emission reduction factors the EPA considers under CAA section 111(a)(1), when a state considers the systems of emission reduction identified in the applicable emission guideline using the factors and evaluation metrics the EPA considered in assessing those systems pursuant to RULOF, the state will necessarily consider the potential impacts and benefits of control to communities affected by a designated facility that is receiving a less-stringent standard of performance.

Thus, while the EPA is not promulgating a regulatory requirement in subpart Ba for states to consider the impacts of applying a less-stringent standard of performance on the communities most affected by and vulnerable to emissions from a designated facility invoking RULOF, the EPA anticipates that states will consider these impacts. To this end, states may look to the EPA's emission guideline and its consideration of nonair quality health and environmental impacts and the amount of emission reductions available in determining the degree of emission limitation for guidance on considering the health and environmental impacts on communities affected by a designated facility for which RULOF has been invoked. Additionally, the procedural requirements under subpart Ba for meaningful engagement with pertinent stakeholders on state plan development that the EPA is finalizing will play an important role in RULOF. Meaningful engagement, which the EPA is defining as ''timely engagement with pertinent stakeholder representation in the plan development or plan revision process,''[144] and providing that ''[s]uch engagement should not be disproportionate in favor of certain stakeholders and should be informed by available best practices,'' should address, *inter alia,* the application of any less-stringent standards of performance pursuant to RULOF. Thus, the EPA intends for communities most affected by and vulnerable to the health and environmental impacts of pollution from a designated facility invoking RULOF to have an opportunity to participate in the process of determining how that facility is addressed in the relevant state plan. The EPA may also consider whether to promulgate requirements pertaining to consideration of impacts on vulnerable communities as part of an individual EG in the future, at which point it would

---

[143] In the notice of proposed rulemaking, the EPA ''recognize[d] that the consideration of communities in the standard setting process, such as what constitutes a benefit to a vulnerable community and what is a reasonable level of control, is highly dependent on the designated pollutant and source category subject to an EG.'' 87 FR 79203.

[144] The EPA is also finalizing the proposed definition of ''pertinent stakeholders'' to include those who are most affected by and vulnerable to the health or environmental impacts of pollution from the designated facilities addressed by the plan or plan revision.

provide guidance on how to do so specific to the designated facilities and designated pollutant at issue.

g. Authority To Apply More Stringent Standards as Part of the State Plan

The EPA, in the notice of proposed rulemaking, addressed two different sources of authority that would allow the Agency to approve state plans that include standards of performance that are more stringent than the degree of emission limitation determined by the EPA in the applicable EG. First, the EPA explained that allowing states to apply a more stringent standard of performance as part of their CAA section 111(d) plans is consistent with CAA section 116, which generally authorizes states to include more stringent standards of performance or requirements regarding control or abatement of air pollution in their plans. Second, the EPA proposed to interpretation the RULOF provision in CAA section 111(d)(1), and specifically the ''other factors'' consideration, as allowing states to adopt more stringent standards of performance.[145] As explained below, the EPA is not finalizing its proposed interpretation that states can use the RULOF provision in CAA section 111(d)(1) to adopt, and have the EPA approve, more stringent standards of performance in their state plans because, inter alia, states already have the authority and ability to do so under CAA section 116.

As explained in the notice of proposed rulemaking, the anti-preemption requirements of CAA section 116 provide that nothing in the statute shall preclude or deny the right of states to adopt or enforce ''any standard or limitation respecting emissions of air pollutants.'' While CAA section 116 clearly extends to a state adopting or enforcing a standard of performance more stringent than required under CAA section 111(d), the subpart Ba implementing regulations did not explicitly speak to whether the EPA can approve a state plan that includes such standard of performance. However, the EPA proposed to find that CAA section 116, as interpreted through the Supreme Court in *Union Electric Co.* v. *EPA,*[146] requires the EPA to approve a state plan that includes more stringent standards of performance under CAA section 111(d). The EPA therefore proposed to modify the existing 40 CFR 60.24a(f),[147] clarifying that to the extent a state chooses to submit a plan that includes standards of performance that are more stringent or compliance schedules that are more rapid than the requirements of an EG, states have the authority to do so under this provision and CAA section 116. Further, the EPA proposed to clarify that it has the obligation, and therefore the authority, to review and approve such plans and render the more stringent requirements federally enforceable if all applicable requirements are met.

The EPA is finalizing the proposed changes to the provision currently at 40 CFR 60.24a(f) which, as renumbered pursuant to this final rule, is now 40 CFR 60.24a(i). The Agency acknowledges that it previously took the position in the ACE Rule that *Union Electric* does not control the question of whether CAA section 111(d) state plans may be more stringent than Federal requirements. The EPA took this position in the ACE Rule on the basis that *Union Electric* on its face applies only to CAA section 110, and that it is ''potentially salient'' that CAA section 111(d) is predicated on specific technologies whereas CAA section 110 gives states broad latitude in the measures used for attaining the NAAQS.[148] The EPA no longer takes this position. Upon further evaluation, the EPA finds that, because of the structural similarities between CAA sections 110 and 111(d), CAA section 116 as interpreted by *Union Electric* requires the EPA to approve CAA section 111(d) state plans that are more stringent than required by the EG.

The Court in *Union Electric* rejected a construction of CAA sections 110 and 116 that measures more stringent than those required to attain the NAAQS cannot be approved into a federally enforceable SIP but can be adopted and enforced only as a matter of state law. The Court found that such an interpretation of CAA section 116 ''would not only require the Administrator to expend considerable time and energy determining whether a state plan was precisely tailored to meet the Federal standards but would simultaneously require States desiring stricter standards to enact and enforce two sets of emission standards, one federally approved plan and one stricter state plan.'' 427 U.S. at 263–64. The Court concluded there was no basis ''for visiting such wasteful burdens upon the States and the Administrator.'' *Id.* CAA sections 111(d) and 110 are structurally similar in that both require the EPA to establish targets to meet the objectives of the respective sections (*i.e.,* the degree of emission limitation set by an EG under CAA section 111(d), and attainment and maintenance of the NAAQS under CAA section 110), and states must adopt and submit to the EPA plans which include requirements to meet these targets. Specifically, the EPA establishes a presumptive standard of performance corresponding to the degree of emission limitation it has determined in an EG, and state plans under CAA section 111(d) must establish standards of performance that generally reflect this degree of emission limitation. Because CAA section 116 applies to ''any standard or limitation,'' this provision clearly applies to standards of performance adopted under CAA section 111(d). Therefore, the Court's rationale in *Union Electric* as it pertains to the application of CAA section 116 in the context of the cooperative federalism structure of CAA section 110 also applies to CAA section 111(d). That is, the assessment of CAA section 116 in the context of requirements that states develop and submit to the EPA for evaluation against nationally applicable standards or criteria applies equally to CAA sections 110 and 111(d). On that basis, the EPA is finding that the Court's holding applies and controls the outcome here, as well. Requiring states to enact and enforce two sets of standards of performance, one that is exactly equal to the EPA's presumptive standard of performance that is federally approved as part of the CAA section 111(d) plan and one that is stricter and is only adopted and enforced as a matter state requirements, runs directly afoul of *Union Electric'*s holding that there is no basis for interpreting CAA section 116 in such manner.

Moreover, there is nothing in CAA section 111(d) that precludes states from adopting, and EPA from approving, more stringent standards of performance.[149] In fact, permitting

---

[145] 87 FR 79204–06.

[146] 427 U.S. 246, 263–64 (1976).

[147] The existing provision at 40 CFR 60.24a(f) provides that ''[n]othing in this subpart shall be construed to preclude any State or political subdivision thereof from adopting or enforcing,'' (1) standards of performance more stringent than an EG, or (2) compliance schedules requiring final compliance at earlier times than specified in an EG. In the proposed rulemaking, the EPA added several proposed provisions to 40 CFR 60.24a, which resulted in § 60.24a(f), in addition to being amended, being renumbered as § 60.24a(n). However, the EPA is not finalizing all the new provisions it proposed; as a result, erstwhile § 60.24a(f) is now being finalized, with amendments, at § 60.24a(i).

[148] 84 FR 32559–61.

[149] In the 1975 CAA section 111(d) implementing regulations the Agency explained that EPA's emission guidelines will reflect its judgment of the degree of control that can be attained by various classes of existing source without unreasonable costs. Particular sources within a class may be able to achieve greater control without unreasonable costs. Moreover, States that believe additional

Continued

states to adopt more stringent standards of performance and include such standards in their state plans is entirely consistent with the purpose and structure of CAA section 111(d). States bear the obligation pursuant to CAA section 111(d)(1) to establish standards of performance. Nothing in CAA section 111(d) suggests that Congress intended to preclude states from determining that it is appropriate to regulate certain sources within their jurisdiction more strictly than otherwise required by Federal requirements. For the EPA to do so would be arbitrary and capricious in light of the overarching purpose of CAA section 111(d), which is to require emission reductions from existing sources for certain pollutants that endanger public health or welfare. It is inconsistent with the purpose of CAA section 111(d) and the role it confers upon states for the EPA to constrain them from further reducing emissions that harm their citizens, and the EPA does not see a reasonable basis for doing so.

The EPA also included a second rationale for permitting more stringent standards of performance in the notice of proposed rulemaking. The Agency explained that CAA section 111(d)(1) provides that states are permitted to consider remaining useful life and other factors ''in applying a standard of performance to any particular source under a plan,'' but does not specify that the source-specific standard must be a *less stringent* standard of performance. Aside from the explicit reference to remaining useful life, the statute is silent as to what the ''other factors'' are that states may consider in applying a standard of performance and whether such factors can be used only to weaken the stringency of a standard of performance for a particular designated facility. Therefore, in addition to proposing that states may include, and the EPA must approve, more stringent standards of performance in state plans pursuant to CAA sections 111(d) and 116, the EPA also proposed to interpret CAA section 111(d)(1) as allowing states to consider ''other factors'' in exercising their discretion to apply a more stringent standard to a particular source. The Agency acknowledged that it had previously, in promulgating subpart Ba in 2019, taken the position that the statutory RULOF provision authorizes only standards of performance that are less stringent than the presumptive level of stringency required by a particular EG,[150] and explained why it was proposing to change course. To codify its revised interpretation of the RULOF provision, the EPA proposed explicit regulatory text that would have allowed states to use RULOF, and specifically, ''other factors,'' to apply a more stringent standard of performance. The new provision at 40 CFR 60.24a(m) would have also required that state plans include an adequate demonstration that the standard of performance is more stringent than required by an application EG and meet all other applicable requirements.

The EPA received comments both in support of and opposed to its proposed interpretation that states may apply more stringent standards of performance and that EPA has an obligation to approve such standards in state plans. Several commenters stated the Agency has appropriately interpreted CAA section 116 and 111(d), as well as *Union Electric Co.* v. *EPA,* as allowing states to submit, and the EPA to approve, more stringent standards. One commenter also agreed that the statutory phrase ''remaining useful life and other factors'' does not foreclose a state plan from applying a more stringent standard of performance to a particular source; while ''remaining useful life'' implies a less stringent standard, ''other factors'' does not. Another commenter asserted that the EPA need not rely on ''other factors'' to permit states to apply more stringent standards because states already have the ability to do so in light of the Supreme Court's ruling in *Union Electric.* Commenters that disagreed with the EPA's proposed interpretation generally recognized that states can adopt more stringent rules than those required by the EPA but asserted that the CAA does not authorize the EPA to approve them into state plans and thus make them federally enforceable. One commenter argued that the EPA's BSER determination defines the extent of both EPA and state authority under CAA section 111 and that the RULOF provision does not authorize states to select a different, more stringent BSER under the guise of RULOF. Another commenter stated that the EPA's position that RULOF is a variance provision for sources that cannot meet the BSER due to limited remaining useful life or other factors is in tension with its interpretation that the same provision provides a broad grant of authority for states to impose more stringent standards on sources. The same commenter pointed out the difference in proposed requirements for states invoking RULOF to apply a less stringent standard and those for applying a more stringent standard.

The EPA agrees with commenters that it need not rely on ''other factors'' for authority to permit states to submit, and the EPA to approve, more stringent standards of performance in state plans. As explained above, CAA sections 116 and 111(d), and the Court's interpretation in *Union Electric* of section 116 as it relates to CAA section 110's analogous statutory framework, provide a sufficient basis this position. Moreover, upon further consideration of the history of the RULOF provision and the EPA's interpretation of that provision as a variance for states to use when a source cannot reasonably achieve the degree of emission limitation determined by the EPA, the Agency is not finalizing its proposed interpretation that the RULOF provision allows states to adopt more stringent standards of performance in their plans. The EPA is therefore not finalizing the provision it proposed at 40 CFR 60.24a(m) that would have explicitly allowed a state to ''account for other factors in applying a standard of performance that is more stringent than required by an applicable emission guideline, or the proposed provision that ''[t]he plan must include an adequate demonstration that the standard of performance is more stringent than required by an applicable emission guideline, and must meet all other applicable requirements, such as those that provide for the implementation and enforceable of the more stringent standard of performance.'' As a general matter, states already bear the burden of demonstrating that their standards of performance are no less stringent than the corresponding EG. See 40 CFR 60.24a(c).

The EPA disagrees with comments suggesting that the EPA's BSER determination is the ceiling—that the EPA is constrained from approving more stringent standards of performance into state plans. As explained above, there is no support for this position in the statutory language or structure of CAA section 111(d). It is also inconsistent with CAA section 116 and would run counter to the purpose of section 111—reducing emissions of dangerous air pollutants from designated facilities.

---

control is necessary or desirable will be free under section 116 of the Act to require more expensive controls, which might have the effect of closing otherwise marginal facilities, or to ban particular categories of sources outright. 40 FR 53343. Congress did nothing to disturb the understanding that states can use CAA section 116 to adopt more stringent standards of performance when it enacted the 1977 CAA Amendments shortly thereafter.

[150] See EPA's Responses to Public Comments on the EPA's Proposed Revisions to Emission Guideline Implementing Regulations at 56 (Docket ID No. EPA–HQ–OAR–2017–0355–26740) (July 8, 2019).

The EPA anticipates that, in many cases, more stringent standards of performance would entail marginal differences in stringency between the degree of emission limitation in the applicable EG and the state plan requirement. For example, the EPA may determine that, for the source category in general, a control technology can reasonably achieve an 80% reduction in emissions, while a state finds that at a particular designated facility, that same control technology can reasonably achieve a 90% reduction. Or a state may decide that a particular designated facility can install a control technology that has already been demonstrated to reasonably achieve greater emission reductions than the BSER the EPA determined for the source category generally. The EPA also notes that approving more stringent standards of performance in state plans is not a new practice under subpart Ba; for example, in 2020 the EPA approved more stringent standards of performance that California submitted as part of its CAA section 111(d) state plan to implement the emission guidelines for landfill gas emissions from municipal solid waste landfills. These more stringent standards of performance were incorporated into the Code of Federal Regulations and thus became federally enforceable.[151]

In summary, the EPA is finalizing, at 40 CFR 60.24a(i), the proposed revisions to the existing provision (currently at 40 CFR 60.24a(f)) stating that nothing in subpart Ba shall be construed to preclude any state from adopting or enforcing, as part of a state plan, (1) standards of performance more stringent that the applicable EG, or (2) compliance schedules requiring final compliance at earlier times than specified in the applicable EG. The EPA is not finalizing the regulatory text provision proposed at 40 CFR 60.24a(m) stating that a state may account for other factors in applying a more stringent standard of performance.

F. Provision for Electronic Submission of State Plans

The EPA proposed to revise subpart Ba to require electronic submission of state plans instead of paper copies.[152] As explained in the notice of proposed rulemaking, the regulations promulgated in 2019 require state plan submissions to be made in accordance with 40 CFR 60.4. Pursuant to 40 CFR 60.4(a), all requests, reports, applications, submittals, and other communications to the Administrator pursuant to 40 CFR part 60 shall be submitted in duplicate to the appropriate regional office of the EPA. The provision in 40 CFR 60.4(a) then proceeds to list the corresponding addresses for each regional office. The EPA proposed that, rather than requiring paper copies of state plan submissions to be sent to the appropriate regional office, states would submit their state plans electronically via the use of its State Planning Electronic Collaboration System (SPeCS).

As previously described, CAA section 111(d) requires the EPA to promulgate a ‘‘procedure’’ similar to that of CAA section 110 under which states submit plans. The statute does not prescribe a specific platform for plan submissions, and the EPA reasonably interprets the procedure it must promulgate under the statute as allowing it to require electronic submission. Requiring electronic submission is reasonable for the following reasons. Providing for electronic submittal of CAA section 111(d) state plans in subpart Ba in place of paper submittals aligns with current trends in electronic data management and as implemented in the individual EGs will result in less burden on the states. It is the EPA’s experience that the electronic submittal of information increases the ease and efficiency of data submittal and data accessibility. The EPA’s experience with the electronic submittal process for SIPs under CAA section 110 has been successful as all the states are now using the SPeCS, which is a user-friendly, web-based system that enables state air agencies to officially submit SIPs and associated information electronically for review and approval to meet their CAA obligations related to attaining and maintaining the NAAQS. SPeCS for SIPs is the EPA’s preferred method for receiving such SIPs submissions. The EPA has worked extensively with state air agency representatives and partnered with E-Enterprise for the Environment and the Environmental Council of the States to develop this integrated electronic submission, review, and tracking system for SIPs. SPeCS can be accessed by the states through the EPA’s Central Data Exchange (CDX) (*https://cdx.epa.gov/*). The CDX is the Agency’s electronic reporting site and performs functions for receiving acceptable data in various formats. The CDX registration site supports the requirements and procedures set forth under the EPA’s Cross-Media Electronic Reporting Regulation, 40 CFR part 3.

Most of the commenters were supportive of the proposed amendments for electronically submitting state plans. However, a few commenters expressed that EPA should provide an option to submit state plans in paper format. The EPA has determined that submitting state plans electronically is more efficient and less burdensome than paper submittals. States already submit state implementation plans electronically via SPeCS so there should be little to no additional burden associated with using it for state plans. Additionally, having some states submit state plans via SPeCS and other states mail hard-copy plans to regional offices would undermine many of the efficiencies provided to the EPA through the use of electronic submission and could result in confusion. One commenter recommended adding language to clarify that a Negative Declaration letter submitted in accordance with 40 CFR 60.23a(b) can also be submitted via SPeCS. The EPA agrees with the need to add the electronic submittal language to 40 CFR 60.23a(b) identified by the commenter and has added the language in the final rule so that the states submit the Negative Declaration letter using the SPeCS, or through an analogous electronic reporting tool provided by the EPA for the submission of any plan required by this subpart.

The EPA is therefore finalizing the requirements for electronic submittal of state plans in 40 CFR 60.23a(a)(1) and (3). As finalized, 40 CFR 60.23a(a)(1) provides: ‘‘The submission of such plan shall be made in electronic format according with § 60.23a(a)(3) or as specified in an applicable emission guideline.’’ The regulation at 40 CFR 60.23a(a)(3) in turn contains the general requirements associated with the electronic submittal of a state plan in subpart Ba via the use of SPeCS or through an analogous electronic reporting tool provided by the EPA for the submission of any plan required by subpart Ba. The EPA is also including at 40 CFR 60.23a(a)(3) language to specify that states are not to transmit confidential business information (CBI) through SPeCS. Even though state plans submitted to the EPA for review and approval pursuant to CAA section 111(d) through SPeCS are not to contain CBI, the language at 40 CFR 60.23a(a)(3) also addresses the submittal of CBI in the event there is a need for such information to be submitted to the EPA.

---

[151] 40 CFR 62.1100(b)(7); 85 FR 1121 (Jan. 9, 2020); see also ‘‘Appendix E: Comparison of the Major Provisions of the Emission Guidelines and California’s Landfill Methane Regulation,’’ EPA–R09–OAR–2019–0393–0008 (technical support document for EPA action on California’s CAA section 111(d) state plan to implement the EG for landfill gas from municipal solid waste landfills).

[152] 87 FR 79206.

Any other specific requirements associated with the electronic submittal of a particular state plan will be provided within the corresponding EG. The requirements for electronic submission of CAA section 111(d) state plans in EGs will ensure that these Federal records are created, retained, and maintained in electronic format. Electronic submittal will also improve the Agency's efficiency and effectiveness in the receipt and review of state plans. The electronic submittal of state plans may also provide continuity in the event of a disaster like the one our nation experienced with COVID–19.

G. Other Proposed Modifications and Clarifications

1. Standard of Performance and Compliance Flexibility

a. Definition of Standard of Performance

The EPA proposed amendments to 40 CFR 60.21a(f) and 60.24a(b) to clarify that the definition of ''standard of performance'' allows for state plans to include standards in the form of an allowable mass limit of emissions. As explained in the notice of proposed rulemaking,[153] the amendments were intended to harmonize these regulatory definitions with the definitions of ''emission limitation'' and ''emission standard'' in CAA section 302(k), which is ''a requirement established by the State or the Administrator which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis, including any requirement relating to the operation or maintenance of a source to assure continuous emission reduction, and any design, equipment, work practice, or operational standard promulgated under this chapter.'' While the EPA had intended the phrase ''allowable rate or limit of emissions'' in the existing regulatory definitions to encompass the full range of forms included in the statute, to eliminate any potential confusion the Agency proposed to make this explicit.

Most comments received on the proposed revision to the definition of ''standard of performance'' were in support of these amendments. Some commenters pointed out that the revision would be consistent with the statutory definition in CAA section 302(k) and many expressed approval that the revised definition would clearly allow for standards of performance to take the form of mass-based emission limits. Several commenters stressed that, while they supported the proposed definition of standard of performance for subpart Ba, the appropriate form of the standard of performance in any particular EG must be determined in the context of that EG. Some commenters expressed concern that the proposed revision would allow the EPA to define the BSER as a trading program for any source sector, or for states and the EPA to impose emissions averaging and trading programs in CAA section 111(d) plans.

The EPA is finalizing amendments to 40 CFR 60.21a(f) and 60.24a(b) as proposed. The Agency's interpretation of CAA section 111 with regard to emissions trading or averaging is a separate matter that is discussed in section III.G.1.b. of this preamble; it is reiterated that the revisions to the definition of standard of performance are being made to align it with the statutory definition of emission limitation and emission standard in CAA section 302(k) for the purpose of these general implementing regulations. The EPA agrees with commenters that the appropriate form of the standard of performance in any particular EG must be determined in the context of that EG, and the EPA may choose to prescribe the acceptable form or forms of the standard of performance in an individual EG. In addition to finalizing the proposed amendments to 40 CFR 60.21a(f) to clarify that the term ''an allowable rate or limit of emissions'' means ''an allowable rate, quantity, or concentration of emissions'' of air pollutants, the EPA is also finalizing its proposed removal of the phrase ''but not limited to'' from 40 CFR 60.21a(f) as unnecessary and potentially confusing verbiage that is redundant of the word ''including,'' particularly where the definition already identifies a wide breadth of potential standards that may be included in a state plan. Moreover, the EPA is finalizing amendments to the definition of standard of performance under 40 CFR 60.24a(b) to read ''. . . in the form of an allowable rate, quantity, or concentration of emissions'' rather than ''. . . either be based on allowable rate or limit of emission.''

b. Compliance Flexibilities, Including Trading or Averaging

The EPA is finalizing its proposal that CAA section 111(a) and (d) cannot be interpreted, by their terms, to limit the types of controls that states, in their state plans, may authorize their sources to adopt to at-the-source, and thereby preclude states from authorizing their sources flexibilities such as trading or averaging. Under the provisions of CAA section 111(a) and (d), and consistent with the federalism principles that underlie the CAA, states have broad authority to determine the types of control measures for their sources, including trading or averaging, although the EPA may establish constraints to protect the integrity of particular EGs. The EPA is also finalizing its proposal that CAA section 111 cannot be interpreted, by its terms, to limit the ''best system of emission reduction . . . adequately demonstrated'' (BSER) to at-the-source measures. As the EPA explains, many control measures that the EPA has determined to be the BSER in prior rules have outside-the-source components. The EPA is finalizing its repeal of the ACE Rule's contrary interpretations of CAA section 111.

In the proposal, the EPA provided a brief summary of the applicable CAA provisions, the ACE Rule, the D.C. Circuit's decision reversing the ACE Rule, and the U.S. Supreme Court's decision vacating the D.C. Circuit's vacatur of the ACE Rule.[154] For convenience, parts of that summary are reproduced here.

i. *CAA section 111.* Under CAA section 111(d)(1), each state is required to submit to the EPA ''a plan which . . . establishes standards of performance for any existing source'' that emits certain types of air pollutants, and which ''provides for the implementation and enforcement of such standards of performance.'' Under CAA section 111(a)(1), a ''standard of performance'' is defined as ''a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction . . . adequately demonstrated.''

ii. *Rulemaking and caselaw.* In the Clean Power Plan (CPP), the EPA interpreted the term ''system'' in CAA section 111(a)(1) to be broad and therefore to authorize the EPA to consider a wide range of measures from which to select the BSER.[155] Similarly, the CPP took the position that states had broad flexibility in choosing compliance measures for their state plans.[156] The CPP went on to determine that generation shifting qualified as the BSER,[157] and that states could include trading or averaging programs in their state plans for compliance.[158]

The ACE Rule included the repeal of the CPP. It interpreted CAA section 111 so that the type of ''system'' that the EPA may select as the BSER is limited to a control measure that could be

[158] Id. at 64840.

applied at each source (that is, inside the fenceline of each source) to reduce emissions at each source.[159] The ACE Rule also concluded that the compliance measures the states include in their plans must ''correspond with the approach used to set the standard in the first place,'' [160] and therefore must also be limited to inside-the-fenceline measures that reduce the emissions of each source. For these reasons, the ACE Rule invalidated the CPP's generation-shifting system as the BSER, on grounds that it was an outside the source measure, and precluded states from allowing their sources to trade or average to demonstrate compliance with their emission standards.[161]

In 2021, the D.C. Circuit vacated the ACE Rule.[162] The court held, among other things, that CAA section 111(d) does not limit the EPA, in determining the BSER, to at-the- source measures.[163] The court further held that the ACE Rule's premise for viewing compliance measures as limited to at the source measures, which is that BSER measures are so limited, was invalid for the same reason. The court indicated that while requiring symmetry between the nature of the BSER and compliance measures ''would be reasonable'' where necessary to preserve the environmental outcomes a particular BSER was designed to achieve, a universal restriction on compliance measures could not be sustained by policy concerns that were not similarly universal.[164]

In 2022, the U.S. Supreme Court reversed the D.C. Circuit's vacatur of the ACE Rule's embedded repeal of the Clean Power Plan.[165] The Supreme Court made clear that CAA section 111 authorizes the EPA to determine the BSER and the amount of emission limitation that state plans must achieve.[166] However, the Supreme Court invalidated the CPP's generation-shifting BSER under the major question doctrine, explaining that the term ''system'' does not provide the ''clear congressional authorization'' needed to support a BSER ''of such magnitude and consequence.'' [167] The Court declined to address the D.C. Circuit's decision that the text of CAA section 111 did not limit the type of ''system'' the EPA could consider as the BSER to at-the-source measures.[168] Nor did the Court rule on the scope of the states' compliance flexibilities.

iii. *Proposal.* In the proposal, the EPA stated that it has reconsidered the ACE Rule's interpretation of the compliance flexibilities available to states under CAA section 111 and that it was proposing to disagree with the rule's view that trading or averaging are universally precluded [169] and that state plan compliance measures must always correspond with the approach the EPA uses to set the BSER. The EPA added, however, that the flexibility that CAA section 111(d) grants to states in adopting measures for their state plans is not unfettered; rather, CAA section 111(d)(2) requires the EPA to review state plans to ensure that they are ''satisfactory,'' and the EPA may conclude in particular emission guidelines that limiting the types of control measures states may authorize their sources to adopt, including precluding trading or averaging, are necessary to protect the environmental outcomes of the emission guidelines.[170]

In addition, the EPA also proposed to reject the ACE Rule's interpretation that various provisions in CAA section 111 limit the type of ''system'' that may qualify as the BSER to at-the-source measures.[171] The EPA explained that it proposed to agree with the part of the D.C. Circuit's decision in *American Lung Ass'n,*[172] that rejected the ACE Rule's at-the-source statutory interpretation. The EPA added that it recognized that the Supreme Court, in *West Virginia,* did impose limits, through the application of the major question doctrine, on the type of ''system'' that may qualify as the BSER.[173] The EPA made clear that it was not proposing to address the scope of the limits that may result from application of the major question doctrine, and thus was not proposing to address whether it could include trading or averaging as part of the BSER, or to identify any particular control mechanism that could or could not be part of a specific BSER, in light of those limits. Instead, the EPA stated that it may address further those limits, and their implications for the legality of particular systems of emission reduction and state compliance measures, in future emission guidelines.[174]

iv. *The EPA's finalized interpretation of state authority to grant compliance flexibilities.* The EPA is finalizing its proposal that, contrary to the position of the ACE Rule, CAA section 111 does not preclude states from including compliance flexibilities such as trading or averaging for their sources in their state plans, although in particular emission guidelines the EPA may limit those flexibilities if necessary to protect the environmental outcomes of the guidelines. The EPA is also rescinding the related ACE Rule interpretation that CAA section 111 requires that state plan measures be symmetrical to the types of measures the EPA included in the BSER.

Most commenters agreed with the proposal that CAA section 111 does not preclude states from including compliance flexibilities in their state plans. However, several commenters disagreed and submitted adverse comments. Some commenters stated that *West Virginia* is clear that the EPA cannot include generation-shifting as the BSER, and then argued that the EPA cannot include trading as part of the BSER because trading entails generation shifting, and then further argued that for emission guidelines applicable to electric generating units, the EPA cannot authorize trading as a compliance mechanism because trading incentivizes generation shifting to occur and only works if generation shifting does occur. As explained further below, the EPA does not believe that these adverse comments cast doubt on the rationale that it gave in the proposal for why states have the authority to allow compliance flexibilities such as trading or averaging.[175] The EPA continues to agree with the reasoning in *American Lung Ass'n,*[176] in rejecting the ACE Rule's limitations on those measures.

To review the reasons that the ACE Rule gave for asserting that trading or averaging across designated facilities is inconsistent with CAA section 111: The ACE Rule stated that those options would not necessarily require any emission reductions from designated

[169] With respect to averaging, the ACE Rule noted that the D.C. Circuit has recognized that the EPA may have statutory authority under CAA section 111 to allow plant-wide emissions averaging, *See U.S. Sugar* v. *EPA,* 830 F.3d 579, 627 n.18 (D.C. Cir. 2016) (pointing to the definition of ''stationary source''), but stated that the Agency's determination that individual EGUs are subject to regulation under ACE precludes the Agency from attempting to change the basic unit from an EGU to a combination of EGUs for purposes of ACE implementation.

facilities and may not actually reflect application of the BSER. The ACE Rule explained that ''state plans must establish standards of performance—which by definition 'reflects . . . the application of the best system of emission reduction,' ''[177] and then asserted that implementation and enforcement of such standards should be based on improving the emissions performance of sources to which a standard of performance applies. The ACE Rule added that trading or averaging would effectively allow a state to establish standards of performance that do not reflect application of the BSER, and gave, as an example, the possibility that under a trading program, a single source could potentially shut down or reduce utilization to such an extent that its reduced or eliminated operation generates sufficient allowances for a state's remaining sources to meet their standards of performance without themselves making any emission reductions from any other source. The ACE Rule asserted that this compliance strategy would undermine the EPA's determination of the BSER.[178]

This interpretation of CAA section 111 is unduly strained and the EPA rejects it. The provisions of CAA section 111(d) by their terms do not affirmatively bar states from considering trading or averaging as a compliance measure where appropriate for a particular emission guideline. Under CAA section 111(d)(1), each state must ''establish[ ],'' ''implement[ ],'' and ''enforce[ ]'' ''standards of performance for any existing source.'' A state plan may ''establish[ ]'' a standard of performance for each source that constitutes an emissions standard that reflects the amount of emission reduction that the source could achieve by applying the BSER, but the state may also allow measures like trading or averaging as potential means of compliance. Nothing in the text of CAA section 111 precludes states from considering a source's acquisition of allowances as part of a trading program in ''implement[ing]'' and ''enforce[ing]'' a standard of performance for that particular source, so long as the state plan achieves the required overall level of emission reductions.[179] CAA section 111(d)(1) requires only that each source comply with its standard, not that each source do so through applying the BSER. By the same token, contrary to the ACE Rule,[180] CAA section 111(d)(1) does not limit the states to compliance measures that are symmetrical to what the EPA determined to be the BSER unless necessary to preserve the environmental outcomes a particular system was designed to achieve.

For further support for the interpretation that CAA section 111 does not preclude states from authorizing compliance flexibilities such as trading or averaging, the EPA notes that CAA section 111(d)(1) requires a ''procedure similar to that provided by [CAA section 110].''[181] Consideration of the CAA section 110 framework reinforces the absence of any mandate that states consider only compliance measures that apply at and to an individual source. ''States have 'wide discretion' in formulating their plans'' under section 110.[182] The EPA has authorized trading programs in CAA section 110 SIPs for decades. See Economic Incentive guidance.[183]

Such flexibility is consistent with the framework of cooperative federalism that CAA section 111(d) establishes, which vests states with substantial discretion in establishing control requirements for their sources. As the U.S. Supreme Court has explained, CAA section 111(d) ''envisions extensive cooperation between Federal and state authorities, generally permitting each State to take the first cut at determining how best to achieve EPA emissions standards within its domain.''[184]

This interpretation is also consistent with the EPA's consistent views prior to the ACE Rule. The EPA authorized trading or averaging as compliance methods in the 2005 Clean Air Mercury Rule for coal-fired EGUs,[185] and the 2015 Clean Power Plan (CPP).[186]

It must be emphasized that the EPA retains an important role in reviewing state plans for adequacy. Under CAA section 111(d)(2)(A), the EPA must determine that the state plan is ''satisfactory'' and, if the state plan is not satisfactory or if the state does not submit a state plan, the EPA must promulgate a plan that establishes Federal standards of performance for the State's existing sources. Thus, the flexibility that CAA section 111(d)(1) grants to states in adopting measures for their state plans is not unfettered. As the Supreme Court stated in *West Virginia,* ''The Agency, not the States, decides the amount of pollution reduction that must ultimately be achieved.''[187] The Court further stated that state plans must contain ''emissions restrictions that they intend to adopt and enforce in order not to exceed the permissible level of pollution established by EPA.''[188] Thus, the EPA retains the authority to ensure that the permissible level of pollution is not exceeded by any state plan. If the EPA considers that compliance flexibility measures would compromise the ability of the state plan to achieve the environmental outcomes the best system could achieve, the EPA may, in the emission guidelines, preclude such measures or otherwise conclude that the state plan is not satisfactory.

In *West Virginia* v. *EPA,* the Supreme Court did not directly address the state's authority to determine their sources' control measures. Although the Court did hold that constraints apply to the EPA's authority in determining the BSER, the Court's discussion of CAA section 111 is consistent with the EPA's interpretation that the provision does not preclude states from granting sources compliance flexibility.

At the outset of the decision, the Court made clear CAA section 111

---

[177] This paraphrasing by the ACE Rule of the CAA section 111(a)(1) definition of ''standard of performance'' is incomplete—a ''standard of performance'' ''reflects the degree of emission limitation achievable through the application of the best system of emission reduction.''

[178] 84 FR 32557.

[179] This overall level of emissions reduction is the level that would be achieved if each source were to apply the BSER.

[180] 84 FR 32556 (ACE Rule states that one reason why CAA section 111 precludes states from authorizing trading or averaging is that ''[a]pplying an implementation approach that differs from standard-setting would result in asymmetrical regulation'').

[181] *See* CAA section 111(d)(2)(A) (referring to CAA section 110(c)), 111(d)(2)(B) (referring to enforcement of state implementation plans (SIPs)).

[182] *Alaska Dep't of Envtl. Conservation* v. *EPA,* 540 U.S. 461, 470 (2004) (citation omitted); *see Union Elec. Co.* v. *EPA,* 427 U.S. 246, 269 (1976) (''Congress plainly left with the States, so long as the national standards were met, the power to determine which sources would be burdened by regulation and to what extent.''); *Train* v. *Natural Res. Def. Council, Inc.,* 421 U.S. 60, 79 (1975) (''[S]o long as the ultimate effect of a State's choice of emission limitations is compliance with the national standards for ambient air, the State is at liberty to adopt whatever mix of emission limitations it deems best suited to its particular situation.'').

[183] The ACE Rule stated that the reference in CAA section 111(d)(1) to CAA section 110 was limited to the procedure under which states shall submit plans to the EPA, and asserted that it does not imply anything about implementation mechanisms available under CAA section 111(d). 84 FR 32557. The EPA believes that the several references to CAA section 110 in CAA section 111(d)(1) and (2), as noted in the accompanying text, support the view that Congress intended that state plans under CAA section 111(d) would be similar to state plans under CAA section 110, including retaining the authority to grant sources compliance flexibility in appropriate circumstances.

provides different roles for the EPA and the States:

> Although the States set the actual rules governing existing power plants, EPA itself still retains the primary regulatory role in Section 111(d). The Agency, not the States, decides the amount of pollution reduction that must ultimately be achieved. It does so by again determining, as when setting the new source rules, ''the [BSER]. . . . The States then submit plans containing the emissions restrictions that they intend to adopt and enforce in order not to exceed the permissible level of pollution established by EPA.[189]

The Court was clear that the focus of the case was exclusively on the EPA's role, that is, whether the EPA acted within the scope of its authority in establishing the BSER.[190] The Court applied the major question doctrine to hold that the generation-shifting BSER that the EPA promulgated in the CPP exceeded the constraints of the CAA section 111 BSER provisions, in light of ''separation of powers principles and a practical understanding of legislative intent.'' [191] The Court did not identify any constraints on the states in establishing standards of performance to their sources, and its holding and reasoning cannot be extended to apply such constraints. In fact, the Supreme Court at least implicitly recognized that CAA section 111(d) does not preclude states from authorizing sources compliance flexibility when the Court observed that a new or modified source ''may achieve [the EPA-determined] emissions [standard] any way it chooses.'' [192] There is no reason why existing sources should have less flexibility.

It should also be noted that the adverse commenters described above are incorrect in their view that trading necessarily results in generation shifting and that the logic of the *West Virginia* decision precludes any such generation shifting. As just noted, the reasons why the Court held that the CPP's generation-shifting BSER violated the major question doctrine and thus was invalid have no application to states in developing state plans. In addition, the Court was clear that a BSER that has the incidental effect of resulting in generation shifting would not, on those grounds, violate the major question doctrine. The Court emphasized that ''there is an obvious difference between (1) issuing a rule that may end up causing an incidental loss of coal's market share, and (2) simply announcing what the market share of coal, natural gas, wind, and solar must be, and then requiring plants to reduce operations or subsidize their competitors to get there.'' [193] The second option is what the Court viewed the CPP's generation-shifting BSER as attempting to do, which thereby triggers the major question doctrine. But, as a coalition of companies that operate electricity generation as well as transmission and distribution systems commented, the Court ''evinced no general concern about option 1, which is an inevitable consequence of regulation within the power sector, in which all sources of emissions are interconnected and increase or decrease their generation based upon demand for electricity and other sources' availability.'' [194] If the Court in *West Virginia* had little concern with the EPA determining a BSER that has the incidental effect of shifting generation, there is no basis for reading the case to preclude a state from adopting trading measures in its state plan on grounds that those measures may have the incidental effect of shifting generation. In any event, in many instances, trading simply apportions the cost of controls between the sources engaged in the transaction, and does not result in generation shifting. To illustrate, assume that the EPA promulgates an emissions guideline that determines as the BSER the installation by a source of control equipment that captures 40 percent of its emissions of a pollutant. Assume further that a state allows two of its designated facilities of comparable size and emissions to engage in an emission trade, so that one source installs control equipment that captures 80 percent of its emissions, and the other one does not put on control equipment but purchases allowances from the first one that fund half the costs of the first one's control equipment. This type of emissions trade would not necessarily give rise to generation shifting.

For the reasons noted above, the EPA is rescinding the ACE Rule's interpretation that state plans may not include trading or averaging or other compliance flexibilities.

v. *The EPA's finalized interpretation of BSER.* The EPA is also finalizing its proposal to rescind the ACE Rule's interpretation that CAA section 111, by its plain meaning, limits the BSER to at-the-source measures. The ACE Rule's interpretation is incorrect. In addition, as a practical matter, it could call into question many of the EPA's determinations in prior CAA section 111 rules that well-established control measures, including clean fuels and add-on control technology, qualified as the BSER. This is because many of these traditional measures are not entirely at-the-source controls, but also include outside-the-source components. *West Virginia* does not preclude the EPA from rescinding the ACE Rule interpretation because although the Supreme Court held that the CPP's generation-shifting BSER violated the major question doctrine, Court declined to address the ACE Rule's interpretation of CAA section 111.[195]

To repeat for convenience the key requirements for determining the BSER under CAA section 111: each state must establish ''standards of performance for any existing source'' of certain types of air pollutants, under CAA section 111(d)(1); a ''standard of performance'' is defined as ''a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction . . . adequately demonstrated, under CAA section 111(a)(1);'' and ''existing source'' is defined as a ''stationary source,'' which, in turn, is defined, in relevant part, as ''any building, structure, facility or installation,'' under CAA section 111(a)(6) and (a)(3).

The ACE Rule interpreted CAA section 111 to limit, by its plain language, the type of ''system'' that the EPA may select as the BSER to control measures that can be applied at each source to reduce that source's emissions.[196] Specifically, the ACE Rule argued that the requirements in CAA section 111(d)(1), (a)(3), and (a)(6) that each state establish a standard of performance ''for'' ''any existing source'' (in the singular), defined, in general, as any ''building . . . [or] facility,'' and the requirements in CAA section 111(a)(1) that the standard of performance reflect a degree of emission limitation that is ''achievable'' through the ''application'' of the BSER, by their terms, impose this limitation.[197]

Upon reconsideration, the EPA concludes that, contrary to the ACE Rule, CAA section 111(d) does not limit the EPA to at-the-source measures in determining the BSER. The CAA section

[195] 142 S.Ct. at 2615–16.

[196] 84 FR 32523–24.

[197] Id. at 32556–57.

111 requirement that each state establish a standard of performance ''for'' any existing ''building . . . [or] facility,''' means simply that the state must establish standards applicable to each regulated stationary source; and the requirement that the standard reflect a degree of emission limitation ''achievable'' through the ''application'' of the BSER means that the source must be able to apply the system to meet the standard. None of these requirements by their plain language mandate that the BSER is limited to some measure that each source can apply to its own facility to reduce its own emissions in a specified amount. That the standards must be ''for'' a source does not mean that the control measures that form the basis for the standard are limited to measures that apply at the source or that all emission reductions from the control measures must occur at the source.

The ACE Rule also argued that as a matter of grammar, the term ''application,'' which is derived from the verb, ''to apply,'' requires an indirect object, and, further, that the phrase ''application of the best system of emission reduction'' has, as the unstated indirect object, an existing source. From this premise, the ACE Rule concluded that the phrase must be read to refer to the application of the best system of emission reduction at or to the existing source itself.[198] But this premise is incorrect. As the D.C. Circuit explained in *American Lung Ass'n,* ''application'' is a noun, and ''the phrase 'application of the best system of emission reduction' is what is called a nominalization, a 'result of forming a noun or noun phrase from a clause or a verb.' '' [199] The court further explained that ''[g]rammar assigns direct or indirect objects only to verbs—not nouns. No objects are needed to grammatically complete the actual statutory phrase.'' [200] In any event, the fact that any such indirect object is unstated itself contradicts the ACE Rule's conclusion that CAA section 111 by its plain language mandates that the BSER must be limited to at-the-source measures.[201]

It should also be noted that CAA section 111(a)(1) provides that when the EPA determines the BSER, it must ''tak[e] into account'' ''cost'' and ''any nonair quality health and environmental impact and energy requirements.'' As the ACE Rule itself recognized, the EPA may consider the application of these requirements on a ''sector-wide, region-wide or nationwide basis.'' [202] As discussed below, the reference to ''nonair quality health and environmental impact'' may encompass to offsite impacts of control measures. Thus, these provisions contradict the ACE Rule's argument that CAA section 111(d)(1) and (a), by its plain language, limits the BSER to at-the-source measures. By the same token, the term ''achievable'' refers to the ''degree of emission limitation'' that must be ''reflect[ed]'' in the standards of performance ''through the application of the [BSER].'' This term does not, by its plain language, limit the BSER to at-the-source measures.

Importantly, it should be emphasized that the ACE Rule's interpretation that the provisions of CAA section 111(d)(1) and (a) by their plain language require that the EPA identify as the BSER control measures that apply at-the-source would also impose the same limit on the state, that is, limit the state to authorizing its sources to comply with their standards only through at-the-source measures. As a result, this interpretation would preclude the state from allowing its sources compliance flexibilities such as trading or averaging. In fact, the ACE Rule argued that states were limited in that manner. For the reasons noted above, limiting the states in that manner is contrary to the provisions of CAA section 111(d) and the framework of cooperative federalism that CAA section 111(d) establishes.

The ACE Rule also argued that the legislative history of the 1970 CAA Amendments confirms the rule's at-the-source interpretation for BSER.[203] The rule read the legislative history to indicate that the House and Senate bills that led to the adoption of CAA section 111 ''contemplated only control measures that would lead to better design, construction, operation, and maintenance of an individual source. . . .'' [204] The EPA disagrees with this interpretation of the legislative history. The ACE Rule itself acknowledged that the 1970 CAA Amendments legislative history also included broader language in describing the types of measures that were to provide the basis for the standards of performance.[205] In addition, the ACE Rule went on to narrow its argument about legislative history to saying that the 1990 CAA Amendments made clear only that generation-shifting was precluded.[206] *Id.* at 32526 n.62. Thus, the EPA finds that the legislative history cannot be read to confirm the interpretation that section 111(d) and (a)(1), by their plain language, limit the BSER to at-the-source measures.

There is another reason why the ACE Rule's interpretation is incorrect: it appears to be inconsistent with many EPA determinations in previous CAA section 111 rulemakings that certain control measures qualified as the BSER. This is because although those measures apply at the source and reduce

---

[199] 985 F.3d at 948 (citations omitted).

[200] *Id.*

[201] The ACE Rule stated that the CAA provisions concerning the ''best available control technology'' (BACT) provide a CAA structural argument that supports its interpretation that CAA section 111 limits BSER to at-the-source measures. CAA section 165(a)(4) provides that construction and modification of major stationary sources of a pollutant are subject to BACT, as defined under CAA section 169(3), for each pollutant subject to regulation under the CAA. The definition of BACT provides, ''In no event shall application of [BACT] result in emissions of any pollutants which will exceed the emissions allowed by any applicable standard established pursuant to [CAA] section [111] or [112].'' The ACE Rule pointed to the EPA's reading of this sentence to mean that section 111 standards of performance ''operate as a floor to BACT.'' The ACE Rule asserted that, under the definition of BACT, control measures are limited to at-the-source measures. The ACE Rule reasoned that section 111 standards of performance must, by operation of the structure of the CAA, also be interpreted to be limited to at-the-source measures. 84 FR 32525. Upon further review, the EPA rejects this argument. The EPA considers whether CAA section 169(3) should be interpreted to limit BACT to at-the-source measures to be an open question, and is not addressing it at this time. Even if BACT were so limited, the ACE Rule did not demonstrate that any BACT requirement that a particular source would be subject to would be incompatible with any standard of performance that source would also be subject to. Section 169(3) by its plain language provides that the application of BACT may not result in exceedances of any applicable standard of performance.

The ACE Rule also focused on statements in the CPP that it asserted conflated the terms ''application'' and implementation, as well as ''source'' and owner/operator; and that defined ''system'' broadly. The rule asserted that the CPP strained the interpretation of CAA section 111 in those ways to justify determining generation-shifting as the BSER. 84 FR 32526–29. Regardless of whether those arguments have merit with respect to the generation-shifting, they are not relevant to the position that the EPA is taking in the present action that the ACE Rule erred in interpreting CAA section 111 by its terms to limit the BSER to at-the-source measures. It should also be noted that the CPP's recognition that as a practical matter, it is the owner/operator who takes actions to apply control measures and assure that the source's emissions meet the standard is a matter of common sense and applies as well to all control measures, whether at the source or outside the source. The ACE Rule itself referred to the ''owner or operator'' as the entity that ''must be able to achieve an applicable standard by applying the BSER . . . .'' 84 FR 32524.

[205] *Id.* at 32526 n.61. The ACE Rule argued that the canon of *ejusdem generis* required that those broader terms be interpreted to denote at-the-source measures but e*jusdem generis* is an aid in statutory construction and should not be used to narrow the meaning of a statute beyond its intention. Karl N. Llwellyn, Remarks on the Theory of Appellate Decision and the Rules or Canons about how Statutes are to be Construed, 3 Vanderbilt L. Rev. 395, 405 & n.46 (1950).

[206] *Id.* at 32526 n.61.

emissions at the source, they also have components that are outside the source. In *West Virginia,* the Supreme Court recognized that the EPA had, in prior rules, identified as the BSER these ‘‘‘more traditional air pollution control measures.’ ’’[207] The Court made this point as part of its reasoning that the CPP's generation-shifting BSER—which the Court stated differed from these traditional measures—raised a major question. The Court quoted the CPP as describing these traditional measures as ‘‘‘efficiency improvements, fuel-switching,’’ and ‘add-on controls.’ ’’ [208] The Court noted that these types of controls have several characteristics: they ‘‘reduce pollution by causing the regulated source to operate more cleanly.’’ [209] They ‘‘ ‘allow[ ] regulated entities to produce as much of a particular good as they desire provided that they do so through an appropriately clean (or low-emitting) process.’ ’’ ’[210] They are ‘‘technology-based . . . [and] focuse[d] on improving the emissions performance of individual sources.’’ [211]

However, many of these traditional controls also have components that are outside the source. One example includes what the Court, quoting the CPP, identified as ‘‘fuel-switching.’’ [212] Fuel-switching entails the use of lower-emitting fuels. These include fuels that have been cleaned, or processed, to reduce their level of pollutants,[213] such as coal or oil that has been desulfurized. Desulfurization reduces the amount of sulfur in the fuel, which means that the fuel can be combusted with fewer SO_2 emissions. Importantly, the process of desulfurization typically occurs off-site and is undertaken by third parties. Congress itself recognized this in the 1977 CAA Amendments. Specifically, Congress revised CAA section 111(a)(1) to identify the basis for standards of performance for new fossil fuel-fired stationary sources as a ‘‘technological system of continuous emission reduction,’’ including ‘‘precombustion cleaning or treatment of fuels.’’ [214] The 1977 House Committee report stated that fuel cleaning includes ‘‘oil desulfurization at the refinery.’’ [215] The report added that fuel cleaning includes ‘‘various coal-cleaning technologies,’’ which generally are also conducted off-site by third parties.[216] As noted above, in the 1990 CAA Amendments, Congress eliminated many of the restrictions and other provisions added in the 1977 CAA Amendments by largely reinstating the 1970 CAA Amendments' definition of ‘‘standard of performance.’’ Nevertheless, there is no indication that in doing so, Congress intended to preclude the EPA from considering fuel cleaning off-site by third parties. In fact, the EPA's regulations promulgated after the 1990 CAA Amendments continue to impose standards of performance that are based on coal cleaning off-site by third parties.[217]

A second example includes what the Court, again quoting the CPP, identified as ‘‘add-on controls.’’ [218] These controls include air pollution control devices that are installed at the unit. They routinely operate by removing air pollutants from a unit's emission stream and capturing them as a liquid or solid. For example, a baghouse is an add-on control device that captures particulate matter by trapping particles as a dust, which must then be disposed of.[219] Another add-on control device, flue-gas desulfurization, ‘‘scrubs’’ acid gases like sulfur dioxide from emissions using a chemical sorbent that reacts with the pollutant to generate a liquid slurry (wet scrubbing) or solid residue (dry scrubbing). These captured pollutants must then be disposed as solid wastes, discharged as wastewater, or otherwise managed or reused.[220] The same is true for carbon capture and sequestration (CCS): the carbon capture control device scrubs CO_2 from the flue gas stream using a solvent; and the CO_2 must then be stored underground.[221] Downstream management of captured pollutants is thus a commonplace feature of CAA section 111 standards.[222] Downstream management of captured pollutants is thus a commonplace feature of CAA section 111 standards.[223]

Indeed, CAA section 111(a)(1) by its terms recognizes that ‘‘system[s] of emission reduction’’ may entail off-site disposition of pollutants. The provision states that the EPA must consider ‘‘nonair quality health and environmental impact’’ when determining the BSER. Congress adopted this phrase in the 1977 CAA Amendments.[224] As the legislative history stated, Congress added this phrase so that ‘‘environmental impacts would be required to be considered in determining best technology which has been adequately demonstrated.’’ [225] In making this addition, Congress codified the D.C. Circuit's holding in *Essex Chem. Corp.* v. *Ruckelshaus,* 486 F.2d 427, 438–39 (D.C. Cir. 1973), *cert. denied,* 416 U.S. 969 (1974).[226] In *Essex Chem. Corp.,* the D.C. Circuit required that EPA ‘‘take into account counter-productive environmental effects’’ when determining whether a control measure qualifies as the BSER, including ‘‘disposal problems’’ related to the control measure's captured pollutants. The Court remanded the NSPS at issue because there was no evidence that the EPA had considered ‘‘the significant land or water pollution potential

resulting from disposal of the [scrubber system's] liquid purge byproduct.'' [227] That the ACE Rule's interpretation that CAA section 111 limits the BSER to at-the-source measures may be inconsistent with the EPA's prior determinations that traditional control measures like clean fuels and add-on controls qualified as the BSER provides another reason to reject that interpretation.

It should be noted that many of the reasons noted above are comparable to the reasoning by the D.C. Circuit to support its decision in *ALA* that the ACE Rule was incorrect in interpreting CAA section 111 to restrict the BSER to at-the-source measures.[228] The EPA agrees with the D.C. Circuit's reasoning.

In *West Virginia,* the Supreme Court held that the CPP's generation-shifting BSER violated the major question doctrine, and the Court vacated *ALA* on the basis of that holding.[229] However, the Court declined to address the ACE Rule's interpretation of CAA section 111.[230] Thus, its opinion does not cast doubt on the EPA's reasons for rejecting the ACE Rule's interpretation, as noted above and in *ALA.* Several commenters argued that *West Virginia* indicates that control measures that the commenters considered comparable to the generation-shifting BSER of the CPP, including trading programs and other measures that controlled designated facilities in the aggregate, were also precluded from inclusion as the BSER under the major question doctrine.[231] Other commenters disagreed, arguing that *West Virginia* identifies distinctions among those programs, so that the major question doctrine would not necessarily apply.[232] However, as noted in the proposal, in this action, the EPA is not addressing what types of controls, in addition to the generation-shifting BSER of the CPP, would be precluded under CAA section 111 by the major question doctrine. Instead, the EPA will evaluate particular controls against the doctrine, as appropriate, when the EPA considers those controls in future rulemakings under CAA section 111.

2. Minor Amendments or Clarifications

The EPA proposed to amend the regulatory text in subpart Ba to address several editorial and other minor clarifications and is finalizing the amendments as described below. Except as noted specifically below, commenters supported these revisions to the regulatory text.

a. The EPA is finalizing amendments to the applicability provision for subpart Ba under 40 CFR 60.20a, with slight revision from as proposed. As discussed in section II.B. of this preamble, the revised applicability provision clarifies that the provisions of subpart Ba are applicable to an EG published after July 8, 2019. The EPA is finalizing the proposed removal of text that included ''if implementation of such final guideline is ongoing'' because there are no EGs the implementation of which is ongoing; [233] thus, leaving this language in the regulation would be needlessly confusing. Emission guidelines issued on and prior to July 8, 2019, and pursuant to CAA section 129 are subject to the provisions of subpart B. Also, in response to comment that the term ''final emission guideline'' is unclear, the EPA is adding the term ''in the **Federal Register**'' to 40 CFR 60.20a(a) to clarify the publication in the **Federal Register** determines the applicability date. Further clarification of the term ''final emission guideline'' is available in 40 CFR 60.22a(a). A commenter also noted that the proposed rule text deleted all references to ''subpart C of this part'' and removing this language means that it would apply to all EGs in 40 CFR part 60 (that are published after July 8, 2019), including those for incinerators addressed by CAA section 129. This was not the EPA's intent. Therefore, as noted in section III.G.2.b. of this preamble, the EPA is amending the definition of EG within subpart Ba to clarify that subpart Ba does not apply to EGs promulgated under CAA section 129.

b. The EPA is finalizing revisions to 40 CFR 60.21a(e), 60.22a(c), and 60.24a(c) and (f)(1) and (2), largely as proposed, at 40 CFR 60.21a(e), 60.22a(c), and 60.24a(c) and (i)(1) and (2) respectively (differences in numbering are due to provisions changing location in the final regulations relative to proposal). These revisions delete ''subpart C'' from these provisions because EGs can be codified in other subparts of this part and not only in subpart C of this part. In response to a comment requesting clarification, 40 CFR 60.21a(e) is also amended clarify that the definition of emission guidelines for purposes of subpart Ba excludes guidelines promulgated pursuant to CAA section 129. As discussed above, EGs under CAA section 129 are subject to the provisions of subpart B.

c. The EPA is finalizing as proposed an editorial amendment to 40 CFR part 60, subpart A, at § 60.1(a) to add a reference to subpart Ba. The applicability provision in 40 CFR 60.1(a) states that ''[e]xcept as provided in subparts B and C, the provisions of this part apply to the owner or operator of any stationary source which contains an affected facility, the construction or modification of which is commenced after the date of publication in this part of any standard (or, if earlier, the date of publication of any proposed standard) applicable to that facility.'' We are amending this provision to include reference to subpart Ba in addition to subparts B and C.

d. A minor editorial correction at 40 CFR 60.22a(b)(3) amends the term ''nonair quality health environmental effects'' to ''nonair quality health and environmental effects''.

3. Submission of Emissions Data and Related Information

The EPA is finalizing as proposed amendments to 40 CFR 60.25a(a) that delete reference to 40 CFR part 60, appendix D, because the system specified for information submittal by the appendix is no longer in use and clarify that the applicable EG will specify the system for submission of the inventory of designated facilities, including emission data for the designated pollutants and any additional required information related to emissions. The EPA also proposed to delete the term ''related to emissions'' in 40 CFR 60.25a(a). A commenter noted as proposed this deletion caused the provision to be too vague. The EPA agrees that the term ''related to emissions'' should be retained to maintain the original and proper context of this provision. The term is retained by this final action.

4. State Permit and Enforcement Authority

Questions have previously arisen as to whether states may establish standards of performance and other plan requirements as part of state permits

---

[233] The Municipal Solid Waste Landfills EG, which is currently being implemented, has its own applicability provisions and is subject to subpart B.

and administrative orders. The EPA is confirming with this final action that subpart Ba allows for standards of performance and other state plan requirements to be established as part of state permits and administrative orders, which then must be incorporated into the state plan. See 40 CFR 60.27a(g)(2)(ii).

However, the EPA notes that the permit or administrative order alone may not be sufficient to meet the requirements of an EG or the implementing regulations, including the completeness criteria under 40 CFR 60.27a(g). For instance, a plan submittal must include supporting material demonstrating the state's legal authority to implement and enforce each component of its plan, including the standards of performance, 40 CFR 60.27a(g)(2)(iii), as well as a demonstration that each emission standard is quantifiable, non-duplicative, permanent, verifiable, and enforceable. *Id.* at § 60.27a(a)(2)(vi). In addition, the specific EGs may also require demonstrations that may not be satisfied by terms of a permit or administrative order. To the extent that these and other requirements are not met by the terms of the incorporated permits and administrative orders, states will need to include materials in a state plan submission demonstrating how the plan meets those requirements. If a state does choose to use permits or administrative orders to establish standards of performance, it needs to demonstrate that it has the legal authority to do so. These implementing regulations do not themselves provide any independent or additional authority to issue permits and administrative orders under states' EPA approved title I and title V permitting programs.

IV. Summary of Cost, Environmental, and Economic Impacts

In amending general implementing regulations, this final action does not independently impose any requirements and therefore does not directly incur any costs or benefits. However, the amendments finalized in this action can impact the costs and benefits of future EGs subject to subpart Ba. The potential impacts of these amendments as reflected in an EG will vary greatly depending on the source category, number and location of designated facilities, and the designated pollutant and potential controls addressed by the EG. Of note, the EPA may propose to supersede these general provisions in an EG as needed and with appropriate justification. Individual EGs are subject to notice and comment rulemaking, providing the opportunity for stakeholders, including the public, to consider the impacts of implementing or superseding these general implementing regulations in the course of those rulemaking actions.

As described in detail in section III.A. of this preamble, the EPA is finalizing amendments to subpart Ba to replace timelines vacated by the D.C. Circuit in *ALA*[234] and to improve and update other provisions within subpart Ba. This section considers general impacts that could result from the amendments finalized in this action as adopted by an EG.

As discussed in section III.A. of this preamble, the EPA does not interpret the D.C. Circuit's direction to require the Agency to quantitatively evaluate the impacts of potential subpart Ba framework timelines, but rather to consider the balance between the public health and welfare benefits resulting from appropriate and reasonable deadlines for the implementation of EGs and the time needed for the technical, administrative, and legislative actions needed to develop and adopt approvable state or Federal plans. The EPA expects that the amendments to subpart Ba finalized in this action will improve the implementation of EGs under CAA section 111(d). In particular, the EPA expects that the timelines finalized both appropriately accommodate state and EPA processes to develop and evaluate plans to effectuate an EG and are consistent with the objective of CAA section 111(d) to ensure that designated facilities expeditiously control emissions of pollutants that the EPA has determined may be reasonably anticipated to endanger public health or welfare.

While the EPA initially proposed a 15-month deadline for state plan submissions following the promulgation of an EG (87 FR 79176, Dec. 23, 2022), most commenters, including states and state organizations, indicated that 15 months could not accommodate the technical, administrative, and legal steps necessary to develop and adopt an approvable state plan. Based on the comments and additional information received, the EPA is finalizing 18 months for state plan submissions after promulgation of a final EG, and finds that the additional time, compared with the 9 months provided in subpart B, will better accommodate states' processes to develop and adopt approvable plans and will most efficiently effectuate the applicable EG. Under an 18-month state plan submission timeframe, the costs of developing a state plan under an applicable EG subject to subpart Ba, compared with the 9 months provided by subpart B, may be spread over 9 additional months. With this state plan submittal timeline, the EPA is providing states sufficient time to develop approvable implementation plans for their designated facilities that adequately address public health and environmental objectives. A timeline that is insufficient for states to conduct, *inter alia,* the appropriate technical analysis and public engagement may preclude them from timely adopting and submitting approvable state plans, which could ultimately delay the implementation of emission reductions. In addition, a successful submittal of approvable state plans will avoid an attendant expenditure of Federal resources associated with the development of a Federal plan.

After receiving a state plan, the EPA first must determine if the plan is complete. The EPA is finalizing amendments to its determination of completeness so the timeframe for such determination is streamlined from six months to 60 days from receipt of the state plan submission (see section III.A.2. of this preamble). If the EPA determines a state plan submission is complete, it then evaluates the plan to determine whether it satisfies the applicable requirements. The Agency proposes an action (*e.g.,* plan approval or plan disapproval) and then finalizes its action pursuant to a notice-and-comment rulemaking process. As described in detail in sections III.A.3. and III.A.4. of this preamble, the EPA is finalizing a 12-month period for the EPA to take final action on a state plan after a submission is found to be complete. The EPA is also finalizing a 12-month timeline for the EPA to promulgate a Federal plan, which runs from either the state plan deadline if a state has failed to submit a state plan, 60 days following the state plan deadline if a state has submitted a plan by the deadline and the EPA determines it is incomplete, or from the date the EPA finalizes disapproval of a state plan submission. As described in detail in section III. of this preamble, because these timeframes provide for the minimum time reasonably necessary for the EPA to accomplish propose and finalize a Federal plan, the EPA expects these timeframes will minimize the impacts on public health and welfare to the extent possible while ensuring that an EG is expeditiously implemented.

As described in detail in section III.A.5. of this preamble, the EPA is finalizing a requirement that state plans include IoPs if the plan requires final

---

[234] *Am. Lung Ass'n* v. *EPA,* 985 F.3d 914, 991 (D.C. Cir. 2021).

compliance with standards of performance later than 20 months after the plan submission deadline. The compliance schedule, as defined in subpart Ba (40 CFR 60.21a(g)) is a legally enforceable schedule specifying a date or dates by which a source or category of sources must comply with specific standards of performance contained in a plan. If final compliance for a source to meet their standards of performance is more than 20 months after the state plan submittal deadline, the plan must include IoPs, which are defined steps to achieve compliance (*e.g.,* submittal of a control plan, awarding of contracts for emission control systems or process modification, etc.). This 20 month timeline is the trigger for when IoPs must be included in a state plan. An EG will specify what the IoPs are and associated compliance schedules. The EPA considers this slightly longer timeline than is required under subpart B reasonable given that the EPA is also, in this action, extending the timelines for state plan submission under subpart Ba. The EPA notes that IoPs do not, on their own, govern how expeditiously emission reductions are achieved: this is dictated by the final compliance date, which is established in an individual EG. Additionally, any specific requirements associated with IoPs, including extended or truncated timelines, would be included in the EG, as these are dependent on the source type, pollutant, and control strategy addressed.

The EPA is also finalizing amending subpart Ba to enhance requirements for reasonable notice and opportunity for public participation. In particular, the EPA is requiring that states, as part of the state plan development or revision process, provide documentation that they have conducted meaningful engagement with a broad range of pertinent stakeholders and/or their representatives. Pertinent stakeholders include communities most affected by and vulnerable to the impacts of the plan or plan revision (see section III.C. of this preamble).

Overall, the EPA expects the amendments being finalized in this action will benefit the states in the development of approvable state plans. The EPA expects that the amendments associated with meaningful engagement with pertinent stakeholders will potentially increase the amount of information the states can use in designing state plans, which may increase both the level of resources states will need to employ in the development of an approvable plan, as well as the resulting health and welfare benefits of the plan. In addition to health and welfare benefits, there are also administrative benefits of engaging with stakeholders and receiving pertinent information as a state plan is being developed. Such engagement may improve the record for the state's plan and reduce the amount of comments received when the state plan is proposed to the public, which would reduce the amount of effort employed after proposal to address issues raised by the public and stakeholders.

There is variation and uncertainty in determining the magnitude of impacts, both to states and the public, resulting from amendments associated with meaningful engagement. First, the EPA notes that the meaningful engagement provisions being finalized in this action are largely procedural in nature and do not prescribe any particular set of actions or activities that states must undertake. The potential costs and benefits will therefore be determined in significant part by choices that are within states' discretion. Second, the impacts of conducting meaningful engagement will be highly dependent on the number and location of designated facilities addressed by an EG, as well as on the type of health or environmental impacts of the associated emissions. If stakeholder and public involvement pursuant to the meaningful engagement provisions does not generate a large number of specific and unique comments, data, or other considerations, then the level of effort states will employ to review them will be lower in comparison to when meaningful engagement comments are voluminous. It might also be expected that less input and fewer comments might, in certain cases, have an adverse impact on the ability of a state plan to fulfill its health and welfare objectives.

To the extent that states already conduct significant engagement with pertinent stakeholders, the meaningful engagement amendments will most likely not result in additional costs. Conversely, states that do not have engagement procedures already in place may be required to increase their level of effort to engage with pertinent stakeholders. The burden and benefits of meaningful engagement for the pertinent stakeholders will also be highly dependent on the EG and associated variables such as, but not limited to, the geographical distribution of the facilities and communities impacted, available modes of participation for those areas, the pollutants addressed, and the range of options available to the state and facilities for meeting the EG standards. The burden and benefits to pertinent stakeholders may be difficult to quantify, but overall their engagement will be voluntary and is anticipated to result in feedback that may improve the resulting health and welfare benefits of the state plan as perceived and experienced, particularly by those in communities most affected by and vulnerable to the impacts of the plan.

The EPA is also finalizing revisions to the RULOF provisions in subpart Ba. The amendments included in this final action are intended to provide clarity for states to ensure that less-stringent standards of performance for particular designated facilities are consistent with the statutory requirements, as well as a consistent framework for EPA to evaluate such standards across EGs and states (see section III.E. of this preamble).

The magnitude of impacts, both to states and the public, resulting from the final RULOF amendments will vary depending on the particular EG to which the final provisions would apply. As explained in section III.E.2. of this preamble, the EPA believes Congress intended RULOF as a mechanism for states to apply a less-stringent standard of performance in the unusual circumstances in which the degree of emission limitation determined by the EPA is not reasonable for a particular designated facility. Additionally, states are not required to invoke the RULOF provision in any particular instance and may choose not to do so, even if a particular designated facility's circumstances meet the threshold specified in the regulations. If a state does not invoke RULOF in their state plan, then the amendments will not result in any additional costs. If a state does invoke RULOF in their state plan, then the amendments could, in certain circumstances, result in an increased level of effort to develop standards of performance for certain sources. As such, the RULOF amendments could potentially increase the level of resources states will need to employ in the development of an approvable plan. However, because the amendments clarify is required in order for a less-stringent standard pursuant to RULOF to satisfy the statutory requirements, the amendments reduce the uncertainty of states and designated facilities in the development of such standards. This in turn could result in a decrease in the amount of time that a state that wished to invoke RULOF would need, relative to a situation where the requirements were less defined, by avoiding significant back and forth with the EPA and the sources in the state during state plan development. Overall, the EPA expects the RULOF amendments will benefit the states in the development of approvable state plans and therefore result in benefits to public health and welfare.

Finally, the EPA expects that the requirements for electronic submittal and that the availability of the optional regulatory mechanisms being finalized in this action will improve flexibility and efficiency in the call for and submission, review, approval, and implementation of state plans, and thus will overall result in benefits to the states, the EPA, designated facilities, and public health and welfare. In addition, the EPA expects the requirements for electronic submittal will increase the ease and efficiency of data submittal and data accessibility and benefit the states and the EPA. Electronic submittal will also improve the Agency's efficiency and effectiveness in the receipt and review of state plans.

The EPA expects that the overall impacts of the implementation of the amendments to subpart Ba finalized in this action will improve the implementation of EGs under CAA section 111(d).

V. Statutory and Executive Order Reviews

Additional information about these Statutory and Executive orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review; Executive Order 13563: Improving Regulation and Regulatory Review; and Executive Order 14094: Modernizing Regulatory Review

This action is a ''significant regulatory action'' as defined in Executive Order 12866, as amended by Executive Order 14094. Accordingly, the EPA submitted this action to the Office of Management and Budget (OMB) for Executive Order 12866 review. Documentation of any changes made in response to the Executive Order 12866 review is available in the docket.

B. Paperwork Reduction Act (PRA)

This action does not impose an information collection burden under the Paperwork Reduction Act. The requirements in subpart Ba do not themselves require any reporting and recordkeeping activities, and no Information Collection Request (ICR) was submitted in connection with the original promulgation of subpart Ba or the amendments we are finalizing at this time. Any recordkeeping and reporting requirements are imposed only through the incorporation of specific elements of subpart Ba in the individual emission guidelines, which have their own ICRs.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities. This final rule will not impose any requirements on small entities. Specifically, this action addresses processes related to state plans for implementation of EGs established under CAA section 111(d).

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. This final action does not contain a Federal mandate that may result in expenditures of $100 million or more for state, local, and Tribal governments, in the aggregate or the private sector in any 1 year.

This final action is also not subject to the requirements of section 203 of UMRA because, as described in 2 U.S.C. 1531–38, it contains no regulatory requirements that might significantly or uniquely affect small governments. This action imposes no enforceable duty on any local, or Tribal governments or the private sector. However, this action imposes enforceable duties on states. This action does not meaningfully require additional mandates on states beyond what is already required of them and will not impose a burden in excess of $100 million.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the National Government and the states, or on the distribution of power and responsibilities among the various levels of government. The EPA believes, however, that this action may be of significant interest to state governments.

Subpart Ba requirements apply to states in the development and submittal of state plans pursuant to emission guidelines promulgated under CAA section 111(d) after July 8, 2019, to the extent that an EG does not supersede the requirements of subpart Ba. This action finalizes amendments to certain requirements for development, submission, and approval processes of state plans under CAA section 111(d). In particular, the amendments associated with state plan submission deadlines, RULOF provisions, meaningful engagement, and regulatory mechanisms may be of significant interest to state governments. In section IV of this preamble, the EPA summarizes the potential cost, environmental, and economic impacts of the implementation (through individual emission guidelines) of the amendments to subpart Ba being finalized in this action. Overall, the EPA expects these amendments will benefit the states in the development of approvable state plans.

The EPA notes that notice and comment procedures required for the promulgation of individual EGs will provide opportunity for states to address issues related to federalism based on specific application of subpart Ba requirements to that particular EG.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have Tribal implications as specified in Executive Order 13175. It would not impose substantial direct compliance costs on Tribal governments that have designated facilities located in their area of Indian country. Tribes are not required to develop plans to implement the guidelines under CAA section 111(d) for designated facilities. A tribe with an approved TAS under TAR for CAA 111(d) is not required to resubmit TAS approval to implement an EG subject to subpart Ba. This action also will not have substantial direct costs or impacts on the relationship between the Federal Government and Indian tribes or on the distribution of power and responsibilities between the Federal Government and Indian tribes, as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to the action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of ''covered regulatory action'' in section 2–202 of the Executive order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not a ''significant energy action'' because it will not have a significant adverse effect on the supply, distribution or use of energy. Specifically, this action addresses the submission and adoption of state plans for implementation of EGs established under CAA section 111(d).

I. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking does not involve technical standards.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898 (59 FR 7629, February 16, 1994) directs Federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations (people of color and/or indigenous peoples) and low-income populations.

The EPA believes that it is not practicable to assess whether the human health or environmental conditions that exist prior to this action result in disproportionate and adverse effects on people of color, low-income populations and/or indigenous peoples. The 40 CFR part 60, subpart Ba, provisions are the implementing regulations for states to plan in response to individual EGs, and these individual EGs are applicable to specific pollutants from specified categories of existing sources. It is not possible to identify or assess human health and environmental conditions that will be impacted by this rule because this rule does not address a particular set of sources or a particular pollutant. This action is revising the implementing regulations and does not directly impact environmental justice communities or result in new disproportionate and adverse effects.

The EPA identified and addressed environmental justice concerns by specifying new requirements for meaningful engagement with pertinent stakeholders, which includes communities most affected by and/or vulnerable to the impacts of a state plan.

The information supporting this Executive order review is contained in section III.C. and section III.E.3.f. of this action.

K. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 60

Environmental protection, Administrative practice and procedures, Air pollution control, Intergovernmental relations, Reporting and recordkeeping requirements.

Michael S. Regan,
Administrator.

For the reasons set out in the preamble, title 40, chapter I of the Code of Federal Regulations is amended as follows:

PART 60—STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES

■ 1. The authority citation for part 60 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

■ 2. Amend § 60.1 by revising paragraph (a) to read as follows:

§ 60.1 Applicability.

(a) Except as provided in subparts B, Ba, and C of this part, the provisions of this part apply to the owner or operator of any stationary source which contains an affected facility, the construction or modification of which is commenced after the date of publication in this part of any standard (or, if earlier, the date of publication of any proposed standard) applicable to that facility.

* * * * *

■ 3. Amend § 60.20a by revising paragraph (a) introductory text to read as follows:

§ 60.20a Applicability.

(a) The provisions of this subpart apply upon publication of a final emission guideline under § 60.22a(a) if the guideline is published in the **Federal Register** after July 8, 2019.

* * * * *

■ 4. Amend § 60.21a by:
■ a. Revising paragraphs (e) and (f); and
■ b. Adding paragraphs (k) and (l).

The revisions and additions read as follows:

§ 60.21a Definitions.

* * * * *

(e) *Emission guideline* means a guideline set forth in this part, with the exception of guidelines set forth pursuant to section 129 of the Clean Air Act, or in a final guideline document published under § 60.22a(a), which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any non-air quality health and environmental impact and energy requirements) the Administrator has determined has been adequately demonstrated for designated facilities.

(f) *Standard of performance* means a standard for emissions of air pollutants which reflects the degree of emission limitation achievable through the application of the best system of emission reduction which (taking into account the cost of achieving such reduction and any nonair quality health and environmental impact and energy requirements) the Administrator determines has been adequately demonstrated, including a legally enforceable regulation setting forth an allowable rate, quantity, or concentration of emissions into the atmosphere, or prescribing a design, equipment, work practice, or operational standard, or combination thereof.

* * * * *

(k) *Meaningful engagement* means the timely engagement with pertinent stakeholders and/or their representatives in the plan development or plan revision process. Such engagement should not be disproportionate in favor of certain stakeholders and should be informed by available best practices.

(l) *Pertinent stakeholders* include, but are not limited to, industry, small businesses, and communities most affected by and/or vulnerable to the impacts of the plan or plan revision.

■ 5. Amend § 60.22a by revising paragraphs (b)(3) and (c) to read as follows:

§ 60.22a Publication of emission guidelines.

* * * * *

(b) * * *

(3) Information on the degree of emission limitation which is achievable with each system, together with information on the costs, nonair quality health and environmental effects, and energy requirements of applying each system to designated facilities.

* * * * *

(c) The emission guidelines and compliance times referred to in paragraph (b)(5) of this section will be proposed for comment upon publication of the draft guideline document, and after consideration of comments will be promulgated in this part with such modifications as may be appropriate.

■ 6. Amend § 60.23a by:
■ a. Revising paragraph (a)(1);
■ b. Adding paragraph (a)(3);
■ c. Revising paragraph (b); and
■ d. Adding paragraph (i).

The revisions and additions read as follows:

§ 60.23a Adoption and submittal of State plans; public hearings.

(a)(1) Unless otherwise specified in the applicable subpart in this part, within eighteen months after publication in the **Federal Register** of a final emission guideline under § 60.22a(a), each State shall adopt and submit to the Administrator a plan for the control of the designated pollutant to which the emission guideline applies. The submission of such plan shall be made in electronic format according to paragraph (a)(3) of this section or as specified in an applicable emission guideline.

* * * * *

(3) States must submit to the Administrator any plan or plan revision using the State Planning Electronic Collaboration System (SPeCS), which can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*) or through an analogous electronic reporting tool provided by the EPA for the submission of any plan required by this subpart. Do not use SPeCS to submit confidential business information (CBI). Anything submitted using SPeCS cannot later be claimed to be CBI. The State must confer with the Regional Office for the procedures to submit CBI information. All CBI must be clearly marked as CBI.

(b) If no designated facility is located within a State, the State shall submit a letter of certification to that effect to the Administrator within the time specified in paragraph (a) of this section. Such certification shall exempt the State from the requirements of this subpart for that designated pollutant. The State must submit the letter using the SPeCS, or through an analogous electronic reporting tool provided by the EPA for the submission of any plan required by this subpart.

* * * * *

(i) The State must submit, with the plan or revision, documentation of meaningful engagement including a list of identified pertinent stakeholders and/or their representatives, a summary of the engagement conducted, a summary of stakeholder input received, and a description of how stakeholder input was considered in the development of the plan or plan revisions.

■ 7. Amend § 60.24a by:

■ a. Revising paragraphs (b) introductory text, (c), (d), (e), and (f); and

■ b. Adding paragraphs (g), (h), and (i).

The revisions and additions read as follows:

§ 60.24a Standards of performance and compliance schedules.

* * * * *

(b) Standards of performance shall be in the form of an allowable rate, quantity, or concentration of emissions, except when it is not feasible to prescribe or enforce such a standard of performance. The EPA shall identify such cases in the emission guidelines issued under § 60.22a. Where standards of performance prescribing design, equipment, work practice, or operational standards, or combination thereof are established, the plan shall, to the degree possible, set forth the emission reductions achievable by implementation of such standards, and may permit compliance by the use of equipment determined by the State to be equivalent to that prescribed.

* * * * *

(c) Except as provided in paragraph (e) of this section, standards of performance shall be no less stringent than the corresponding emission guideline(s) specified in this part, and final compliance shall be required as expeditiously as practicable, but no later than the compliance times specified in an applicable subpart of this part.

(d) Any compliance schedule extending more than twenty months from the date required for submittal of the plan must include legally enforceable increments of progress to achieve compliance for each designated facility or category of facilities. Unless otherwise specified in the applicable emission guideline, increments of progress must include, where practicable, each increment of progress specified in § 60.21a(h) and must include such additional increments of progress as may be necessary to permit close and effective supervision of progress toward final compliance.

(e)(1) The State may apply a standard of performance to a particular designated facility that is less stringent than or has a compliance schedule longer than otherwise required by an applicable emission guideline taking into consideration that facility's remaining useful life and other factors, provided that the State demonstrates with respect to each such facility (or class of such facilities) that the facility cannot reasonably achieve the degree of emission limitation determined by the EPA based on:

(i) Unreasonable cost of control resulting from plant age, location, or basic process design;

(ii) Physical impossibility or technical infeasibility of installing necessary control equipment; or

(iii) Other circumstances specific to the facility.

(2) For the purpose of this paragraph (e), the State must demonstrate that there are fundamental differences between the information specific to a facility (or class of such facilities) and the information EPA considered in determining the degree of emission limitation achievable through application of the best system of emission reduction or the compliance schedule that make achieving such degree of emission limitation or meeting such compliance schedule unreasonable for that facility.

(f) If the State makes the required demonstration in paragraph (e) of this section, the plan may apply a standard of performance that is less stringent than required by an applicable emission guideline.

(1) The standard of performance applied under this paragraph (f) must be no less stringent (or have a compliance schedule no longer) than is necessary to address the fundamental differences identified under paragraph (e) of this section. To the extent necessary to determine a standard of performance satisfying that criteria, the State must evaluate the systems of emission reduction identified in the applicable emission guideline using the factors and evaluation metrics EPA considered in assessing those systems, including technical feasibility, the amount of emission reductions, the cost of achieving such reductions, any nonair quality health and environmental impacts, and energy requirements. The States may also consider, as justified, other factors specific to the facility that were the basis of the demonstration under paragraph (e) as well as other systems of emission reduction in addition to those EPA considered in the applicable emission guideline.

(2) A standard of performance under this paragraph (f) must be in the form as required by the applicable emission guideline.

(g) Where a State applies a standard of performance pursuant to paragraph (f) of this section on the basis of an operating condition(s) within the designated facility's control, such as remaining useful life or restricted capacity, the plan must also include such operating condition(s) as an enforceable requirement. The plan must also include requirements to provide for the implementation and enforcement of the operating condition(s), such as requirements for monitoring, reporting, and recordkeeping.

(h) A less stringent standard of performance must meet all other applicable requirements, including in this subpart and in any applicable emission guideline.

(i) Nothing in this subpart shall be construed to preclude any State or political subdivision thereof from adopting or enforcing, as part of the plan:

(1) Standards of performance more stringent than emission guidelines specified in this part; or

(2) Compliance schedules requiring final compliance at earlier times than those specified in applicable emission guidelines.

(ii) [Reserved]

■ 8. Amend § 60.25a by revising paragraph (a) to read as follows:

§ 60.25a Emission inventories, source surveillance, reports.

(a) Each plan shall include an inventory of all designated facilities, including emission data for the designated pollutants and any additional information related to emissions as specified in the applicable emission guideline. Such data shall be summarized in the plan, and emission rates of designated pollutants from designated facilities shall be correlated with applicable standards of performance. As used in this subpart, *correlated* means presented in such a manner as to show the relationship between measured or estimated amounts of emissions and the amounts of such emissions allowable under applicable standards of performance.

* * * * *

■ 9. Amend § 60.27a by:

■ a. Revising paragraph (a);

■ b. Adding paragraphs (b)(1) and (2);

■ c. Revising paragraphs (c), (d), (f) introductory text, and (g)(1);

■ d. Removing the word ''and'' from the end of paragraph (g)(2)(viii);

■ e. Redesignating paragraph (g)(2)(ix) as paragraph (g)(2)(x); and

■ f. Adding new paragraph (g)(2)(ix) and paragraphs (h), (i) and (j).

The revisions and additions read as follows:

§ 60.27a Actions by the Administrator.

(a) The Administrator may, whenever he determines necessary, amend the period for submission of any plan or plan revision or portion thereof.

(b) * * *

(1) *Full and partial approval and disapproval.* In the case of any plan or plan revision on which the Administrator is required to act under this paragraph (b), the Administrator shall approve such plan or plan revision as a whole if it meets all of the applicable requirements of this subpart. If a portion of the plan or plan revision meets all the applicable requirements of this subpart, the Administrator may approve the plan or plan revision in part and disapprove in part. The plan or plan revision shall not be treated as meeting the requirements of this chapter until the Administrator approves the entire plan or revision as complying with the applicable requirements of this subpart.

(2) *Conditional approval.* The Administrator may approve a plan or plan revision based on a commitment of the State to adopt and submit to the Administrator specific enforceable measures by a date certain, but not later than twelve months after the date of conditional approval of the plan or plan revision. Any such conditional approval shall be treated as a disapproval if the State fails to comply with such commitment.

(c) The Administrator will promulgate, through notice-and-comment rulemaking, a Federal plan, or portion thereof, at any time within twelve months after:

(1) The State fails to submit a plan or plan revision within the time prescribed or the State has failed to satisfy the minimum criteria under paragraph (g) of this section as of the time prescribed in paragraph (g)(1) of this section; or

(2) The Administrator disapproves the required State plan or plan revision or any portion thereof, as unsatisfactory because the applicable requirements of this subpart or an applicable emission guideline under this part have not been met.

(d) The Administrator will promulgate a final Federal plan, or portion thereof, as described in paragraph (c) of this section unless the State corrects the deficiency, and the Administrator approves the plan or plan revision, before the Administrator promulgates such Federal plan.

* * * * *

(f) Prior to promulgation of a Federal plan under paragraph (d) of this section, the Administrator will conduct meaningful engagement with pertinent stakeholders and/or their representatives and provide the opportunity for at least one public hearing in either:

* * * * *

(g) * * *

(1) *General.* Within 60 days of the Administrator's receipt of a State submission, the Administrator shall determine whether the minimum criteria for completeness have been met for a plan submission or revision. Any plan or plan revision that a State submits to the EPA, and that has not been determined by the EPA within 60 days after the Administrator's receipt of a State submission to have failed to meet the minimum criteria, shall on that date be deemed by operation of law to meet such minimum criteria. Where the Administrator determines that a plan submission does not meet the minimum criteria of this paragraph (g), the State will be treated as not having made the submission and the requirements of this section regarding promulgation of a Federal plan shall apply.

(2) * * *

(ix) Documentation of meaningful engagement, including a list of pertinent stakeholders or their representatives, a summary of the engagement conducted, and a summary of stakeholder input received, and a description of how stakeholder input was considered in the development of the plan or plan revisions; and

* * * * *

(h) The requirements of this paragraph (h) apply to parallel processing. A State may submit a plan requesting parallel processing prior to adoption and to completion of public outreach and engagement by the State in order to expedite review and to provide an opportunity for the State to consider EPA comments prior to submission of a final plan for final review and action. Under these circumstances and at the discretion of the EPA, the following exceptions to the completeness criteria under paragraph (g)(2) of this section apply to plans submitted explicitly for parallel processing:

(1) The letter required by paragraph (g)(2)(i) of this section must request that EPA propose approval of the proposed plan by parallel processing;

(2) In lieu of paragraph (g)(2)(ii) of this section, the State must submit a schedule for final adoption or issuance of the plan;

(3) In lieu of paragraph (g)(2)(iv) of this section, the plan must include a copy of the proposed/draft regulation or document, including indication of the proposed changes to be made to the existing approved plan, where applicable;

(4) In lieu of paragraph (g)(2)(ix) of this section, the plan must include documentation of the engagement conducted prior to the parallel processing submittal and of any planned additional meaningful engagement to be conducted prior to adoption of the final plan; and

(5) The requirements of paragraphs (g)(2)(v) through (viii) of this section do not apply to plans submitted for parallel processing. The exceptions granted in the preceding sentence apply only to EPA's determination of proposed action and all requirements of paragraph (g)(2) of this section must be met prior to publication of EPA's final determination of plan approvability.

(i) The requirements of this paragraph (i) apply to calls for plan revisions. Whenever the Administrator finds that the applicable plan is substantially inadequate to meet the requirements of the applicable emission guidelines in this part, to provide for the implementation of the applicable requirements, or to otherwise comply with any applicable requirement of this subpart or the Clean Air Act, the Administrator shall require the State to revise the plan as necessary to correct such inadequacies. The Administrator must notify the State of the inadequacies and such plan revisions shall be submitted to the Administrator within twelve months or as determined by the Administrator. Such findings and notice must be public.

(1) Any finding under this paragraph (i) shall, to the extent the Administrator deems appropriate, subject the State to the requirements of this part to which the State was subject when it developed and submitted the plan for which such finding was made, except that the Administrator may adjust any dates applicable under such requirements as appropriate.

(2) If the Administrator makes this finding on the basis that a State is failing to implement an approved plan, or part of an approved plan, the State may submit a demonstration to the Administrator it is adequately implementing the requirements of the approved State plan in lieu of submitting a plan revision. Such demonstration must be submitted by the deadline established under this paragraph (i).

(j) The requirements of this paragraph (j) apply to error corrections. Whenever the Administrator determines that the Administrator's action approving, disapproving, or promulgating any plan or plan revision (or portion thereof) was in error, the Administrator may in the same manner as the approval, disapproval, or promulgation revise such action as appropriate without requiring any further submission from the State. Such determination and the basis thereof shall be provided to the State and public.

■ 10. Amend § 60.28a by revising paragraph (a) to read as follows:

§ 60.28a Plan revisions by the State.

(a) Any significant revision to a State plan shall be adopted by such State after reasonable notice, public hearing, and meaningful engagement. For plan revisions required in response to a revised emission guideline, such plan revisions shall be submitted to the Administrator within fifteen months, or as determined by the Administrator, after publication in the **Federal Register** of a final revised emission guideline under § 60.22a. All plan revisions must be submitted in accordance with the procedures and requirements applicable to development and submission of the original plan.

* * * * *

■ 11. Amend § 60.29a by revising the introductory text to read as follows:

§ 60.29a Plan revisions by the Administrator.

After notice and opportunity for public hearing in each affected State, and meaningful engagement for any significant revision, the Administrator may revise any provision of an applicable Federal plan if:

Key Bridge Collapse

[AP News] A cargo ship lost power and rammed into a major bridge in Baltimore, destroying the span in a matter of seconds and plunging it into the river in a terrifying collapse that could disrupt a vital shipping port for months. ...

A leftist perspective envisions methods to ensure safety standards in the future

We still don't know exactly what mechanical defects caused the Dali to lose power and slam into the Francis Scott Key Bridge. We do know that the ship had prior mishaps... A ship like the Dali is only as good as the inspection regime of the nation where it is registered, which is to say not very good. That is the whole appeal of flags of convenience—to operate ships on the cheap. If the U.S. chose, we

A conservative viewpoint considers constructing the bridge efficiently and within a reasonable timeframe

President Biden may indeed waive some environmental-impact rules in order to speed up the construction of the new Baltimore bridge. But the real question is: Why isn't this done more often with ordinary projects, which now drag on forever?

Fewer Americans say China, Russia top threats to US: Gallup

The left is skeptical of the bill, arguing that there is insufficient evidence to justify such a drastic measure.

As Evan Greer, the director at Fight for the Future, a digital rights organization, points out, all social media companies, regardless of where they're based, need to be scrutinized for their capacity to inappropriately surveil Americans and use algorithms to influence American politics. The real solution, people in this camp argue, is not select bans but strict limitations on data that any company can collect on people online. In addition to all this, some civil liberties experts doubt a TikTok ban will survive a First Amendment challenge.
Zeeshan Aleem, MSNBC

The right supports the bill, arguing that TikTok is a propaganda tool for the Chinese government.

Congressional offices were inundated with tens of thousands of phone calls [last] Thursday from panicked young adults who had received a notification from TikTok warning that the app could be shut down... Some users reported that they had to make the call in order to use the app...

This should be a major scandal. A company directly tied to and controlled by the Chinese Communist Party is pushing American children into direct political action. At best, this is political interference by the U.S.'s top adversary. At worst, it's a deliberate effort to weaponize the mental health of American children and divide the country internally — all to force the U.S. government to abandon its national security objectives.
Kaylee McGhee White, Washington Examiner

Adventures With Liz

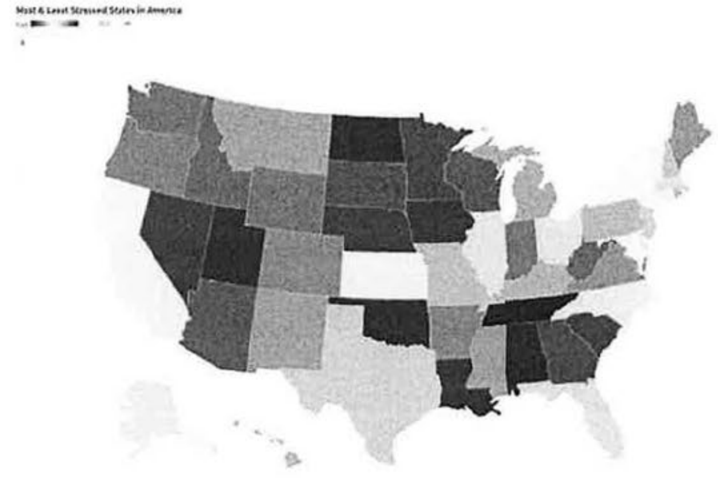
Liz Markham, GNDC's Membership Director, is digging into the job! She's got a hunt for adventure and we are just trying to keep up! Ride along!

COMMON GROUND
When Cory Fong, MDU Resources Group invited Liz to join their table at the Bismarck Mandan Chamber EDC Focus event, Liz jumped at the opportunity. Cory is not only a GNDC Board Member, but also one of the nicest guys you'll meet in ND Business. He brings his passion for policy forward as well as a thoughtfulness and appreciation for GNDC's efforts. Liz appreciated the seat at the table and the conversations that took place.

By The Numbers

Map Shows the Most and Least Stressed US States

The United States is one of the wealthiest countries in the world, and yet, according to recent Gallup polls, it is also one of the most stressed.



More than a quarter of U.S. adults report feeling too stressed to function most days, according to a poll conducted by the American Psychological Association in 2022. However, people in some states are significantly more stressed than others. So which states top the list?

What recession? Professional forecasters raise expectations for US economy in 2024

The left criticizes McConnell, arguing that he relentlessly pursued partisan goals to the detriment of the country.

This is the guy who violated every known norm to hold open Justice Antonin Scalia's seat, ostensibly because it came open in an election year, only to fill Justice Ruth Bader Ginsburg's seat when people were already voting in the 2020 election. I think he made a lot of Americans wake up and realize that this was all Calvinball, that he had no principles to begin with...

But even more than that, Mitch McConnell was the guy who realized you don't need to win elections to enact Republican policy. You don't need to change hearts and minds. You don't need to push ballot initiatives or win over the views of the people. All you have to do is stack the courts. You only need 51 votes in the Senate to stack the courts with far-right partisan activists like Aileen Cannon and Matthew Kacsmaryk. And they will enact Republican policies under the guise of judicial review.
Mark Joseph Stern, Slate

The right generally praises McConnell, arguing that he effectively advanced conservative priorities.

Others counter, it is true that McConnell could be too cautious at times, present his caucus with unpalatable last-minute deals, and sometimes back the wrong horse in Senate primaries. But, overall, his judgment was sound, and anyone who thinks Republicans could have accomplished more with a more aggressive leader congenial to the bomb throwers now has the cautionary example of the post–Kevin McCarthy House GOP to consider...

He won the trust of most of his caucus and was always cognizant of their political needs. Even with narrow majorities, he was able to muster an extraordinary degree of party unity and had a knack for knowing when to cut a deal and when to draw a line. At the top of his game, his Democratic counterparts, Harry Reid and then Chuck Schumer, couldn't come close to matching him as a political chess player or legislative tactician; sometimes it didn't even seem fair.

North Dakota Supreme Court upholds dismissal of Bismarck-Mandan Rail Bridge lawsuit

The Oglala Sioux Tribe in South Dakota has banned Gov. Kristi Noem from the Pine Ridge Reservation, one of the largest in the U.S. This comes days after the Republican governor gave a speech about wanting to send razor wire and security personnel to Texas to help deter immigration at the U.S.-Mexico border.

"Due to the safety of the Oyate, effective immediately, you are hereby Banished from the homelands of the Oglala Sioux Tribe!" Tribe President Frank Star Comes Out said in a Friday statement addressed to Noem. "

Link to USNews

North Dakota would be the first state to set an age limit for U.S. Senate and House candidates under a measure that could go before voters in June, though it's unclear whether a state limit on federal officeholders would violate the U.S. Constitution.

The move comes at a time of heightened interest in the topic given the advanced age of some congressional leaders and the leading presidential candidates in both parties. At least one political observer said the move could be an effort to create a test case for the nation.

Child care gaps in rural America threaten to undercut small communities

Candy Murnion remembers vividly the event that pushed her to open her first day care business in Jordan, a town of fewer than 400 residents in a sea of grassland in eastern Montana.

Garfield County's public health nurse, one of few public health officials serving the town and nearly 5,000 square miles that surround it, had quit because she had given birth to her second child and couldn't find day care.

And she isn't alone.

Data collected prior to the pandemic shows that...

North Dakota Ethics Commission sees uptick in complaints

Complaints to the North Dakota Ethics Commission have been on the rise since late 2022, though the commission says it can't disclose any specifics about them.

In most cases, state law requires filings to be kept confidential unless the commission determines them to be substantiated.

"We understand the irony of that, because we're the Ethics Commission and we're all about transparency," said Executive Director Rebecca Binstock.

Fielding ethics complaints is the...

US Chamber of Commerce calls for more "optimistic" message on economy

The U.S. Chamber of Commerce is making a full-throated defense of free enterprise, launching a counter-offensive against a "constant loop of pessimism" from businesses and politics that is undermining faith in the country's outlook.

Driving the news: CEO Suzanne Clark is expected to insist in a speech on Thursday that the virtues of American capitalism are being drowned out by a news cycle that amplifies "everything [that's] wrong, and bad, and dire about this country."

Biden administration to unveil contractor rule that could upend gig economy

The administration of U.S. President Joe Biden will release a final rule as soon as this week that will make it more difficult for companies to treat workers as independent contractors rather than employees that typically cost a company more, an administration official said.

The U.S. Department of Labor rule, which was first proposed in 2022 and is likely to face legal challenges, will require that workers be considered employees entitled to more benefits and legal protections than contractors when they are "economically dependent" on a company.

The minimum wage is going up in 22 states on Jan. 1

For Americans making minimum wage, it's an automatic raise — but it also ripples out. Typically, increasing the wage floor for the lowest earners pushes up pay for those who make a bit more than the minimum, as employers have to adjust pay scales upwards.

The big picture: More states are requiring a $15 an hour minimum wage — including New York, Maryland, and New Mexico — a dozen years after Fight for $15 kicked off its campaign. Thanks to inflation, the dollar amount doesn't quite mean what it used to.

North Dakota to follow judge's redistricting order for 2024 election, despite appeal

for treating mental or physical illness, going to medical appointment, caring for a family member who's ill, and even due to inclement weather that may close children's school and keep them home.

It also covers absences related domestic abuse or sexual assault.

Anyone is eligible for the sick and safe time if they work 80 hours a year and don't qualify as an independent contractor...

Link to CBS News

That first billion came from conventional wells.

Ness said there's more oil in the Bakken that can be recovered.

"Somewhere down the line, technology and opportunity are going to align," Ness said. "We have the opportunity to extend the life of the Bakken another 30 to 50 years, and produce another 5 to 8 billion more barrels, just because of technology."

Adventures with Liz

Liz Markham, GNDC's Membership Director, is digging into the job! She's got a hunt for adventure and we are just trying to keep up! Ride along!

SWAG EXCHANGE

Liz recently caught up with Keith Lang from S&S Promotional Group! They had a great time talking about the ins and outs of the statewide promotional business. Keith and Liz shared stories...and yes, they exchanged a few goodies too. Liz learned how Keith, after running his own business for years, is now working from home and enjoying a more flexible schedule. Cheers to Keith and S&S Promotional Group for making work and swag look like a breeze!

Both Sides of the Coin

Red Sea Attacks

[AP News] In the last four weeks, Houthi militants have attacked or seized commercial ships 12 times and still hold 25 members of the MV Galaxy Leader hostage in Yemen... The United Kingdom, Bahrain, Canada, France, Italy, Netherlands, Norway, Seychelles and Spain have joined the new maritime security mission, Austin said. Some of those countries will conduct joint patrols while others provide intelligence support in the southern Red Sea and the Gulf of Aden.

The U.S. and a host of other nations are creating a new force to protect ships transiting the Red Sea that have come under attack by drones and ballistic missiles fired from Houthi-controlled areas of Yemen, Defense Secretary Lloyd Austin announced Tuesday in Bahrain...

The left calls for greater international cooperation.

Contrary to common assumptions, U.S. military presence across the Middle East increased over

The right calls for a military response to deter both the Houthis and Iran.

At the same time, "Biden should make clear that the U.S. will not protect ships in the Red Sea that

By The Numbers

The minimum wage is going up in 22 states on Jan. 1

For Americans making minimum wage, it's an automatic raise — but it also ripples out. Typically, increasing the wage floor for the lowest earners pushes up pay for those who make a bit more than the minimum, as employers have to adjust pay scales upwards.

The big picture: More states are requiring a $15 an hour minimum wage — including New York, Maryland, and New Mexico — a dozen years after Fight for $15 kicked off its campaign.
Thanks to inflation, the dollar amount doesn't quite mean what it used to.

Biden administration to unveil contractor rule that could upend gig economy

The administration of U.S. President Joe Biden will release a final rule as soon as this week that will make it more difficult for companies to treat workers as independent contractors rather than employees that typically cost a company more, an administration official said.

own military buildup and that of its proxies... The risks created by the sustained U.S. military presence in the Middle East can only be addressed by reducing that presence...
Concerns that Iran might be emboldened by such moves are overblown. Facing domestic political and economic pressure, Iran has little to gain from starting a regional war, and has instead pursued diplomatic efforts with neighbors in recent months. And its malign meddling across the region, while certainly a concern, is best countered through intelligence cooperation, maritime and air defense partnerships with allies, and targeted sanctions.
Frederic Wehrey and Jennifer Kavanagh, Los Angeles Times

and coast guard vessels are simultaneously ramming Philippine vessels. Beijing is taking this action within the Philippines's exclusive economic zone because it makes grand imperialist claims over the near entirety of the South China Sea...

The Philippines is a treaty defense ally of the U.S. Beijing is ultimately engaged in exactly the same action as the Houthis: attacking the rights of free navigation in international waters. In turn, it should be an absurd proposition for the U.S. to defend Chinese shipping interests.

North Dakota lawmaker who used homophobic slurs during DUI arrest has no immediate plans to resign

A North Dakota Republican lawmaker has no plans to immediately resign, despite party leaders' calls for him to step down after he railed against police with profane, homophobic and anti-migrant language during a recent traffic stop that ended in his arrest on a charge of drunken driving.

along with the original document's requirements, in Article 2, that the president be at least 35 years old and born in the United States...
In that sense, the Colorado Supreme Court's holding is no more exotic than dozens of past court rulings that a candidate fails to meet constitutional qualifications such as age. And were we to adopt the view of Trump's lawyers, Colorado and other states could not exclude candidates from the ballot even if they plainly fail to satisfy age, residency, citizenship and other requirements. The potential political impact of the ruling, however, could not be more seismic.
Harry Litman, Los Angeles Times

every place in between. You say Donald Trump is a threat to democracy? This finding is more a threat to democracy literally than anything Trump has ever done...

The decision is stayed pending an appeal to the United States Supreme Court. If SCOTUS lets this stand, we will spend 2024 with Democrats going state by state literally trying to fix the election unambiguously using an argument at least half the country will consider not only illegitimate, but possibly worth fighting in literal terms. January 6th will look like a child's birthday party in comparison.

Subject: 200 Ways the Biden Administration and Democrats Have Made it Harder to Produce Oil & Gas
Date: Monday, March 11, 2024 4:05:12 PM
Attachments: Outlook-kuli0132.png

John,

Not sure if you've seen this yet but the IER updated the list they've been tracking since Biden took office and published a new report.

On March 8, 2024, the Institute for Energy Research (IER) published a comprehensive report titled "200 Ways the Biden Administration and Democrats Have Made it Harder to Produce Oil & Gas." This report meticulously details the various policies and executive actions undertaken by the Biden Administration that have significantly hindered oil and gas production in the United States. The report highlights changes in environmental regulations, shifts in financial policies, and international strategies that have collectively contributed to challenges faced by the domestic energy sector. The IER's analysis aims to shed light on the cumulative impact of these actions on energy production, economic growth, and energy security in the country.

200 things list IER.docx (instituteforenergyresearch.org)

It is a good resource for reference as it chronologically lists every action that has taken place since day 1 of the administration.

Regards,

Eric Delzer
Regulatory Affairs Manager

IER INSTITUTE FOR ENERGY RESEARCH®

200 Ways the Biden Administration and Democrats Have Made it Harder to Produce Oil & Gas

President Biden and the Democrats in Congress and the states have a plan for American energy: make it harder to produce and more expensive to purchase. Since Mr. Biden took office, his administration and its allies have taken over 200 actions deliberately designed to make it harder to produce energy here in America. A list of those actions, which includes a few high-profile actions taken in states like New York and California, appears below.

On January 20, 2021,

1. Besides canceling the Keystone XL pipeline,
2. President Biden restricted domestic production by issuing a moratorium on all oil and natural gas leasing activities in the Arctic National Wildlife Refuge.
3. He also restored and expanded the use of the government-created social cost of carbon metric to artificially increase the regulatory costs of energy production of fossil fuels when performing analyses, as well as artificially increase the so-called “benefits” of decreasing production.
4. Biden continued to revoke Trump administration executive orders, including those related to the Waters of the United States rule and the Antiquities Act. The Trump-era actions decreased regulations on Federal land and expanded the ability to produce energy domestically.

On January 27, 2021,

5. Biden issued an executive order announcing a moratorium on new oil and gas leases on public lands
6. or in offshore waters
7. and reconsideration of Federal oil and gas permitting and leasing practices.
8. He directed his Interior Department to conduct a review of permitting and leasing policies.
9. Also, by Executive Order, Biden directed agencies to eliminate federal fossil fuel "subsidies" wherever possible, disadvantaging oil and natural gas compared to other industries that receive similar Federal tax treatments or other energy sources which receive direct subsidies.
10. This Biden Executive Order attacked the energy industry by promoting "ending international financing of carbon-intensive fossil fuel-based energy while simultaneously advancing sustainable development and a green recovery." In other words, the U.S. government would leverage its power to attack oil and gas producers while subsidizing favored industries.
11. Biden's EO pushed for an increase in enforcement of "environmental justice" violations and support for such efforts, which typically are advanced by radical environmental organizations and slip-and-fall lawyers hoping to cash in on the backs of energy consumers.

On February 2, 2021,

12. The EPA hired Marianne Engelman-Lado, a prominent environmental justice proponent, to advance its radical Green New Deal social justice agenda at the EPA, a signal to industry that it plans to continue its attack on American energy.

On February 4, 2021,

13. At the behest of the January 27th Climate Crisis EO, the DOJ withdrew several Trump-era enforcement documents which provided clarity and streamlined regulations to increase energy independence.

On February 19, 2021,

14. Biden officially rejoined the Paris Climate Agreement, which is detrimental to Americans while propping up oil production in Russia and OPEC and increasing the dependence of Europe on Russian oil and natural gas. It also benefits China, who dominates the supply chain for critical minerals that are needed for wind turbines, solar panels, and electric vehicle batteries.

On February 23, 2021,

15. The Biden administration issued a Statement of Administration Policy in support of H.R. 803 which curtailed energy production on over 1.5 million acres of federal lands.

On March 11, 2021,

16. The President signed ARPA, which included numerous provisions advancing Biden’s green priorities, such as a $50 million environmental slush fund directed towards “environmental justice” groups, including efforts advanced by Biden’s EO.
17. ARPA also included $50 million in grant funding for Clean Air Act pollution-related activities aimed at advancing the green agenda at the expense of the fossil fuel industry.

On March 15, 2021,

18. Biden's Securities and Exchange Commission sought input regarding the possibility of a rule that would require hundreds of businesses to measure and disclose greenhouse gas emissions in a standardized way, hugely increasing the environmental costs of compliance and disincentivizing oil and gas production.

On April 15, 2021,

19. The Federal Energy Regulatory Commission's policy statement outlines — and effectively endorses — how the agency would consider market rules proposed by regional grid operators that seek to incorporate a state-determined carbon price in organized wholesale electricity markets. This amounts to a de facto endorsement of a carbon tax that would be paid by everyday Americans in their utility bills.

On April 16, 2021,

20. At Biden's Direction, Secretary of the Interior Deb Haaland revoked policies in Secretarial Order 3398 established by the Trump administration including rejecting "American Energy Independence" as a goal;
21. rejecting an "America-First Offshore Energy Strategy;"
22. rejecting "strengthening the Department of the Interior's Energy Portfolio;"
23. and rejecting establishing the "Executive Committee for Expedited Permitting." These actions set the stage for the unprecedented slowdown in energy activity by the Interior Department, steward of 2.46 billion acres of federal mineral estate and all its energy and mineral resources.

On April 22, 2021,

24. Biden issued the U.S. International Climate Finance Plan to funnel international financing toward green industries and away from oil and gas.

On April 27, 2021,

25. The Biden administration issued a Statement of Administration Policy in support of S.J. Res. 14 which rescinded a Trump-era rule that would have cut regulations on American energy production.

On April 28, 2021,

26. Biden's EPA issued a Notice of Reconsideration that would propose to revoke a Trump-era action that revoked California's waiver for California's Advanced Clean Car Program (Light-Duty Vehicle Greenhouse Gas Emission Standards and Zero Emission Vehicle Requirements).

On May 5, 2021,

27. This proposed Fish and Wildlife Service Rule revokes a Trump administration rule and expands the definition of "incidental take" under the Migratory Bird Treaty Act (MBTA). The rule would impact energy production on federal lands, increasing regulatory burdens.

On May 20, 2021,

28. Biden issued an executive order on Climate-Related Financial Risk that would artificially increase regulatory burdens on the oil and gas industry by increasing the "risk" the federal government undertakes in doing business with them.

On May 28, 2021,

29. Biden's FY 2022 revenue proposals include nearly $150 billion in tax increases directly levied against the oil and gas energy producers.

On July 28, 2021,

30. This Department of Energy determination increases regulatory burdens on commercial building codes, requiring green energy codes to disincentivize natural gas and other energy sources. DOE readily admits they ignored efforts private industry is making on their own and utilized the questionable "social costs of carbon" to overstate the public benefit.
31. The Executive Order also kicked off the development of more stringent long-term fuel efficiency and emissions standards, a backdoor way to compel the electrification of vehicles.

On August 11, 2021,

32. The White House released a letter from Jake Sullivan begging OPEC+ (OPEC plus Russia) to produce more oil.

On September 3, 2021,

33. Biden's Department of Transportation issued a proposed rule that would update the Corporate Average Fuel Economy Standards for Model Years 2024–2026 Passenger Cars and Light Trucks to increase fuel economy regulations on passenger cars and light vehicles. The modeling calculated "fuel savings" by multiplying fuel price with 'avoided fuel costs' to disincentivize gasoline by making it more costly to afford ICE cars and trucks.

On September 9, 2021,

34. NASA and the FAA launched a partnership to reduce "fuel use and harmful emissions" by strong-arming industry to adopt elements of their green agenda.
35. The Department of Education's Climate Adaptation Plan (CAP) includes efforts to incorporate the green agenda into as many guidance and policies as possible, effectively leveraging the department as an anti-fossil fuel propaganda tool.

On October 4, 2021,

36. The FWS published its final rule revoking Trump-era actions which eased burdensome regulations on energy action.

On October 7, 2021,

37. The Council on Environmental Quality revoked Trump administration NEPA reforms that reduced regulatory burdens by reinstating tangential environmental impacts of proposed projects.

38. Biden announced plans to designate the Northeast Canyons and Seamounts Marine National Monument, a move counter to Trump's reversal of a similar Obama-era proclamation. Trump aimed to allow energy exploration in the area to increase energy independence.
39. The U.S. Department of Agriculture's (USDA) CAP includes efforts to switch fuel away from oil and natural gas and subsidize more costly, less efficient fuel sources.
40. As part of its CAP, EPA intends to incorporate Biden's Green New Deal agenda throughout its rulemaking process.

On October 21, 2021,

41. This report paints climate change, and therefore oil and gas producers, as a "risk to financial stability." The report recommended the "climate disclosures" later set forth by the Biden administration.

On October 28, 2021,

42. Rep. Rho Khanna interrogated oil CEOs about why they were increasing production as their 'European Counterparts' were lowering their own.

On October 29, 2021,

43. The Bureau of Land Management announced the use of social costs of carbon in decision-making for approving permits for oil and gas drilling. This devalues the economic benefits of energy production on federal lands.

On October 30, 2021,

44. The Department of Labor issued a final ESG Rule that would require fiduciaries to consider the economic effects of climate change and other so-called environmental, social and governance (ESG) factors when evaluating funds for retirement plans. The rule would strongly encourage fiduciaries to draw capital from domestic energy development in oil and natural gas to renewables.

On November 2, 2021,

45. The Biden administration led a “Global Methane Pledge” to reduce global methane emissions by 30 percent by 2030. Neither Russia nor China signed the pledge, increasing the world’s reliance on these two countries for energy-related imports and disadvantaging the U.S. oil and natural gas industry, as well as large consumers of energy such as industrial manufacturing and agriculture.

On November 4, 2021,

46. Biden committed to “ending fossil fuel financing abroad,” targeting the global fossil fuel industry, thereby disadvantaging them, which increases global oil and gas prices. Further, key countries, like China, did not sign the pledge, so the pledge harms signatories while empowering adversaries. This is another case of unilateral economic and energy disarmament.

On November 5, 2021,

47. Biden Energy Sec. Granholm laughed at questions about boosting oil production.

On November 12, 2021,

48. New Source Review: These broad, overreaching regulations target new, modified, and reconstructed oil and natural gas sources, and would require states to reduce methane emissions from hundreds of thousands of existing sources nationwide for the first time. The Proposed Rule follows the President's Day 1 Climate EO and the passage of the S.J. Res. 14, a CRA rescinding Trump-era energy independence policies. The proposed rule spends several paragraphs dismissing the effects of the rule on the oil and gas industry and misleadingly applies its effects on the industry to only the "140,000" (an underestimate of the over 220,000) employees directly involved in extraction. This means it ignores the nearly 10 million other people working in the oil and gas industry and the impacts to the oil and gas economy more broadly.

On November 15, 2021,

49. Biden's Interior Department announced plans to withdraw Chaco Canyon from oil and gas drilling for 20 years.
50. The Biden administration nominated Saule Omarova to serve as Comptroller of the Currency. Omarova's past comments speak for themselves: "A lot of the smaller players in [the fossil fuel] industry are going to, probably, go bankrupt in short order—at least, we want them to go bankrupt if we want to tackle climate change," she said.

On November 17, 2021,

51. HUD's CAP leverages the Community Development Block Grant to advance 'environmental justice' efforts.
52. Biden calls on the FTC to probe "anti-consumer behavior" by energy companies.

On November 19, 2021,

53. Biden endorsed several oil and gas provisions in the Build Back Better Bill, including a new tax on methane, of up to $1500 per ton;
54. prohibiting energy production in the Arctic and offshore leasing on the Outer Continental Shelf (OCS) in the Atlantic, Pacific and Eastern Gulf of Mexico Planning Areas;
55. increased fees and royalties for onshore and offshore oil and gas production;
56. a new $8 billion tax on companies that produce, process, transmit or store oil and natural gas starting in 2023;
57. limited ability of energy producers to claim tax credits for upfront and royalty payments in foreign countries – amounting to a tax increase on domestic energy producers;
58. and a 16.4 cent tax on each barrel on crude oil – up from 9.7 cents – a $13 billion tax increase on oil production.

On November 26, 2021,

59. Biden's Interior Department issued its report on the Federal Oil and Gas Leasing Program includes recommendations to raise rents and royalty rates on oil and gas producers, even though federal energy production already lags that from state and private lands.

On December 14, 2021,

60. The EPA launched a revamp of its Office of Civil Rights to add so-called environmental justice enforcement as a key pillar in enforcing Title VI civil rights complaints. The agency's announcements mean social justice claims against, among others, the oil and gas industry will increase costs and penalties that have specious connections to its environmental mission.

On December 21, 2021,

61. Biden's Department of Transportation issued its Final Rule revoking Trump-era actions which prevented California from arbitrarily becoming the national standard for fuel emissions. The rule set the stage for the administration to reinstate California's waiver, and, since automakers do not make different cars for different states, the rule would allow California's radical environmental policies to reach nationwide, forcing people nationwide to pay for vehicles meeting California's standards.

On December 30, 2021,

62. Biden's EPA issued its Final Rule for increased "fuel efficiency standards." According to the Final Rule, "These standards are the strongest vehicle emissions standards ever established for the light-duty vehicle sector. The rule, in responding to comments, claims "energy security benefits to the U.S. from decreased exposure to volatile world oil prices" suggesting that decreasing oil and gas production in the U.S. will result in less exposure to the international oil and gas market because they will be disincentivizing vehicles that use oil and gas. The rule also claims that it will result in "fuel savings" entirely due to less use of fuel.

On January 13, 2022,

63. DOE announced an initiative to hire 1,000 staffers for their Clean Energy Corps, a group of staff dedicated to Biden's promise to destroy fossil fuels.

On January 14, 2022,

64. Biden nominated Sarah Raskin to serve as Vice Chair of the Federal Reserve. She was deemed so radical in her belief that fed policy should be dictated by environmental policy that she gained a bipartisan opposition and had to withdraw her nomination.

On February 9, 2022,

65. A proposed rule on Coal and Oil Power Plant Mercury Standards would revoke a Trump-era rule that cut red tape on coal and oil-fired power generators and followed the Supreme Court's rejection of an earlier Obama administration rule. This would effectively reinstate Obama-era regulations which sought to increase regulations on coal and oil-fired power plants.

On February 18, 2022,

66. FERC updated a 23-year-old policy for assessing proposed natural gas pipelines, adding new considerations for landowners, environmental justice communities, and other factors. In a separate but related decision, the commission also laid out a framework for evaluating projects' greenhouse gas emissions.

On February 21, 2022,

67. The Biden administration paused working all new oil and gas leases on Federal land in response to a judge blocking their arbitrary use of social costs of carbon, unnecessarily hurting domestic oil and gas production.

On February 28, 2022,

68. The Ozone Transport Proposed Rule would expand federal emissions regulations over a wider geographic region and over a wider array of sources, including the gathering, boosting and transmission segments of the oil and gas sector. Integral energy production states like Nevada, Utah and Wyoming would be required to jump through more red tape.

On March 1, 2022,

69. Refusal To Appeal adverse leasing court decision: The Biden administration refused to appeal an unprecedented decision to vacate an offshore oil and gas leasing sale held in November 2021. This means under Biden, the U.S. has not held one successful lease sale offshore.
70. Certification of New Interstate Natural Gas Facilities: This policy statement increases climate change regulations for new interstate natural gas facilities.

On March 8, 2022,

71. President Biden tried to deflect from his anti-energy record saying there are 9,000 issued leases on federal lands without current drilling. This is true and it's also true that this is the lowest percentage of unused leases in at least 20 years — in other words, lease utilization is at a multi-decade high.

On March 9, 2022,

72. EPA Reinstates California Emissions Waiver: The EPA reinstated California's emissions waivers, allowing the state to set its own greenhouse gas emissions standards, standards which will likely be adopted nationwide and are sure to make vehicles more expensive. The practical effect is that California is setting policy for people in all the other states despite their terrible record of energy inflation.

On March 11, 2022,

73. Natural Gas Infrastructure Project Reviews: This interim regulation will increase the regulatory burden on natural gas facilities by, among other things, requiring climate change impacts be considered when determining whether a project is in the public interest.

On March 16, 2022,

74. Doubling Down on Social Costs of Carbon: The 5th Circuit Court of Appeals reinstated the dubious social costs of carbon metric which had been rejected by another court by issuing a stay on the lower court's ruling. The ruling itself cast doubt on the lower court's ruling. The Biden administration argued against the lower court's ruling to reinstate the SCC metric. The Social Cost of Carbon is a "made-up" number designed to make any hydrocarbon project in the U.S. more expensive. It is an "end-around" the politically difficult carbon tax most of the Green Establishment supports.

March 21, 2022,

75. SEC Proposed Rule on Mandatory Climate Disclosures: The SEC's proposed rule would require public companies to disclose greenhouse gas emissions
76. and their exposure to climate change. This rule would massively increase so-called environmental costs of compliance and, in tandem with so-called social costs of carbon, artificially disincentivizing oil and gas production.

March 28, 2022,

77. Army Corps of Engineers' Review of its Nationwide Permit 12 for Oil or Natural Gas Pipeline Activities: The corps announced it would be reviewing NWP 12 late last month as part of Biden's day-1 executive order on climate change mandating all federal agencies ensure their work is in line with its climate and environmental objectives. The review is part of a long list of actions that confuse and delay permitting for critical infrastructure. This makes pipelines harder to build and improve in the U.S.

March 30, 2022

78. Environmental Justice Advisory Council Meeting: The WHEJAC will hold its first two meetings to, among other things, advance Green New Deal priorities including "environmental justice and pollution reduction, energy, climate change mitigation and resiliency, environmental health, and racial inequity."

March 31, 2022

79. President Biden announces that he will sell one million barrels of oil a day from the Strategic Petroleum Reserve for the next six months.
80. Biden wants to penalize oil companies with unused leases: President Biden called on Congress to pass legislation enacting "use it or lose it" fines on wells that oil companies have leased from the federal government but have not used in years and "on acres of public lands that they are hoarding without producing… Companies that are producing from their leased acres and existing wells will not face higher fees." The extra fees on federally leased land are on top of rents that the oil companies pay to hold the leases, "bonus bids" paid by the winning bidder

at lease sales and the fact that 66 percent of federal leases are currently producing oil. This is simply a deflection from the Biden administration's war on affordable North American energy supplies.

81. Biden's Budget Contains More Anti-Oil Proposals: President Biden's budget for the fiscal year 2023 is $5.8 trillion. It contains large amounts of climate spending and anti-oil and gas policies that did not get passed in his Build Back Better bill last year.
82. Biden is seeking $50 billion for programs to address climate change,
83. including $18 billion to build the U.S. government's resilience to climate change,
84. $3.3 billion in funding for clean energy projects and at least $20 million for a new "Civilian Climate Corps."
85. To help pay for the increased climate spending, Biden is asking Congress to eliminate tax provisions that aid domestic energy production,
86. including tax deductions for intangible drilling costs and low-production wells that enable small producers in the United States to produce oil. Removing these deductions will lower domestic output while further raising already high oil and gasoline prices.

April 5, 2022,

87. Biden's Department of Energy Office of Fossil Energy and Carbon Management releases a "Strategic Vision" with no discussion of increasing domestic fossil energy production: The Department of Energy is statutorily required to carry out research and development with "the goal of improving the efficiency, effectiveness, and environmental performance of fossil energy production, upgrading, conversion, and consumption." (42 USC 16291) However, the Biden Department of Energy has no interest in increasing fossil energy production.

Despite the requirements of the law, the Strategic Vision is only about "Advancing Justice, Labor, and Engagement; Advancing Carbon Management Approaches toward Deep Decarbonization; and Advancing Technologies that Lead to Sustainable Energy Resources."

April 12, 2022,

88. Biden extended the availability of higher biofuels-blended gasoline during the summer to lower gasoline costs and to reduce reliance on foreign energy sources. The measure will allow Americans to buy E15, a gasoline blend that contains 15 percent ethanol from June 1 to September 15. Oil refiners are required to blend some ethanol into gasoline under a pair of laws, passed in 2005 and 2007, known as the Renewable Fuels Program, intended to lower the use of oil and greenhouse gas emissions and reduce dependency on foreign oil by mandating increased levels of ethanol in the nation's fuel mix every year. However, since the passage of the 2007 law, the mandate has been met with criticism that it has contributed to increased fuel prices and has done little to lower greenhouse gas emissions. With looming food shortages already acknowledged by President Biden, turning his back on domestic energy production while dedicating even more food to make energy inefficiently is not wise.

April 15, 2022,

89. Biden announced 144,000 acres of the federal mineral estate opened for oil and gas leasing — just 0.00589 percent of the 2.46 billion acres the American people own. White House Press Secretary Jen Psaki said, "Today's action…was the result of a court injunction that we continue to appeal, and it's not in line with the president's policy, which is to ban additional leasing."
90. The administration announced it would resume leasing, but with a royalty rate almost 50 percent higher.
91. Withdrawal of M-37046 and
92. reinstatement of M37039: "The Bureau of Land Management's Authority to Address Impacts of its Land Use Authorizations Through Mitigation" The Interior Department reversed a Trump administration decision which limited the scope of "compensatory mitigation" the Department could force upon projects on federal land as a condition of receiving a permit, which will hit energy and mining projects especially hard. Under the new guidance, opponents in the federal government could require mitigation located far from the project with little relevance, effectively giving bureaucrats a blank check to request whatever they wish of a permit seeker with little controls. This decision was made less than a week after the DOI Inspector General reported that there were no controls or apparent records justifying previous versions of this program, and warned they may have to review the overall program again. This is a "3rd world" approach giving government officials the latitude to effectively deny a project by assessing "compensatory mitigation" so expensive as to make it uneconomic, or to fund their pet projects by extorting additional funds from a permit-seeker.

April 19, 2022,

93. Biden Restores Climate to NEPA: The Biden administration completed reforms on how agencies implement the National Environmental Policy Act, effectively undoing one of the Trump administration's most important environmental regulatory rollbacks. This opens the door for officials to cook up whatever justification they desire to impede energy development under the guise of NEPA.

April 20, 2022,

94. White House Climate Advisor Gina McCarthy states on MSNBC that "President Biden remains absolutely committed to not moving forward with additional drilling on public lands."

April 21, 2022,

95. U.S. Climate Envoy John Kerry said the world's reliance on natural gas should be limited to a decade. He said, "We have to put the industry on notice: You've got six years, eight years, no more than 10 years or so, within which you've got to come up with a means by which you're going to capture, and if you're not capturing, then we have to deploy alternative sources of energy." Repeated statements like this from administration officials tell investors not to sponsor energy investments in the U.S., since it implies the use of those energy sources will be limited by the government.

April 25, 2022,

96. Biden reverses Trump's Alaska oil plan: The Biden administration released a management plan for the National Petroleum Reserve Alaska, an Indiana-sized area reserved for oil and gas leasing. The final decision reverses a Trump-era plan that had opened most of the reserve to oil and gas leasing and withdraws some of the most prospective oil and gas areas from consideration.

April 28, 2022,

97. The Biden administration admitted to using faulty modeling which overestimated wildlife effects, delaying permitting on existing leases.

May 18, 2022,

98. The Biden administration announced they were canceling a lease sale of over one million acres in the Cook Inlet in Alaska.
99. At the same time, the Biden administration announced they were canceling a lease sale in the Gulf of Mexico.

May 19, 2022,

100. HR. 7688 is named the "Consumer Fuel Price Gouging Prevention Act," and it would give the President vast powers to set price controls by executive fiat. If passed, this legislation will cause even more harm to American energy consumers. Price controls don't work, and our experience during the gas lines of the 1970s should remind us that price controls will lead to shortages
101. S.4214 is a similar "price gouging" bill taken up in the Senate.

June 2, 2022,

102. The Biden administration settled with environmental litigants to do what the Biden administration wanted to do and more thoroughly analyze the climate impacts of oil and gas leasing on 4 million acres of federal lands. This provides more delay, potential litigation about sufficiency, and more uncertainty about investment.
103. Biden's EPA announced they were allowing states greater power to stop roads, dams, shopping malls, housing developments, wineries, breweries, pipelines, coal terminals, and other projects using Section 401 of the Clean Water Act.

June 7, 2022,

104. Biden's EPA deals a death blow to Pebble Mine in Alaska. Citing its authority under the 1972 Clean Water Act, EPA proposed a legal determination that would ban the disposal of mining waste rock in the Bristol Bay watershed. Pebble is one of the world's largest copper deposits –essential for electrification—and holds enormous quantities of additional minerals, including strategic ones.

June 8, 2022,

105. Biden reduces fees on renewables while raising them on oil and gas. President Biden's Interior Department announced it will reduce the fees on renewable projects on federal lands after announcing recently that royalty rates and rents would increase as much as 50% for oil and gas projects on federal lands.

June 28, 2022,

106. President Biden considers new regulations that would hamper the largest oil-producing area in the world. His latest consideration is EPA implementing new requirements that would curb drilling across parts of the Permian Basin—the world's biggest oil field that straddles Texas and New Mexico.

July 6, 2022,

107. President Biden releases his draft offshore lease plan. The plan includes an option with zero lease sales. There is the potential for ten potential new leases in the Gulf of Mexico and one in the Cook Inlet off the southern coast of Alaska. There are no new leases in federal waters off the Atlantic and Pacific coasts. Biden's plan is in sharp contrast to President Trump's proposed offshore lease plan that had 47 new offshore drilling leases, including in the Atlantic and Pacific oceans. President Trump had proposed a vast expansion of drilling sales to cover more than 90 percent of coastal waters, including areas off California and new zones in the Atlantic and Arctic. The earliest Biden's offshore lease program could be finalized is likely late fall.

July 7, 2022,

108. The Biden administration proposes a strict appliance standard rule for furnaces, the goal of which is to increase the upfront cost of using natural gas furnaces so great that people will switch to electric heating.

July 14, 2022,

109. Biden sells oil to China from the SPR. Biden has sold more than five million barrels of oil from the SPR to European and Asian nations instead of U.S. refiners, compromising U.S. energy security. Biden's Energy Department in April announced the sale of 950,000 barrels from SPR to Unipec, the trading arm of the China Petrochemical Corporation, which is wholly owned by the Chinese government. China purchased that oil from U.S. emergency reserves to bolster its own stockpile. China has been buying large amounts of oil for its reserves since the early COVID lockdowns when prices were low due to demand destruction.

July 15, 2022,

110. Biden's Federal Highway Administration, without authority to do so, proposed requiring all states to track and reduce on-road vehicle greenhouse gas emissions.

August 16, 2022,

111. President Biden signs the Inflation Reduction Act (IRA), which includes new taxes on natural gas extraction and methane leaks, and
112. Superfund taxes on crude oil and its related products, and
113. An extension of biofuel tax credits and a new tax credit for sustainable aviation fuel. These biofuel tax credits will encourage existing petroleum refining capacity to convert to biofuels, making it harder for Americans to get the petroleum fuel products they need for transportation and home heating. These incentives will make the United States import more petroleum products from

countries with additional capacity such as China and the Middle East, while committing more agricultural products to fuel, rather than food.

114. IRA: The law also encourages states to adopt California's plan to phase out gas-powered vehicles by 2035.

August 17, 2022,

115. A federal judge reinstated a moratorium on coal leasing from federal lands that had been implemented during the Obama administration and was lifted under President Donald Trump. The ruling from U.S. District Judge Brian Morris requires government officials to conduct a new environmental review prior to resuming coal sales from federal lands. According to the judge, the government's previous review of the program had not adequately considered the impacts of climate change from coal's greenhouse gas emissions, among other effects.

August 18, 2022

116. Secretary of Energy Jennifer Granholm sent a letter to refiners threatening "to deploy emergency actions" against the industry if they continue to export refined products or otherwise fail to build refined product inventories. This ignores the record of increasing exports of petroleum coinciding with rising production in the U.S.

August 22, 2022,

117. U.S. Appeals Court reinstates Biden's ban on oil and gas leasing

September 6, 2022

118. The Biden administration reached an agreement with environmental groups to halt drilling permits on over 58,000 acres of land in a sue-and-settle case.

September 12, 2022,

119. EPA announced they rejected Cheniere Energy's LNG appeal to exempt two turbines at LNG export terminals from a hazardous pollution rule despite the needs of the Europeans and others for LNG and Biden's promises to help allies with supplies.

September 19, 2022

120. The Department of Energy announces the sale of an additional 10 million barrels of oil from the SPR.

September 20, 2022,

121. The Biden administration is expected to soon finalize a rule banning oil and gas leasing near Chaco Culture National Historical Park opposition from local Indigenous leaders, who say the administration's rule would prevent them from collecting royalties on their land.

September 30, 2022,

122. Secretary of Energy Jennifer Granholm and senior White House officials met with U.S. refiners. The Biden administration officials threatened the refiners with an export ban.

October 5, 2022,

123. The Biden administration is reportedly working to wind down sanctions against Venezuela's authoritarian government in exchange for oil production. This ignores that Venezuelan crude oil is much more carbon intensive than the domestic oil the Biden Administration is restricting, or Canadian oil which would have been transported via the Keystone XL pipeline.

October 7, 2022,

124. The Securities and Exchange Commission announced that it was reopening the comment period on the ESG rule because a "technological error" resulted in the deletion of some public comments. But the SEC only gave people 14 days to figure out if their comment was deleted and to submit a comment again.

October 2, 2022,

125. Biden administration officials lobbied the Saudis and other members of OPEC+ to hold off reducing oil output until after the midterm elections.

October 6, 2022,

126. The Department of the Interior moves forward with some leasing but notes that they are “mandated” by the Inflation Reduction Act. In other words, DOI is trying not to lease unless mandated by an act of Congress. This ignores that current law requires them to lease periodically, which they are honoring in the breach.

November 2, 2023

127. President Biden threatens oil companies with a windfall profits tax—again. “Their profits are a windfall of war,” Mr. Biden said, referring to the Russian invasion of Ukraine as the reason for high prices for oil and gasoline. Biden could easily increase domestic oil production by changing his anti-oil and gas policies that began on his first day in office.

November 9, 2022

128. California proposes banning new diesel trucks by 2040. The California Air Resources Board (CARB) proposed a regulation that would require manufacturers to sell only “zero-emission” medium and heavy-duty vehicles in the state by 2040.

November 16, 2022

129. The U.S. supports the phase out of hydrocarbon fuel sources at COP27.

November 17, 2022

130. Biden releases more stringent requirements to EPA's proposed methane rule at COP27. At the Conference of the Parties (COP27) in Egypt, President Biden's Environmental Protection Agency (EPA) released the text of a supplemental proposed rule regulating methane emissions from the oil and natural gas industries that is *more stringent* than the original proposed rule in 2021. The 2021 rule targets emissions from existing oil and gas wells nationwide, rather than focusing only on new wells as previous EPA regulations have done. The new rule released at COP27, however, includes *all drilling* sites, even smaller wells that emit less than 3 tons of methane per year. Small wells currently are subject to an initial inspection but are rarely checked again for leaks. The new proposal also requires operators to respond to credible third-party reports of high-volume methane leaks. These more stringent requirements result in a near doubling of the economic costs, which are estimated to produce a 13 percentage point increase in reduced emissions from 2005 levels by 2030. Increasing costs will increase bills for consumers at a time when natural gas prices are already expected to climb.

131. Federal government grants lesser prairie chicken ESA protections.

November 29, 2022

132. EPA proposes exorbitant estimates for the social cost of carbon. President Biden's Environmental Protection Agency (EPA) has proposed a new estimate for the social cost of carbon emissions that nearly quadruples the interim figure from the Obama Administration. The Biden administration has been using the Interagency Working Group's interim value of $51 per metric ton of carbon dioxide, but EPA has proposed increasing it to $190.

November 30, 2022

133. Instead of relying on the scientific method, the Biden administration instructed regulatory agencies to apply "indigenous knowledge" to "research, policies, and decision making."

December 7, 2022

133. President Biden seeks fossil fuel-free federal buildings and bans natural gas.

December 8, 2022

134. The Bureau of Land Management piles its methane rule atop those set by EPA and Congress. BLM's proposal would tighten limits on gas flaring on federal land and require energy companies to better detect methane leaks. The rule would impose monthly limits on flaring and charge fees for flaring that exceeds those limits.

December 23, 2022

135. California's regulators release their net zero plan. California regulators approved a plan to reduce the state's carbon-dioxide emissions by 85 percent from 1990 levels by 2045, thereby reaching carbon neutrality, meaning the state will remove as many emissions from the atmosphere as it emits. It aims to do so in part by reducing fossil fuel demand.

January 10, 2023

136. U.S. Interior Department names Elizabeth Klein to oversee offshore energy. She had initially been nominated by the White House to be the Deputy Interior Secretary under current chief Deb Haaland but was withdrawn from consideration in March 2021 amid opposition from moderate Alaska Republican Senator Lisa Murkowski, whose vote was needed for her confirmation, over concerns that Klein was opposed to oil development.

January 12, 2023

137. EPA's proposed rule regarding the Clean Water Act. The rule would expand the EPA and Army's regulatory oversight to include traditionally navigable waters, territorial seas, interstate waters and, "upstream water resources that significantly affect those waters." According to the two agencies, the revised rule is based on definitions that were in place before 2015. Farming groups, oil and gas producers, and real estate developers criticized the regulations as overbearing and burdensome to business, and, in particular, the ruling has the potential to affect natural gas infrastructure projects. It also would exert federal control over lands not owned by the federal government.

January 17, 2023

138. Biden appointee proposes ban on gas stoves. Richard Trumka Jr., a Biden commissioner on the CSPC, told *Bloomberg* the ban is justified because gas stoves increase respiratory problems such as asthma among children, which is a myth promoted by environmentalists whose real agenda is not to reduce asthma but to ban natural gas. Gas stoves are used in about 35 percent of households nationwide, or about 40 million homes. The household figure is closer to 70 percent in some states, such as California and New Jersey. Other states where many residents use gas stoves include Nevada, Illinois, and New York.

January 31, 2023

139. The Biden administration blocks Minnesota's Twin Metals Mine. The Biden administration blocked plans for a major copper, nickel and cobalt mine in northern Minnesota that could have helped supply minerals for his "net-zero" plans. The "Twin Metals Project" would have tapped the Duluth Complex within the Superior National Forest, where 95 percent of the nation's nickel reserves and 88 percent of American cobalt reserves are found.

February 3, 2023

140. The Biden administration blocks the development of Alaska's Pebble Mine. The U.S. Environmental Protection Agency blocked the development of the proposed Pebble mine–the most significant undeveloped copper and gold resource in the world–because of stated concerns about its environmental impact on Alaska's aquatic ecosystem.

March 3, 2023

141. Biden EPA approves Midwest governors’ request for year-round E15 sales. The Biden administration is recommending for approval a rule that would allow expanded sales of gasoline with a higher ethanol blend (15 percent ethanol), based on a request from governors in Midwest states.

March 9, 2023

142. Biden administration attacks oil and gas in FY24 budget proposal.

March 10, 2023

143. Biden’s offshore oil and gas lease plan was delayed by 18 months. President Biden’s oil and gas offshore lease plan is late and will be even later as the Interior Department argues it needs until December to finalize the plan. It told a court it needs the rest of the year to complete an analysis on the delayed five-year program, which will replace the expired 2017-2022 program.

March 14, 2023

144. Biden withdraws more areas of Alaska from oil exploration. The Biden administration announced major restrictions on offshore oil leasing in the Arctic Ocean and across Alaska’s North Slope supposedly to temper criticism from environmentalists over a pending decision on an oil drilling project in Alaska’s National Petroleum Reserve known as Willow and to form a “firewall” to limit future oil leases in the region. The Interior Department said it would issue new rules to block oil and gas leases on more than 55 percent of the 23 million acres

that form the National Petroleum Reserve-Alaska and bar drilling in nearly 3 million acres of the Beaufort Sea — closing it off from oil exploration. The restricted area of over 16 million acres is about the size of West Virginia. The Willow project, if approved, would take place inside the petroleum reserve, which is located about 200 miles north of the Arctic Circle. The National Petroleum Reserve was established in 1912 as a backup source of oil for the federal government, originally for the Navy, as it was at one time referred to as the Naval Petroleum Reserve. Four sites in the country comprised the Naval Petroleum Reserve. The fourth site is on the North Slope of Alaska.

March 16, 2023

145. Sen. Whitehouse introduces the "Clean Competition Act," a carbon border tax. One consequence of this policy would be a negative impact on trade relations with the rest of the world. A carbon border tax will likely lead to retaliatory tariffs with our trading partners and a trade war as increasing tariffs are applied back and forth. A carbon tax like this one would impact heavy industry the most, as it would raise prices on things like steel, aluminum, and other industrial inputs. Because the costs of tariffs are ultimately passed along to consumers, starting a trade war with the world's largest producer of aluminum (China produced nearly 60 percent of world aluminum in 2021) is a far cry from supporting the American working class. Additionally, carbon border taxes are ripe for political gamesmanship because determining the true carbon intensity of products from a variety of countries with different regulatory systems and variations in how emissions are tracked is no simple task. The sheer complexity of rating products would impose massive compliance costs throughout global supply chains, the last thing that is needed with runaway inflation and supply chains that are still

recovering from the dual shocks of the pandemic and Russia's invasion of Ukraine.

March 17, 2023

146. EPA's "Good Neighbor" rule increases the costs of electricity for consumers. The Biden administration announced tougher limits on emissions from power plants, factories and other industrial facilities that cross state boundaries. The new standards, announced by the Environmental Protection Agency (EPA), are intended to place tighter constraints on emissions from 23 Midwestern and Western states that have coal and natural gas power plants and facilities. This interstate regulation, known as the "good neighbor" rule, strengthens and expands an earlier interstate air pollution standard that was enacted during the Obama administration. In finalizing the rule, the EPA included three western states in the regulation — California, Nevada and Utah, due mainly to emissions from their industrial facilities. The new rule includes increased flexibilities, giving power plants emission allowances that will decrease over time. EPA was able to finalize the new standards as the U.S. Court of Appeals for the D.C. Circuit rejected a challenge to EPA's proposed rule by coal companies and others this month. This rule is but one of many the Biden Administration is planning to roll out in pursuit of its quest to kill coal plants in the United States, as IER has detailed.

March 20, 2023

147. Biden uses veto to preserve DOL Rule on ESG investing.

March 23, 2023

148. U.S. Army Corp of Engineers slow walks Line 5 permitting process.

March 30, 2023

149. California gasoline price gouging bill. California Democratic lawmakers approved a bill that could provide a penalty for supposed price gouging at the gasoline pump, allowing regulators the power to fine oil companies for supposedly profiting from gas price spikes similar to those that California experienced last summer. Democratic Governor Gavin Newsom called for a special legislative session to pass a new tax on oil company profits after the average price of gas in California hit a record high of $6.44 per gallon, according to AAA. State regulators, however, did not pass a new tax because they were worried about supply shortages and higher prices as oil companies pass the new tax onto consumers.

March 31, 2023

150. New York State to ban gas stoves in new buildings. New York will become the first state to pass a law banning natural-gas and other fossil-fuel hookups in new buildings on its way to meeting President Biden's net zero carbon goals and the state's own targets for greenhouse-gas reduction. The New York State Climate Leadership and Community Protection Act, passed in 2019, calls for a reduction in economy-wide greenhouse-gas emissions of 40 percent by 2030 and 85 percent by 2050 from 1990 levels.

April 4, 2023

151. The Bureau of Land Management (BLM) proposes a rule to try to get around the Federal Land Policy and Management Act's (FLPMA) requirements for "multiple-use and sustained yield" and instead have even more lands in conservation.

April 12, 2023

152. Biden releases new rules to force electric Vehicles on Americans. The New York Times notes that EPA is releasing rules that are intended to ensure that electric cars represent between 54 and 60 percent of all new cars sold in the United States by 2030 and 64 to 67 percent by 2032—in 9 years. That would exceed President Biden's earlier goal announced in 2021 to have all-electric cars account for half of new car sales by 2030. The purpose of the new EPA regulations is to essentially regulate cars with combustible engines out of business by making the rules so stringent that car companies cannot comply, which is a de facto death knell. Today, less than six percent of cars are electric, despite tax credits of up to $7,500. The federal government is also providing tens of billions of subsidies to the battery producers and offering prime parking spaces to electric vehicles with charging stations at nearly every shopping center in America. This ruling would result in a complete transformation of the automotive industrial base and the automotive market, whether the American public likes it or not.

153. EPA announces new GHG emissions regulations rule for heavy-duty vehicles ((such as delivery trucks, refuse haulers, public utility trucks, transit, shuttle,

school buses, etc.) and tractors (such as day cabs and sleeper cabs on tractor-trailer trucks) starting in model year 2027.

April 25, 2023

154. EPA Proposes to Regulate Carbon Dioxide Emissions from Existing and New Power Plants.

May 12, 2023

155. Department of Transportation Proposes Rules to Reduce Methane Emissions from pipelines.

May 15, 2023

156. EPA proposes new regulations requiring power plants to reduce GHG emissions and require carbon capture and sequestration or hydrogen co-firing even though these are uneconomic technologies.

June 2, 2023

157. Biden orders a 20-year ban on oil and gas leasing within 10 miles of Chaco Culture National Historical Park. In withdrawing the lands from development against the wishes of the Navajo Nation, the action prevents Navajo mineral owners from developing their oil and natural gas resources and realizing $194 million in royalty income over 20 years.

June 22, 2023

158. The U.S. Fish and Wildlife Service (FWS) proposes three new ESA rules regarding interagency cooperation, listings, and critical habitat designation. Taken together, the Biden Administration is seeking to erode the standards with the goal of listing species that do not credibly meet the ESA's definition of threatened or endangered species and designated critical habitat on such massive scales, including areas that are unoccupied. The result is reduced areas open to development, increased costs, unwarranted or unjustified permit requirements, delays, and a multitude of operational constraints that significantly impact the ability to responsibly develop energy resources.

159. The U.S. Fish and Wildlife Service (FWS) along with the National Marine Fisheries Service (NMFS) propose new regulation on interagency cooperation with respect to the Endangered Species Act.

160. The FWS and NMFS also propose the new regulations on Listing Endangered and Threatened Species and Designating Critical Habitat.

161. The FWS proposes an additional rule pertaining to endangered species. These three rules taken together seek to erode the standards with the goal of listing species that do not credibly meet the ESA's definition of threatened or endangered species and designated critical habitat on such massive scales, including areas that are unoccupied. The result is reduced areas open to development, increased costs, unwarranted or unjustified permit requirements, delays, and a multitude of operational constraints that significantly impact the ability to responsibly develop energy resources.

June 30, 2023

162. The U.S. Fish and Wildlife Service (FWS) proposes to list the Dunes Sagebrush Lizard as endangered under the Endangered Species Act (ESA). Despite extensive conservation efforts by oil and natural gas operators, the listing in the highly productive Permian Basin of Texas and New Mexico seems specifically designed to reduce development in one of the nation's most prolific oil producing regions.

July 20, 2023

163. Biden Administration Proposes to Raise Drilling Costs on Federal Lands. The Interior Department's Bureau of Land Management (BLM) has proposed a rule to implement the increased increasing royalty rates for oil and natural gas drilling production on federal lands from 12.5 percent to 16.67 percent—about a third higher–and increased leasing fees that Congress passed in the Inflation Reduction Act (IRA). BLM goes far beyond IRA by also raising the minimum bond paid upon purchasing an individual drilling lease from $10,000 to $150,000. To top it off, they propose raising the minimum bond required for a drilling lease on multiple public lands in a state from $25,000 to $500,000—a 20-fold increase. Developers must pay the bond before drilling begins. The agency also proposes limits designed to steer development away from wildlife and cultural sites. The Interior Department estimates that energy firms will incur $1.8 billion in additional costs by 2031.

July 26, 2023

164. The White House holds a Methane Summit to reduce methane emissions, but doesn't invite anyone from the industry.

July 28, 2023

165. NHTSA proposes new fuel efficiency regulations requiring the average light-duty vehicle estimated to reach 58 miles per gallon by 2032.
166. NHTSA proposes new fuel efficiency regulations for heavy-duty pickup trucks and vans (HDPUVs) for MYs 2030-2035.

August 1, 2023

167. EPA proposes updated greenhouse gas reporting requirements for the oil and natural gas industry. Rather than recognizing that industry continues to decrease methane and other greenhouse gas emissions, the rule attempts to overcount GHGs as a means to eventually impose a carbon budget on the industry. By manipulating emissions factors that are used to calculate emissions, the rule could overestimate industry emissions nearly three-fold.

August 2, 2023

168. The White House issues new guidance on valuing ecosystem services for use in calculating costs and benefits of proposed regulations.

August 3, 2023

169. BLM proposes removing more than 1.6 million acres from oil and gas leasing in Colorado.

August 4, 2023

170. BLM proposes to close 1.566 million acres to oil and natural gas leasing in the Grand Junction and Colorado River Valley field offices in the highly productive Piceance Basin on Colorado's West Slope. The Energy Information Administration (EIA) considers the Piceance Basin to have five of the top 50 natural gas fields in the United States in proven reserves. The update to the Resource Management Plan and supplemental Environmental Impact Statement is designed to cut off new development in the promising Mancos Shale formation.

August 7, 2023

171. Biden proposed 236-pages of revisions to NEPA (National Environmental Policy Act) guidance to make it harder to permit any natural gas, oil, or coal project.

August 10, 2023

172. EPA denies small refinery biofuel waivers and sets large future biofuel mandates.

August 24, 2023

173. The Interior Department holds lease sale 261, but withdraws 6 million acres previously scheduled for leasing.

September 5, 2023

174. The Department of Transportation banned the transportation of LNG by train.

September 6, 2023

175. The Biden administration canceled oil and gas leases held by the state of Alaska in the 1002 area of ANWR. This area was specifically set aside by Congress for oil and gas leasing and Congressionally-mandated lease sales.
176. The Biden administration proposed new regulations to make it more difficult to produce oil and gas in the National Petroleum Reserve-Alaska by withdrawing almost half of the prospective area.

October 2, 2023

177. The Biden administration's five-year plan for offshore oil and gas leasing will not include any sales in 2024 and will feature just three in the final four years–the lowest number of auctions in the history of the program.

178. Army Corps of Engineers continues "inexplicably lethargic" environmental review of Line 5. Line 5 moves about 23 million gallons of oil and gas products daily between the United States and Canada.

October 18, 2023

179. An E&E News analysis shows a 30 percent decrease in permits issued for new offshore oil and gas wells during the first two years of the Biden administration compared to the equivalent period under the Trump administration. Unfavorable policies are deterring companies from making long-term, capital-intensive investments in the U.S. Gulf of Mexico (GOM), where almost all U.S. offshore drilling occurs. The Bureau of Safety and Environmental Enforcement (BSEE) permitted 105 wells in Biden's first two years, which compares to approving 148 during Trump's first two years in office and 275 during Obama's first two years. Oil companies face tougher regulations under Biden, uncertainty in oil prices, and higher expenses as they move into drilling deeper waters.

October 27, 2023

180. A proposed Environmental Protection Agency (EPA) rule on hydrofluoric-acid-based alkylation could spur a round of refinery closures as the cost of replacing hydrofluoric acid based alkylation with alternatives is extremely high. EPA is considering adding amendments to its Risk Management Program (RMP) regulation that could effectively eliminate the use of hydrofluoric acid at U.S. refineries to make cleaner gasoline. Finalization of the rule would result in a loss of U.S. alkylation capacity that would reduce supplies of gasoline and aviation fuel, resulting in higher fuel prices for consumers. It could also shutter some refineries and impact U.S. energy and economic security.

October 31, 2023

181. Biden designates longtime political operative Laura Daniel-Davis as Acting Deputy Secretary for the Department of Interior. Biden previously nominated Daniel-Davis to serve as Assistant Secretary for Land and Minerals Management, but withdrew the nomination after it became clear it would not advance in the senate over concerns of her anti-production track record. This move bypasses congressional authority and places another politically motivated opponent of domestic energy production into the leadership of DOI.

November 2, 2023

182. Biden's Department of Energy (DOE) has increased the time it takes to review a permit for exporting LNG from 7 weeks to a minimum of 11 months. The slowing of permit approval could mean that nearly-completed LNG projects are not able to supply European buyers in need of gas because they do not have the permit. The drastic slowing of LNG export permits represents the most significant limit thus far on an industry planning to add 50 percent more to U.S. export capacity by 2026.

November 6, 2023

183. Biden-Harris Administration Releases Final Guidance on OMB Circular A-4. The 2003 version of Circular A4 advised agencies to use discount rates ranging from 3% to 7% to calculate present values of future costs and benefits. The updated 2023 Circular A4 advises agencies to use the rate of return to Treasury Inflation Protected Securities (TIPS), which currently are roughly 1.7%. The rates reflect the weight given to future impacts of climate change. A higher rate means

a lower dollar value is assigned to future impacts; a lower rate assigns more value to those impacts.

November 11, 2023

184. Biden's Department of the Interior announced a draft of the department's Environmental Justice Strategic Plan. The plan calls for all DOI employees, including those responsible for permitting energy production on federal lands, to be "held accountable for advancing environmental justice." The plan also calls for more of DOI's resources to be used for the purposes of increasing employees' 'awareness and understanding of environmental justice" to be considered in all decision making.

November 17, 2023

185. U.S. Senate Majority Leader Charles Schumer and 22 other Democratic senators recently wrote to the U.S. Federal Trade Commission (FTC), alleging that multi-billion dollar acquisitions by Exxon Mobil and Chevron would lead to reduced competition and higher prices for consumers and asking regulators to launch antitrust probes. Exxon has proposed buying Pioneer Natural Resources for $60 billion and Chevron agreed to acquire Hess for $53 billion. The letter clearly shows, however, that these politicians do not understand much about the U.S. oil market: its players and their contributions to the nation's energy security. First, it is hard to understand how competition would be reduced when Exxon and Pioneer combined produce only about 5 percent of U.S. oil, which is just a fraction of the oil OPEC members control–approximately 80 percent of the world's proven oil reserves. The United States has roughly 9,000 small independent oil producers that produce 83 percent of total U.S. oil production

and 90 percent of total U.S. natural gas production. In Texas, there were more than 5,700 oil and gas producers operating in 2022.

December 1, 2023

186. Buried within the Department of Interior's extensive 200+ page proposal for updating the Fluid Mineral Leases and Leasing Process is a proposed rule that introduces a novel "preference criteria," a potentially transformative mechanism that has garnered relatively little attention but could provide the Biden administration with an additional tool to impede responsible oil and natural gas development. In essence, this would empower the Bureau of Land Management to integrate the "preference criteria" into its regulations governing oil and natural gas, enabling the BLM to preemptively exclude land parcels with "sensitive cultural, wildlife, and recreation resources" from potential leasing, even before conducting environmental analyses.

December 4, 2023

187. EPA issues new methane rule. EPA's new rule requires frequent monitoring and repair of methane leaks at well sites, centralized production facilities, and compressor stations using established inspection technologies or, at an operator's election, novel advanced detection technologies. Similarly, storage vessels at production facilities are regulated in largely the same manner under this final rule as existing VOC requirements. However, storage vessels that previously were unaffected by regulation, including both new and existing facilities, may now be subject to NSPS based upon updated definitions and the addition of a new applicability trigger. Finally, the rule aims to phase out venting and flaring of gas coming from oil wells.

December 8, 2023

188. The Environmental Protection Agency (EPA) updated its estimate of the "social cost" of carbon dioxide—a contrived way of increasing the cost of everything made from or using hydrocarbon resources to vilify those projects and keep them from becoming economic. The new estimate nearly quadruples the estimated cost of carbon dioxide to the world that the Biden administration is currently using — a change that will result in stronger climate rules and more stringent regulations that will increase costs for consumers as the least expensive materials will now cost more when projects are being considered and their costs estimated. The change could affect everything from "tiny rules" such as those concerning vending machines to more significant regulations. It is the Biden administration's way to justify its present position, which as President Biden said, is to "end fossil fuels."

December 11, 2023

189. The Interior Department announced new actions in support of "nature-based" solutions. The policy directs land managers and decision makers to use guidance from "environmental justice and Indigenous Knowledge" to implement "nature-based" climate solutions into all operations on federal lands.

December 14, 2024

190. The U.S. Treasury Department's Office of the Comptroller of the Currency (OCC) carried out its first climate risk assessment of more than two dozen banks in recent months, laying the groundwork for heightened scrutiny of Wall Street's

accounting for climate change. The climate risk assessment will limit financing opportunities for oil and gas projects.

January 5, 2024

191. The Department of the Interior announces Deputy Assistant Secretary for Land and Minerals Management Steve Feldgus has been named Principal Deputy Assistant Secretary for Land and Minerals Management. Feldgus has been an outspoken opponent of domestic mineral production.

January 12, 2024

192. The Biden administration revealed its strategy for implementing a new methane emissions fee targeting the oil and gas sector, aimed at accelerating efforts to curb the release of this potent greenhouse gas. This fee, reaching up to $1,500 per metric ton by 2026, was stipulated by Congress under the 2022 Inflation Reduction Act. However, crucial aspects such as the calculation method for charges and criteria for exemptions have been delegated to the EPA for determination.

January 26, 2024

193. Biden halts permitting for new LNG export facilities.

January 31, 2024

194. Interior halts New Mexico oil plan.

February 7, 2024

195. A new round of political appointments at the Department of Energy places Alexandra Teitz in the office of the DOE's general council. Teitz, a former Obama administration staffer, has written extensively about the federal government's responsibility to prohibit the development of natural gas and oil on federal lands during her work with Climate 21.

February 9, 2024

196. A new round of political appointments at the Department of the Interior places Maryam Hassanein in the office of the DOI's Land and Minerals Management. Prior to joining the administration, Hassanein worked for the League of Conservation Voters, an extreme environmentalist organization that promotes stopping energy production on federal lands in the name of the "climate crisis" among other radical environmental positions.

February 14, 2024

197. The Environmental Protection Agency recently finalized a new rule to reduce the level of particulate matter (PM) by updating the national air-quality standards. Particulate matter is made up of microscopic solid particles such as dirt, soot or smoke and liquid droplets in the air up to 2.5 microns in diameter — far smaller than a human hair. Particulate matter comes from a variety of sources including power plants, cars, dust, construction sites and wildfire smoke. The new rule will lower the annual standard to 9 micrograms per cubic meter from 12 micrograms per cubic meter established by the Obama Administration. The 24-hour standard which is meant to account for short-term spikes will remain at 35 micrograms

per cubic meter. Since 2000, particulate matter has declined by 42 percent, even as the U.S. gross domestic product has increased by 52 percent. The new rule does not impose controls on specific industries; it lowers the annual standard for fine particulate matter for overall air quality, leaving states to force industries to comply or close their doors. The EPA plans to take samples of air across the country starting this year through 2026 to identify counties and other areas that do not meet the new standard. It will also tweak its air monitoring network to better capture the air pollution that communities living near industrial infrastructure face. States would then have 18 months to develop compliance plans for those areas. States that do not meet the new standard by 2032 could face penalties. While the standard itself would not force polluters to shut down, the EPA and state regulators could use it as the basis for other rules that target specific sources such as diesel-fueled trucks, refineries and power plants. Opponents indicate that it will hamper American manufacturing and eliminate jobs and could shut down power plants and/or refineries. EPA officials, however, did not estimate the employment impact of the new rule because of the variety of industries affected. Industry groups like the American Forest & Paper Association, American Wood Council and the group's member company CEOs sent a letter to the White House in October expressing their opposition to the rule, saying the move, "threatens U.S. competitiveness and modernization projects in the U.S. paper and wood products industry and in other manufacturing sectors across our country." "This would severely undermine President Biden's promise to grow and reshore U.S. manufacturing jobs, and ultimately make American manufacturing less competitive." "It also would harm an industry that has been recognized as an important contributor to achieving the Administration's carbon reduction goals, including in future procurement for federal buildings."

198. The Department of Energy announces its second annual equity action plan. Straying ever farther from the department's statutory mission to "assist in the development of a coordinated national energy policy," Secretary Granholm seeks to prioritize "environmental justice and inclusivity" in the agency's rulemaking. The plan complicates DOE procurement and R&D processes by introducing arbitrary political considerations.

Cc: Eric Delzer <edelzer@ndoil.org>; Bradley A. Aman <brad.aman@clr.com>
Subject: NDPC Bakken Power Supply Work Group

At the recent NDPC Board of Directors meeting, NDPC Chairman of Board Todd Slawson created a work group to explore the growing challenges in the Bakken Region relating to reliable and affordable electric power. Chairman Slawson appointed Bradley Aman, Vice President of Facilities and Projects for Continental Resources as Chairman of the work group. The work group will educate themselves on the power supply/power demand issues and identify potential solutions for oil and gas producers and midstream companies. The intent of the work group is to hold a handful of meetings and bring forth their findings to the NDPC Summer Board meeting on June 19th in Medora.

The Bakken Power Supply Work Group will hold the first virtual or in-person meeting on Thursday, March 14 from 3:30 – 5pm. Todd Brickhouse the CEO at Basin Electric Power Cooperative will attend the meeting and provide an overview from Basin's perspective on power supply to the Bakken Region.

If you or your company would like to have a representative or two on the Work Group contact Eric Delzer to be added to the list by March 12th. [redacted]

Details and an agenda for the meeting will be sent on March 13th.

Please contact me with any questions.

Good afternoon!

The North Dakota Petroleum Foundation will be hosting this year’s Bakken Rocks CookFest in Tioga on Thursday, July 18 in Tioga. The event includes a Bakken Basics Information Session from 2:30-4 p.m. in the Tioga Community Center and a BBQ, Education Tent, live music, games and activities for kids, and more from 4-7 p.m. in the Tioga Park.

This free, family-friendly event has been an important outreach event for the Foundation and the oil and gas industry. This year, we’re expecting anywhere between 2,500 and 3,500 people to attend this year’s event, and hope you will join us to meet with constituents and enjoy a great evening!

We appreciate your support in the past and we hope to see you at this year’s event!

Sincerely,

TESSA SANDSTROM

Subject: Fw: EPA Highlights Biden-Harris Administration’s New National Security Memorandum on Critical Infrastructure
Date: Tuesday, April 30, 2024 4:52:46 PM
Attachments: Outlook-zhrlqwb5.png

John and Reice,

Take a look at the press release below regarding the President's national security memorandum to secure and enhance the resilience of critical U.S. infrastructure that came out this afternoon. This would be a great opportunity for the NDIC to call out the disingenuous irony of this proclamation in a press statement or letter. Especially since they're literally forcing us to go to war with them to protect our critical infrastructure.

National Security Memorandum on Critical Infrastructure Security and Resilience | The White House

NATIONAL SECURITY MEMORANDUM/NSM-22
MEMORANDUM FOR THE VICE
PRESIDENT THE SECRETARY OF
STATE THE SECRETARY OF THE
TREASURY THE SECRETARY OF
DEFENSE THE ATTORNEY

www.whitehouse.gov

Biden is directing all agencies to protect our nation's critical infrastructure, but the bureaucrats running those agencies at the direction of the administration are currently the biggest threat to our nation's critical infrastructure. They're trying to shut down pipelines and coal plants at the same time forcing EV's and grid batteries that rely on Chinese supply chains, and in some cases, software created by Chinese companies, when our biggest cybersecurity threat is coming from China. Among the critical infrastructure directly identified in this memorandum are Energy, Food and Agriculture, Transportation Systems, and Water and Wastewater Systems. All of these sectors have already been severely compromised by their own actions. There is a ton of great material in here you can throw back in their face.

The term “critical infrastructure” has the meaning provided in section 1016(e) of the

USA Patriot Act of 2001 (42 U.S.C. 5195c(e)), namely systems and assets, whether physical or virtual, so vital to the United States that the incapacity or destruction of such systems and assets would have a debilitating impact on national security, national economic security, national public health or safety, or any combination of those matters.

The term "all threats, all hazards" means a threat or an incident, natural or manmade, that warrants action to protect life, property, the environment, and public health or safety, and to minimize disruptions of Government, social, or economic activities. It includes, but is not limited to: natural disasters, cyber incidents, industrial accidents, pandemics, acts of terrorism, sabotage, supply chain disruptions to degrade critical infrastructure, and disruptive or destructive activity targeting critical infrastructure.

The term "resilience" means the ability to prepare for threats and hazards, adapt to changing conditions, and withstand and recover rapidly from adverse conditions and disruptions.

Some of these directives directly contradict their own actions:

"The Department of Energy (DOE) shall carry out its statutory responsibilities to address the short-, mid-, and long-term energy challenges facing the Nation, including those implicating electricity, petroleum, natural gas, nuclear material, and other energy resources and services, in coordination with relevant Federal departments and agencies, as appropriate. Consistent with authorities, DOE leads the policy, preparedness, risk analysis, technical assistance, research and development, operational collaboration, and emergency response activities for the United States energy sector."

"The Federal Government, including SRMAs, shall use a common risk-based approach to reducing risk to critical infrastructure. Critical infrastructure risks can be assessed in terms of threats or hazards, vulnerability, and consequence. For the purposes of this effort, the term "risk" refers to the potential for an unwanted outcome, as determined by its likelihood and the consequences. Risk management efforts should be prioritized based on this shared definition, which necessitates identifying the criticality of assets and systems within and across sectors."

"Critical infrastructure owners and operators have primary responsibility, and are uniquely positioned, to manage most risks to their operations and assets. The policy of the Federal Government shall be to support and guide the entities that own, operate, or otherwise control critical infrastructure assets and systems by providing these entities with the information, intelligence analysis, and other support, as appropriate, to manage and mitigate asset-level risks."

"Effective risk management necessitates the Federal Government, in coordination with

owners and operators to the extent practicable, identify, assess, prioritize, mitigate, and monitor risks that may have a potentially debilitating impact on national security (including national defense and continuity of Government), national economic security, or public health or safety."

"Departments and agencies shall also collaborate with private-sector partners; State, local, Tribal, and territorial entities"

"This effort shall include supporting sector coordinating councils, including the State, Local, Tribal, and Territorial Government Coordinating Council. These councils should be inclusive and include owners and operators, their trade associations, and other industry representatives."

The memo mostly targets cyber security threats, but the biggest threat to critical infrastructure in the U.S. is the Biden administration itself.

We'd be happy to support NDIC's leadership in any collaborative response. I'm guessing all other trade associations in the state would be willing to sign on as well if you wanted to include them. I know you guys are as swamped as we are, but the timing of this couldn't be more perfect. Especially, since it was literally published while the NDIC was holding a public meeting discussing all these impending federal rules and lawsuits.

EPA Highlights Biden-Harris Administration’s New National Security Memorandum on Critical Infrastructure

EPA takes important steps to secure our nation’s water infrastructure

WASHINGTON – Today, April 30, 2024, the White House issued a new National Security Memorandum (NSM) to secure and enhance the resilience of U.S. critical infrastructure. The NSM will replace a decade-old presidential policy document on critical infrastructure protection and launch a comprehensive effort to protect U.S. infrastructure against all threats and hazards, current and future.

“Cybersecurity and climate change threats pose serious risks to the drinking water and wastewater services that people in this country rely on every day, and recent cyber attacks on water systems underscore the urgency of increased and coordinated action to protect public health and the environment,” **said EPA Deputy Administrator Janet McCabe.** “The Biden-Harris Administration is leading a comprehensive effort to secure our nation’s critical infrastructure against all threats, and the efforts outlined in the new National Security Memorandum are vital to ensuring that EPA and other federal entities are taking the necessary steps to safeguard public health and our economy.”

The NSM will help ensure U.S. critical infrastructure can provide the nation a strong and innovative economy, protect American families, and enhance our collective resilience to disasters before they happen – strengthening the nation for generations to come. This NSM specifically clarifies the roles and responsibilities of the lead federal agencies identified to improve the resilience of our critical infrastructure sectors against all hazards. EPA is the official sector risk management agency with respect to the water sector. The NSM also implements a coordinated national approach to assess and manage sector-specific risks.

Thanks to the President’s Investing in America agenda, as well as the emergence of new technologies, America has a historic opportunity to build for the future. Good investments require taking steps to manage risk, and for our water infrastructure, that means building in resilience to all hazards upfront and by-design. Through the President’s Investing in America agenda, the Biden-Harris Administration has announced nearly $50 billion to modernize the nation’s water infrastructure. These resources, including more than $23 billion in drinking water and clean water State Revolving Funds, can be used to support a broad range of approaches to build resilience to all hazards, including climate resilience and cybersecurity threats.

The nation faces an era of strategic competition where state actors will continue to target American critical infrastructure – and tolerate or enable malicious activity conducted by non-state actors. In the event of crisis or conflict, America’s adversaries may attempt to compromise our critical infrastructure to undermine the will of the American public and impede the projection of U.S. military power abroad. Resilience, particularly for our most sensitive assets and systems, is the cornerstone of homeland defense and security.

Further, the growing impact of climate change, including changes to the frequency and intensity of natural hazards, as well as supply chain shocks and the potential for instability, conflict, or mass displacement, places strain on the infrastructure that

Americans depend upon to live and do business.

ATTN: Jennifer Bohman – submitted via www.regulations.gov

Re: Revisions and Confidentiality Determinations for Data Elements under the Greenhouse Gas Reporting Rule; Docket Id. No. EPA–HQ–OAR–2019–0424

Dear Administrator Regan:

The North Dakota Petroleum Council (NDPC) appreciates the opportunity to submit comments as your agency considers a proposal to amend specific provisions in the Greenhouse Gas Reporting Rule.

Established in 1952, the NDPC is a trade association that represents more than 550 companies involved in all aspects of the oil and gas industry, including oil and gas production, refining, pipeline, transportation, mineral leasing, consulting, legal work, and oil field service activities in North Dakota, South Dakota, and the Rocky Mountain Region.

NDPC members have a vested interest in the Environmental Protection Agency's (EPA) efforts to improve the data collected under the rule and clarify provisions that reporting entities have had questions about. However, we believe some improvements can be made to this proposal.

NDPC specifically endorses the comments submitted on the proposal by the American Exploration and Production Council (AXPC) and the American Petroleum Institute (API). NDPC also submits the following comments for consideration.

Consider Economic Impacts

In 2021, oil and natural gas accounted for 68% of energy consumption in the US.[1] The oil and natural gas industry is an integral part of the US economy and affordable energy benefits all Americans. Cost-effective and balanced regulation of the energy industry can benefit human health and the environment, but economic impacts must always be considered. In recent years we have seen how high energy costs have driven inflation, increasing the cost of essential goods and services for families across all social and economic groups.

---

[1] https://www.eia.gov/energyexplained/us-energy-facts/

We understand that the original intent of the rule was to assess significant sources of GHG emissions for potential new regulations, and now it is moving in the direction of estimating all GHG and methane emissions for fee collection. For this reason, the NDPC requests the EPA take great care in finalizing this proposal. Any final rule will directly impact our industry resulting in immediate economic impacts today and on future generations.

Clarify Source Categories

One clarification we feel is necessary is to ensure the oil and natural gas source category and its segments are clearly defined, especially the Processing segment. In the NSPS OOOOa Background Technical Support Document (TSD), the EPA states: "The final rule covers emission sources within the oil and natural gas source category, which includes onshore crude oil production and natural gas production, processing, transmission and storage."

These are discreet segments that the EPA discusses and defines in the TSD. The production segment includes everything from the wellhead through the gathering system and ends at the refinery or natural gas processing plant. The EPA describes oil refining and natural gas processing as: "The oil refinery sector is considered separately from the oil and natural gas sector. Therefore, at the point of custody transfer at the refinery, the oil leaves the oil and natural gas sector and enters the petroleum refining sector."

The EPA states further: "Natural gas processing consists of separating certain hydrocarbons and fluids from the natural gas to produce 'pipeline quality' dry natural gas. While some of the processing can be accomplished in the production segment, the complete processing of natural gas takes place in the natural gas processing segment." At this point, the pipeline quality natural gas leaves the processing segment and enters the transmission and storage segment.

We are asking the EPA to clarify that while some processing of natural gas can occur in either the production or processing segment, a natural gas processing plant can only exist in the Processing segment, beginning at the end of the gathering system and ending when pipeline-quality natural gas is delivered into the transmission and storage segment.

We appreciate your serious consideration of these comments and appreciate you moving forward in a measured and thoughtful manner.

Sincerely,

Ron Ness
President, North Dakota Petroleum Council

Subject: New GHG Reporting Final Rule
Date: Monday, April 8, 2024 2:36:03 PM
Attachments: Outlook-vavt1zhf.png
GHG Reporting_NDPC Comments_Oct 6, 2022.docx

John,

Just want to give you a heads up on another final rule that is about to come out. It was signed for publishing in the Federal Register last week.

Revisions and Confidentiality Determinations for Data Elements Under the Greenhouse Gas Reporting Rule (epa.gov)

This rule was proposed in the summer of 2022. As of right now it has not been published, nor announced yet. I imagine it will drop sometime this week.

ENVIRONMENTAL PROTECTION AGENCY
40 CFR Parts 9 and 98
[EPA-HQ-OAR-2019-0424; FRL-7230-01-OAR]
RIN 2060-AU35
Revisions and Confidentiality Determinations for Data Elements Under the Greenhouse Gas Reporting Rule
AGENCY: Environmental Protection Agency (EPA).
ACTION: Final rule.

SUMMARY: The EPA is amending specific provisions in the Greenhouse Gas Reporting Rule to improve data quality and consistency. This action updates the General Provisions to reflect revised global warming potentials; expands reporting to additional sectors; improves the calculation, recordkeeping, and reporting requirements by updating existing methodologies; improves data verifications; and provides for collection of additional data to better inform and be relevant to a wide variety of Clean Air Act provisions that the EPA carries out. This action adds greenhouse gas monitoring and reporting for five source categories including coke calcining; ceramics manufacturing; calcium carbide production; caprolactam, glyoxal, and glyoxylic acid production; and facilities conducting geologic sequestration of carbon dioxide with enhanced oil recovery. These revisions also include changes that will improve implementation of the rule such as updates to applicability estimation methodologies, simplifying calculation and monitoring methodologies, streamlining recordkeeping and reporting, and other minor technical corrections This

Federal Register Notice was signed on April 3, 2024, and the Agency is submitting it for publication in the Federal Register. While we have taken steps to ensure the accuracy of this Internet version of the document, it is not the official version. Please refer to the official version in a forthcoming Federal Register publication, which will appear on the Government Printing Office's website (https://www.govinfo.gov/app/collection/fr) and on Regulations.gov (https://www.regulations.gov) in Docket No. EPA-HQ-OAR-2019-0424. Once the official version of this document is published in the Federal Register, this version will be removed from the Internet and replaced with a link to the official version. or clarifications. This action also establishes and amends confidentiality determinations for the reporting of certain data elements to be added or substantially revised in these amendments.

DATES: This rule is effective January 1, 2025. The incorporation by reference of certain material listed in this final rule is approved by the Director of the Federal Register beginning January 1, 2025. The incorporation by reference of certain other material listed in the rule was approved by the Director of the Federal Register as of January 1, 2018.

I'll let you know if I see it come out.

NDPC Board of Directors Meeting February 2024 – Grand Forks, ND

**Times are subject to change*

Important Addresses:

Canad Inn – 1000 S 42nd St, Grand Forks, ND 58201

Energy and Environmental Research Center (EERC) – 15 N 23rd St, Grand Forks, ND 58202

Toasted Frog – 124 N 3rd St, Grand Forks, ND 58203

Ralph Engelstad Arena – One Ralph Engelstad Arena Dr, Grand Forks, ND 58203

Tentative Agenda:

Thursday, February 29th

1:00 – 2:30 p.m.	NDPF Board Meeting
3:00 p.m.	Hotel check-in open
3:00 – 4:30 p.m.	"Best of EERC" Presentation

Please join the NDPC Board of Directors, state and local leaders, and special guests for a dynamic 90-minute session exploring the EERC's current projects that hold significance for our members, state, and region.

6:00 p.m.	Board bus to Toasted Frog
7:00 p.m.	NDPC Board Dinner at Toasted Frog

*Transportation provided to and from Toasted Frog

Friday, March 1st

8:00 a.m.	Board Breakfast, EERC
8:30 – 11:30 a.m.	NDPC Board of Directors Meeting
12:00 p.m.	Lunch/Ticket handout
1:30 – 3:00 p.m.	UND EERC or UND CEM tour
4:30 – 6:00 p.m.	Social at Upper Playmakers (at Canad Inn)
6:00 p.m.	Bus departs for Ralph Engelstad
7:07 p.m.	Puck drop for UND vs. Western Michigan
9:45 p.m.	Bus back to Canad Inn

Check out by 11:00 a.m. Saturday March 2nd

***Thank you to AE2S, Construction Engineers, EERC, & UND Alumni Association & Foundation for hosting our Board of Directors for the UND Hockey game and providing the food and refreshments!!

OFFICE OF AIR AND RADIATION
WASHINGTON, D.C. 20460

May 6, 2024

Ms. Holly Hopkins
Vice President, Upstream Policy
American Petroleum Institute
Via Electronic Mail: hopkinsh@api.org

Ms. Wendy Kirchoff
Vice President of Policy and Regulatory Affairs
American Exploration and Production Council
Via Electronic Mail: wendy.kirchoff@axpc.org

Dear Ms. Hopkins and Ms. Kirchoff:

This letter concerns the petition for reconsideration of the Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review (89 FR 16820, March 8, 2024) that you submitted on April 5, 2024, pursuant to Clean Air Act (CAA) section 307(d)(7)(B) on behalf of your respective organizations, American Petroleum Institute and American Exploration and Production Council.

Two of the issues you raise in your petition are the (1) vent gas net heating value (NHV) monitoring and alternate sampling demonstration requirements for flares and enclosed combustion devices, and (2) temporary flaring provisions for associated gas in certain situations.

Without making a determination as to whether these two issues meet the mandatory requirements for reconsideration under CAA section 307(d)(7)(B), the U.S. Environmental Protection Agency (EPA) is granting reconsideration on these two issues as a matter of discretion, voluntarily exercised by the EPA. We intend to issue a *Federal Register* notice initiating public review and comment on these issues. At this time, we are not expressing our views on the appropriateness of reconsidering any of the other issues raised in your petition, which we are continuing to review.

Separate from the two issues identified above for which the EPA is granting reconsideration, the EPA is also taking the opportunity in this letter to provide clarification regarding when owners and operators must conduct performance testing with respect to NHV sampling and storage vessels to demonstrate compliance with the applicable NSPS Subpart OOOOb emission standard. Under NSPS Subpart OOOOb, NHV sampling is considered a monitoring requirement (either continuously or via the 14-day sampling demonstration). The EPA is aware of a large number of storage vessels that have triggered applicability prior to the effective date of the rule that will have to complete initial performance testing requirements.

Per 40 CFR 60.8(a) (the General Provisions for NSPS), a source generally has 180 calendar days after startup to conduct performance (i.e., compliance) testing. As applied to this rule, affected sources that were new, modified, or reconstructed after the supplemental proposal for this rule (December 6, 2022), but before the final rule's effective date of May 7, 2024, have 180 calendar days after the effective date of the rule to conduct performance (i.e., compliance) testing. For NSPS subpart OOOOb sources that are new, modified or reconstructed after the final rule's effective date of May 7, 2024, the applicable monitoring requirements (including the 14-day NHV sampling demonstration) must be completed within 180 calendar days after initial startup of the source. Per 40 CFR 60.8(a), the same 180 calendar day performance (i.e., compliance) demonstration timeframe also applies to any storage vessel.

With respect to the issue of closed vent systems (CVS), we acknowledge API and AXPC's position regarding the "no identifiable emission" standard, and the EPA looks forward to continuing discussions with you on this topic.

If you have any questions regarding this letter, please contact Penny Lassiter at (919) 541-5396 or by email at lassiter.penny@epa.gov. We thank you for your continuing interest in this rule, and we look forward to hearing from you during the rulemaking process for those aspects of the rule that we are reconsidering.

Sincerely,

Tomás Carbonell

Subject: EPA Grants Reconsideration

Good afternoon,

I would like to pass along some good news today.

The EPA has granted the industry's petition for reconsideration of the Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review (89 FR 16820, March 8, 2024) that was submitted on April 5, 2024. I have attached the letter that they sent to API and AXPC granting discretionary reconsideration on:

(1) vent gas net heating value (NHV) monitoring and alternate sampling demonstration requirements for flares and enclosed combustion devices, and

(2) temporary flaring provisions for associated gas in certain situations.

"Without making a determination as to whether these two issues meet the mandatory requirements for reconsideration under CAA section 307(d)(7)(B), the U.S. Environmental Protection Agency (EPA) is granting reconsideration on these two issues as a matter of discretion, voluntarily exercised by the EPA. We intend to issue a Federal Register notice initiating public review and comment on these issues. At this time, we are not expressing our views on the appropriateness of reconsidering any of the other issues raised in your petition, which we are continuing to review."

The EPA also provided clarification and guidance on performance testing NHV storage vessels under OOOOb.

Have a great day!

Subject: Natural Asset Companies- Governor Burgum Comments

Good morning and happy Friday,

I have attached two documents to this email detailing our significant concerns regarding the proposed Natural Asset Companies rule. Fortunately, the rule was withdrawn as the comment deadline closed on January 17th; however, we still submitted these comments for inclusion in the public and administrative records.

The first document is our North Dakota special and unique concerns regarding the rule, and the second document is a coalition letter Governor Burgum signed with 6 other Governors.

Feel free to contact us if you have any questions.

Thank you,

John Reiten

EERC Luncheon and Tour RSVP List - 03.01.2024.xlsx
2024 BoD Hockey Tickets and Suites.xlsx

John,

Attached are the RSVP lists we've compiled for the EERC luncheon and EERC/College of Engineering and Mines tours as well as the UND hockey game, both taking place Friday, March 1.

Note the two tabs on the hockey game RSVP list. The UND Alumni Association (Suite 225) is where we have Governor Burgum, Lt. Governor Miller, Jace Beehler, and yourself. That suite list is located at the bottom of the first tab. The second tab includes members of our Board, event sponsors, and other guests.

Subject: Oil and Gas Leasing Rule Challenge
Date: Tuesday, May 7, 2024 4:03:36 PM
Attachments: Outlook-12pjw3x3.png

Good afternoon Phil,

I tried calling but couldn't make a connection. I just wanted to let you know that Western Energy Alliance will be filing a challenge to the BLM leasing rule next week, mainly on the grounds of the prohibitive bonding rates. NDPC will likely be joining them as a co-plaintiff. It is my understanding that this suit will be filed in Wyoming, but WEA may file on the conservation and landscape health rule up here in the 8th Circuit.

Let me know if you have any questions.

Regards,

Eric Delzer
Regulatory Affairs Manager

Re: Oil and Natural Gas Associations' Comments on BLM's Proposed Rule, Fluid Mineral Leases and Leasing Process, 88 Fed. Reg. 47,562 (July 24, 2023), RIN 1004-AE80, Docket ID: BLM-2023-0005-0003 ("Proposed Rule")

Dear Ms. Stone-Manning:

The American Petroleum Institute ("API"), Alaska Oil and Gas Association ("AOGA"), American Exploration and Production Council ("AXPC"), Colorado Oil & Gas Association ("COGA"), West Slope Colorado Oil and Gas Association ("WSCOGA"), Independent Petroleum Association of America ("IPAA"), Montana Petroleum Association ("MPA"), New

Mexico Oil and Gas Association ("NMOGA"), North Dakota Petroleum Council ("NDPC"), Petroleum Alliance of Oklahoma, Permian Basin Petroleum Association ("PBPA"), Utah Petroleum Association ("UPA"), Western States Petroleum Alliance ("WSPA"), and Petroleum Alliance of Wyoming ("PAW") (collectively "the Associations") appreciate the opportunity to submit comments on the above-referenced Bureau of Land Management ("BLM") Proposed Rule.

The Associations support BLM's goal of ensuring fair returns for the American public from activities on federal lands, but we are concerned that BLM's approach with this rule overreaches its statutory authority and could have a damaging impact on U.S. energy security and the economy. First, these changes disregard Congress' and multiple courts' rejection of the Administration's recent attempts to dramatically curtail federal oil and natural gas leases.[1] Second, these changes reject existing robust planning and environmental review processes. Instead, they enhance BLM discretion to constrain onshore access—both procedurally and on a case-by-case basis. Third, these changes may compromise the Administration's environmental goals by creating greater dependence on foreign sources for American energy needs. While the demand for oil and natural gas persists—which the Administration has repeatedly acknowledged will be true for the foreseeable future—it is often preferable to have that production occurring domestically and on federally-managed lands rather than from other locations or energy sources that have a more significant environmental footprint. Therefore, BLM should abandon several aspects of this Proposed Rule, or at a minimum, substantially revise and re-propose them to reflect functional and effective regulations prior to issuing any final rule.

THE ASSOCIATIONS' INTERESTS

API is the only national trade association representing all facets of the oil and natural gas industry, which supports more than 10 million U.S. jobs and nearly 8 percent of the U.S. economy. API's nearly 600 members include large integrated companies, as well as exploration and production, refining, marketing, pipeline, and marine businesses, and service and supply firms. They provide most of the nation's energy and are backed by a growing grassroots movement of Americans. Many API members have a keen interest in the Proposed Rule because they currently hold interests in or operate federal onshore oil and gas leases throughout the United States.

AOGA is a non-profit trade association located in Anchorage, Alaska. AOGA's member companies account for the majority of oil and gas exploration, development, production, transportation, refining, and marketing activities in Alaska. AOGA and its members are longstanding supporters of federal lands use, conservation, management, and research in the Arctic.

AXPC is a national trade association representing 34 leading independent oil and natural gas exploration and production companies in the United States. AXPC companies support millions of Americans in high-paying jobs and invest a wealth of resources in our communities.

---

[1] *See, e.g.*, Inflation Reduction Act of 2022, Pub. Law No. 117-169; *State of North Dakota v. U.S. Dep't of Interior, et al.*, No, 21-148, ECF No. 98 (D.N.D. Mar. 27, 2023) (slip. op.); *Louisiana v. Biden*, 622 F. Supp. 3d 267 (W.D. La. 2022).

Dedicated to safety, stewardship, and technological advancement, AXPC's members strive to deliver affordable, reliable energy to consumers while positively impacting the economy and the communities in which we live and operate. As part of this mission, AXPC members understand and promote the importance of advancing positive environmental and public-welfare outcomes and responsible stewardship of the nation's natural resources. AXPC's members are committed to being good stewards of federal and Indian resources and operating in compliance with all federal requirements. AXPC member companies produce more than half of U.S. onshore production each year.

COGA is a non-profit trade organization that represents over 200 companies throughout the state of Colorado. For nearly 40 years, COGA has sought to create a thriving, innovative and respected oil and natural gas industry in Colorado that embodies the values of our communities, prioritizes the protection of our environment, and provides the natural resources that advance our society. COGA provides a positive, unified, and proactive voice for the oil and natural gas industry in Colorado.

As a membership association representing oil and gas exploration, production, and midstream companies, **WSCOGA** members will be directly impacted by the results of this rulemaking and has a significant interest in ensuring clarity, consistency, and fairness in the further development of oil and gas regulations. WSCOGA provides a unified political and regulatory voice for the oil and natural gas industry in the Piceance Basin and the rest of Western Colorado. WSCOGA's represents over 90 member companies and its mission is to produce natural gas products for the benefit of society.

IPAA is a national upstream trade association representing thousands of independent oil and natural gas producers and service companies across the United States. Independent producers develop 91 percent of the nation's oil and natural gas wells. These companies account for 83 percent of America's oil production, 90 percent of its natural gas and natural gas liquids (NGL) production, and support over 4.5 million American jobs.

MPA is a Montana-based trade association representing over 150 member-companies involved in all aspects of the oil and natural gas industry. MPA's members include producers, refiners, suppliers, pipeline operators, transporters, and mineral owners as well as service and supply companies that support all segments of the industry and employ a substantial number of hard-working Montanans.

NMOGA is a coalition of oil and natural gas companies, individuals, and stakeholders dedicated to promoting the safe and environmentally responsible development of oil and natural gas resources in New Mexico. Representing over 1,000 members, NMOGA works with elected officials, community leaders, industry experts, and the general public, to advocate for responsible oil and natural gas policies and increase public understanding of industry operations and contributions to the state. New Mexico's oil and natural gas activity is concentrated in two areas: the Permian Basin in the southeast and the San Juan Basin in the northwest. New Mexico is one of the United States' leading producers, ranking 2nd in annual oil production and 9th in annual natural gas production. New Mexico is attracting interest and attention from around the globe, as the Permian Basin undergoes a resurgence of production and investment activity.

Established in 1952, **NDPC** is the trade association and primary voice for the oil and gas industry in North Dakota. NDPC represents more than 550 companies involved in all aspects of the oil and gas industry, including oil and gas production, refining, pipeline development and operation, transportation, mineral leasing, consulting, legal work, and oil field service activities in North Dakota, South Dakota, and the Rocky Mountain Region. The mission of NDPC is to promote opportunities for open discussion, lawful interchange of information, and education concerning the petroleum industry; to monitor and influence legislative and regulatory activities on the state and national level; and to accumulate and disseminate information concerning the petroleum industry to foster the best interests of the public and industry.

The **Petroleum Alliance of Oklahoma** represents more than 1,400 individuals and member companies and their tens of thousands of employees in the upstream, midstream, and downstream sectors and ventures ranging from small, family-owned businesses to large, publicly traded corporations. Its members produce, transport, process and refine the bulk of Oklahoma's crude oil and natural gas.

PBPA is the largest regional oil and gas association in the United States. We represent the men and women who work in the oil and gas industry in the Permian Basin of West Texas and southeastern New Mexico. The Permian Basin is the largest inland oil and gas reservoir and the largest oil and gas producing region in the world. PBPA consists of the largest producers as well as the smallest operators in the Permian Basin. Part of PBPA's mission is to promote environmentally conscious operations and sustainable economic profitability among all our members, large and small.

UPA is a statewide oil and gas trade association established in 1958 representing companies involved in all aspects of Utah's oil and gas industry. UPA members range from independent producers to midstream and service providers, to major oil and natural gas companies widely recognized as industry leaders responsible for driving technology advancement resulting in environmental and efficiency gains. UPA members operate extensively on federal lands and have a long history of stewardship and conservation.

WSPA is a non-profit trade association that represents companies that account for the bulk of petroleum exploration, production, refining, transportation and marketing in the five western states of Arizona, California, Nevada, Oregon, and Washington. WSPA members operate in upstream, midstream, and downstream segments of the oil and natural gas industry.

PAW represents companies involved in all aspects of responsible oil and natural gas development in Wyoming, including upstream production, oilfield services, midstream processing, pipeline transportation and essential work such as legal services, accounting, consulting and more. PAW advocates for oil and gas development that supports sustainable production of Wyoming's abundant resources; fosters mutually beneficial relationships with Wyoming's landowners, businesses, and communities; and upholds the values of science-based, environmental stewardship. Eighty-five percent of the oil and gas companies operating in Wyoming are classified as small businesses.

GENERAL COMMENTS

The Associations generally support BLM's effort to update and clarify the federal onshore oil and natural gas leasing and lease management regulations. The Associations support the proposed changes that implement the Inflation Reduction Act ("IRA") as well as those that reduce and streamline filing and recordkeeping requirements. However, the Associations have multiple concerns with the rule. Among other shortcomings, it contravenes BLM's statutory authority and does not reflect the foundational concepts of the Federal Land Policy and Management Act ("FLPMA") and BLM's mission. The Associations' comments and concerns about the Proposed Rule reflect certain foundational concepts that should shape any BLM regulation:

1. Onshore federal fluid minerals should remain a viable and attractive investment option with a balanced, predictable, and equitable leasing and lease management process.

2. The Associations disagree that the existing regulations governing BLM's discretionary functions are inadequate to protect the fiscal interests of the American public, which include not only direct proceeds from leasing, but also affordable, abundant, domestic energy that lowers prices at the pump and broadens foreign policy options.

3. The Associations disagree that the existing regulations fail to promote leasing practices that are consistent with diligent development requirements and multiple-use and sustained-yield principles. BLM should not limit areas available for leasing by directing leasing to what BLM subjectively considers "appropriate" locations, either under its informal expression of interest ("EOI") process or its proposed formal nomination process. Regional planning, National Environmental Policy Act ("NEPA") reviews, and other processes already conduct the requisite balancing in identifying suitable areas for leasing.

4. BLM cannot adopt new leasing procedures that sidestep or dilute its statutory obligation to conduct quarterly lease sales in each state.

5. BLM cannot adopt regulatory changes that unduly constrain opportunities for development and operations on already-issued leases or that breach or otherwise unduly impair rights conferred under those leases.

6. BLM cannot confer undue authority on other Department of the Interior ("DOI") bureaus, and other surface managing agencies, to constrain leasing and development of oil and natural gas leases on federally-managed lands.

7. BLM should not impose undue bonding and additional financial burdens on the oil and natural gas industry beyond new statutory requirements under the IRA.

8. BLM should not "streamline" disqualification of entities from existing or new leases, akin to suspension and debarment but without corresponding due process.

The likely impacts of this Proposed Rule appear to exacerbate challenges created by other recent proposals and efforts by BLM and other federal agencies, thereby decreasing domestic energy supplies and undermining energy security. The Associations refer BLM to, and incorporate by reference, their submitted comments on those regulatory proposals.[2]

A. Federal Onshore Oil and Natural Gas Leasing Is Critical to the United States' Global Leadership in Energy Production.

The U.S. is a global leader in both emissions reductions[3] and energy production.[4] Oil and natural gas exploration and development on federal lands and waters provide enormous benefits to our nation and its citizens—for our economy, our environment, and our national security. Because of the vital importance of energy production on public lands, overreaching land management regulations place our domestic energy supply at risk. Reduced production on federal lands also harms local communities that depend upon the jobs and revenues generated by lawful energy development. To the extent BLM's Proposed Rule reduces opportunities for oil and gas development on public lands, the U.S. and its allies will likely import more oil and natural gas from countries that may have lower environmental standards and could revert to coal for power generation, resulting in higher emissions domestically and internationally—precisely the opposite of the Administration's overriding policy objectives.[5]

The U.S. oil and natural gas industry produces and delivers nearly 70% of the energy our country uses. Our nation and the world will continue to need reliable, affordable oil and natural gas - energy that will serve as the foundation for broader opportunities for decades to come. Oil and natural gas production on public lands is a crucial part of the nation's program for energy security and economic strength. Likewise, the oil and natural gas industry is essential to supporting a modern standard of living by providing communities with access to affordable, reliable, and cleaner energy. The industry's top priority remains public health and safety, and our member companies have well-established policies in place for proactive community engagement and feedback aimed at fostering a culture of trust, inclusivity, and transparency.

Reg. 19,583 (April 3, 2023); Council on Environmental Quality ("CEQ"), National Environmental Policy Act Implementing Regulations Revisions Phase 2, 88 Fed. Reg. 49,924 (July 31, 2023).

[3] According to EPA, "Between 1970 and 2020, the combined emissions of the six common pollutants (PM2.5 and PM10, SO2, NOx, VOCs, CO and Pb) dropped by 78 percent. This progress occurred while U.S. economic indicators remain strong." EPA, *Progress Cleaning the Air and Improving People's Health* (May 1, 2023), https://www.epa.gov/clean-air-act-overview/progress-cleaning-air-and-improving-peoples-health#pollution.

[4] According to the Energy Information Administration, the United States is ranked first globally in total energy production from both natural gas and from petroleum and other liquids. U.S. Energy Info. Admin., *Total Energy Production from Natural Gas*, https://www.eia.gov/international/rankings/world?.pa=287&u=2&f=A&v=none&y=01%2F01%2F2021.

[5] The International Energy Agency reports that coal consumption rose 3.3% in 2022. https://www.iea.org/news/global-coal-demand-set-to-remain-at-record-levels-in-2023.

The Associations and their members believe that all people should be treated fairly, regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. In this regard, it is crucial to bear in mind that oil and natural gas development on federal lands promotes investment in rural areas where state and local economies depend on the industry for jobs, continued economic prosperity, and revenue generated from state severance taxes and local taxes generated from these projects.

Just as importantly, the Associations' members support the health and sustainability of public lands and resources. The oil and natural gas industry employs technology and strategies as part of its support for environmental stewardship—taking measures to prioritize protecting public health and the environment, while working to deliver plentiful energy. Measures for the protection of species, habitats, and groundwater are all part of the Associations' members' approach to oil and natural gas development, and projects are designed, managed, and operated to identify and address potential environmental impacts associated with activities ranging from initial exploration to eventual closure. The Associations' members make unparalleled efforts to improve the compatibility of their operations with the environment while responsibly and economically developing energy resources and supplying high quality products and services to consumers. Indeed, across these varied operations, the Associations' members are working continually to minimize and reduce impacts to air, water, and land resources, including to protected species and habitats. At the same time, the Associations' members implement and improve innovative practices and technology while continuing to bolster research that looks for new ways to further enhance environmental performance.

In addition, the Associations and their members monitor, compile and report emissions data per government regulations and on a voluntary basis as appropriate, conduct studies with academic institutions, and work closely with state and federal regulators. This type of collaboration has resulted in improved habitat and species health. For example, modern energy production methods and technologies have resulted in a 70% reduction in surface disturbance when compared to historical practices.[6] The industry also works with many stakeholder groups to understand wildlife migration patterns and routes in areas where operations occur. In particular, oil and natural gas production on BLM lands provides immense value for the nation. BLM manages approximately 245 million acres of surface estate on public lands in the United States (more than any other federal agency).[7] BLM also manages the federal government's onshore subsurface mineral estate (approximately 700 million acres).[8]

[7] The White House, *Department of the Interior, in* THE BUDGET FOR FISCAL YEAR 2024 (2023), https://www.whitehouse.gov/wp-content/uploads/2023/03/int_fy2024.pdf.

[8] BLM, *About the BLM Oil and Gas Program*, https://www.blm.gov/programs/energy-and-minerals/oil-and-gas/about#:~:text=The%20BLM%20manages%20the%20Federal,benefit%20of%20the%20American%20public.

The Congressional Research Service ("CRS") recently explained the enormous importance of oil and natural production on federal lands to the federal government, the states, local communities, and the nation as a whole.[9] Production of oil and natural gas from onshore federal lands represents almost 10% of total domestic production of crude oil and natural gas. CRS found that total revenues from oil and natural gas leases on onshore federal lands exceeded $4.2 billion in fiscal year 2019. This substantial return for the taxpayer is comprised of royalty and interest payments, bonuses, rentals, and other sources. In turn, these funds were disbursed to states (more than $2 billion), the Reclamation Fund (more than $1.5 billion), and the U.S. Treasury ($444 million), among other recipients.[10]

More recent data published by DOI's Office of Natural Resources Revenue ("ONRR") shows that, for fiscal year 2022, federal leases generated more than $7.6 billion in revenues (from bonus bids, royalties, rents, and other sources).[11] For fiscal year 2022, ONRR disbursed over $4.3 billion in funds collected from leasing activities on federal lands and waters to 33 states.[12] As stated by CRS, "[f]ederal revenues from oil and natural gas leases provide income streams that support a range of federal and state policies and programs."

Relevant benefits also extend beyond direct proceeds from BLM onshore oil and gas leases. The Associations refer BLM to and incorporate by reference the attached analysis of "Economic Benefits of Onshore Federal Oil and Natural Gas Leasing." Based on reliable modeling, in fiscal year 2022, onshore federal oil and natural gas development supported nearly 250,000 jobs, generated $19.4 billion in labor income, and contributed $36.7 billion to U.S. Gross Domestic Product ("GDP"). More broadly, between fiscal year 2013 and fiscal year 2022, onshore federal oil and natural gas leasing supported an average of 190,000 jobs, generated $13.4 billion in labor income, and contributed $24.2 billion to GDP each year.

The many added costs and burdens in the Proposed Rule needlessly place these substantial economic returns at risk. This concern is heightened for marginal properties for which the Proposed Rule's new bonding and other burdens could accelerate termination and thereby result in waste of federal oil and natural gas. Moreover, the Proposed Rule could undercut its stated environmental justice aims by reducing good jobs and economic benefits for otherwise disadvantaged communities that stem from onshore federal oil and gas activities.

[12] *Id.*

B. The Proposed Rule Inappropriately Stifles Critical Domestic Energy.

Though purporting to principally implement statutory changes enacted in the IRA, the Proposed Rule includes other significant changes that could dramatically and inappropriately curtail oil and natural gas leasing and corresponding production. Several proposed provisions introduce new uncertainty into BLM's leasing process. In doing so, contrary to its preamble's assertions, the Proposed Rule contradicts directives to BLM for "improvements in the Nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends." 88 Fed. Reg. at 47,608 (citing Executive Order 13563).

Perhaps of greatest concern is the Proposed Rule's creation and implementation of new "preference criteria" that are opaque and subjective. Emblematic of the Proposed Rule's flawed approach is its assertion that "this approach would provide stakeholders with greater certainty, as it would be understood at the outset of the leasing process that the preference criteria would guide the BLM's decision-making." *Id.* at 47,566-67. But the only such added certainty appears to be substantially less oil and natural gas leasing, as BLM's non-"preference" of certain areas would likely amount to their indefinite exclusion from leasing. That is, the Proposed Rule would repeatedly defer the leasing of promising oil and natural gas prospects, instead "directing leasing toward areas that do not have" what BLM perceives to be "any sensitive cultural, wildlife, and recreation resources." *Id.* at 47,566. It is disconcerting that BLM would attempt to shift toward subjective judgments rather than rely on already-existing intensive planning efforts, NEPA reviews, and other environmental safeguards making such onshore areas suitable for oil and natural gas leasing.

If implemented as written, the Proposed Rule could essentially eliminate the opportunity for exploration or the expansion of newly discovered producing areas, constrain future oil and natural gas development to areas where it already exists, and shrink such areas even further, thereby discouraging further innovation, new discoveries, and ultimately domestic production. Even after accepting nominations and holding lease sales, BLM would reserve the ability to impose new conditions and ultimately deny leases. Additionally, despite BLM only nominally offering acreage for leasing or itself nominating tracts in which industry has indicated no interest, BLM could nonetheless unduly count such acreage against its IRA minimums for onshore oil and natural gas leasing to enable BLM to issue rights-of-way for wind and solar energy development on federal lands.

Vague rules and standards create substantial uncertainty, undermine investor confidence, and reduce the value and reliability of partnerships with federal agencies on shared efforts to responsibly operate on and around federal lands and resources. Through statutes like FLPMA, longstanding agency regulations and policies, and judicial decisions, the concepts of "multiple use" and "sustained yield" have become well understood. Yet a variety of provisions in the Proposed Rule, employing many undefined or ill-defined key terms, would create uncertainty about implementation of this existing framework, while also adding a host of other new policies and tools that will further exacerbate that uncertainty. Such problematic provisions include, but are not limited to: (1) novel and undefined "preference criteria"; (2) broad and summary disqualification of persons from bidding on and receiving leases; (3) unnecessarily added steps and opportunities for BLM to further restrict lease terms or otherwise deter leasing during the leasing process; (4) open-ended operational restrictions announced within and even after lease sales; (5) needless tying up of capital via substantially greater bonding requirements; and (6) impermissible creation of veto authority in other agencies that has no statutory foundation.

The results of such uncertainty in the Proposed Rule would be the following: create, (rather than obviate) conflict among key stakeholders and uses; reduce the regulatory certainty that is essential to support investment in economically productive uses; and hinder the ability of BLM to achieve the congressional mandates set forth in FLPMA and the Mineral Leasing Act ("MLA"). Therefore, BLM should revise and re-propose its Proposed Rule to properly manage federal lands for energy production among other statutory purposes and to ensure companies have a clear understanding of what they are bidding on and the lease terms that will govern their property rights. Ultimately, BLM and industry should work in concert to provide responsible and reliable domestic energy leasing and production that benefits the U.S. public.

The Proposed Rule is particularly concerning for the western states, which contain 99% of all lands managed by BLM. The MLA provides that "lease sales shall be held for each State where eligible lands are available at least quarterly and more frequently if the Secretary of the Interior determines such sales are necessary." 30 U.S.C. § 226. The MLA further provides that, as a general matter, 50% of money received from sales, bonuses, royalties, and rentals is distributed to the states where the leased lands are located. As noted above, for fiscal year 2022, federal leases generated over $7.6 billion in revenues (from bonus bids, royalties, rents, etc.). For fiscal year 2022, the ONRR disbursed over $4.3 billion in funds collected from leasing activities on federal lands and waters to 33 states.[13]

According to revenue data published by ONRR,[14] during fiscal year 2022, more than $8.8 billion was distributed to federal and local governments and Native American tribes as a result of federal *onshore* production alone (the majority of which comes from oil and natural gas production on federal lands). During that same period, almost 440 million barrels of oil and almost 3.5 trillion cubic feet of natural gas were produced from federal onshore lands. For New Mexico alone, disbursements from onshore energy production resulted in over $2.7 billion in disbursements to state and local governments in fiscal year 2022. In the same period, Wyoming received over $785 million in disbursements for onshore production. Additional funds are distributed to states via the Reclamation Fund, which supports critical infrastructure in local communities; the Land and Water Conservation Fund, which supports state and local efforts to conserve areas; and the Historic Preservation Fund, which supports efforts to preserve historical and cultural resources through state and local grants.

As previously noted, CRS has explained that "[f]ederal revenues from oil and natural gas leases provide income streams that support a range of federal and state policies and programs."[15] States and local governments use these funds to support a variety of needs,

---

[13] DOI, *FY 2022 Announcement*, *supra*.

[14] DOI, *Natural Resources Revenue Data* (May 26, 2023), https://revenuedata.doi.gov/.

[15] TRACY, *supra*. According to the Western Governors Association, "The federal government has codified several historic agreements and programs to compensate western states for reduced revenue associated with the presence of tax-exempt federal lands within their borders. Western Governors call upon the federal government to honor its statutory obligations to share royalty

including funding for schools, social services, and infrastructure. Because of the direct connection between energy leasing and production and state and local revenues, the Proposed Rule risks cuts to these revenues and, hence, direct harm to these states and communities.

Another consideration, not analyzed in the Proposed Rule, is that due to the checkerboard nature of federal tracts in some states, state and private mineral interests adjacent to BLM lands could be adversely impacted by the Proposed Rule. *Cf. Wyoming v. DOI*, 493 F. Supp. 1046, 1083 ("BLM's implementing regulations have historically maintained this distinction between its general regulatory authority over Federal leases and its more limited authority with respect to the private and State leases that may be pooled with Federal interests."). This could result in delays or complete exclusion of such non-federal minerals in addition to the previously-mentioned loss in federal bonuses and royalties. BLM thus should further engage directly with the states where BLM lands are situated to ensure that new BLM policies and rulemakings do not result in unjustified impacts on these areas.

C. The Proposed Rule Imposes Unreasonable New Financial Burdens on Lessees and Operators.

The cumulative effect of the additional costs BLM is proposing to add, coupled with the already increased costs required by the IRA, is to impose potentially stifling financial burdens on federal oil and gas lessees and operators. The consequence will be that many existing lessees and operators may no longer be able to continue operating their federal leases, and the number of potential lessees willing to bid for new federal lease interests in future competitive lease sales may decline as well.

The IRA imposes mandatory increased fees on lessees and operators that BLM is implementing through the Proposed Rule. The minimum royalty rate for new oil and gas leases is increasing from 12 ½ percent to 16 2/3 percent. Royalty rates for reinstated leases also are increasing from 16 2/3 percent to 20 percent. The IRA increases the minimum bid amount from $2 per acre to $20 per acre. Rental rates are increased from $1.50 per acre to $3 per acre the first two years of the lease (100 percent increase), $1.50 per acre to $5 per acre the next three years (233 percent increase), $2 per acre to $5 per acre for years six through eight (150 percent increase), and $2 per acre to $15 per acre the last two lease years (650 percent increase). Rental rates for reinstated leases similarly are increased from $10 per acre to $20 per acre (100 percent increase). The IRA also imposes a new $5 per acre fee (indexed to inflation) for any person that submits an expression of interest in leasing federal lands.

The cumulative impact of these congressionally-mandated increased rates and fees on federal lessees and operators without doubt will be extraordinarily burdensome. Yet BLM is proposing to simultaneously exacerbate those burdens via the Proposed Rule that would impose

---

and lease payments with states and counties. States, as recipients of revenues from these programs and agreements, should be provided meaningful and substantial opportunities for consultation in the development of federal policy affecting those revenues." W. Governor's Ass'n, *WGA Policy Resolution 2023-02* (Dec. 7, 2022), https://westgov.org/resolutions/article/wga-policy-resolution-2023-02-states-share-of-royalties-and-leasing-revenues-from-federal-lands-and-minerals.

other substantial cost increases, some that even Congress was unwilling to impose at the same time as the broad increases described above. While Congress declined to do so, BLM is proposing to increase the lease bond that an operator must provide to BLM from $10,000 to $150,000 (1,500 percent increase), and the state-wide bond from $25,000 to $500,000 (2,000 percent increase). BLM also is proposing to eliminate nationwide bonds entirely, depriving lessees and operators of a financial tool currently available to mitigate bonding costs by spreading them over a larger universe of leases. BLM also is proposing to increase a range of processing and filing fees by several hundred percent, including raising the fee for an Application for Permit to Drill to $11,805, a large increase over the current fee.

The detrimental effect of these staggering cumulative rate and fee increases will fall disproportionately on smaller lessees and operators who operate the marginal properties that constitute a substantial percentage of production from federal leases. The negative economic impacts likely will cause some operators to cease operations on these marginal properties, permanently stranding and thereby wasting federal oil and gas resources inconsistent with long-standing statutory federal mineral leasing principles. The increased costs to operate on federal leases also will deter smaller operators from participating in future lease sales, constraining competition and likely causing an overall reduction in future bonus bids.

It is serious error for BLM to assume that oil and natural gas lessees and operators will be able to absorb these cumulative cost increases and continue business as usual on federal lands. Indeed, the Proposed Rule does not meaningfully evaluate its economic effects in the real-world context of contemporaneous IRA-based cost increases. Where BLM does quantify costs of certain proposed provisions codifying the IRA, BLM appears to understate them. For example, based on the last five years of National Fluids Lease Sale System data, annual EOI fees increases appear to be about 145 percent higher (approximately $9.3 million) than BLM estimates (approximately $3.8 million). Nor does the Proposed Rule assess its economic effects aggregated with other BLM and Administration initiatives placing even more costs on federal oil and gas lessees and operators.

To the contrary, the Proposed Rule inappropriately downplays its economic impacts on the regulated community, particularly small businesses. For example, with respect to BLM's proposed new bonding costs, BLM's RFA analysis states that "the annual cost to secure a bond would not be material," suggesting the increased bonding might have some limited impact on small businesses. *Id.* at 47,609. That is because BLM claims that buying a bond is only 1 to 3.5 percent of the bond value on an annual basis. That simplistic metric provides an incomplete picture. For example, even premiums comprising a small percentage of the Proposed Rule's sharply increased bonding requirements may impose a significant burden on the bottom line of a small business, particularly if those premiums must be paid each year of the lease. The Proposed Rule also presumes equal access to bonding. Moreover, certain industry experts anticipate that small companies may need to self-bond the entire amount in some instances. Thus, BLM must adopt a more holistic and pragmatic economic analysis before proceeding to any final rule.

SECTION-BY-SECTION COMMENTS

BLM is proposing changes simultaneously to a large number of existing regulations. For ease of reference, the Associations' comments below follow the same organization of sections as in the Proposed Rule. Many of the modifications to sections in the Proposed Rule include only grammatical or similar minor modifications to reflect an updated style, and do not include any substantive changes to BLM's existing regulations. The Associations are not providing any comment on those sections, and generally support those modifications.

The Associations offer comments on several sections with proposed substantive changes to the Proposed Rule's regulatory text. For clarity, throughout these comments, the Associations provide suggested regulatory text revisions in redline format to facilitate BLM's consideration:

- Recommended language for removal is indicated in ~~strikethrough text~~, except where the Associations recommend deletion of a provision of the Proposed Rule in its entirety.
- Recommended language for addition is indicated in <u>underlined text.</u>

References herein to existing regulatory sections are to title 43 of the Code of Federal Regulations unless specified otherwise.

I. PART 3000

A. § 3000.5 Definitions.

The Associations generally support BLM's efforts to clarify, simplify, and contemporize the definitions section for part 3000. However, BLM should not create a new definition of "person." It instead should use the definition of that term in the Federal Oil and Gas Royalty Management Act, 30 U.S.C. § 1702, that already applies to BLM. Creating a new regulatory definition could cause inconsistency and unnecessary confusion.

Recommended Revision:

> <u>*Person* means any individual, firm, corporation, association, partnership, consortium, or joint venture or entity, including a partnership, association, State, political subdivision of a State or territory, or a private, public, or municipal corporation.</u>

The proposed changes to the term "surface managing agency" are also problematic. The existing definition in § 3000.0-5 limits the definition to "any Federal agency *outside of the Department of the Interior* with jurisdiction over the surface overlying federally-owned minerals" (emphasis added). The proposed definition would expand the referenced federal entities to include "any Federal agency, other than the BLM, having management responsibility for the surface resources that overlay federally owned minerals." This would now include other DOI bureaus, for example, the U.S. Fish & Wildlife Service ("FWS") and the Bureau of Reclamation ("BOR"). Therefore, a legal problem with this definition is that it improperly expands the surface managing agency consent provisions of the Mineral Leasing Act for Acquired Lands ("MLAAL"), 30 U.S.C. § 352, which provides that "[n]o mineral deposit covered by this section shall be leased except with the consent of the head of the executive department, independent establishment, or instrumentality having jurisdiction over the lands containing such deposit . . . ." The FWS Director and the BOR Director are not heads of an executive department. Thus, BLM does not have the authority to delegate the MLAAL surface management responsibility for acquired lands to a DOI bureau official subordinate to the Secretary of the Interior (who is the head of the executive department) through this definitional change or otherwise.

Also, as explained below in relation to the changes to proposed § 3101.52, this proposed definitional change would improperly grant the FWS, BOR or other DOI bureau Director authority to block a Secretarial decision to lease federally-managed minerals. BLM therefore should not adopt the proposed change to the definition of "surface managing agency" in any final rule.

The Associations also refer to BLM to the comments below on proposed § 3120.42 utilizing the newly defined terms "acreage for which expressions of interest have been submitted" and "acres offered for lease."

B. § 3000.40 Appeals.

This proposed section would retain the provisions of existing § 3000.4 with minor revisions. However, this existing provision allowing adversely affected parties to appeal BLM leasing-related decisions to the Interior Board of Land Appeals ("IBLA") practically provides no appeal right because IBLA review generally takes several years.[16] The result is that the decision of the "authorized officer," defined in proposed § 3000.5 as "*any BLM employee* authorized to perform the duties prescribed in parts 3000 and 3100" (emphasis added), effectively becomes the final decision of the agency because by the time a leasing-related decision would reach the point for an IBLA determination, the issue in many instances could be moot. That is because within that multi-year IBLA appeal period, absent a stay granted by the IBLA, an appellant likely would need to comply with the challenged order or make other investments in its lease, and its primary lease term would continue to run. Therefore, as part of this regulatory update, BLM should utilize this opportunity to adopt a provision for State Director review similar to existing 43 C.F.R. § 3165.3(b) that allows adversely affected parties to promptly obtain BLM management level review from a decision of the "authorized officer." An adverse State Director decision then would be appealable to IBLA.

Recommended Revision:

> Except as provided in 43 CFR 3000.120, 3000.130, 3101.53(b), 3165.4, and 3427.2, any party adversely affected by a decision of

---

[16] IBLA publishes a list of its pending appeals, https://www.doi.gov/oha/organization/ibla/IBLA-Pending-Appeals (as of July 31, 2023). There currently are several hundreds of pending appeals, many of which were filed in 2017, confirming that at the current rate it may take as long as seven years from when an appeal is filed with IBLA to receive a decision. Even if IBLA were able to cut its processing time for decisions by half, waiting that length of time effectively neutralizes any benefit to a prevailing appellant because later events may overtake an extant leasing dispute.

> the authorized officer made pursuant to the provisions of 43 CFR parts 3000 or 3100 has a right of appeal ~~pursuant to 43 CFR part 4~~. Any adversely affected party that contests an order or decision of the authorized officer issued under the regulations in parts 3000 and 3100 may request an administrative review before the State Director, either with or without oral presentation. Such request, including all supporting documentation, must be filed in writing with the appropriate State Director within 20 business days of the date such order or decision was received or considered to have been received and must be filed with the appropriate State Director. Upon request and showing of good cause, an extension for submitting supporting data may be granted by the State Director. Such review will include all factors or circumstances relevant to the particular case. Any party who is adversely affected by the State Director's decision may appeal that decision to the Interior Board of Land Appeals as provided in 43 C.F.R. part 4.

C. § 3000.60 Filing of Documents.

The Associations support BLM's proposal to allow for e-filing of necessary documents. However, to ensure that the appropriate official receives the e-filing, and to avoid any risk of default as a result of e-filing with the wrong person in a BLM office, or as a result of circumstances where a BLM employee may no longer be employed in that office, the final rule should require each BLM office to designate an email address for filing. An e-filing should be deemed timely if it is received by 11:59 pm local time in the appropriate BLM office. BLM should also ensure that its electronic systems are well-maintained and BLM provides sufficient training to operators utilizing electronic reporting. Some members of the Associations have experienced that BLM's electronic system frequently goes down, requires frequent changing of passwords, and presents other challenges.

Recommended Revision:

> All necessary documents must be filed in the proper BLM office. Documents may be submitted to the BLM using hard-copy delivery services, in-person delivery, or by electronic filing. A document will be considered filed when it is received in the proper BLM office. When using hard-copy delivery services or in-person delivery, the document will be considered filed only when received during regular business hours. See 43 CFR part 1820, subpart 1822. Each BLM office will establish an email address for acceptance of electronic filing that will be published on BLM's website, and electronic filing will be considered filed only when received by 11:59 pm local time in that BLM office.

D. § 3000.100 Fees in general.

For the reasons discussed below for proposed § 3000.120(a), BLM should revise proposed § 3000.100(c) to include the opportunity for notice and comment for adjustments to fixed fees established under this subchapter.

Recommended Revision:

> (c) Periodic adjustment. The BLM will periodically adjust fees established in this subchapter according to changes in the Implicit Price Deflator for Gross Domestic Product, which is published quarterly by the U.S. Department of Commerce. ~~Because the fee recalculations are simply based on a mathematical formula, t~~The BLM will change the fees in final rules ~~without~~ with the opportunity for notice and comment.

E. § 3000.120 Fee schedule for fixed fees.

This proposed section would add new fixed fees and increase existing fees for the listed processing and filing fees. The Associations generally support expansion of BLM's use of fixed fees as opposed to fees determined on a case-by-case basis. One exception is the $3,100 fee for a competitive lease application. BLM explains in the preamble that this fee was established as including the costs for BLM to undertake any necessary NEPA reviews. However, contrary to the preamble, nothing in CEQ regulations—existing or proposed—prohibits an applicant from preparing or assisting with the preparation of any BLM NEPA document, which would reduce BLM's costs. Therefore, the Associations suggest that the cost for a competitive lease application should be determined case-by-case under § 3000.110, or alternatively that the cost would be fixed at $3,100 but the applicant would have the option to request a case-by-case fee determination to establish a fee for a particular lease application. Such a situation would be, for example, where the NEPA or other costs to BLM would not support the $3,100 fee because the applicant will incur some or all of those costs separately.

Subsection (a) also would adjust the fixed fees annually "according to the change in the Implicit Price Deflator for Gross Domestic Product." The automatic inflation provision is contrary to the requirements for establishing these fees and should be removed. As BLM explains in the preamble, establishing these fees is a multi-factor process taking into account BLM's actual costs and other factors such as the monetary value of the right or privilege, the monetary value to the applicant, the efficiency factor, the public benefit factor, and the public service factor. BLM nowhere explains its authority to assume that any or all of these factors would justify an automatic annual adjustment based solely on inflation. Instead, to adjust a fixed fee, BLM must re-apply all of the factors, make a new determination as to whether the fee warrants an adjustment, and similarly codify that determination via rulemaking. Nor does BLM reference any other authority to impose this annual inflation adjustment.

In this subsection, BLM also states that it only would publish any fixed fee adjustment on BLM's website. As an initial matter, this is inconsistent with the provisions of proposed § 3000.100(c) which provide that for "fees established in this subchapter . . . BLM will change the fees in final rules . . . .” Additionally, because the fixed fees initially would be set by regulation, BLM must correspondingly amend any fixed fee through a regulatory change for it to have legal effect. BLM also should adopt any fixed fee adjustments through notice and comment rulemaking because the public should have the opportunity to address BLM’s application of the above-described factors in adjusting any fixed fee. Therefore, BLM should modify both §§ 3000.120(b) and 3000.100(c) to require notice and comment rulemaking to adjust any fixed fees in this subchapter of the regulations. For consistency and the convenience of the regulated community, BLM also should publish the updated fixed fees annually on its website.

The list of fees in Table 1 for § 3000.120 includes the “Expression of interest fee per acre or fraction thereof.” Section 50262(d) of the IRA amended the MLA to add a new 30 U.S.C. § 226(q) establishing a $5 per acre fee for expressions of interest in leasing available lands for exploration and development of oil and natural gas. New subsection 226(q)(2)(B) expressly authorizes the Secretary to adjust the $5 per acre fee “by regulation, not less frequently than every 4 years . . . to reflect the change in inflation.” Therefore, Congress requires that any adjustment to this fee be accomplished through regulation. BLM has no discretion to include a provision in proposed § 3000.120 allowing for an inflation adjustment for those fees through a website notification.

Recommended Revision:

> (a) The table in this section shows the fixed fees that must be paid to the BLM for the services listed for FY 2024. These fees are nonrefundable and must be included with documents filed under this chapter. BLM may adjust these fees periodically by final rule with the opportunity for notice and comment, and adjusted f~~F~~ees will ~~be adjusted annually according to the change in the Implicit Price Deflator for Gross Domestic Product since the previous adjustment and~~ ~~will subsequently~~ be posted on the BLM website (*https://www.blm.gov*) before October 1 each year. Revised fees are effective each year on October 1.

F. § 3000.130 Fiscal terms of new leases.

This section would establish per acre rental and bonus bid amounts. The fees established in the proposed rule are based on changes to the MLA required by the IRA, and the Associations agree that BLM has no discretion as to their adoption in this rulemaking. However, BLM also would provide in this section that the established rental rates and bonus bid amounts “will be adjusted annually according to the change in the Implicit Price Deflator for Gross Domestic Product since the previous adjustment and will subsequently be posted on the BLM website . . . before October 1 each year.” BLM does not have the authority to require these annual inflation adjustments. Section 50262(b)(1) of the IRA amends the MLA, 30 U.S.C. § 226(b)(1)(B), to set a minimum bonus bid of “$10 per acre during the 10-year period beginning on the date of enactment of the Inflation Reduction Act of 2022.” Nothing in the IRA authorizes an adjustment of the $10 minimum bid amount during that 10-year period, for inflation or otherwise. Under the MLA, “thereafter” the Secretary may establish by regulation a higher minimum bonus bid but only on certain specified grounds, namely when such increases are "necessary (i) to enhance financial returns to the United States; and (ii) to promote more efficient management of oil and natural gas resources on Federal lands." 30 U.S.C. § 226(b)(1)(B).

Similarly, Section 50262(c)(1) of the IRA amends the MLA, 30 U.S.C. § 226(d), to set per acre rental rates at prescribed levels for the 10-year primary term of the lease for leases issued after the IRA's effective date (August 16, 2022). Again, nothing in the IRA authorizes an adjustment of these rental rates for any reason, including for inflation, during the 10-year period.

Congress knows how to require inflation adjustments when it wants to, but did not do so here. As explained above, IRA Section 50262(d) amended the MLA to add a new 30 U.S.C. § 226(q) establishing a $5 per acre fee for expressions of interest in leasing available lands for exploration and development of oil and natural gas. New 30 U.S.C. § 226(q)(2)(B) expressly authorizes the Secretary to adjust the $5 per acre fee by regulation "to reflect the change in inflation." Also contrast the Federal Civil Penalties Inflation Adjustment Act of 2015, Public Law 114-74, sec. 701, in which Congress provided for inflation-based adjustments in civil penalty amounts. Thus, Congress knows how to provide for inflation adjustments when it so chooses, and it affirmatively chose not to allow inflation adjustments for the minimum bid and rental rates.

The Proposed Rule references no other authority that would support annual inflation adjustments for the rental and bonus fees. Indeed, even BLM acknowledged in the preamble that "[t]he IRA precludes the adjustment of these fiscal terms until after August 16, 2032." BLM thus has no discretion to include a provision in proposed § 3000.130 allowing for an annual inflation adjustment.

Recommended Revision:

> The table in this section shows the fiscal terms for new leases. ~~Terms will be adjusted annually according to the change in the Implicit Price Deflator for Gross Domestic Product since the previous adjustment and will subsequently be posted on the BLM website (*https://www.blm.gov*) before October 1 each year. Revised fees are effective each year on October 1.~~

II. PART 3100

A. § 3100.5 Definitions.

This section of the Proposed Rule would add several new definitions. The Associations agree with most of the revised definitions, but there are a few that BLM should change in any final rule.

BLM would define the term "modification" as "a change to the provisions of a lease stipulation for some or all sites within the leasehold and either temporarily or for the term of the lease." However, BLM uses the term in other contexts of the Proposed Rule. For example, § 3101.12 Surface use rights, provides (emphasis added):

> A lessee will have the right to use only so much of the leased lands as is necessary to explore for, drill for, mine, extract, remove and dispose of all the leased resource in a leasehold subject to applicable requirements, including stipulations attached to the lease, restrictions deriving from specific, nondiscretionary statutes, and such reasonable measures as may be required and detailed by the authorized officer to avoid, minimize, or mitigate adverse impacts to other resource values, land uses or users, federally recognized Tribes, and underserved communities. Such reasonable measures may include, but are not limited to, relocation or *modification* to siting or design of facilities, timing of operations, specification of interim and final reclamation measures, and specification of rates of development and production in the public interest. *Modifications* that are consistent with lease rights include, but are not limited to, requiring relocation of proposed operations by more than 800 meters and prohibiting new surface disturbing operations for a period of up to 90 days in any lease year.

In addition, subsection (b) of § 3140.23 Application requirements, provides (emphasis added):

> (b) A plan of operations may be *modified* or amended before or after conversion of a lease or valid claim to reflect changes in technology, slippages in schedule beyond the control of the lessee, new information about the resource or the economic or environmental aspects of its development, changes to or initiation of applicable unit agreements or for other purposes. To obtain approval of a *modification* or amended plan, the applicant must submit a written statement of the proposed changes or supplements and the justification for the changes proposed. Any *modifications* will be in accordance with 43 CFR 3592.1(c). The approval of the *modification* or amendment is the responsibility of the authorized officer. Changes or *modification* to the plan of operations will have no effect on the primary term of the lease. The authorized officer will, prior to approving any amendment or *modification*, review the *modification* or amendment with the appropriate surface management agency. For leases within units of the National Park System, no amendment or *modification* will be approved without the consent of the Regional Director of the National Park Service in accordance with § 3140.70.

Finally, § 3141.22 Exploration licenses, provides in subsection (c)(2) (emphasis added) that "[t]he authorized officer may require *modification* of the original exploration plan to accommodate the legitimate exploration needs of the person(s) seeking to participate and to avoid the duplication of exploration activities in the same area, or that the person(s) should file a separate application for an exploration license." Subsection (e)(8) further provides that (emphasis added):

> The licensee may submit a request for *modification* of the exploration plan to the authorized officer. Any *modification* will be subject to the regulations in this section and the terms and conditions of the license. The authorized officer may approve the *modification* after any necessary adjustments to the terms and conditions of the license that are accepted in writing by the licensee.

Because the regulations in part 3100 use the term "modification" in contexts other than changes to lease stipulations, to avoid confusion BLM should remove the proposed definition.

BLM should modify the proposed definition of "Oil and gas agreement" because an agreement may in some instances include unleased lands. In those circumstances, the operator typically may place the production proceeds into an interest-bearing escrow account until the lands are leased.

Recommended Revision:

> *Oil and gas agreement* means an agreement between lessees and the BLM to govern the development and allocation of production for existing leases <u>and unleased lands</u>, including, but not limited to, communitization agreements, unit agreements, secondary recovery agreements, and gas storage agreements.

BLM is proposing to add new definitions for the terms "responsible bidder" and "responsible lessee." Each of these terms would exclude a person who has a "history of noncompliance" with applicable regulations and lease terms. These terms are used in proposed § 3102.51 Compliance, which provides that "[o]nly responsible and qualified bidders may own, hold, or control an interest in a lease or prospective lease." The Associations have substantial concerns with these definitions because it is unclear what a "history of noncompliance" means. It could be construed broadly to mean that if a person ever was found to have been in noncompliance with its federal oil and gas lease terms, or applicable BLM regulations or ONRR royalty reporting and valuation regulations in 30 C.F.R. part 1206, it could be precluded from obtaining future federal lease interests, even if it corrected the alleged noncompliance after notice from the regulatory agency. Similarly, it is unclear how these definitions would be applied to extant claimed noncompliance with regulations or lease terms that are under appeal to the agency or the IBLA and are either subject or not subject to a stay under 43 C.F.R. § 4.21 or other applicable regulations. Under the Proposed Rule, those persons too could be disqualified from obtaining future federal oil and gas lease interests. Nor does the preamble provide any explanation of what BLM intends by the phrase "history of noncompliance."

BLM also proposes to add a new definition of "qualified lessee" as a "person in compliance with the laws and regulations governing the BLM issued leases held by that person." The Associations have the same concerns with this definition, as well as with the related definition of "qualified bidder," because they again are unclear whether any regulatory or lease noncompliance (or allegation thereof), even a minor one, could render a person unqualified to hold federal onshore leases. Moreover, the definition of "qualified bidder" does not account for the involvement of brokers or non-operating partners when bidding on leases, and could substantially impede bidding if it were to mandate established bonding in place prior to bidding or similar other requirements.

Please also see the Associations' comments on proposed § 3102.51 and its scope of "responsible and qualified bidders and lessees." To allay these concerns, BLM should clarify in this proposed definitions section and in proposed § 3102.51 that it will continue to adhere only to the factors in MLA Section 17(g), 30 U.S.C. § 226(g), in determining who may hold a lease.

BLM is proposing to add definitions of the terms "assignment" and "transfer" that would have corresponding, but different, meanings. BLM's sister bureau, the Bureau of Ocean Energy Management ("BOEM"), recently issued a proposed rule stating that the terms "transfer" and "assignment" are "interchangeable." Risk Management and Financial Assurance for OCS Lease and Grant Obligations, 88 Fed. Reg 42,136, 42,149, 42,151, 42,169 (June 29, 2023). BLM should ensure consistency and clarity in use of these terms between the two bureaus regulating federal oil and gas leasing onshore and on the Outer Continental Shelf.

B. § 3100.22 Drilling and production or payment of compensatory royalty.

This section is unchanged from the corresponding existing section. BLM should consider using this rulemaking opportunity to amend this section to also address circumstances involving two federal leases with different fund distribution codes. For example, such a situation may involve a MLA lease with a royalty revenue distribution governed by 30 U.S.C. § 191(a) being drained by a well on an MLAAL lease with a different royalty revenue distribution that allocates a higher proportion of funds to non-federal recipients based on the provisions of the statute pursuant to which the lands were acquired. This regulation also should reference the lessee's opportunity to create a federally-approved agreement for sharing of production among the affected leases.

Recommended Revision:

> Where lands in any leases are being drained of their oil or gas content by wells either on a Federal lease issued at a lower rate of royalty or on non-Federal lands, or by a lease with a different royalty revenue funds distribution requirement, the lessee must both drill and produce all wells necessary to protect the leased lands from drainage. In lieu of drilling necessary wells, the lessee may, with the consent of the authorized officer, pay compensatory royalty in the amount determined in accordance with 43 CFR 3162.2–4, or under an oil and gas agreement among the affected leases and tracts.

C. § 3100.40 Public availability of information.

In the preamble, BLM states that it is considering making publicly available names and addresses of the nominator, lessees, operating rights holders and operators through BLM's automated system, and that such information is already publicly available. BLM provides no justification for publishing information on all entities registered to bid during a lease sale, rather than only information regarding issued leases.

D. § 3101.12 Surface use rights.

The proposed changes to this section are extremely concerning to the Associations and their members because they improperly broaden BLM's authority to impose limitations on the exercise of lease rights. It is well-established that the issuance of a federal onshore oil and gas lease entitles the lessee to develop its lease subject to only limited, reasonable restrictions. *Conner v. Burford,* 848 F.2d 1441 (9th Cir. 1988). That is, consistent with the MLA, BLM cannot wholly prevent lessees from engaging in all surface-disturbing activities necessary for mineral development, except where the lease it issues states otherwise, principally in a no-surface-occupancy provision. Consistently, courts typically find that onshore federal leasing is the point that results in an irretrievable commitment of resources for oil and gas development, effectively eliminating the no action alternative and generally requiring more detailed environmental review prior to lease issuance onshore compared to earlier stages onshore or leasing offshore.[17]

Yet, the Proposed Rule risks precluding development of existing leases at odds with rights already conferred under those contracts. That is because the proposed new limitations on the lessee's ability to exercise its lease rights would be so restrictive that the development rights which a MLA or MLAAL federal oil and gas lease has historically granted could be rendered effectively illusory. The redrafted section would subject use of leasehold lands for oil and gas operations to "applicable requirements" that would include "such reasonable measures as may be required by the authorized officer to avoid, minimize, or mitigate adverse impacts to other resource values, land uses or users, federally recognized Tribes, and underserved communities." The terms "avoid" and "mitigate" are newly-added and undefined limitations. These rights reserved to BLM are so broad, vague, and subjective that they could empower BLM to significantly constrain or entirely prevent operations on the leasehold. If the lessee objects, its

---

[17] *See, e.g., id.* at 1451; *New Mexico ex rel. Richardson v. Bureau of Land Mgmt.*, 565 F.3d 683, 718 (10th Cir. 2009) (lessee "cannot be prohibited from surface use of the leased parcel once its [non-no surface occupancy ("NSO")] lease is final"); *see also Pennaco Energy, Inc. v. U.S. Dep't of the Interior*, 377 F.3d 1147, 1160 (10th Cir. 2004) (the lease provided lessees with certain rights and did not give the federal government the authority to deny drilling activity); *Sierra Club v. Peterson*, 717 F.2d 1409, 1412, 1415 (D.C. Cir. 1983) (BLM must either prepare an Environmental Impact Statement before leasing or "retain the authority to preclude surface disturbing activities until an appropriate environmental analysis is completed"); *Ctr. for Biological Diversity v. BLM*, 937 F. Supp. 2d 1140, 1153 (N.D. Cal. 2013) (non-NSO leases required environmental analysis prior to issuance even though they contained provisions allowing BLM to deny all surface disturbing activities if threatened or endangered species are found); Bureau of Land Mgmt., U.S. Dep't of the Interior, BLM Manual H-1624-1 Planning for Fluid Mineral Resources, at I-2 (1990), https://www.blm.gov/sites/blm.gov/files/uploads/Media_Library_BLM_Policy_Handbook_H_1624_1.pdf ("By law, these impacts must be analyzed before the agency makes an irreversible commitment. In the fluid minerals program, this commitment occurs at the point of lease issuance.").

only recourse under the rules would be to challenge the BLM decision through an administrative appeal—with no certainty that its lease term would be suspended in the interim. And unless BLM amends the appeal regulation as the Associations suggest to first allow for State Director review, that appeal process would inexorably last several years.

BLM asserts in the preamble that these authorities inserted into this section are consistent with the standard BLM lease form since 2008. However, as BLM further explains in the preamble, "[t]he standard lease form authorizes the BLM to require 'reasonable measures' to the extent such measures would be consistent with the lessee's rights." The BLM lease form also does not subordinate the oil and gas lessee's rights to any subsequently issued right for other uses or users; rather, it does the opposite. *See* BLM Form 3100-11 (March 2023), ¶ 6 ("Lessor reserves the right to continue existing uses and to authorize future uses upon or in the leased lands, including the approval of easements or rights-of-way. Such uses must be conditioned so as to prevent unnecessary or unreasonable interference with rights of lessee."). BLM references no lease provision that grants the agency the proposed new broad authority to severely constrain or deny lease operations to the extent set forth in the Proposed Rule.

Under this section, BLM also proposes to allow altering the location of a well by "more than 800 meters." That means there would be no limit to how far BLM may require relocation of a well on a lease, and BLM has provided no data or other scientific justification to support what relocation distance is appropriate. In fact, though BLM's preamble summarily asserts "changes in technology" to support the proposed changes, it provides no technical justification.

The existing rule provides that BLM may not require relocation of a well by more than 200 meters.[18] 43 C.F.R. § 3101.1-2. Thus, the Proposed Rule arbitrarily replaces a maximum provision with an unlimited provision. Moreover, it could very well prohibit on-lease surface use and require surface activities, like drilling, to occur at an off-lease surface location (e.g., the Proposed Rule would unreasonably delete the existing regulatory prohibition on BLM requiring that "operations be sited off the leasehold"). *Id.* Precluding on-lease surface use impermissibly deprives a lessee of a vested right to develop its minerals, potentially constituting a taking of a lessee's property right. Additionally, well placement is typically based on geology, topography, and surface owner requirements (including wildlife, cultural, wetland, and similar issues that inform the well placement). BLM also fails to explain what rights BLM or a lessee may have to locate wells or facilities off-lease, particularly when other tracts may be held by different entities.

Accordingly, the Proposed Rule should be modified to establish a *maximum* allowable relocation distance based on scientific data justifying the decision, and to prohibit relocation to an off-lease location without the lessee's prior consent. Also, at a minimum, BLM's ability to move a well location must not result in a loss of maximum efficient recovery of oil or natural gas; add significant costs; or materially change access routes, surface disturbance, or availability of utilities or infrastructure compared to a lessee's chosen surface location. BLM regulations

---

[18] BLM claims that despite the existing regulations' clear 200 meter maximum, the IBLA held in *Yates Petroleum,* 176 IBLA 144, 156 (2008), that BLM may impose greater restrictions. But *Yates* did not confer on BLM the unbounded authority reflected in the Proposed Rule, or bless any BLM-imposed limitation, including based on the Proposed Rule's plethora of novel and subjective criteria, as "reasonable" or "consistent with lease rights."

should not support waste of oil and gas resources, nor should they provide a basis for BLM to contravene the lease contract.

Moreover, BLM is proposing to change the annual period for which it may prohibit new surface disturbing operations from 60 days to 90 days, with no justification for that proposed change. This extension is too long and is unwarranted. For example, depending on how BLM applies these prohibition windows, they may result in even longer inoperative periods due to weather conditions, wildlife considerations, natural processes, and economic factors during the remaining calendar year. BLM should not adopt this modification to the existing rule.

To the extent BLM would seek to apply the regulatory changes it is proposing to allow the agency to constrain or prevent operations on existing leases, it presents a material breach of contract or a regulatory taking, potentially subjecting the United States to substantial contract damages or payment of just compensation.[19] Breach and takings concerns for existing leases are especially salient given the development rights conferred by onshore federal oil and gas leases under the MLA and interpretive case law, as discussed above. The Proposed Rule would significantly alter standards in place at the time existing leases were bargained for, by imposing substantial costs and burdens on lessees, or even precluding or terminating production.[20] At a minimum, proposed § 3101.12 and other Proposed Rule provisions purporting to materially curtail existing lease rights would do so. The Proposed Rule's language does not even limit the timing for imposing surface use restrictions under this section. For example, it could be read to allow imposition of such conditions during or after construction of wells or facilities on a lease. Or it could be interpreted to require later drilled wells to utilize different, more distant facilities than earlier APDs approved without such setbacks or other conditions. Accordingly, BLM is incorrect in determining "that the rule would not cause a taking of private property or require further discussion of takings implications under Executive Order 12630." BLM should not adopt proposed provisions that would allow for such potential breach or takings, and must provide a more complete analysis of why its final rule would not do so.

E. § 3101.13 Stipulations and information notices.

The Associations are again very concerned about the proposed changes to the existing regulations in this section. Proposed new subsection (a) would give BLM broad authority to "consider the sensitivity and importance of potentially affected resources," and any "uncertainty concerning the present or future condition of those resources," and then based on this highly subjective and amorphous standard, consider "whether a resource is adequately protected by stipulation *without regard for the restrictiveness of the stipulation on operations*" (emphasis added). This subsection would allow BLM to offer for lease lands that are eligible and available

---

[19] *See Mobil Oil Prod. Southeast, Inc. v. U.S.*, 530 U.S. 604 (2000); *Amber Res. Co. v. U.S.*, 68 Fed. Cl. 535 (2005).

[20] *See Marathon Oil Co. v. Andrus*, 452 F. Supp. 548, 551 (D. Wyo. 1978) (invalidating BLM's former NTL-4, and finding: "This Court cannot lose sight of the general rule that, when the executive department charged with the execution of a statute gives a construction to it and acts upon that construction for many years, the Court looks with disfavor upon a change whereby parties who have contracted in good faith under the old construction may be injured by a different interpretation.").

for leasing, but then subject the offered leases to additional stipulations that could restrict operations to the point that they are uneconomic or infeasible to undertake.

Providing BLM with unfettered discretion to impose lease stipulations that constrain or effectively prevent operations would severely undermine the value of those leases and discourage entities from bidding on those leases due to the resulting investment uncertainty. Yet, per BLM, the acreage purportedly offered for lease would contribute to fulfilling the IRA's minimum acreage criteria to allow BLM to issue rights-of-way for wind and solar energy development on federal lands. Thus, the addition of this subsection provides an avenue for BLM to technically meet the oil and gas acreage offered for lease required by IRA Section 50265 as necessary for BLM to issue wind and solar rights-of-way, while from a practical standpoint potentially discouraging leasing or constraining opportunities to develop minerals on federal lands. This new proposed subsection (a), together with the proposed changes in § 3101.12, make federal oil and gas lease development rights far less predictable, reliable, and practical, and therefore would significantly undermine the value to operators. Thus, in any final rule, BLM should remove subsection (a) in its entirety. At a minimum, BLM should remove the final clause of subsection (a) ("without regard for the restrictiveness of the stipulation on operations")—and instead require that all stipulations applicable to specific leases/parcels be disclosed prior to a lease sale, and appropriately circumscribe BLM's discretion to impose lease stipulations to not frustrate efficient and orderly federal leasing or development of leasehold rights.

F. § 3101.14 Modification, waiver, or exception.

Subsection (b) presents potential disruption to the competitive lease sale process. Under these new provisions, if following a lease sale, but prior to lease issuance, BLM determines it needs to add an additional restrictive stipulation, the winning bidder is given an opportunity to refuse the stipulation and the BLM may reject the bid. Also, if after a lease sale is concluded BLM adds or modifies a stipulation that increases the value of the parcel, BLM will reject the bid and include the parcel in the next competitive lease sale. These provisions inject uncertainty into the competitive leasing process and inappropriately allow BLM to "reopen" the lease conditions in a manner that may very well impact the value of the lease to the winning bidder. Again, at a minimum, all lease conditions or stipulations must be disclosed prior to a lease sale. Once a competitive lease sale is held, and competitors to the winning bidder are aware of the per acre amount the winning bidder was willing to pay to obtain a lease tract, allowing BLM to "undo" the lease sale and re-bid the tracts is anticompetitive and unfair to the winning bidder. BLM also could improperly use this provision as a tool to undo a lease sale where it is dissatisfied with the result of the competitive sale by unilaterally imposing a new stipulation with no opportunity for public involvement, which is inconsistent with subsection (a)'s requirement that BLM involve the public in any change to a lease term or stipulation. BLM's only support for these new provisions is a preamble assertion that they purportedly are consistent with existing "policy," but BLM does not identify the source of that policy or how it has been applied.

BLM also is proposing to remove the language from existing § 3101.1-4 that allows BLM to grant waivers, modifications, or exceptions if "proposed operations would not cause unacceptable impacts." BLM asserts this provision has been overused and resulted in adverse impacts. Yet, the Proposed Rule does not recognize the host of reasonable circumstances where flexibility under the existing provision does not result in unacceptable impacts (see below paragraph). BLM should not remove this flexibility available to BLM field offices without providing evidence of these purported adverse impacts and then establishing appropriate limits on this flexibility if necessary to narrowly address those specific adverse impacts. Nor can BLM in its preamble credibly dismiss this existing standard as "very subjective" when its Proposed Rule would introduce a bevy of more subjective standards.

Moreover, BLM's proposed narrowing of § 3101.14 will be very detrimental to real-time operations and could cause serious health, safety, and environmental consequences. The kinds of actions that warrant waivers, modifications, or exceptions usually are time sensitive and require real-time data that is evaluated by qualified individuals, such as immediate downhole drilling changes or wildlife stipulation relief based on a 2-week window of field nest evaluations. Other waivers, modifications, or exceptions are needed due to technological advances (e.g., flexhose and Coriolis meters). Thus, BLM should preserve the flexibility in the existing regulation.

G. § 3101.21 Public domain lands.

The text of subsection (a) should reference that the acreage limit in this section is only for federal leases on public domain lands. BLM should not rely only on the section title.

Recommended Revision:

> No person may take, hold, own or control more than 246,080 acres of Federal oil and gas leases <u>on public domain lands</u> in any one State at any one time. No more than 200,000 acres of such acres may be held under option.

H. § 3101.22 Acquired lands

The text of subsection (a) should reference that the acreage limit in this section is for federal leases on acquired lands. BLM should not rely only on the section title.

Recommended Revision:

> (a) No person may take, hold, own or control more than 246,080 acres of Federal oil and gas leases <u>on acquired lands</u> in any one State at any one time. No more than 200,000 acres of such acres may be held under option.

I. § 3101.51 General Requirements.

This proposed section would provide that "[p]ublic domain and acquired lands will be leased only with the consent of the surface managing agency . . . ." The Associations have significant concerns with the proposed changes to this section.

BLM explains in the preamble that this proposed section would combine subsections (a), (b), and (c) of existing § 3101.7-1 applicable to acquired lands, public domain lands, and National Forest System lands, respectively. However, this proposed section would grant surface managing agencies expanded authority beyond that which is provided under applicable statutes and the existing rules to veto acreage for federal oil and gas lease sales. It also would expand the scope of federal entities that would be authorized to exercise that "veto" authority because of BLM's proposed revision to the definition of "surface managing agency" in § 3000.5 improperly expanding that term to include DOI bureaus.

Only part of this proposed regulation is consistent with applicable requirements. Surface management agency consent is statutorily required for BLM to lease oil and gas beneath acquired lands under the MLAAL (30 U.S.C. § 352, requiring consent of "the head of the executive department . . . and subject to such conditions as that official may prescribe . . . ."). Thus, for example, if the minerals beneath a National Forest are acquired minerals, BLM may not lease the oil and gas without the consent of the Secretary of Agriculture.

However, there is no corresponding general statutory consent provision under the MLA for leasing oil and gas on public domain lands other than national forests (*see* 30 U.S.C. § 226(f)), and current regulations do not grant such expansive authority. Recognizing this non-existent statutory consent authority for public domain lands, existing § 3101.7-1(b) provides that BLM may not lease public domain lands unless it has "consulted" with the surface managing agency (defined in existing § 3000.0-5(m) as "any Federal agency *outside* of the Department of the Interior with jurisdiction over the surface overlying federally-owned minerals"), and the surface managing agency has "reported its *recommendations* to lease with stipulations, if any, or not to lease to the authorized officer" (emphasis added). Existing § 3101.7-1(b) provides that BLM may proceed to lease unless "consent or lack of objection of the surface managing agency is required by statute." Thus, the consultation/recommendation standard under the existing rules does not equate to an absolute consent role. In the absence of general statutory consent authority, which the Proposed Rule nowhere identifies, BLM does not have the authority to delegate to another federal agency the Secretary's authority to decide which public domain lands should be offered for lease.

Also concerning to the Associations and their members regarding implementation of this proposed section is that, as explained above, proposed § 3000.5 would expand the definition of "surface managing agency" to include not only federal Departments, but also DOI bureaus. Read together, proposed §§ 3101.51 and 3000.5 would grant FWS, BOR or other DOI bureaus authority to prevent leasing of acquired minerals beneath lands they administer even though they are not an "executive department" under the MLAAL. Proposed § 3101.51 also would provide DOI bureaus veto authority for public domain lands leasable under the MLA—even if BLM, or the Secretary, wanted to lease the parcels. While the Secretary oversees subordinate DOI agencies, it is well-established that all DOI agency officials, including the Secretary, would be bound by a duly promulgated regulatory provision diminishing the Secretary's ultimate leasing authority. *Vitarelli v. Seaton*, 359 U.S. 535, 539-40 (1959); *United States v. Nixon*, 418 U.S. 683, 696 (1974). BLM therefore should remove this proposed section purporting to convey to DOI bureaus this expanded authority to prevent leasing of federal minerals.

Recommended Revision:

> ~~Public domain and a~~Acquired lands will be leased only with the consent of the surface managing agency [with amended definition in § 3000.5 to include only non-DOI agencies]~~,~~. ~~which,~~ BLM will

> require the consent of the surface managing agency for public domain lands only if there is a statutory requirement for such consent. ~~u~~Upon the surface managing agency's receipt of a description of the lands from the authorized officer, it will report to the authorized officer that it consents to leasing with stipulations, if any, or withholds consent or objects to leasing.

J. § 3101.52 Action by the Bureau of Land Management.

The Associations have the same concerns with this section of the Proposed Rule as with its immediately preceding section. Proposed § 3101.52(b) provides that "[t]he authorized officer will not issue a lease on lands to which the surface managing agency objects or withholds consent." Like § 3101.51, this subsection means that regardless of whether the lands are acquired or public domain lands, the BLM will not lease lands when a surface management agency objects to leasing or withholds its consent. This is an improperly broad veto authority granted to surface managing agencies for public domain lands, and like the previous section suffers from the excessively broad definition of the term "surface managing agency" for acquired lands. BLM should not extend this authority to preclude leasing of public domain lands except for circumstances where the surface managing agency has statutory consent authority.

Recommended Revision:

> (b) The authorized officer will not issue a lease on acquired lands, or for other lands for which the surface managing agency has statutory authority to consent to leasing, to which the surface managing agency objects or withholds consent. In all other instances, the Secretary has the final authority and discretion to decide to issue a lease.

K. § 3101.53 Appeals.

As explained above regarding proposed § 3000.40, this existing provision providing adversely affected parties an appeal to the IBLA from BLM decisions relating to rejection of offers to lease, or to issue a lease with stipulations recommended by the surface managing agency, effectively eviscerates any appeal right because IBLA review generally takes several years. Therefore, as part of this regulatory update, BLM should amend this section to include State Director review, with the option to further appeal to IBLA.

Recommended Revision:

> ~~The~~ Any person adversely affected by a decision of the authorized officer to reject an offer to lease or to issue a lease with stipulations recommended by the surface managing agency, may request an administrative review before the State Director, either with or without oral presentation. Such request, including all supporting documentation, must be filed in writing with the appropriate State Director within 20 business days of the date such order or decision was received or considered to have been received and must be filed with the appropriate State Director. Upon request and showing of good cause, an extension for submitting supporting data may be granted by the State Director. Such

review will include all factors or circumstances relevant to the particular case. Any party who is adversely affected by the State Director's decision may appeal that decision ~~may be appealed~~ to the Interior Board of Land Appeals under 43 CFR part 4.

L. § 3102.51 Compliance.

Under this section, "[o]nly responsible and qualified bidders and lessees may own, hold, or control an interest in a lease or prospective lease." The Associations explained their concerns with the definitions of these terms in their comments above on proposed § 3100.5. The Associations have further concerns with this section because it requires that the person be in compliance with multiple subsections that, in turn, reference other statutory and regulatory provisions. In particular, subsection (f) of this section appears to unreasonably disqualify persons from holding federal lease interests, and to unlawfully subject existing leases to cancellation.

Under this subsection (f), adopted to implement 30 U.S.C. § 226(g), a signature on an offer, lease, assignment, or transfer constitutes evidence of compliance that the signatory and any of its affiliates has not failed to comply with reclamation requirements with respect to all leases and operations on those leases in which such person has an interest. The proposed subsection would modify the existing regulations by providing that BLM may find persons noncompliant when they purportedly fail to comply with reclamation obligations in the time specified in a "notice from the BLM," rather than after BLM takes additional enforcement steps such as issuing a written order, an Incident of Noncompliance ("INC"), or a civil penalty. Despite eliminating from the existing subsection the need for BLM to take these additional enforcement steps, the proposed subsection would carry over the provision from the existing rule that "any such person in violation of this paragraph (f) will be subject to the cancellation provisions of 43 CFR 3108.30, notwithstanding any administrative or judicial appeals that may be pending with respect to violations or penalties assessed for failure to comply with the prescribed reclamation standards on any lease holdings." The effect of this new provision is that if you receive notice from BLM asserting that you or any of your affiliates has an unfulfilled reclamation obligation (regardless of accuracy of the assertion) for any federal oil and gas lease, and you in good faith challenge that determination administratively, BLM may proceed to cancel your leases while the appeal is pending unless you fulfill the claimed reclamation deficiency. This is unreasonable restructuring of the existing subsection and will result in a denial of due process by effectively mooting any appeal opportunity.

Moreover, the newly proposed sentence in subsection (f) would expand the scope of this subsection from only "reclamation" requirements to also encompass "other standards established under 30 U.S.C. 226." Indeed, the other sentences of subsection (f) would continue to refer only to "reclamation." This unwarranted expansion would only exacerbate the lease cancellation concerns discussed above.

BLM should not adopt the proposed changes to this section in the final rule, and instead adhere to the terms of existing 43 C.F.R. § 3102.5–1.

Subpart 3103.

In its preamble, BLM asks for comment on whether it should adopt a 5-year diligent development requirement, and a rental increase if diligent development requirements are not met. BLM should not. These new diligent development terms would impose large cost increases on a substantial number of leases. They also would not allow the operator flexibility to properly evaluate and commence operations in a responsible developmental situation and economic manner consistent with lease requirements. Federal leases include terms, such as the recently increased rental fees, that already incentivize prudent development or lease surrender.

New diligent development requirements also are unnecessary because in the IRA Congress amended the MLA to establish new escalating minimum rental requirements to spur diligent development of federal leases. First, IRA Section 50262(c) amends 30 U.S.C. § 226(d) to permanently increase the prior minimum rental rate from $1.50 per acre per year for the first through fifth years, and not less than $2 per acre per year thereafter, to "$3 per acre per year during the 2-year period beginning on the date the lease begins for new leases, and after the end of that 2-year period, $5 per acre per year for the following 6-year period, and not less than $15 per acre per year thereafter. . . ." That section then provides that "in the case of a lease issued during the 10-year period beginning on the date of enactment of the Inflation Reduction Act of 2022, $3 per acre per year during the 2-year period beginning on the date the lease begins, and after the end of that 2-year period, $5 per acre per year for the following 6-year period, and $15 per acre per year thereafter." Consequently, until 2032, Congress has considered the diligent development issue and increased rental rates as prescribed in IRA Section 50162, and BLM has no discretion to alter those rates by rule. For the period beginning in 2032, it is premature for BLM to consider whether to escalate what would then become the same level of prescribed minimum rental rates, which already are much higher than pre-IRA rates. Instead, BLM should wait to assess the status of the federal oil and gas leasing regime and related market dynamics until closer to 2032.

The Proposed Rule also ignores the obstacles often placed by regulatory agencies and others that have the consequence of delaying development for reasons beyond the lessee's control after a lease is issued. As a result, it would not be appropriate for BLM to impose any other diligent development requirements at this time.

M. § 3103.31 Royalty on production.

This section properly recognizes that the royalty rate increases prescribed in IRA Section 50262(a)(1) do not apply to existing leases with lower royalty rates. The Associations note that BLM thus must be prepared to respond to increased requests for surface commingling approvals and other consequences of neighboring leases with disparate royalty rates.

N. § 3103.42 Suspension of operations ["SOO"] and/or production ["SOP"]; § 3165.1 Relief from operating and/or producing requirements.

The Proposed Rule, like existing 43 C.F.R. § 3103.4–4(a), would allow a suspension "of all operations and production" "only in the interest of conservation of natural resources," and would require a "SOO only" or a "SOP only" request to show "*force majeure.*" BLM should take the opportunity in this rulemaking to instead broaden eligible circumstances for an SOO or SOP beyond *force majeure*, or at a minimum should acknowledge that BLM's own delays constitute such *force majeure* for purposes of an SOO or SOP. Doing so would afford flexibility regarding suspensions, where warranted, based on individual circumstances. The Proposed Rule fails to explain the existing limitations, or to cite to or harmonize BLM's recent IM 2023-012 addressing the grounds and process for a lease SOO or SOP.[21] BLM also must reconcile the proposed new § 3165.1(c) and IM 2023-012—both of which would newly foreclose suspensions based on an APD filed less than 90 days before lease expiration—with agency policy against premature suspensions, and with the reality of BLM's own delays in processing APDs and suspensions, so that lessees can clearly understand the appropriate timing for submitting and adjudicating APDs and requests for suspensions.

O. § 3104.10 Bond Obligations

BLM should retain Certificates of Deposit ("CDs") and Letters of Credit ("LOCs") as forms of security for personal bonds. The Proposed Rule's stated rationale for removing these options is that CDs are difficult to manage and it is difficult for banks to include BLM's requirements in a LOC. However, BLM provides no information on how often this occurs, what type of operators (small or large) use CDs and LOCs, and other similar details on the issue. At a minimum, BLM should provide an analysis of this issue for review and comment before removing such options. As a general matter, and as further explained in the Associations' comments below on proposed § 3104.50, BLM should afford greater—rather than less—flexibility to operators regarding forms of security, particularly given the Proposed Rule's drastically higher minimum and additional bond amounts.

P. § 3104.20 Lease bond.; § 3104.30 Statewide bonds.

The Associations support the principle that existing lease interest owners and their operator should be responsible for fulfilling all lease obligations, including decommissioning. This is not a burden that should be placed on predecessor interest owners that may have assigned away their lease interest years, or even decades, ago. Nor is it a burden that should fall on the American taxpayer when there is no predecessor in interest. However, BLM should ensure that its financial assurance requirements for existing interest owners and operators are applied sensibly and fairly.

The Proposed Rule's increases in bonding amounts for lease ($150,000) and statewide ($500,000) bonds are excessive, and likely will result in premature termination of operations and corresponding waste of federal resources. While the Proposed Rule's preamble cites draft bills that led to the IRA in proposing corresponding minimum bonding amounts, Congress ultimately did *not* enact those minimums. *See* 88 Fed. Reg. at 47,581. BLM's economic justification fails to account for circumstances of individual leases that have been in effect for years if not decades. This is particularly concerning for leases nearing the end of their productive life, because BLM's imposition of 15-to-20 fold increases of lease and statewide bonding obligations on such leases could be expected to result in premature shut-in and abandonment, leaving otherwise producible oil and gas resources in the ground. These bonding changes will be particularly impactful to

---

[21] https://www.blm.gov/policy/im-2023-012.

smaller operators with less financial wherewithal to obtain such increased bonding or pay associated premiums. Therefore, BLM should consider reducing the proposed minimum bond amounts, or alternately providing for accommodations to existing leases unable to feasibly satisfy the dramatically increased minimum bond amounts.

BLM should modify § 3104.20 of the Proposed Rule because it is inconsistent with other sections of the Proposed Rule and is confusing. For example, under proposed § 3104.10, before any surface disturbing activities, the lessee, operating rights owner *or* operator would have to submit a surety bond or personal bond for the amounts required in subpart 3104. However, proposed § 3104.20 then inconsistently limits what is permitted under proposed § 3104.10 by providing that "[t]he operator must be covered by a bond in its own name as principal or obligor in an amount of not less than $150,000 for each lease . . . ." BLM claims in the preamble that this change is intended to simplify bonding requirements among the operator, lessee, and operating rights holder. However, BLM fails to appreciate that as a result of the substantial minimum bond amount increases that now would be incorporated into this section, this new operator bonding requirement would put a large financial burden on operators of multiple leases, particularly if they are operating on federal leases in several different states. For example, for an operator with 10 federal leases each in a different state, this proposed change would increase the bond obligation from $100,000 under the existing rules to $1.5 million as a result of the per lease bond amount increase required under this Proposed Rule. BLM's primary concern should be that at least one person must post the required financial assurance for a lease, and should leave it to the operator, lessee, and operating rights owner to determine among themselves who will provide the required bonding for a particular lease.

This proposed section further would provide that "[a]dditional bonding may be posted by a lessee, or owner of operating rights," with no further clarification in the regulatory language or the preamble as to what additional bonding obligation this section is referring to. If BLM is referring to supplemental bonding under § 3104.50(b), then it should clarify the rule accordingly. However, if it is a reference to supplemental bonding, then BLM is creating a potential problem if the operator fails to comply with a lease obligation. It would be uncertain whether BLM must first make a claim against the operator's security, or whether BLM could choose instead to make an initial claim against the supplemental financial assurance posted by the lessee or sublessee. These are financial issues that are better left to the lease interest owners and the operators to allocate and not for BLM to dictate through rulemaking. Again, BLM's primary concern should be that it is provided with adequate financial assurance to meet the lease obligations, and not which person provides the base bonding or the supplemental bonding.

The last sentence of this proposed section provides that "[w]here two or more principals have interests in different formations or portions of the lease, separate bonds may be posted." First, "principals" is an undefined term. If BLM means lessee or sublessee, it should use the understood terminology in the Proposed Rule. Second, it is unclear what BLM means by "separate bonds may be posted." BLM should clarify if it means separate bonds are a requirement, although if a single well is producing from multiple zones the interests in which are held by different sets of persons, a single bond meeting the requirements for a lease is sufficient to ensure decommissioning of that well.

Additionally, BLM should abandon its proposal to eliminate the option for a nationwide bond authorized under existing § 3104.3(b). BLM asserts in the preamble that nationwide bonds are "administratively inefficient" because they call upon BLM to manage risks nationwide. It further states that the proposed increases in the minimum lease and statewide bond "would allow the agency to ensure improved bonding." These vague justifications that BLM proffers do not outweigh the producing industry's need for a continued nationwide bond to achieve efficiencies and continue providing affordable energy to the U.S. public. The 15-fold increase in the minimum lease bond amount and the 20-fold increase in the minimum statewide bond amount will impose considerable new financial burdens on smaller operators, particularly those with operations across multiple states; a reasonable nationwide bonding option ameliorates those burdens. Also, significant increases and reduced flexibility in bonding requirements may cause smaller operators to prematurely cease operations, thereby increasing risks of bankruptcies and orphan wells. BLM also does not account for the fact that nationwide bonds favorably reduce overall risk by spreading it over a larger geographical area. Further, the elimination of a nationwide bond would create more inefficiencies for BLM by eliminating the ability to cover de minimis acreage positions across multiple states. As a placeholder, the recommended revisions below include the $2 million nationwide bonding level contained in draft bills that resulted in the IRA; as indicated above, however, BLM should reduce that amount as appropriate.

Recommended Revision:

§ 3104.20 Lease bond.

The operator, a lessee, or an owner of operating rights (sublessee) must ~~be covered by~~ provide a bond in its own name as principal or obligor in an amount of not less than $150,000 [or lower amount per comments above] for each lease conditioned upon compliance with all of the terms of the lease. ~~Additional bonding may be posted by a lessee, or owner of operating rights (sublessee), as they are ultimately responsible under § 3106.72.~~ Where two or more ~~principals~~ lease interest holders have interests in different formations or portions of the lease, separate bonds may be posted.

§ 3104.30 Statewide and nationwide bonds.

In lieu of lease bonds, lessees, owners of operating rights (sublessees), or operators may furnish a bond in an amount of not less than $500,000 [or lower amount per comments above] covering all leases and operations in any one State, or in an amount of not less than $2,000,000 [or lower amount per comments above] covering all leases and operations nationwide.

Q. § 3104.40 Surface owner protection bond.

This proposed section conflicts with several state requirements involving split estate and access/surface owner bonding. While BLM must evaluate through NEPA analysis any significant impacts to the surface environment as a result of its approvals or other actions, BLM should not duplicate state requirements for the protection of non-federal surface owners through operator bonding. BLM therefore should add a new subsection (a) acknowledging state requirements where they apply. In addition, BLM should make clear that this section applies only where the surface is not federally owned, consistent with existing 43 C.F.R. § 3171.19(b)(2). BLM also should address the interplay between existing § 3171.19(b)(2), which this Proposed Rule would not modify, and proposed § 3104.40 which may be duplicative or inconsistent. Namely, § 3171.19(b)(2) allows for an "agreement" with the surface owner in lieu of bonding, and such an agreement does not necessarily require payment of "compensatory damages" as proposed in § 3104.40. BLM should also clarify that such bonds are not intended to cover reclamation, but rather only compensation for inadvertent "reasonable and foreseeable damages to crops and tangible improvements" as stated in the Proposed Rule.

Recommended Revision:

(a) This section applies only if:

(i) the relevant state does not have regulations or procedures that provide for surface owner protection bonds; and

(ii) the surface is not federally owned.

R. § 3104.50 Increased amount of bonds.

This section is the same as existing § 3104.5 with only minor changes. However, BLM should use this rulemaking as an opportunity to modify this section to address its longstanding shortcomings. One of the Associations' concerns is that subsection (b) provides that the authorized officer may raise bond amounts if the operator has a "history of previous violations" or otherwise "poses a risk" due to factors such as uncollected royalties due, or decommissioning costs that exceed the present bond amount. First, the reference to "uncollected royalties due" is unclear as to what it includes. It should include only amounts that have been finally determined to be due and owing but that remain unpaid, and not amounts demanded but subject to administrative appeal, payment of which is stayed pending appeal under 30 C.F.R. § 1243.8.

Second, the concept of royalties owed as being a lease obligation is an anachronism due to the treatment since 1996 of federal oil and gas lease royalty obligations under the Federal Oil and Gas Royalty Management Act, as amended by the Royalty Simplification and Fairness Act. Under that statute, royalty obligations are not a general lease obligation, but are proportionate among the lease interest owners. 30 U.S.C. § 1712. Therefore, it no longer is legally proper for BLM to require that any one lease interest owner guarantee payment of the royalty obligations of its co-interest owners in the lease. In addition, any BLM requirement to provide supplemental financial assurance for royalty disputes is duplicative and unnecessary. Under 30 C.F.R. §§ 1243.4 and 1243.8, if you dispute an ONRR royalty payment demand on production from an onshore federal lease and appeal that demand to the ONRR Director or the Interior Board of

Land Appeals, those regulations properly address the need to provide any financial assurance to obtain a stay of the payment demand pending resolution of the appeal.

The reference to "history of violations" also is vague and requires parameters as to the seriousness of the violations, age of the violations, and whether the violations BLM may have asserted are subject to administrative or judicial review. It also is unclear if an operator's violations must have occurred on the same lease or on any federal lease that it operates. It is entirely inappropriate for lease interest owners on a lease to have to provide supplemental financial assurance for violations that occurred on another lease. Alleged noncompliance with BLM operating regulations also should not trigger a need for additional financial assurance if those violations were unrelated to decommissioning or similar significant lease-related financial obligations. For example, a missing seal on an oil tank does not provide a reasoned basis for BLM to demand supplemental financial assurance. To the extent there exist outstanding financial obligations, BLM has adequate enforcement tools to pursue and collect those amounts and should not use supplemental bonding to address that extant alleged noncompliance.

Additionally, for the same reasons explained above for other appeals sections, the regulations should provide that an operator or lease interest owner may seek State Director review of the authorized officer's demand for supplemental financial assurance. IBLA review of the State Director's decision also should be permitted.

Finally, in view of the significant bonding increases under proposed § 3104.50, BLM should afford flexibility in the forms of acceptable financial assurance instruments to satisfy a BLM demand for increased bond amounts. BLM's sister agency BOEM provides for such flexibility in financial assurance for operators on the Outer Continental Shelf. *See, e.g.*, 30 C.F.R. § 556.900(g). Therefore, in addition to traditional bonds, BLM should be able to consider third-party guarantees, abandonment accounts, or other forms of adequate financial security proposed by an operator and acceptable to BLM.

Recommended Revision:

> (b) The authorized officer may require an increase in the amount of any bond whenever it is determined that the operator poses a risk due to a history of failing to perform reclamation on BLM-managed leases or ~~factors, including, but not limited to, a history of previous violations, a notice from the ONRR that there are uncollected royalties due,~~ due to the total cost of plugging existing wells and reclaiming lands exceed~~s~~ing the present bond amount based on the estimates determined by the authorized officer. The increase in bond amount may be to any level specified by the authorized officer, but in no circumstances will it exceed the total of the estimated costs of plugging and reclamation, ~~the amount of uncollected royalties due to the ONRR,~~ plus the amount of money owed to the lessor due to previous violations remaining outstanding. An operator may satisfy a demand for increased bonding by providing another form of security that BLM determines protects the interests of the United States to the same

> extent as a bond. Any person aggrieved by a decision of the authorized officer to increase bond amounts is subject to State Director review, and review by the Interior Board of Land Appeals, in accordance with 43 C.F.R. § 3165.3.

S. § 3104.70 Default.

Subsection (b)(2) adds new disqualification language for those persons who do not cure bonding defaults. Under this new subsection, if you fail to cure your bonding defaults, BLM may prevent you from acquiring new federal lease interests. The Associations object to this additional subsection because it effectuates the equivalent of suspension or debarment even if BLM does not pursue that route under paragraph (b)(3) with its corresponding due process protections. Accordingly, BLM should remove proposed subsection (b)(2).

T. § 3104.90 Bonds held prior to [EFFECTIVE DATE OF THE FINAL RULE].

Because the Proposed Rule's new minimum lease bond requirements are such a significant increase over the minimum bonding levels in existing regulations, BLM also should uniformly allow for a five-year phase-in period to meet all of the different bonding requirements for existing leases, including in proposed §§ 3104.20 and 3104.30, and should modify proposed § 3104.90 accordingly. This modified phase-in would avoid potentially disruptive financial impacts to lessees and to the financial marketplace that lessees and operators rely upon for securing financial assurance for their federal oil and gas lease operations. Moreover, as discussed above, BLM should remove proposed subsection (c) and preserve nationwide bonding.

U. § 3106.42 Transfers of other interests, including royalty interests and production payments.

BLM is updating this section to ensure that transfers of overriding royalty interests, payments out of production, and similar transfers are reported to BLM. BLM should clarify that BLM approval is not required for these transfers.

V. § 3106.60 Bond requirements.

This section requires an assignee of record title or transferee of operating rights to furnish bonding to replace bonding maintained by the assignor or transferor. But proposed § 3104.20 would place the principal bonding obligation for a lease on the operator. BLM should harmonize the two sections consistent with changes recommended to these sections provided above.

W. § 3107.10 Extension by drilling.

BLM is proposing in subsection (c) that when a BLM-approved directional or horizontal well is drilled from an off-lease location, BLM will consider drilling to have commenced on the lease area when drilling begins at the off-lease location. The Associations support this change as reflecting the realities of advanced drilling technologies.

X. § 3107.21 Continuation by production.

Consistent with the change BLM is proposing for § 3107.10(c), BLM should add the following sentence to this section: "When a BLM-approved directional or horizontal well is completed within multiple leased areas, BLM will consider production to have commenced from each of those leased areas." This will confirm that a lease is held by production from the directional or horizontal well.

Y. § 3120.11 Lands available for competitive leasing.

The Proposed Rule amends the introductory sentence of this section from "[a]ll lands available for leasing *shall* be offered for competitive bidding" to "[a]ll lands *eligible and* available for leasing *may* be offered for competitive auction" (emphasis added). The preamble states that addition of the term "eligible" is to better conform to the MLA, 30 U.S.C. § 226(a) and (b), and "better reflect Interior's statutory discretion to identify lands available for oil and gas leasing." But the changed regulatory language would make the decision to lease more flexible for BLM than the statute allows, including making quarterly leasing in each state appear voluntary, by changing "shall" to "may," contrary to recent court decisions in the wake of EO 14008 Section 208. *See State of North Dakota v. DOI*, No, 21-148, ECF No. 98 (D.N.D. Mar. 27, 2023) (slip. op.); *Louisiana v. Biden*, 622 F. Supp. 3d 267, 293-94 (W.D. La. Aug. 18, 2022); *see also W. Energy All. v. Jewell,* No. 16-912*,* 2017 WL 3600740, at *8 (D.N.M. Jan. 13, 2017). The Associations view this proposed provision as another opportunity to inappropriately limit federal leasing. At a minimum, any change to the existing regulation should mirror the precise language of the statute: "Lease sales shall be held for each State where eligible lands are available at least quarterly and more frequently if the Secretary of the Interior determines such sales are necessary."

Z. § 3120.12 Requirements.

BLM is proposing to amend subsection (a) to provide that "[e]ach BLM State Office will hold sales at least quarterly if eligible lands are available for competitive leasing." This is a significant change from existing § 3120.1-1 which provides that "[a]ll lands available for leasing shall be offered for competitive bidding under this subpart . . . . ", with the latter providing less discretion to remove acreage otherwise available for lease. BLM again states in the preamble that "[t]he proposed rule would update paragraph (a) to conform this section with the language of 30 U.S.C. 226(a) and (b)." However, like proposed § 3120.11 above, the proposed language appears to imbue BLM with more discretion than the statute (30 U.S.C. § 226(b)) does. That statute provides: "Lease sales shall be held for each State where eligible lands are available at least quarterly and more frequently if the Secretary of the Interior determines such sales are necessary." BLM's proposed provision here, particularly coupled with BLM's proposed new "preference criteria" in this Proposed Rule and with BLM's separately proposed "conservation and landscape health" rule, appears to reduce acreage for leasing by relying on other, subsequent determinations that lands available under applicable Resource Management Plans should not be "eligible" for leasing due to BLM's later assertion of potential resource "conflicts." Again, at a minimum, any change to the existing regulation should mirror the precise language of the statute quoted above.

AA. § 3120.30—3120.34 Nomination process.

The preamble to the Proposed Rule asks for comment on whether BLM should reinvigorate the "formal" nomination process for parcels to be included in a competitive auction, which to date BLM has largely eschewed in favor of informal expressions of interest ("EOIs"). BLM explains that "[a]side from a few test sales following the enactment of FOOGLRA, the BLM has never employed the formal nomination process." It is unclear how this proposal would function differently than existing EOIs, except to afford BLM another "mechanism" to limit lease areas under its newly expressed criteria. It also is unclear what BLM means when it states that "[t]he proposed rule would update the following sections [§§ 3120.31-.33] for the formal nomination process with the intent to make these nominations *nonbinding* . . . ." Moreover, BLM does not harmonize the BLM Policy Manual on Communitization (at 10), which states that unleased federal lands within communitization agreements "should be offered for competitive leasing as soon as possible." Such federal lands should not be subject to nomination limitations or EOI criteria set forth in the Proposed Rule.

The Proposed Rule further leaves several relevant questions unanswered for this formal nomination process. For example, would BLM go through the same EOI process to track submissions though the system and allow the public to see what the BLM has nominated? How will BLM confirm industry interest in such acreage? Under what criteria would BLM nominate parcels? Will BLM-nominated parcels be counted in the IRA's acreage calculations for onshore solar and wind rights-of-way? On this last point, BLM should not count all such BLM-nominated acreage for IRA purposes as much of that acreage may never be offered or leased or even attract industry interest in a lease sale. Indeed, BLM need only look to the results of recent offerings for onshore solar and Gulf of Mexico offshore wind to observe the disconnect between government and industry perceptions of attractive areas for energy development.

BB. § 3120.33 Parcels receiving nominations.

BLM is amending existing § 3120.3-5 to no longer mandate that BLM include nominated parcels in a competitive lease sale. Instead, BLM would provide that it "may" include such parcels. That is nonsensical. Proposed § 3120.32 provides that nominations are filed in response to a "List of Lands Available for Competitive Nominations." Thus, BLM has already determined that the lands are available to include in a competitive lease sale. BLM should not get another opportunity to exclude parcels on that list from a competitive sale once they are duly nominated.

CC. § 3120.41 Process.

As discussed in the Associations' general comments above, this proposed provision is among the most problematic in the Proposed Rule. At the outset, BLM fails to explain how the process for EOIs is different from the formal nomination process outlined in the Proposed Rule's preceding sections. Considering BLM's acknowledgement that to date it has leased solely based on the EOI process, BLM should fully delineate the respective workings of the two processes, to avoid potentially misapplying the formal process as an opportunity to constrain access to federal oil and gas while claiming credit toward IRA offered acreage targets.

More critically, subsection (f) introduces "preference criteria" for BLM to utilize in selecting lands to offer in onshore lease sales in response to EOIs. Again, the subjectivity and uncertainty of these criteria contradict BLM's professed rejection of "subjective" criteria and embrace of "certainty." 88 Fed. Reg. at 47,574, 47,565. Also, these preference criteria are ill-defined or undefined. For example, "important fish and wildlife habitats or connectivity areas" is a very broad concept. It potentially captures far more than an Area of Critical Environmental Concern ("ACEC"), which is already subject to existing defined criteria, procedures, reporting, and mitigation.[22] Existing laws such as FLPMA, the Clean Water Act, and the Endangered Species Act already balance multiple uses and protect water bodies and species on BLM lands, and refusing to lease in an area with "important" habitat is unclear and unnecessary. To the extent that the "important" area is already covered by another existing law, the preference criteria would be duplicative. And to the extent the preference criteria are used to exclude additional areas from leasing, the Proposed Rule fails to follow the appropriate procedures for area designation or acreage withdrawal, including a public comment process.[23] The same is true for "historic properties" under the National Historic Preservation Act and laws protecting specific cultural lands. The MLA clearly does not vest BLM with jurisdiction to achieve the same ends as these other statutes.

What is more, BLM purports to set forth only "minimum" criteria in this subsection, and states that it "would consider additional criteria and factors." 88 Fed. Reg. at 47,590. BLM then invites inclusion of additional factors such as "environmental justice concerns" and "greenhouse gas emissions," and does so without appropriate parameters for their consideration. *Id.* at 47,566, 47,590. The Associations are concerned that BLM could wield such additional criteria to simply reduce federal oil and gas leasing—whether or not those criteria are expressly adopted in a final rule. This proposed subsection (f) could be used to functionally freeze oil and gas activities to already existing areas and eliminate new *exploratory* oil and gas development on federal lands. *E.g., id.* at 47,591 ("The BLM would implement this EOI preference process to conserve certain public lands . . . ."); *id.* ("For example, offering leases where current infrastructure exists should reduce the overall footprint of energy development and limit wildlife impacts and habitat fragmentation."); § 3120.41(f)(1) (BLM will consider "[p]roximity to oil and gas development existing at the time of the BLM's evaluation, giving preference to lands upon which a prudent operator would seek to expand existing operations").

The Associations and their member companies share the same commitment as BLM to ensuring that environmental justice concerns are addressed. We support the core principles that uphold environmental justice policy and practice: fair treatment and meaningful engagement, and the industry strives to ensure safe and responsible operations, respecting the communities and the environment where the industry operates. The industry is deeply committed to working with local communities and policymakers to promote these principles across the energy sector. However, BLM should not develop additional criteria in this rulemaking, but instead work with the ongoing CEQ efforts, including on environmental justice, to ensure an aligned and streamlined regulatory process. Specifically, on July 31, 2023, CEQ proposed Phase 2 revisions to its regulations implementing the NEPA, 40 C.F.R. parts 1500-1508. Environmental justice has long been a part of NEPA analysis; however, for the first time, the Proposed Rule would

---

[22] *See* 43 U.S.C. § 1712(c)(3); 43 C.F.R. § 1610.7-2; BLM IM 2023-013.
[23] *See id.*; 43 U.S.C. § 1714.

codify a definition of "environmental justice" for NEPA purposes. BLM's proposal to prematurely implement additional criteria could lead to inconsistencies across regulatory programs, resulting in uncertainty and delays. Also, adding criteria that could potentially duplicate NEPA and efforts by other agencies creates redundancy and administrative complexity.

Furthermore, at the leasing stage, neither BLM nor an operator can forecast with certainty what specific mitigation efforts the operator may undertake to address environmental or environmental justice considerations. BLM should not prejudge how operations on the tract will be conducted in determining whether to exclude the lands entirely from leasing. For example, some operators are voluntarily undertaking extensive programs aiming to achieve or approach carbon net zero operations in basins.

Overall, BLM fails to explain why the preference criteria are needed in the first place. The Proposed Rule suggests that the preference criteria are separate from and precede NEPA review. *Id.* ("The preference criteria generally would be applied before the NEPA analysis is completed."). It is unclear what this means, or how this would avoid improper predetermination of the NEPA process that is specifically intended to analyze such criteria. Furthermore, the preference criteria are likely unnecessary given the greatly reduced surface impacts associated with today's well drilling and completion technology. Lessees may now elect where practicable (as opposed to being compelled by BLM under the Proposed Rule) to horizontally drill well laterals from many miles away while avoiding impacts to any sensitive resources located on a BLM lease. Lessees also operate pursuant to well-developed state programs, such as the Wyoming Executive Order on Greater Sage Grouse, that demonstrate oil and gas development's successful coexistence with wildlife conservation.

Accordingly, BLM should remove subsection (f) from this section of the Proposed Rule. BLM also should not adopt additional potential criteria such as those contemplated in its preamble. Doing so, particularly when coupled with other surface use restrictions in the Proposed Rule, would only detract from the predictability and functionality of BLM federal oil and gas leasing.

DD. § 3120.42 Agency inventory of leasing.

Section 50265(b)(1) of the IRA provides that during the 10-year period following enactment, BLM may not issue a right-of-way for wind or solar energy development on public domain or acquired lands unless BLM has held an onshore oil and gas lease sale in the 120 days preceding the right-of-way issuance, and during the 1-year period preceding the right-of-way issuance BLM has held oil and gas lease sales the total acres of which exceed the lesser of 2,000,000 acres or 50 percent of the acreage for which expressions of interest were submitted for lease sales during that 1-year period. BLM issued IM 2023-006 to establish a process for counting the acreage offered to implement this statutory prerequisite.

Proposed § 3120.42 provides that BLM will periodically calculate the "acreage for which expressions of interest have been submitted" and total "acres offered for lease," both of which are newly defined terms in proposed § 3000.5. Yet proposed § 3120.42 provides no calculation method. This problem is compounded by proposed § 3000.5's exclusion of expressions of interest acreage that previously was "proposed for leasing" in "any pending sale" or in any "other expression of interest pending BLM disposition." For the record, BLM should not rely upon IM 2023-006 or other aspects of the Proposed Rule that are inconsistent with the requirements of the IRA by improperly inflating acreage totals nominated or offered for federal onshore oil and gas leasing, or by improperly decreasing the number of acres included in the determination of acreage for which EOIs were submitted. Indeed, BLM has not explained why the agency finds it necessary to itself nominate lands if prospective operators have not expressed interest in those lands and they thus are unlikely to be successfully bid or produced.

EE. § 3120.63 Award of Lease.

Under the last sentence of subsection (e) of this proposed section, "[i]f the BLM cannot issue the lease within 60 days, the BLM may reject the offer." BLM should not adopt this proposed sentence, which sets up possibly routine rejection by BLM of winning lease offers after a competitive sale is held. The corresponding preamble text merely points to delays from the existence of protests and legal challenges to lease sales, and BLM "policy" to allow the high bidder to await resolution or decline the lease. It nowhere justifies BLM unilaterally rejecting a lease offer. Indeed, the last sentence of subsection (e) is incompatible with the rest of this proposed section and the existing regulation foreclosing a high bidder from withdrawing its bid. Nor should BLM's preamble anticipate that "[t]hese protests and challenges may require the BLM to complete a corrective environmental analysis to reach resolution." Rather, BLM should stand behind its NEPA and other analyses.

III. PART 3150

A. § 3151.30 Collection and submission of data.

The Associations have concerns with this new proposed section of the regulations requiring submission to BLM, and possibly public release, of results of geophysical exploration activities nationwide. BLM provides no basis for this requirement or discussion as to why BLM needs this information, how it will be used, or with whom it will be shared. Operators have spent significant funds to conduct these explorative surveys, and the resulting data is highly confidential business information ("CBI"). At a minimum, if BLM requires the submittal of this information, BLM should treat it as presumptively CBI and accordingly not disclose it to the public or competitors under 43 C.F.R. part 2.

IV. PART 3160

A. § 3162.3-4 Well abandonment.

The Associations oppose subsection (c)'s imposition of a maximum four-year period "except in extraordinary circumstances" to permanently abandon wells that the Proposed Rule defines as temporarily abandoned. In some fields, an operator may not know within four years whether it will need that well, including for secondary recovery operations, water injections, or other purposes. The Associations are concerned that BLM may not consider such circumstances as "extraordinary" to extend the proposed four-year maximum period. It would be wasteful and more environmentally impactful to inflexibly require an operator to permanently abandon a well and later have to drill a replacement well. Rather, the maximum period to permanently abandon temporarily abandoned wells should be the same as for shut-in wells in subsection (d), allowing for additional one-year periods where warranted.

BLM also should delete proposed paragraph (d)(1) in this section. Shut-in wells should not require separate notices to the BLM within 90 days of shutting in a well. Wells are required to be reported on the ONRR Form-4054 ("OGOR") beginning with the last month of drilling and continuing until the well is abandoned. Thus, shut-in wells already are reported (Well Status codes 12 (OSI) and 13 (GSI)). This reporting requirement should suffice, and BLM can track these wells through monthly OGOR reports. If it is BLM's intention to track wells that are shut in for extended periods, i.e., up to the 3 years noted in paragraph (d)(2), then the rule should make it clear that it does not apply to wells that are shut in only for short periods of time. In particular, this circumstance would include wells that are shut in periodically but have actual production each month (in which instance the OGOR would show the wells as producing wells).

V. PART 3170

A. § 3171.14 Valid Period of Approved APD.

The Associations support BLM's goal to reduce administrative burdens associated with APD extension requests. However, there is often good cause for such extensions, and as the Proposed Rule's preamble points out, nearly all wells were spud within four years of approved APDs. Accordingly, the most efficient and equitable method to achieve BLM's goal is to establish a uniform four-year term for an APD, rather than two or three years as BLM proposed. A four-year APD term also more closely correlates with NEPA review accompanying an APD approval, given that NEPA review typically remains valid for at least a five-year period (absent significantly changed circumstances). BLM also should clarify that any new time limitation would apply only prospectively to APDs issued after the effective of a final rule. Moreover, BLM needs to provide a procedure for an operator to obtain an approved sundry notice that its APD remains valid in circumstances covered by proposed § 3171.14(b).

VI. MISCELLANEOUS

Beyond the above comments, the Associations offer a few final overarching comments regarding the Proposed Rule's preamble and discussion of "procedural matters." First, despite its preamble's broad statement, it is not for BLM to determine that every provision in the proposed rule is "severable." 88 Fed. Reg. at 47,566. Rather, that determination is for a court in any legal challenge to the Proposed Rule in part or in whole. In any event, BLM's revision of its Proposed Rule as recommended in these comments should help obviate this issue.

Second, BLM cannot rely on the "public welfare" clause in 30 U.S.C. § 187 (MLA) to support widespread curtailment of leasing. *Id.* at 47,565, 47,573. This provision speaks to terms to be included in leases, and the specific clause (following the final semicolon) addresses economic terms for reasonable wages and prices for federal mineral production. Moreover, the Proposed Rule fails to link its proposals to any aspect or measure of the public welfare. As discussed above, existing regulations are already sufficiently protective of public resources. Furthermore, the Proposed Rule nowhere accounts for the fact that sharp curtailment of federal oil and gas activities would injure the public welfare via lost jobs and diminished economic support for reliant or disadvantaged communities and states.

Finally, BLM makes a counterfactual assumption that the Proposed Rule will have no substantial effects on energy supply. *Id.* at 47,613. That appears to be impossible if BLM is actually significantly curtailing future federal onshore oil and gas leasing via this Proposed Rule, as BLM elsewhere indicates should occur. *Id.* at 47,591, 47,613-14. Moreover, BLM offers no evidence for its presumption that lessees can freely rededicate resources from federal to non-federal lands. BLM's conclusion also ignores significant cumulative cost impacts on oil and natural gas operators stemming from BLM's full suite of proposed rulemakings, such as the proposed Waste Prevention Rule (cited *supra*) and forthcoming Site Security and Measurement rules.

* * *

Thank you for the opportunity to provide these comments. The Associations and their members remain committed to working with BLM on the subject matter of the Proposed Rule. Please do not hesitate to contact us if you have any questions.

Sincerely,

Economic Benefits of Onshore Federal Oil and Natural Gas Leasing from FY 2013 – 2022

Table of Contents

Executive Summary

The development of oil and natural gas resources on federal lands yields significant economic benefits. The oil and natural gas industry generates direct benefits via production on federal lands and revenue sharing in which approximately 50 percent of bonuses, rents, and royalties are shared with the state where they occur. These benefits bolster local government services like education and healthcare. Additionally, the oil and natural gas industry also generates indirect economic benefits that arise from the industry's purchases of goods and services, along with induced benefits that result from direct and indirect labor spending the income they earn from the industry.

To analyze these impacts, we utilize the IMPLAN model. This model relies on publicly available "input-output" tables from the US Bureau of Economic Analysis which establishes connections between industries' purchases and their corresponding output. In this study we examine the benefits of onshore federal leasing generated between FY 2013 and FY 2022 with a specific focus on development in New Mexico, Wyoming, North Dakota, Colorado, and Utah. We find that in FY 2022, onshore federal oil and natural gas development supported nearly 250 thousand jobs, generated $19.4 billion in labor income, and contributed $36.7 billion to GDP. Between FY 2013 and FY 2022, we estimate that onshore federal oil and natural gas leasing supported an average of 190 thousand jobs, generated $13.4 billion in labor income, and contributed $24.2 billion to GDP each year.

Economic Benefits of Federal Leasing, FY 2013 – FY 2022

Completion Cost Estimates

Wells Spud

Based on Bureau of Land Management (BLM) data, five states represented 95.5 percent of the 2,063 well bores started on federal lands in FY 2022—New Mexico (59.3 percent), Wyoming (14.5 percent), North Dakota (8.0 percent), Colorado (8.0 percent), and Utah (5.6 percent). Between FY 2013 and FY 2022, 92.2 percent of wells spud were located in the five aforementioned states—see Figure 1. Given that New Mexico, Wyoming, North Dakota, Colorado, and Utah account for the majority of wells spud as well as oil and natural gas production on federal lands, we focus on these five states and combine all other states.

Figure 1. Wells Spud by State and Period

State	Wells Spud, FY 2022	Percent	Well Spud, FY 2013 - FY 2022	Percent
New Mexico	1,223	59.3	7,037	39.2
Wyoming	300	14.5	4,419	24.6
North Dakota	166	8.0	1,771	9.9
Colorado	165	8.0	1,900	10.6
Utah	116	5.6	1,411	7.9
Other	93	4.5	1,408	7.8
Total	2,063	100	17,946	100

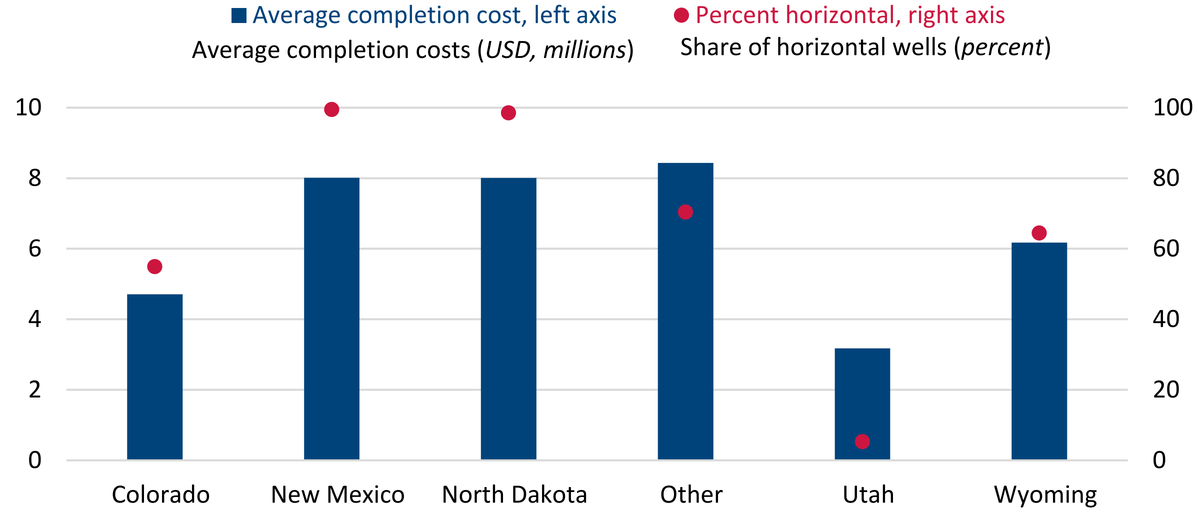
Note: This figure does not include "Indian leases."

Average Completion Costs per Well Bore

Rystad Energy collects and estimates completion costs for over 500 thousand wells and separates these costs into ten categories—drilling services, facilities, fuel and power, oil country tubular goods, other completion costs, other drilling costs, proppant, rig, stimulation, and water. We restrict the wells in our sample to those drilled between FY 2013 and FY 2022, that had a BLM lease and were not on Indian land. These restrictions reduce the number of wells spud between FY 2013 and FY 2022 to 16,200, roughly matching BLM's well spud estimates. As in the BLM data the top five federal oil and natural gas producing states, in Rystad's data, represent roughly 95.0 percent of wells spud on federal land between FY 2013 and FY 2022.

We generate average completion costs by state and fiscal year, using Rystad's cost data based on the well's spud date. In FY 2022, the average cost of a completed well on federal lands was $7.0 million. State well completion costs ranged from $3.2 (Utah) to $8.0 (North Dakota) million—see Figure 2. These cost differences are partly explained by well direction. For example, whereas 94.7 percent of wells spud on federal lands in Utah were either directional or vertical, in North Dakota 98.5 percent of wells spud on federal lands were horizontal. Relative to directional or vertical wells, horizontal wells have higher completion costs. In FY 2022, 82.6 percent of wells spud on federal lands were horizontal. Compared to FY 2013, the percentage of wells spud that are horizontal (34.6 percent) has increased 48 percentage points. While horizontal wells, typically, have higher completion costs than vertical wells, they are generally more productive and reduce oil and natural gas well's surface footprint.

Figure 2. Average Completion Costs and Well Direction by State, FY 2022



Sources: Rystad Energy; API calculations.

Total Federal Onshore Completion Costs

Having determined average completion costs by state, we estimate total completion costs by multiplying Rystad's well completion cost data by BLM's well spud data. This procedure generates total completion costs by state and fiscal year—see Figure 3. Between FY 2013 and FY 2022, firms spent $98.8 billion on onshore federal well completions or about $9.9 billion per year. Completion costs in New Mexico (49 percent), Wyoming (21 percent), and North Dakota (15 percent) represented 84 percent of total onshore federal well completion expenditures. In FY 2020, completion costs dropped 24 percent year over year but have rebounded thereafter. In FY 2022, total completion costs were roughly $15 billion and were up 46 percent year over year.

Figure 3. Total Well Completion Costs by State, FY 2013 - 2022

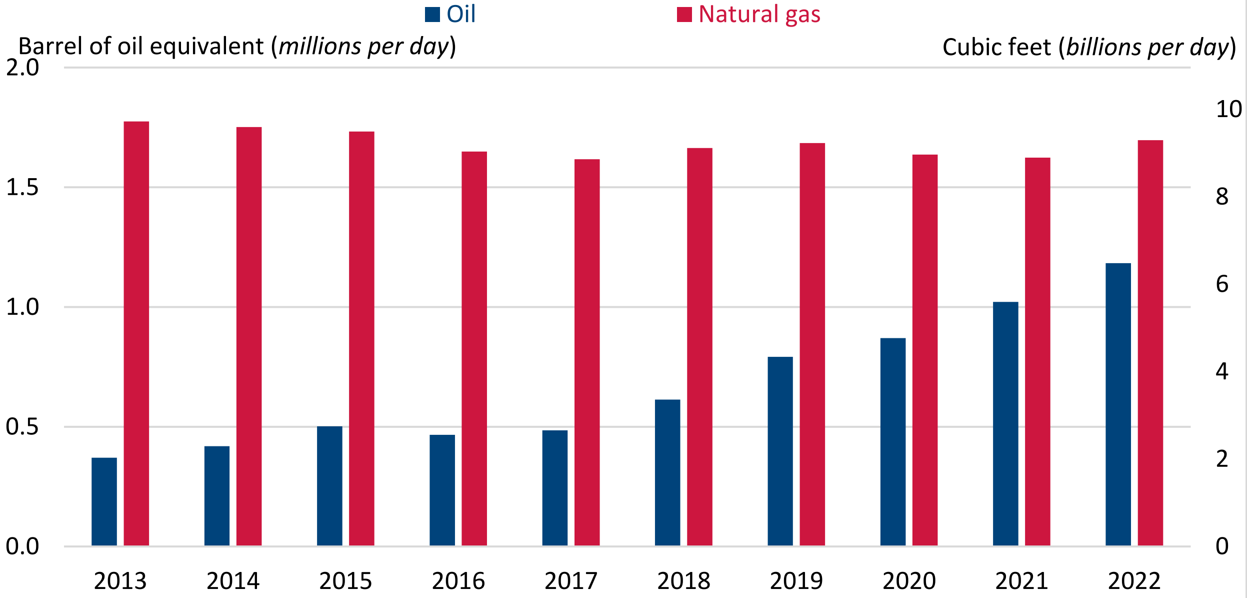
Production Estimates

Federal Production Estimates

We estimate production expenditures by state and fiscal year using Rystad's per barrel of oil equivalent (BOE) cost estimates and the Office of Natural Resources Revenue's (ONNR) production data. First, we use ONNR's production data to determine onshore federal natural gas and oil production[1] in BOE[2] terms. Between FY 2013 and FY 2022, federal lands produced roughly 1.7 million BOE of natural gas per day and about 672 thousand barrels per day of oil. Over the ten year period, federal lands produced 8.6 billion BOEs of natural gas (6.1 billion) and oil (2.5 billion)—Figure 4. While natural gas production has declined by 4.4 percent between FY 2013 and FY 2022, oil production has tripled. Over the same period, ninety-five percent of production occurred in Wyoming (36 percent), New Mexico (33 percent), Colorado (16 percent), Utah (6 percent), and North Dakota (5 percent).

Figure 4. Federal Onshore Oil and Natural Gas Production, FY 2013 - FY 2022



Sources: Office of Natural Resources Revenue; API calculations.
Notes: Production estimates do not land classes designated as "mixed exploratory" or "Native American."

---

[1] We only include production on the land classes designated "federal" which excludes "mixed exploratory" and "Native American" land classes.

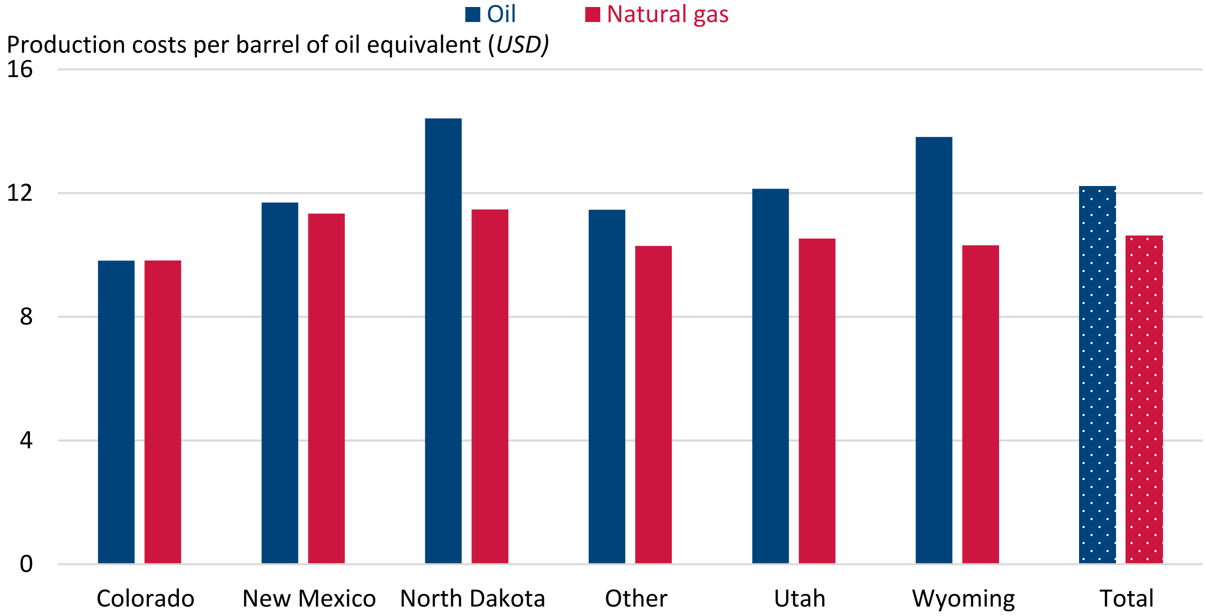
[2] We convert natural gas thousand cubic feet (MCF) to barrel of oil equivalents using a conversion factor of 5.478.

Production Cost Estimates Per Barrel of Oil Equivalent

Rystad estimates production cost per BOE by product type—i.e., oil and natural gas—and includes costs associated with taxes; selling, general and administrative expenses; transportation; production; and abandonment. Rystad presents their production cost estimates by state and calendar year. Their data does not allow us to derive production cost estimates, specifically, for federal lands as Rystad's per barrel production estimates include all onshore production. However, we believe that the composition of private and federal wells is likely similar and that their production costs do not vary substantially excluding federal royalties which we discuss in the following section.

We find that the average unweighted production cost associated with a barrel of oil is roughly $12 and that the average unweighted production cost associated with a BOE of natural gas is about $11. However, we find that average production costs vary by state—see Figure 5. For example, in California the average production cost per barrel of oil was $22, over the period, which is about 1.6 times higher than the US average unweighted production cost per barrel of oil. Similarly, in California the average natural gas production cost per barrel of oil equivalent was $16, over the period, which is about 1.4 times higher than the national unweighted average production cost per barrel of oil equivalent.

Figure 5. Average Production Costs per Barrel of Oil Equivalent, 2013 - 2022

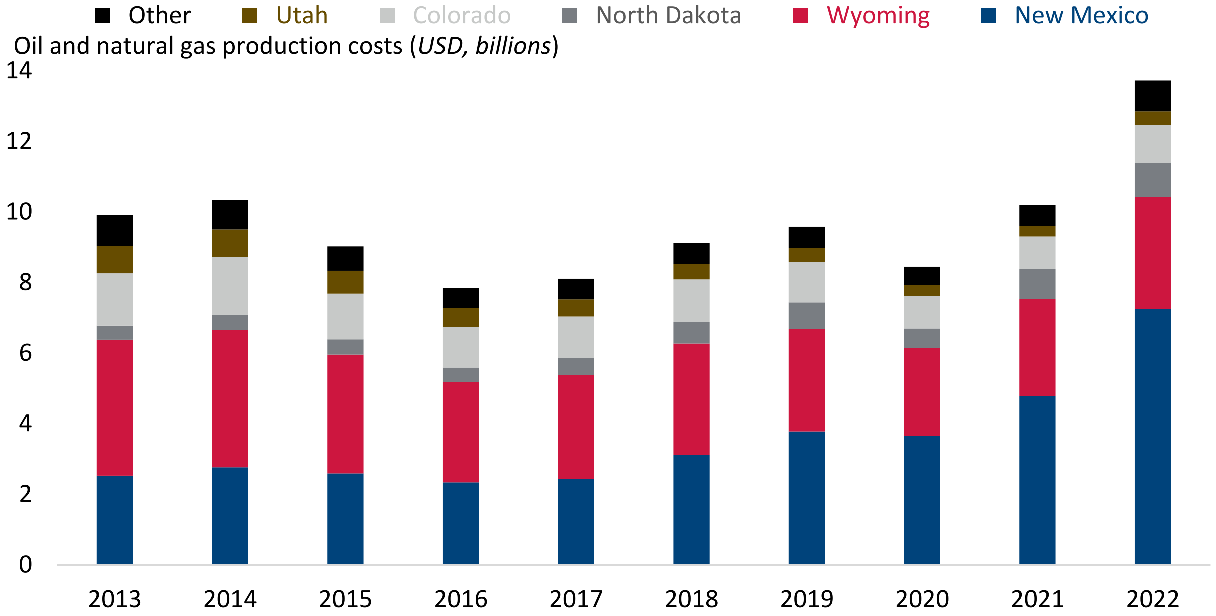


Sources: Rystad Energy; API calculations.

Total Production Costs

We generate total production costs by state and fiscal year, using Rystad's per barrel of oil equivalent production cost data in combination with ONNR's production data.[3] Multiplying Rystad's, respective, per barrel production costs by ONNR's, corresponding, production data generates our total production cost estimates—see Figure 6. We estimate that, between FY 2013 and FY 2022, firms spent $92 billion on production costs, roughly $9.2 billion each year. Production costs were primarily located in Wyoming (35 percent), New Mexico (33 percent), and Colorado (13 percent) representing 82 percent of total expenditures.

Figure 6. Total Federal Land Production Expenditures by State, FY 2013 - 2022



Sources: Rystad Energy; Office of Natural Resources Revenue; API calculations.

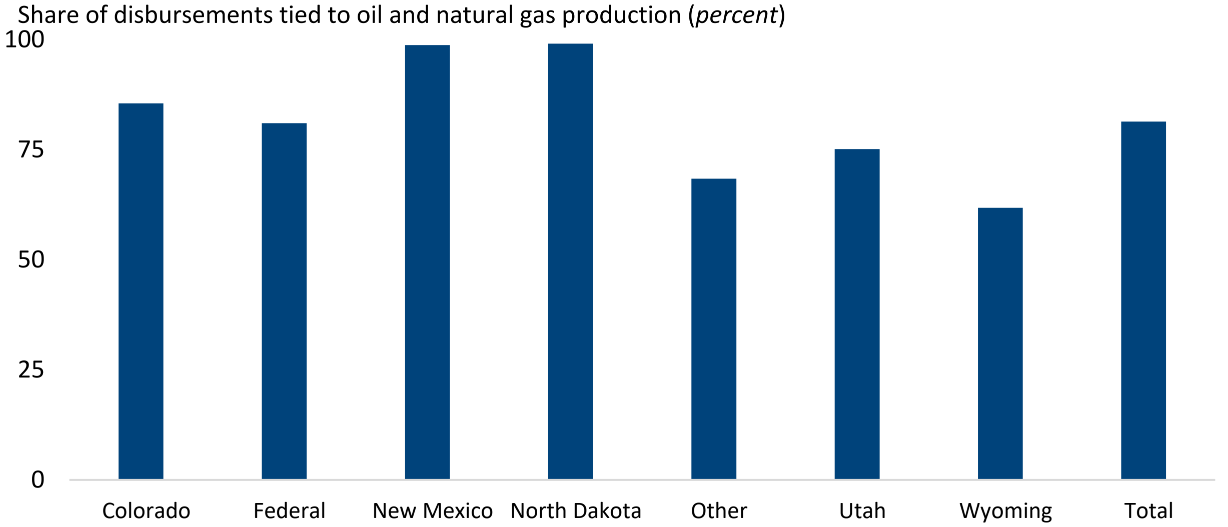
---

[3] Because Rystad presents their data in calendar years and the rest of our study is in fiscal years, we match the nearest calendar year in Rystad's production cost data to the nearest fiscal year in ONNR's production data.

Oil and Natural Gas Disbursements

We estimate disbursements generated by federal onshore oil and natural gas production using ONNR disbursement data.[4] ONNR only offers disbursement data by commodity as of FY 2017. Prior to FY 2017, ONNR did not distinguish disbursements by commodity. We estimate disbursements by commodity between FY 2013 and FY 2016 as follows. First, we use ONNR's FY 2017 – FY 2022 data excluding disbursements tied to offshore production and fund types designated as Native American Tribes & Allottees. Second, we group disbursements into two categories 1) oil and natural gas[5] and 2) other such as wind, sulfur, etc. Finally, we determine the percent of disbursements that were tied to oil and natural gas production by recipient and fiscal year.[6] Between FY 2017 and FY 2022, the percentage of disbursements that were tied to oil and gas production varied by recipient—see Figure 7. For example, in New Mexico and North Dakota almost all disbursements were tied to onshore oil and natural gas production, while in "other" states only 66 percent of disbursements were tied to onshore oil and natural gas production.

Figure 7. Average Share of Onshore Disbursements Tied to Oil and Natural Gas Production by Recipient, FY 2017 - FY 2022



Sources: Office of Natural Resources Revenue; API calculations.

Notes: In New Mexico and North Dakota, the proportion of disbursements allocated to oil and gas, ocassionally, exceeded a 100 percent. We capped disbursements at 100 percent.

---

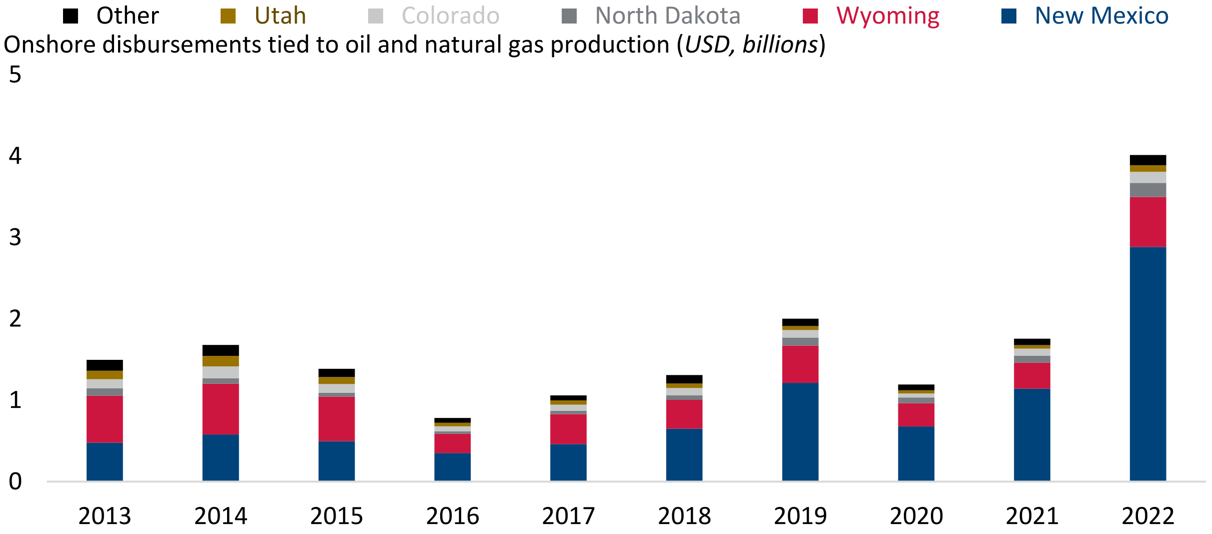
[4] We rely on disbursement data instead of revenue data because it allows us to identify the recipient of the disbursement which is required for our IMPLAN calculations.

[5] Oil and natural gas include commodities identified as oil & gas (pre-production), oil, and gas.

[6] In New Mexico and North Dakota, the proportion of disbursements allocated to oil and gas exceeded a 100 percent. We capped disbursements at a 100 percent.

We then apply our ratios of onshore disbursements between FY 2017 and FY 2022 by recipient to ONNR's FY 2013 and FY 2016 disbursement data[7], to approximate the share of disbursements that were likely tied to oil and natural gas production on federal lands—see Figure 8. We find that, between FY 2013 and FY 2022, recipients received a total of $35 billion in oil and natural gas disbursements equal to roughly $3.6 billion a year. Fifty-three percent ($19 billion) of disbursements went to the federal government or programs, while state and local governments received the remaining 47 percent. Of the 47 percent of disbursements that went to state and local governments, New Mexico and Wyoming received 80 percent (roughly $13 billion).

Figure 8. Onshore Disbursements Tied to Oil and Natural Gas Production by Recipient, FY 2013 - FY 2022



Sources: Office of Natural Resources Revenue; API calculations.

Notes: We estimate FY 2012 to FY 2016 disbursements based on the share of oil and natural gas disbursements between FY 2017 - 2021. This figure does not include disbursements to the federal government or federal programs.

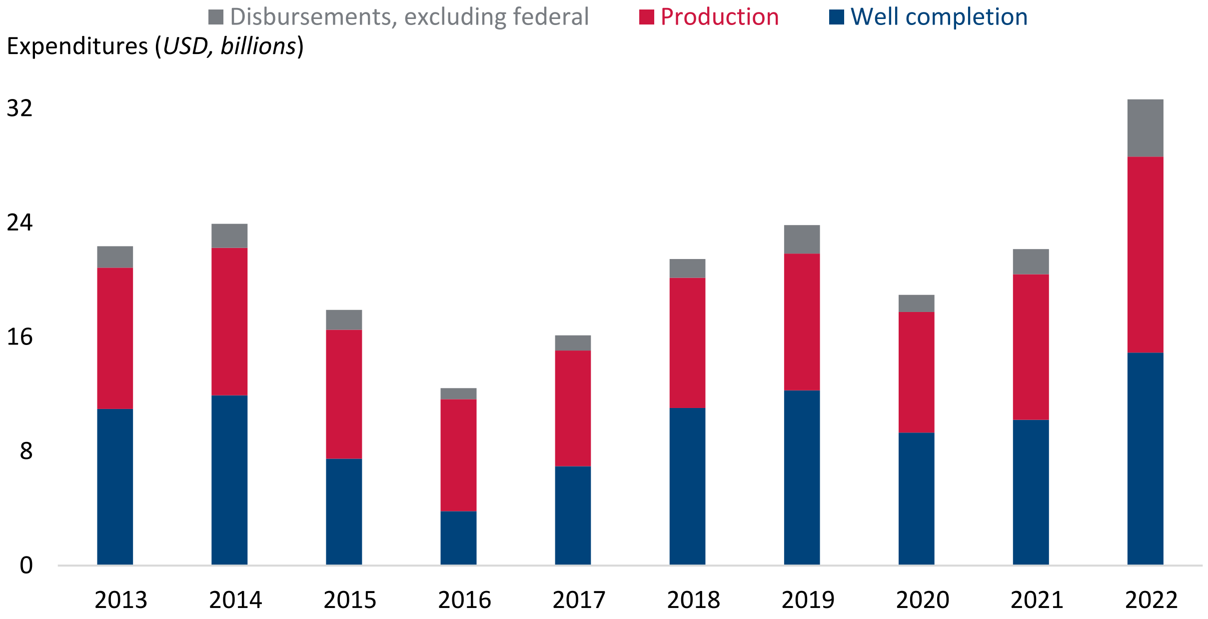
---

[7] We remove disbursements that are not identified as onshore or that are tied to "Native American tribes and individuals" fund types. These changes align ONNR's FY 2012 – FY 2016 data, with ONNR's FY 2017 – FY 2022 data.

Total Expenditures and Disbursements

Between FY 2013 and FY 2022, firms spent roughly $212 billion on federal onshore oil and natural gas production—disbursements, excluding federal ($16.7 billion), production ($96.2 billion), and well completion ($98.8 billion). Over the period, average expenditures were roughly $21.2 billion per year. Total expenditures were clustered regionally, New Mexico (44 percent), Wyoming (27 percent), North Dakota (10 percent), and Utah (10 percent). To determine these expenditures impact on employment and economic growth we use IMPLAN and allocate total expenditures to impact categories that correspond to the specific expenditures and state where they occurred.[8] We do not include oil and natural gas disbursements received by the federal government in our economic modelling—see Figure 9.

Figure 9. Total Expenditures by Category, FY 2013 - FY 2021



Sources: Bureau of Land Management; Rystad Energy; Office of Natural Resources Revenue; API calculations.

---

[8] The IMPLAN categories we use for well completion costs are 29 (sand and gravel mining), 35 (drilling oil and gas wells), 36 (support activities for oil and gas operations), 49 (water, sewage and other systems), 216 (Iron, steel pipe and tube manufacturing from purchased steel), 264 (oil and gas field machinery and equipment manufacturing), and 399 (wholesale, petroleum and petroleum products). We group all production expenditures into the IMPLAN category 20 (oil and natural gas extraction). We distribute oil and natural gas disbursements between four IMPLAN categories—539 (state education), 540 (health services), 541 (other state) and 542 (local education)—based on IMPLAN's state level estimates of payroll expenditures. In all cases, we allocate the expenditures to the states that they accrue expect for OCTG costs which we assign to "other" states as little OCTG expenditures occur in the five states where the lion share of oil and natural gas production occurs.

Employment and Economic Benefits

Using the IMPLAN model we find that in FY 2022, onshore federal oil and natural gas development supported nearly 250 thousand jobs, generated $19.4 billion in labor income, and contributed $36.7 billion to GDP—see Figure 10. Notably, drilling and development contributed the most to total jobs and labor income, while extraction resulted in the highest total GDP. While direct benefits primarily accrue to five states with the most federal oil and natural gas development the indirect and induced impacts reach the entire US economy—see Figure 11. The "other" category experiences the highest indirect and induced economic effects, reflecting the widespread influence of supply chain purchases and general induced spending. New Mexico currently leads with the largest economic impact, accounting for approximately 40 percent of the total US impact.

Figure 10. Economic Benefits of Federal Oil & Natural Gas Leasing, Fiscal Year 2022

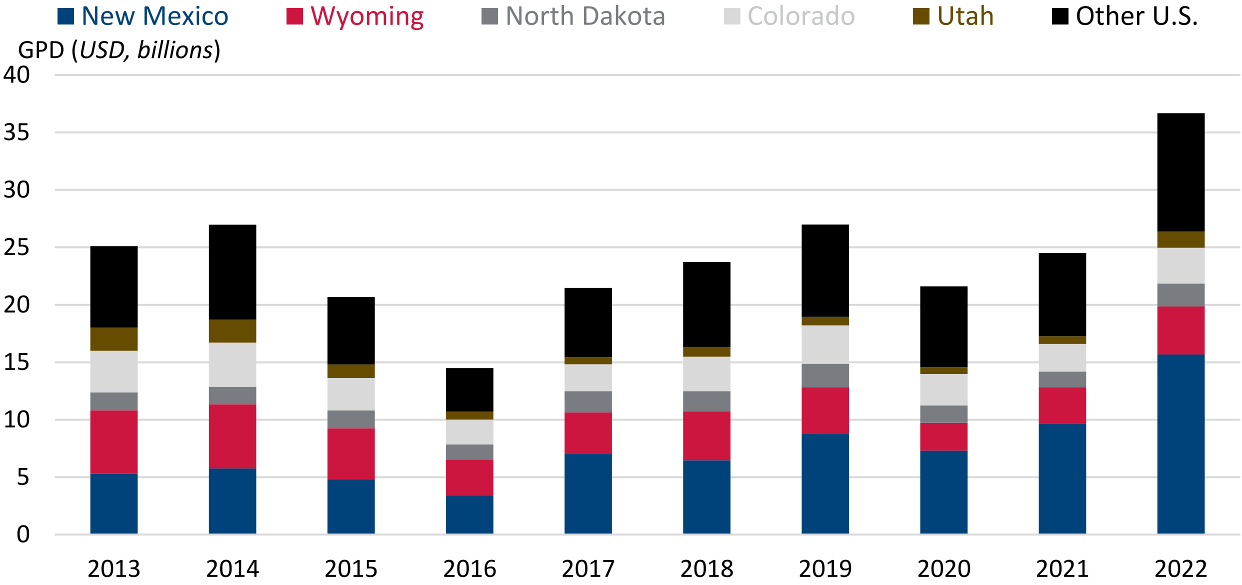
Utah	3.0	8.1	11.2	0.2	0.6	0.8	0.6	0.9	1.4
Wyoming	15.1	9.3	24.4	1.3	0.5	1.8	3.2	0.9	4.2
Other	3.8	71.7	75.5	0.5	5.8	6.3	1.0	9.4	10.3
Total	95.8	151.6	247.4	8.6	10.8	19.4	18.8	17.9	36.7

Sources: Bureau of Land Management; Rystad Energy; IMPLAN; API calculations.
Notes: US impacts only.

Examining ten-year trends of employment labor income, and GDP—see Figure 12 and 13—FY 2022 stands out as the year with the most substantial economic impact, largely driven by the growing impacts of the New Mexico portion of the Permian Basin. Colorado, Utah, and Wyoming have generally shown declining economic impacts from federal Leasing over the last decade, with a minor post-COVID-19 economic rebound in 2022. Conversely, North Dakota's economic impacts have exhibited variations over the years, without showing a definitive upward or downward trend. We find that between FY 2013 and FY 2022, onshore federal oil and natural gas leasing supported an average of 190 thousand jobs, generated $13.4 billion in labor income, and contributed $24.2 billion to GDP each year.

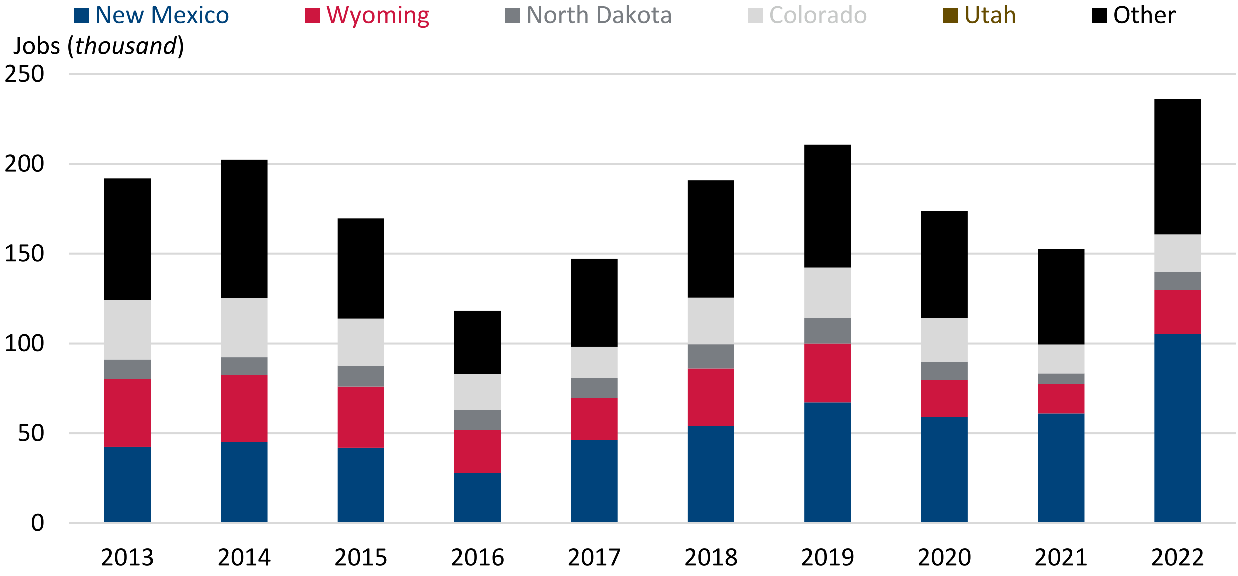
Figure 12. GDP Supported by Onshore Federal Oil & Natural Gas Leasing by FY



Sources: Bureau of Land Manegement; Rystad; IMPLAN; API calculations.

Notes: Includes benefits from production, drilling and development, and Federal revenue sharing. Revenue sharing supports state and local governments.

Figure 13. Jobs Supported by Onshore Federal Oil & Gas Leasing by FY



Source: BLM, Rystad, IMPLAN, API Calculatoins

Notes: Includes benefits from production, drilling and development, and Federal revenue sharing. Revenue sharing supports state and local govenments.

Conclusion

The development of oil and natural gas resources on onshore federal lands yields significant economic benefits. We find that in FY 2022, onshore federal oil and natural gas development supported nearly 250 thousand jobs, generated $19.4 billion in labor income, and contributed $36.7 billion to GDP. Between FY 2013 and FY 2022, we estimate that onshore federal oil and natural gas leasing supported an average of 190 thousand jobs, generated $13.4 billion in labor income, and contributed $24.2 billion to GDP each year.

2023 09 22 Oand G Coalition Comments on BLM Proposed Leasing Rule Final Filed Comments and Benefits Report.pdf

---

Good afternoon regulatory committee,

The Bureau of Land Management has released the final Onshore Oil and Gas Leasing Rule. It has been made available for public review but hasn't been published in the federal register. A copy of the final rule text can be found here.

NDPC joined over a dozen other trade partners in submitting 60 pages of comments (attached) in September of 2023. Upon initial review of the rule, none of our concerns appear to have been addressed in the final rule. The new provisions will make it very challenging economically to produce energy on federal lands.

The main changes in the final rule are:

- **Implementation of provisions of the Inflation Reduction Act (IRA)** pertaining to royalty rates, rentals, and minimum bids.
    - Royalty rate increased from 12.5% to 16.67% for new leases.
    - Reinstated leases increase to a minimum royalty rate of 20%

- **Updates to the bonding requirements** for leasing, development, and production.
    - Increases bond amount from $10,000 to $150,000.

- **Revisions to some operating requirements**, including:
    - Extending the term of an approved APD based on a lease suspension.
    - Requiring relocation of proposed operations by up to 800 meters to avoid resource conflicts.
    - Clarifying the process for modifying lease terms and stipulations.

- **Elimination of the formal lease nominations process**.
    - Replaced by a new "expression of interest" (EOI) process.

- **Addition of a new section addressing severability based on comment submissions**.

- **Updates to cross references and definitions throughout the regulations**.
    - Changed the “shall” to “may” to clarify that the Secretary retains the discretion to decide, even after lands have been determined to be eligible and available, what lands will ultimately be offered for lease.

- **Removal of "outdated" or "unnecessary" provisions**.

IPAA Statement on the new rule:

Dan Naatz, IPAA COO and EVP: "The final rule will not improve stewardship of federal lands, as BLM claims, but will have the effect of driving mineral production off of these areas. The regulatory environment has become so hostile to American oil and natural gas producers operating on federal land that it's clear the Biden Administration intends for "multiple use" lands to only be used for conservation and recreation. The true losers with this misguided policy are states and localities that rely on revenues from federal land extractive industries to meet their budget obligations year after year. Rather than taking their mandate to be good stewards of federal land for the betterment of the American people seriously, the Biden Administration continues to ignore the people in local towns and communities across the West in order to placate a small group of environmentalists and to further reduce American oil and natural gas production."

Here are some additional news stories from this afternoon regarding the rule.

Oil and gas companies must pay more to drill on federal lands under new Biden administration rule (msn.com)

Biden administration raises cost for oil and gas drilling on public lands for first time in decades - Washington Examiner

Subject: Public Lands Rule

Hello,

The Bureau of Land Management recently released its Public Lands Rule which aims to achieve multiple objectives, including the improvement of public land health and resilience in the face of climate change, the conservation of important wildlife habitat and intact landscapes, the facilitation of responsible development, and the recognition of unique cultural and natural resources.

To ensure effective implementation of the Public Lands Rule, the BLM

Montana/Dakotas has assembled a team of subject matter experts who will be available to deliver presentations and address any questions or concerns you may have. Your ongoing collaboration and support will be crucial as we navigate the implementation phase which will go into effect May 18, 2024.

As our valued partners and stakeholders, we invite you to engage with us in this endeavor and take advantage of the opportunity to have our team of experts present to your groups. These presentations will provide a comprehensive understanding of the rule, allowing you to actively participate in the conservation and management of our public lands. Together, we can ensure that these lands are passed on to future generations in as good or better shape than we found them.

If you'd like to schedule a meeting for a personalized presentation, please contact me with the following information:

- Preferred Time and Date
- Location
- In-person or Virtual
- Specific topics relevant to your organization

The Public Lands Rule comes at a crucial moment as our public lands face unprecedented challenges such as drought, wildfires, and the decline in their overall health. By managing for landscape health, the BLM aims to achieve its multiple use and sustained yield mission while prioritizing conservation as an essential component of public lands management.

To learn more about the rule and its specific provisions, I encourage you to review the detailed information provided on the Public Lands Rule website and in the final rule. This document outlines the objectives, processes, and benefits associated with the Public Lands Rule.

Thank you, and we look forward to hearing from you.

Take care,
Christine Cimiluca

1 EXECUTIVE SUMMARY

This executive summary presents the results of the U.S. Environmental Protection Agency's (EPA) regulatory impact analysis (RIA) of the proposed rule implementing the methane waste emissions charge (WEC) required under the Inflation Reduction Act (IRA). The RIA is intended to provide the public with information on the relevant benefits and costs of this proposed rulemaking and to comply with executive orders, as well as other potential impacts of the rulemaking. This rulemaking proposes how EPA would implement the WEC according to the specifications in the IRA. Specifically, the rule proposes how the WEC will be calculated and how the exemption and netting provisions will function.

The WEC does not directly require emissions reductions from applicable facilities or emissions sources. However, by imposing a charge on methane emissions that exceed waste emissions thresholds, oil and natural gas facilities subject to the WEC are expected to perform methane mitigation actions and make operational changes where the costs of those changes are less than the WEC payments that would be avoided by reducing methane emissions. In addition, because volatile organic compound (VOC) and hazardous air pollutant (HAP) emissions are emitted along with methane from oil and natural gas industry activities and are simultaneously reduced by methane mitigation actions, reductions in methane emissions as a result of the WEC also result in co-reductions of VOC and HAP emissions.

This RIA analyzes potential emissions changes and economic impacts of the WEC that arise through two pathways: 1) through the application of cost-effective methane mitigation technologies, and 2) through changes in oil and natural gas production resulting from price changes under the proposed rule. The analysis of methane mitigation is based on bottom-up engineering cost and mitigation potential information for a range of methane mitigation technologies. Application of methane mitigation technologies reduce WEC payments for WEC obligated parties by reducing methane emissions compared to a baseline without additional methane mitigation actions. The analysis assumes that methane mitigation is implemented where the engineering control costs are less than the avoided WEC payments for a particular mitigation technology.

Additionally, oil and natural gas firms may change their production and operational decisions in response to the WEC. This potential impact is modeled using a partial equilibrium

(PE) model of the crude oil and natural gas markets. The total cost of methane mitigation and WEC payments is added as an increase to production costs, resulting in changes in equilibrium production of oil and natural gas and associated emissions. Projected WEC payments are estimated after methane emissions reductions from both methane mitigation and economic impacts are accounted for.

Using emissions reported to Subpart W for Reporting Year (RY) 2021 as an illustrative example, Table 1-1 shows that the WEC would be imposed on less than 15 percent of national methane emissions from petroleum and natural gas systems. Total methane emissions reported to the Greenhouse Gas Reporting Program (GHGRP) Subpart W are significantly less than national methane emissions from the U.S. Greenhouse Gas Inventory for petroleum and natural gas systems. WEC-applicable facilities are the subset of GHGRP facilities that report at least 25 thousand metric tons CO_2e to Subpart W segments subject to the WEC.

It is also important to note that the WEC would only apply to methane emissions that are above the emissions threshold, not for all emissions from WEC-applicable facilities. The WEC has exemptions related to regulatory compliance, emissions from plugged wells, and unreasonable delay in environmental permitting, although these provisions do not impact the illustrative results in Table 1-1. Finally, emissions subject to WEC accounts for netting of emissions between facilities. Under the proposed WEC, facilities with emissions below their emissions threshold may reduce emissions subject to the WEC at other facilities with emissions above the emissions threshold where those facilities are under common ownership or control.

Table 1-1 Emissions Subject to the WEC

	CH_4 emissions, 2021	
	(thousand metric tons)	**($MMTCO_2$e with GWP=28)**
Petroleum and Natural Gas Systems National Total (GHGI)	8,600	240
GHGRP Subpart W	2,800	79
From WEC-applicable facilities (>25,000 $mtCO_2$e to W)	2,100	60
Facility emissions exceeding emissions threshold	1,200	33
Emissions subject to WEC, after netting	1,000	29

The benefit-cost analysis contained in this RIA for the WEC considers the potential benefits and costs of the WEC arising from cost-effective mitigation actions under the WEC as well as the potential transfers from affected operators to the government in payments. Costs include engineering costs for methane mitigation actions and costs resulting from production changes in oil and natural gas markets under the rule. While EPA expects a range of health and environmental benefits from reductions in methane, VOC, and HAP emissions under the WEC, the monetized benefits of the rule are limited to the estimated climate benefits from projected methane emissions reductions. These benefit estimates are based on the social cost of methane (SC-CH_4). A screening-level analysis of ozone-related benefits from projected VOC reductions can be found in Appendix A of the RIA. However, these estimates are treated as illustrative and are not included in the quantified benefit-cost comparisons in the RIA.

EPA estimates that this action will result in cumulative emissions reductions of 960 thousand metric tons of methane over the 2024 to 2035 period. These reductions represent about 33 percent of methane emissions that would be subject to the WEC before accounting for the adoption of cost-effective emission reduction technologies. Virtually all the reduced emissions result from mitigation activities undertaken by industry to reduce WEC payments. Less than 1 percent of the estimated reductions is associated with decreased production activity in the oil and natural gas sector estimated under the proposed rule. In addition to methane emissions reductions, the WEC is estimated to result in reductions of 140 thousand metric tons of VOC and 5 thousand metric tons of HAP over the 2024 to 2035 period.

Table 1-2 Projected Emissions Reductions from the Proposed Waste Emissions Charge, 2024-2035

	Emission Changes			
	Methane (thousand metric tons)	**VOC (thousand metric tons)**	**HAP (thousand metric tons)**	**Methane (million metric tons CO_2 Eq. using GWP=28)**
Total	960	140	5	27

The WEC has important interactions and is designed to work hand-in-hand with the New Source Performance Standards (NSPS OOOb) and Emissions Guidelines (EG OOOOc) for the Oil and Natural Gas Sector by accelerating the adoption of cost-effective methane mitigation technologies, including those that would eventually be required under the NSPS OOOOb or EG OOOOc. The annual projected emissions reductions, costs, and WEC obligations are significantly affected by these interactions.

The EPA proposed updates to the Oil and Gas NSPS OOOOb/EG OOOOc in 2021, published a supplemental proposal in 2022, and finalized the NSPS OOOOb/EG OOOOc in December 2023. In addition to requirements already in place, these rules include standards for many of the major sources of methane emissions in the oil and natural gas industry. To avoid double counting of benefits and costs, the baseline for this proposal includes reductions resulting from the NSPS OOOOb/EG OOOOc based on information from the 2023 Final RIA. Specifically, that analysis showed methane emissions reductions from the EG OOOOc beginning to take effect in 2028. As facilities implement emission controls required by the NSPS OOOOb and EG OOOOc, emissions subject to the WEC decline.

The second interaction between the WEC and NSPS OOOOb/EG OOOOc is the regulatory compliance exemption provision of the WEC. Under this provision, when certain conditions are met with respect to the implementation of the Oil and Natural Gas NSPS OOOOb/EG OOOOc, applicable facilities in compliance with the NSPS OOOOb/EG OOOOc are exempted from the WEC. The analysis in this RIA assumes that the regulatory compliance exemption takes effect in 2027, such that, in 2027 and later, facilities in the industry segments subject to requirements under the NSPS OOOOb/EG OOOOc do not owe WEC payments.

Projected methane emissions subject to WEC after accounting for methane mitigation and energy market impacts are estimated to be about 830 thousand metric tons in 2024, and then drop significantly the regulatory compliance exemption takes effect in 2027. Table 1-3 provides projected WEC-applicable emissions in the baseline and policy scenario.

Table 1-3 Projected Net WEC Emissions and WEC Obligations in the Policy Scenario

Year	Methane Emissions Subject to WEC in Baseline (thousand metric tons)	Reductions from Methane Mitigation (thousand metric tons)	Reductions from Energy Market Impacts (thousand metric tons)	Methane Emissions Subject to WEC in Policy Scenario (thousand metric tons)
2024	980	150	0.1	830
2025	940	300	0.1	650
2026	900	470	2.0	430
2027	13	5	0.0	8.6
2028	13	5	0.0	8.5
2029	13	5	0.0	8.5
2030	13	5	0.0	8.5
2031	13	5	0.0	8.5
2032	13	5	0.0	8.4
2033	13	5	0.0	8.4

Year	Methane Emissions Subject to WEC in Baseline (thousand metric tons)	Reductions from Methane Mitigation (thousand metric tons)	Reductions from Energy Market Impacts (thousand metric tons)	Methane Emissions Subject to WEC in Policy Scenario (thousand metric tons)
2034	13	5	0.0	8.4
2035	13	5	0.0	8.3
Total 2024-2035	2,900	960	2.6	2,000

Climate benefits associated with this proposed rule are monetized using estimates of the social cost of methane (SC-CH_4) which calculates the avoided climate related damages from reducing methane emissions. Methane is the principal component of natural gas. As a potent GHG, methane absorbs terrestrial infrared radiation once emitted into the atmosphere, which in turn contributes to increased global warming and continuing climate change. Methane reacts in the atmosphere to form ozone, which also impacts global temperatures. In addition to other GHG emissions, methane contributes to warming of the atmosphere, which over time leads to increased air and ocean temperatures, changes in precipitation patterns, melting and thawing of global glaciers and ice sheets, increasingly severe weather events, such as hurricanes of greater intensity, and sea level rise, among other impacts.

This proposed rulemaking is projected to reduce VOC emissions, which are a precursor to ozone. Ozone is not generally emitted directly into the atmosphere but is created when its two primary precursors, VOC and oxides of nitrogen (NO_X), react in the atmosphere in the presence of sunlight. Emissions reductions under the WEC may decrease ozone formation, human exposure to ozone, and the incidence of ozone-related health effects. VOC emissions are also a precursor to $PM_{2.5}$, so VOC reductions may also decrease human exposure to $PM_{2.5}$ and the incidence of $PM_{2.5}$- related health effects.

Available emissions data show that several different HAP are emitted from oil and natural gas operations. Emissions of eight HAP make up a large percentage of the total HAP emissions by mass from the oil and natural gas sector: toluene, hexane, benzene, xylenes (mixed), ethylene glycol, methanol, ethyl benzene, and 2,2,4- trimethylpentane (U.S. EPA, 2011b). Reductions of HAP emissions under the WEC may reduce exposure to these and other HAP.

In Section 9.3 of the RIA, EPA identifies existing potential environmental justice issues for the communities in counties that have emissions sources that are expected to owe the WEC charge and thus may be positively affected by emissions changes under the proposal. Compared to the national average, these communities include a higher percentage of individuals who identify as racial and ethnic minorities, have lower average incomes, and have slightly elevated health risks associated with various air emissions. Reductions in VOC and HAP emissions as a result of the WEC are expected to benefit communities in these counties. Because the WEC does not directly require emissions reductions, EPA has not projected specific locations that emissions reductions might occur. In addition, detailed proximity analysis is infeasible because the emissions affected by the WEC occur at hundreds of thousands of locations.

The total cost of the proposed rule includes the engineering costs for methane mitigation actions implemented by the oil and natural gas industry to reduce WEC obligations. This includes the initial capital costs required to implement and install the specific mitigation technology. In addition, for mitigation technologies with expected lifetimes greater than one-year, annual recurring operations and maintenance (O&M) costs which include labor, energy and materials are also incorporated. Finally, the total mitigation costs also include the avoided cost of natural gas losses.

The social cost of energy market impacts is the loss in consumer and producer surplus value from changes in natural gas market production and prices. The economic impacts analysis uses a partial equilibrium model and estimates that the impact of the gas market is minimal, with the largest impact occurring in the first few years with a price increase of less than 0.1% and a quantity reduction of less than 0.1%.

Table 1-4 presents results of the benefit-cost analysis for the proposed WEC. The table presents the present value (PV) and equivalent annual value (EAV), estimated using discount rates of 2, 3, and 7 percent, of the changes in quantified benefits, costs, and net benefits relative to the baseline.[1] These values reflect an analytical time horizon of 2024 to 2035, are discounted

---

[1] Monetized climate effects are presented under a 2 percent near-term Ramsey discount rate, consistent with EPA's updated estimates of the SC-GHG. The 2003 version of OMB's Circular A-4 had generally recommended 3 percent and 7 percent as default discount rates for costs and benefits, though as part of the Interagency Working Group on the Social Cost of Greenhouse Gases, OMB had also long recognized that climate effects should be discounted only at appropriate consumption-based discount rates. While this RIA was being drafted, OMB

to 2023, and are presented in 2019 constant dollars. The table includes consideration of the non-monetized benefits associated with the emissions reductions projected under this proposal.[2]

Table 1-4 Projected Benefits and Costs from the Proposed Waste Emissions Charge (million 2019$)

	2 Percent Near-Term Ramsey Discount Rate					
	PV	**EAV**	**PV**	**EAV**	**PV**	**EAV**
Monetized Climate Benefits[a]	$1,900	$180	$1,900	$180	$1,900	$180
	2 Percent Discount Rate		**3 Percent Discount Rate**		**7 Percent Discount Rate**	
	PV	**EAV**	**PV**	**EAV**	**PV**	**EAV**
Total Social Costs	$390	$37	$380	$38	$340	$43
Cost of Methane Mitigation	$360	$34	$350	$35	$320	$40
Cost of Energy Market Impacts	$30	$3	$29	$3	$26	$3
Net Benefits[b]	$1,500	$140	$1,500	$140	$1,600	$140
Non-Monetized Benefits	Ozone benefits from reducing 960 thousand metric tons of methane from 2024 to 2035 PM2.5 and ozone health benefits from reducing 140 thousand metric tons of VOC from 2024 to 2035 HAP benefits from reducing 5 metric tons of HAP from 2024 to 2035 Visibility benefits Reduced vegetation effects					

[a] Monetized climate benefits are based on reductions in methane emissions and are calculated using three different estimates of the social cost of methane (SC-CH_4) (under 1.5 percent, 2.0 percent, and 2.5 percent near-term Ramsey discount rates). For the presentational purposes of this table, we show the climate benefits associated with the SC-CH_4 at the 2 percent near-term Ramsey discount rate. Please see Table 6-5 for the full range of monetized climate benefit estimates.

[b] Several categories of climate, human health, and welfare benefits from methane, VOC, and HAP emissions reductions remain unmonetized and are thus not directly reflected in the quantified benefit estimates in the table. See Section 6.1 for a discussion of climate effects that are not yet reflected in the SC-CH_4 and thus remain

---

finalized an update to Circular A-4, in which it recommended the general application of a 2.0 percent discount rate to costs and benefits (subject to regular updates), as well as the consideration of the shadow price of capital when costs or benefits are likely to accrue to capital (OMB 2023). Because the SC-GHG estimates reflect net climate change damages in terms of reduced consumption (or monetary consumption equivalents), the use of the discount rate estimated using the average return on capital (7 percent in OMB Circular A-4 (2003)) to discount damages estimated in terms of reduced consumption would inappropriately underestimate the impacts of climate change for the purposes of estimating the SC-GHG. See Section 6.1 for more discussion.

[2] As discussed in Section 6 of this RIA, the monetized benefits estimates provide an incomplete overview of the beneficial impacts of the proposal. In particular, the monetized climate benefits are incomplete and an underestimate as explained in Section 6.1. In addition, important health and welfare benefits anticipated under these proposed rules are not quantified or monetized. EPA anticipates that taking non-monetized effects into account would show the proposals to have greater benefit than the tables in this section reflect. Simultaneously, the estimates of costs used in the net benefits analysis may provide an incomplete characterization of the true costs of the rule. The balance of unquantified benefits and costs is ambiguous but is unlikely to change the result that the benefits of the proposal exceed the costs.

unmonetized and Section 6.2 for a discussion of other non-monetized benefits. A screening-level analysis of ozone benefits from VOC reductions can be found in Appendix A of the RIA.

WEC payments are transfers and do not affect total net benefits to society as a whole because payments by oil and natural gas operators are offset by receipts by the government. Therefore, from a net-benefit accounting perspective, transfers are considered separately from costs and benefits (and are therefore not included in Table 1-4). As explained further in Section 2.7, the approach taken here is in line with OMB guidance and the approach taken for RIAs for other rules impacting payments to the government, such as the Bureau of Land Management (BLM)'s waste prevention rule.

One of the reasons that transfers are not considered costs is because they represent payments to the U.S. Treasury that do not affect total resources available to society. Payments to the U.S. Treasury can then be used to fund other programs, and the pairing of revenue collection (e.g., the WEC payments) with commensurate expenditures (e.g., financial assistance programs) by the federal government can be designed to be revenue neutral. The Methane Emission Reduction Program created under CAA section 136 includes both collection and expenditure components. In addition to establishing the WEC, another key purpose of CAA section 136 is to encourage the development of innovative technologies in the detection and mitigation of methane emissions. See 168 Cong. Rec. E869 (August 23, 2022) (statement of Rep. Frank Pallone). CAA section 136(a) and (b) provides $1.55 billion to, among other things, help finance the early adoption of emissions reduction methodologies and technologies and to support monitoring of methane emissions. These incentives for methane mitigation and monitoring complement the WEC.

The WEC has the effect of better aligning the economic incentives of oil and natural gas companies with the costs and benefits faced by society from oil and gas activities. In the baseline scenario the environmental damages resulting from methane emissions from the oil and gas sector are a negative externality spread across society as a whole. Under the WEC, this negative externality is internalized, oil and gas companies are required to make WEC payments in proportion to the climate damages of methane emissions subject to the WEC.[3] Alternatively,

---

[3] Note that Congress specified that the WEC would rise to $1,500 per metric ton of methane in 2026 and beyond. This value is consistent with estimates of climate damages associated with emissions of a metric ton of methane

firms can avoid making WEC payments by mitigating their emissions generating climate benefits associated with the amount of mitigation.

Table 1-5 provides details of the calculation steps used to estimate projected WEC obligations and climate damages based on projected emission subject to WEC. In order to compare projected WEC payments to climate damages from emissions subject to the WEC, WEC payments are converted from nominal dollars to 2019 constant dollars using a chain-weighted GDP price index from the 2023 Annual Energy Outlook (EIA, 2023).

Table 1-5 Details of Projected WEC Obligations and Climate Damages from Emissions Subject to WEC (million 2019$)

Year	Methane Emissions Subject to WEC in Policy Scenario (thousand metric tons)	Charge Specified by Congress (nominal $ per metric ton)	WEC Payments in Policy Scenario (million nominal $)	WEC Payments in Policy Scenario (million 2019$)	SC-CH_4 Values under 2% Near-Term Discount Rate (2019$ per metric ton)	Climate Damages from Emissions Subject to WEC (million 2019$)[a]
2024	830	$900	$750	$620	$1,900	$1,600
2025	650	$1,200	$770	$630	$2,000	$1,300
2026	430	$1,500	$640	$510	$2,100	$890
2027	9	$1,500	$13	$10	$2,200	$18
2028	9	$1,500	$13	$10	$2,200	$19
2029	9	$1,500	$13	$10	$2,300	$20
2030	9	$1,500	$13	$9	$2,400	$20
2031	9	$1,500	$13	$9	$2,500	$21
2032	9	$1,500	$13	$9	$2,500	$21
2033	8	$1,500	$13	$9	$2,600	$21
2034	8	$1,500	$13	$8	$2,700	$21
2035	8	$1,500	$13	$8	$2,800	$21
Total 2024-2035	2,000	-	$2,300	$1,800	-	$4,000

[a] Climate damages are based on remaining methane emissions subject to WEC after accounting for emissions reductions and are calculated using three different estimates of the social cost of methane (SC-CH_4) (under 1.5 percent, 2.0 percent, and 2.5 percent near-term Ramsey discount rates). For the presentational purposes of this table, we show the climate benefits associated with the SC-CH_4 at the 2 percent near-term Ramsey discount rate.

---

that were available at the time the IRA was passed. The February 2021, 'Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990,' estimated that the social cost of CH4 under a 3% discount rate for emissions occuring in the year 2020 was $1,500.

2 BACKGROUND AND OVERVIEW

2.1 Introduction

This document presents the regulatory impact analysis (RIA) for the notice of proposed rulemaking titled “Waste Emissions Charge for Petroleum and Natural Gas Systems.” The proposed rulemaking would implement a waste emissions charge (WEC) for methane (CH_4) emissions that are reported by applicable facilities to EPA under Greenhouse Gas Reporting Program (GHGRP) Subpart W and exceed emissions intensity thresholds. The proposal responds to requirements from the Inflation Reduction Act.

2.2 Statutory Requirements

This section describes the legal basis for the proposed WEC. The Inflation Reduction Act (IRA), signed into law on August 16, 2022, introduced new requirements for methane emissions from petroleum and natural gas systems, including a Waste Emission Charge (WEC). Section 60113 of the Inflation Reduction Act added section 136 to the CAA, entitled “Methane Emissions and Waste Reduction Incentive Program for Petroleum and Natural Gas Systems.” Section 136(c) of the CAA, “Waste Emissions Charge, states, “The Administrator shall impose and collect a charge on methane emissions that exceed an applicable waste emissions threshold under subsection (f) from an owner or operator of an applicable facility that reports more than 25,000 metric tons of carbon dioxide equivalent of greenhouse gases emitted per year pursuant to subpart W of part 98 of title 40, Code of Federal Regulations, regardless of the reporting threshold under that subpart.” Other key sections of the CAA that define the requirements of the methane emissions and waste reduction incentive program include the following:

- Section 136(d) of the CAA, “Applicable Facility,” defines the term applicable facility for the purposes of section 136.
- CAA section 136(e), “Charge Amount,” specifies that the waste emissions charge is determined by multiplying methane emissions reported to subpart W by specified charge rates for calendar year 2024, calendar year 2025, and calendar year 2026 and each year thereafter.
- CAA section 136(f), “Waste Emissions Threshold,” establishes the thresholds by industry segment above which the EPA must impose and collect the CH_4 emissions charge. The subsection also provides that the EPA shall allow for the netting of emissions for certain facilities under common ownership or control and provides for several exemptions from charges.

- CAA section 136(g) mandates that the waste emissions charge shall be imposed and collected beginning with respect to emissions reported for calendar year 2024 and for each year thereafter.

The charge per metric ton of methane emitted in excess of the industry segment-specific threshold increases according to the following schedule, as specified in the IRA: $900 in calendar year 2024, $1,200 in 2025, and $1,500 in 2026 and beyond. Thresholds are set based on industry segments and activities conducted at the facility. The waste emissions threshold is a facility-specific amount of metric tons of methane emissions calculated using the segment-specific methane intensity thresholds and a facility's natural gas throughput (or oil throughput in certain circumstances); facilities that have methane emissions below the threshold would not be required to pay the charge. It is also important to note that the WEC would only apply to the subset of methane emissions that are above the emission threshold, not for a facility's total methane emissions. The emission thresholds for each industry segment-specific are specified in CAA section 136(f), which are shown in Table 2-1 .

Table 2-1 Waste Emissions Thresholds by Industry Segment in CAA Section 136(f)

Industry Segments	Applicable Waste Emissions Threshold, Calculated as the Metric Tons of Methane Emissions Equal to:
Onshore petroleum and natural gas production Offshore petroleum and natural gas production	0.20 percent of the natural gas sent to sale from the facility; OR 10 metric tons of methane per million barrels of oil sent to sale from such facility, if the facility sent no natural gas to sale
Onshore petroleum and natural gas gathering and boosting Onshore natural gas processing Liquefied natural gas storage Liquefied natural gas import and export equipment	0.05 percent of the natural gas sent to sale from or through the facility
Onshore natural gas transmission compression Underground natural gas storage Onshore natural gas transmission pipeline	0.11 percent of the natural gas sent to sale from or through the facility

The EPA is proposing to establish provisions for the WEC at 40 CFR part 99 consistent with the authority and directives set forth in CAA section 136(c) through (g). This proposed rulemaking is hereafter referred to as the "WEC proposal" and the proposed provisions under 40 CFR part 99 are hereafter referred to as "proposed WEC regulations."
